Let me just take this illustration. Conscious attention, which is the faculty we use most to negotiate and get around, is rather like the headlight of a car. And the headlight illuminates the road in front but it does not shine on the wiring that connects the headlight with the battery and the battery with the engine, so we are not ordinarily aware of how we are aware. And as a result of that, we don't understand our connection with the world, and we are unaware of what our real self is. Therefore, we get anxious. And we are afraid that death may be the end of us, and that somehow we will just pass out of this world altogether that will be that. Well this is of course the purest superstition. Because you're everybody is indestructible. We, as individual organisms as what we call physical bodies we come and go like leaves on a tree but there's the tree. And you are the tree. In the saying of Jesus 'I am the vine. You are the branches.' But that I am Before Abraham was I am. Is the self and this what the Hindus call the Brahman and the Chinese call the Tao. And are. The Tao is curious.

And so, the basic idea in this is that life is a dance. Of flowing downs which consists of going on and stopping that is to say what the Chinese call yang and yin. Yang is the southern side, or the sunny side of the mountain. It is a sunny south side of a mountain or the north bank of a river, where ever the sun falls. Yin is therefore a shadow side. Now imagine a mountain with only one side nobody has. A river with only one bank. Now life, you see, is a highly a game of Now You See It Now you don't. On up a wave. Moves in crests and troughs. Now you can have a wave unless you have both a crest and a trough. This is true in hydraulics, in terms of water, in electronics, in terms of physics, without the one you don't have the other. And so the relationship between least two things is called it this is the most important term there is in Taoist philosophy, is called mutual arising, and it's done like this.

This is the most important idea in the whole thing, this character means reciprocal or mutual, and this is based on an old idea ground for of a plant growing a rise to come into being and the whole of the fundamental idea is that the yang and the yin come into being together. You never find one without the other there's a sort of secret conspiracy, like Tweedle Dum and Tweedle Dee agreed to have a battle. So that, although there are different, like front and back are different too high and low are different, being and

nonbeing are different. Nevertheless they always go together so that to be on not to be is not the question. See it is the question for the west for all existentialist thinking to be on not to be that really if the question therefore man must necessarily be anxious, trembling always, the moment he knows that he is, he faces the possibility that he might not be. And so he trembles.

So, it is because of this then that the individual person all comes to feel that he is not something strange in this world. He comes to feel that he's an expression of it, and of the world as himself rather than his physical body alone. His physical body yes, that's you. And it has a certain degree of independence. But it's an expression of the whole thing in the same way as a wave as an expression of the ocean. See the ocean waves, and says yoo-hoo, I'm here. So in the same way, the whole cosmos waves with you and says I. And to the other waves hello glad to meet but we are all really. The one center expressing itself play in an infinite variety of ways.

Now then you say well what does this lead to in terms of practical consequences. Well it leads to a respect for the external world as one's own body. It leads to knowing how to get with it. Knowing how to do things, to act with the grain, rather than against the grain. And this is a, the most important lesson that ancient China has to teach the modern west, the modern technological west, is how to get with it. Because you see we have in technology as fantastic power to altering the not only the external environment, but for altering ourselves. What we can by technology, by neurological surgery, and by drugs and all sorts of things, we can change our own brains and begin to interfere technologically with our own characters. Now, the most asinine thing for us to do, would be to live in this lovely environment and spoil it by living in it. That's ridiculous.

So if you are a skillful architect works on the principle of the traditional Taoist and Zen architecture. You go to your environment let's say it is great still here and you say to it Good morning. And you even about so to it and say 'I want to live here but what kind of house would you like to have on the Hill.' Well the Hill says 'I would like a house that will disrupt as little as possible, because I have a game going on.' I have a huge complexity of plants and insects and small animals that manage to keep this hill here all these plants retain the hill they they prevented from falling down the they

prevent avalanches and all sorts of things like that so the Hill suggest to the sensitive artist the architect to build a house that does not interfere with the ecology of the hill. And so he thinks now, how will I do this, and he comes up with a solution where the only alteration he need to make to the Hill is to build some sort of a road to the house. But actually, what we're doing instead of that is we're going into our kills with bulldozers and we're terracing them, so as to make room for houses that would be appropriate on flat land and put them in the hills now we need the flat land for agriculture. All flat land anywhere available in California should be farmed, and people should live in the hills. But in order to do that we've got to understand how to treat hills. You see?

So if you look at the way the hills on the north side and the east side of Kyoto have been civilized. Why they never did that thing that...They have the most beautiful way of concealing houses in the hills so that you hardly know they're there. They don't know they didn't have any bulldozers. And the way the farmers have adapted their land to the landscape and done contour farming in the in the hills it's exquisite. So that a country, which is eighty percent of the land, is non Arab or because it's mountain. Has been made in combination with the sea eighty percent self-supporting. It's simply fantastic. They farm in the sea of eight seaweeds and things that we don't eat but all along the California coast there is a fantastic abundance of money in food kelp. You know how to cook it was just great. But we have to learn these lessons you see, in order to get by because we're going to have a terrible time if we don't know so this is the principle that is call him in Taoist philosophy wu-wei. This means not to force things. That's the best English translation, I've come to. It's sometimes translated not doing. No artificiality and no interference. But our work forcing as when a forced laugh forcing a lock forced behavior forced kindness fostered love in that sense forcing don't force it.

So, it means action in accordance with the character of the moment, and of the circumstances in which you're acting you see you can't not interfere with the world. Everything you do interferes with your environment and nobody knows this better than a chemist or physicist. Because he realizes the especially the physicist, that whenever he so much as inspects the behavior of electrons the things he has to do to inspect their behavior alter

the way in which they behave. Another was shine a light on something to look at it and that bombardment of light effect it. Especially at the nuclear level.

So in another way, let's say you, you put fertilizers in the soil, and that alters the ground. Now, ground that has had fertilizers put into it is not the same kind of ground as ground that hasn't. You understood the ground before you put the fertilizers in it and decided what to put in, but after you put it in it you've got to study it all over again to see what's happened to know what to do next time. And you see this constantly keeps moving. To know things is to change them. You cannot, not interfere. So the idea is to learn how to interfere skillfully. That's wu-wei. How to act with the grain.

And then there's one other thing but it has to be understood. Which goes into this this is not found in ancient Taoism but it is found in Zen it comes in later Chinese philosophy but it's based historically on the Taoist view of the world and this is the word Li. Now this is a very fascinating expression. It means, originally, markings in Jade. Grain in wood. Fiber in muscle. Western scholars have translated it reason or principle, but this isn't very good it doesn't get the feeling of it. Li is the word used to designate the character of the order of nature. And so our scholars tend to translate it the laws of nature, see? But the Chinese have no word that we can correctly translate as the laws of nature. Because they don't look upon nature as obeying laws. They look upon it as orderly but not legal.

Now you cannot write down the rules of fair play. It something that we know without being it's too complicated to be put into words. Just in the same way exactly, that we cannot describe our own nervous system. It's too complicated. And will always elude us, but where we'll get somewhere near it, right now the judge who understands equity goes beyond law. Because he is informed with this principle. Here Li. And the markings in creators like this when you get a piece of jade and look at its markings and. You don't think of them as chaotic. When you see a dirty old ashtray with cigarette butts in it and rolled up bits of paper the pieces of Kleenex and things that everybody is throw away, you know that that's a mess. And you don't want that kind of a mess around. You get rid of it. But, when you look at the patterns on rocks or the shapes of clouds or the outlines of trees,

you've got something which isn't orderly in the sense of being symmetrical. It doesn't form fours, you know? But you know it's beautiful.

And so the painter in the Western tradition has copied clouds and trees and everybody when he copies clouds and trees as it were that's a picture I know what that's about. But clouds don't mean anything. They're not a picture of anything they're just clouds, they're just clouding. And so the poem. I don't know if I wrote it that now I didn't there's one called. 'Blue Mountains are spontaneously Blue Mountains white clouds are spontaneously white clouds. They just do that you see that's their game. But they what they are definitely something that we recognise as having an order and not being chaos. But we can't quite pin down where in that order consists. We know it is order. And we can analyze it physically, chemically, and we can find out a lot about the behavior of surface tensions, which are a way of explaining why our bubbles in water form the way they do white clouds form the way they do it separates etc. But, what we get is only an approximation to it. Like for example, when you measure a piece of land, you're a surveyor, and you'll reduce it to so many small triangles and you measure those triangles and that measures the land that's only an approximation to what's actually there. Fine, so far so good, but we never quite get it.

So there is there's always I'm graspable indefinable principle of order in things which is Li. And that explains why Chinese art appreciates in all that it does a certain element of the uncontrolled. Now you see when you use for example a brush. Let's take it right here. In our Here the brush runs a little dry. And you are at the mercy of the hairs of this brush. Now some painters like to let everything go wild. In a certain sense, the man who did that has let things go pretty wild. But what the ideal that they're aiming at is what you have to be a tremendous master to accomplish is to let it go wild within limits. To create a situation which overall is orderly, but allows for the unexpected random surprises. And so they look upon our daily life in exactly the same way.

I was talking about bees earlier on, and somebody suggested to me the other day that these are quite remarkable for this reason. That every bee does exactly what it feels like doing. And yet. It's all orderly. Imagine that,

supposing you could get up at the beginning of the day and live in such a way that you did just exactly what you personally wanted to do. You didn't pay any attention about what anybody else thought of doing or the schedules are anything like that you did just what you felt like. But it so turned out that what you felt like was what everybody else felt like doing with you, and it was an orderly performance.

Well the bees have it. And so to follow the Tao. is to acquire the art of doing exactly what you feel like doing. And at the same time it wu wei, in the sense that it does not force anything on anybody. Or impose on you. But, to do that, to act naturally, you have to understand this word, which in Chinese is called ziran. That which is. Now where this mean so, this means self. Self -so. What is so of itself this is pronounced ziran. And this we translate into English nature. Although it's very unlike our word nature. It means what happens without being shoved. Without being forced. What is so, of itself. What happens naturally we do have it in that sense it comes naturally when we say that. It's second nature. Something like that, when we say that we get this thing so the Tao. Passage and Lao-Tzu's writing places the Tao's method, is to be so of itself.

Now, we have had an image of the universe in which it's run by somebody the Lord God is in control. And he made it all he engineering it all, understands all about it and he remains in control. The Chinese is exactly the opposite. It looks as a part of the universe as not being in control at all. But is being perfectly orderly of itself. So he says the great Tao flows everywhere, both to the left and to the right. It loves and nourishes all things, but does not lauded over them. And when good things are accomplished it lays no claim to them.

I know for example, an order, in a sort of a religious order in Japan, where it's both men and women. They live in about two hundred of them they live in families. And they live very simple way and they're fantastically happy people. But what there they do is they they round their garden and farm and so on, but they also they they are always buzzing around town finding out if somebody is sick and a family is in a hopeless mess. Everybody is sick, they can't even clean up their toilets they can't do their washing and so on

these people move in and they do clean out the toilets they do the washing and they clean up the whole house and disappear.

You know it's a very curious kind of a thing but they just vanish. So there's a poem in Zen which says 'Entering the forest he does not disturb a blade of grass. Entering the water he doesn't make a ripple.' Because he was so in accord with the scene. And he flowed so easy through it that nobody noticed.

Water not disturbed by waves, settles down of itself. A mirror covered with dust it is clear and bright. The mind should be like this.

Early Chinese Zen

One of the things that is a really interesting problem, is just why Zen has become so fascinating to many people in the West. Because as you find Zen in Japan today, it's a pretty tough scene. There are very few Japanese interested in it. The Monastery of Myoshinji in Kyoto, was built to accommodate six hundred monks. There are now thirty. For example, I wanted to have a conversation with a learned priest of the Shingon sect. And I had two interpreters; his wife, who speaks very good English and the interpreter we had for our group. And as we got into things, they started to say sorry but this is impossible to translate into English. We don't know what it means. So I said, All right let's get some paper. And when any word arose that they didn't understand I had him write it in Chinese characters. Which I can more or less read.

And so we managed to can't converse in this very strange roundabout way of the syntax being conveyed by the interpreters and the actual terms being written. But that shows who say that they've been quite intelligent people, but the interpreter was a very intelligent man and the priest wife a very and well educated woman. But they don't know what it's all about. So how come then you see, this fascination in the West? Well, it's due very largely to the way in which certain people have presented Zen to the west notably Suzuki. And R.H. Blithe. They have made a great use of the Zen story of the anecdotes. There is a book of Zen anecdotes, these conversations between the masters and their students. They're called Mondo or question-

answer. There is a book which is called the Mooman Khan. And it's just a collection of stories. And I remember a friend of mine in England, when this was first in circulation, getting this book when he was in hospital. And he said I don't understand it at all but it's cheered me up immensely.

So the typical sort of Zen story where the student asks the teacher a question. What is the fundamental meaning of Buddhism? And the master says, 'Wait around until there's no one here and I'll tell you.' So later the student says to him, 'now there's nobody around Master what is it?' and he takes him out into the garden. And he points at the bamboos. And the students as I don't understand. The master says, 'What a long bamboo that one is. What a short one that one is.' Period. It has a kind of a shaggy dog feeling, it has a it just leaves you wondering. Well what's this meant to convey?

And the answer of course is that Suzuki explains most carefully it's not a symbolical tale. In other words you're not supposed to understand that bamboos symbolize something. In the way that for example the parables in the New Testament are symbolical tales. Is not like that at all. All these zen mando. Are absolutely clear there is no concealed symbolism except in very rare incident and then the symbolic element is subordinate. Always the answer is completely straight. For example, there is a famous koan, where the answer to the question, 'What is the fundamental meaning of Buddhism?' is the second son of the Sho family, and the third son of the Cole family. Or something like that.

And once a student. Gave an answer to this koan. And the teacher accepted it, but the teacher's chief student who was standing by at the time said when the other student had gone away, he said I think you should test on this. And, I don't think he really understands. So he called him back the next day and said oh I gave him this koan again and he gave the same answers he gave before and the teacher said no no that won't do at all. But Master you accepted this answer yesterday. But the Master replied, 'Yesterday it was yes but today it is no.'

When another, when we had a talk with one of the great Roshi's in Japan on our last visit. We were discussing the translation of zen texts into English. And there's quite a work going on in that way. But he said it's not

necessary. If you understand Zen, you can use any book to teach it with. You could use the Bible you could use Alice in Wonderland. After all he said the sound of the rain needs no translation. And this is a very very straight story, you see, this is saying exactly what it's about in the plainest language. Only people overlook it. You know, when something's right under your nose and you can't see it and you go looking over there there there there there and you're carrying it you see. It's like that. And so Suzuki has explained that that's the way it is. That once when Sabro Hasegawa, the great Japanese painter was at a dinner party here in San Francisco somebody asked him what about understanding Zinn How long does it take. He said 'it might take you thirty years it might take you three minutes. I mean that.'

So you see the element of fascination that it's right under your nose you're looking right at it and see Asika you don't get sort of strangely puzzled when you've lost something, and somebody is kidding you. They're not piling it up deal with that why don't you see it. It's right there. And you can't for the new. I have you with it I mean it's far more interesting that sort of situation than something that's really difficult to find anywhere you'd have to go digging on the floors in it some and if a treasure were concealed in the walls of this ferryboat and I would have to go digging through the walls and look at all sorts of things but here is the treasure concealed in full view, and concealed by being in full view but in the place that's too obvious to look. So that's the flavor of Zen, and that's why it's become so fascinating. Also, there are other elements in it that. It has a humor to it which is peculiarly Chinese. I don't think the Japanese have quite the humor in their Zen that the Chinese had. And you because you see this humor comes from Taoism. The say the writings of Chuang Tzu, who was the great Taoist philosopher who lived shortly after three hundred B.C. He's the only really great humorous philosopher. And that flavor has passed on into Zen. And also Zen is something experiential. You're not required to believe in anything. It doesn't have any doctrines. It's entirely consists in a state of consciousness. Awakened consciousness, so as if I were to say to you, you if you were puzzled about something you know, you were what calls concerned about being. What is this thing, life? Why are we here? Why it why is that suffering? Why do all these creatures multiply in different ways? Shapes Why are the ducks? Why are the trees while other

snails clams people all out for heaven sakes why? And why do they come and go on what happens to them when they go we all want to know that. So that's the kind of concern.

Zen answers this, not with an idea but with a changed state of consciousness. And we'll never know whether you can get that change state of consciousness instantly right now without further ado or whether you have to work for many long years. There was an American student of Zen. Went to Japan on a Fulbright. And he started and started he practiced his meditations and sat in the meditation posture with all the other monks. And the last part of the technique is to work up a state of intense doubt, puzzling about what is it? You know what's this? What is it? What is existence? What is isness? Well he worked and worked and worked at it. And nothing happened. And the time for his stay was very close to the end, and he couldn't get a renewal of the grant and he had to go back to the United States and he thought this is absolutely terrible I won't get it I won't get the Satori, the Awakened insight. So he went to the master and said look this is desperate you've got to help. The Master said, "Now look you'll do what you've got to do is now go into what's called seshen. Seshenn means study of the mind. And but it means prolonged meditation where you hardly even sleep. And it isn't really get to work on your koan, and see me four times a day. And see if you can answer your can and I'll help you. So you worked and it worked and it worked and he sat there and nothing happened nothing have. Until almost the day he had to leave when suddenly he saw that there was nothing to realize. And then he had it.

You see, Zen works on this principle it's called using an empty fist to deceive a child. You know when you say an hour to a child what have I got here? The child is all interest what is in there and you hide your hand this way that way and so on when the child is fantastically interested and then finally, there's nothing. So in the same way, you can get a problem about life. Which is a closed fist. What is it all about? It's like asking what's that pit in the middle of an onion? And you take off all the skins and so on zones on and suddenly you find you've got a litter of skins and no pit. There wasn't anything in it. And you might say well that's it's a hoax. It's, the life is a deception. A tale told by an idiot. And yet, what you had missed, in looking for the pit, were the beautiful skins. See, that's the edible part of the

onion. Whereas you may peel a potato. The Onion is all skint. But excellent.

Now they might have one has done under these circumstances is you have missed the point by being too eager. You have therefore overlooked what was obvious. And so problems are made about the nature of the universe by asking the wrong questions. May I repeat that there are four great philosophical questions. And in a way they are all of the mistaken. But they are the questions that people have asked through all history about the world one who started it.? Two, Are we going to make it? Three, Where are we going to put it? And four who's going to clean up? Plato.Aristotle. Kant. Descartes are all discussing these four questions. Now you see but they give you the beginning the beginning who started it that's a misleading question. Know what it is if it was always here you know, it is what there is. And you had it there. But if you see if you get under that you know what what do I see when the some kind of shenanigans going on, the police come by, they want to who started it. They're looking for a ringleader because they want someone to blame society requires that somebody should be blamed.

So what we do is from childhood, all human beings get together and they make up the idea that you started it. Only it's no fun if we know immediately who started it. It has to be sort of concealed so people tell lies and cover up and so on and so we want to know who's good guys and who are the bad guys really there aren't any differences. We're all collectively doing what we're doing, and because one person is as we know say a criminal it has to do with his parents and his environment and so on but that mustn't be admitted. Because we wouldn't know how to deal with all of us. See, if the thing that's that that's the matter with human beings is all human beings in addition to their environment and the fishes and the birds and everything it all goes together, it's absolutely interconnected. And but that's no fun you see, so we break, we pretend that it's all broken up into bits. And that one starts it and so on.

So, once you've done that once you've broken it all up into bits, and you start playing cops and robbers. Then you have problems. And it may be fun to have problems, it's perfectly alright to have problems. Because that's the interest of things. We make life interesting by making it difficult. And

sometimes we overdo it. And then it gets desperate, and then people begin to ask well what's it all about? Why are we doing this? Then you have to go to a zen master or somebody like that to be cured of your illusions. And the way he does it, you see, is to make you ask intensely What is it? What is the sound of one hand? Listen. Really listen what is the sound of one hand? What is that say when somebody asks as a master what is the fundamental meaning of Buddhism? He said 'the cypress tree in the yard'. All right go up there and look at it. Are just the sound moo. The Great Master Joshu was asked does a dog have Buddha nature. And he said no. Moon Chinese. But everybody knows if they started any Mahayana Buddhism they're not only good dogs have it in them but in nature which means the capacity to become a Buddha, an awakened one or you could say it means Buddha nature could roughly mean. The divine center.

So why did the master say no? So they what they do is this. They they work on the word no. And sometimes the masters teach them to say No really. Now he says Say No shout it. And the student shouts, and the teacher says, 'You didn't really mean it, try again.' And so he gets to yelling No This in no no no and the teacher is no this is not good enough get behind it, get with it. And the student get so frustrated, he suddenly realizes he can't say no. Well now, you know a little bit about this. Supposing you take the word know and you say it many times NO NO NO NO NO. And it becomes funny. You wonder isn't it strange that this funny sound no, which makes you it a little bit on the tip of your nose means no, well what does no mean?. What does it mean that you don't know what I mean when I say No see I mean no means I won't. I don't want any dinner or something I won't play with you.

But take the situation of a person making this exchange with another. See, we know we know the meaning of the word no. But what does it mean that we are able to have this exchange of meaning this communication. Does that mean anything? Well, it in a way it doesn't you can come and sit over here there's plenty of room. What, that is is the fact that we as human beings communicate, that we say how do you do in the morning and goodbye at night that we eat, that we have children, and they all put in the boxes, and they become doctors and lawyers and business executives, and they do this and they do that it's just that the trees go up and they do this

and they wave in the wind and the birds flap around and they eat things and that makes bird because all the food you eat flows into your shape just like a flowing stream has a whirlpool in it and it keeps the whirlpool there but the Whirlpool is never the same water it goes on and on.

So in just the same way all these creatures are a kind of a tide of food and it goes in and it does that creature and it flaps around and then it goes out again. So what's all that about? In the Buddhist philosophy is that all that is called thusness. It's like that. Like did you ever see a lady go this way go that way. And so a Buddha is called in Sanskrit a tathagata, which means one who comes or goes thus. This very simple, that's that that's what it's doing and things are doing that. Only to make a kind of game of it, we put valuations on it. It's like poker you get chips how much of the chips worth well they're worth anything you want to say their work. So in the same way all this is going on and you say well what is important. Is the something important or well yes we say there are certain things that are more important than others. We've agreed among ourselves because we are people that we are more important than seagulls. And the seagulls have agreed among themselves that they're more important than people. And they they recognise their kind and they pick out in life all the things that are significant to their needs as we pick out the things that are significant to our needs. We say now that's the thing that really must happen but actually nothing must happen. It just, it just happens. And that's called thusness are such a mess. And so the zen is concerned that the whole nature of Zen is to get you back to seeing the suchness of things. You see, it's a process of un-hypnotizing things. You see, when you you hypnotize people by making them pay attention. So I want you to look very closely at my finger. And I want you to relax completely and pay attention only to this finger. And there are many other ways of doing it you. You hypnotized people much better by not letting them know that's what your doing. And all showbiz and teaching and so on is hypnosis. Your parents began to entice you in the moment you were born because they told you what was important to look at you know baby looks at everything. They really is interested in just anything around I mean children sometimes point out things for which we have no words to say what's that. You say what do you mean? Why don't you see that? Roanoke a perfectly clear I'm that what's what's about it what's the word for that you suddenly realize that they're pointing out a

configuration of patterns on something that we don't have a word for. Me, for example we don't have a single word in English for dry space. We don't have a word for most kinds of smell. For example, the smell of cheap perfume. Like Ben-Hur, or that sort of very metallic, crude kind of perfume. We don't have any word that describes that specific quality of smell. Because we haven't thought it significant very much to bother about our noses. But little children smell everything, they look into everything, they suck their toes, they explore their whole bodies everything all around. And they're fascinated. But the adults say now now don't touch this do touch that look at this don't bother about that, because they're teaching them the human game and what is significant and what is not.

Now, when you see you have picked out things in the world that are very important things, the significant things. In other words the scenes a thing is a name for something you think about. All things are units of thought like an inch is a unit of measurement or an ounce is a unit of weight a saying is a unit of thought it's a think. And so when you say you can only think of one thing at a time you can only think one think at a time that's what it's saying because actually think of the things think of the tape recorder how many things is the tape recorder? You know it's a mass of stuff. Human body likewise. But when that predicament is foisted upon you, are divided life into all these things. Then you are under the delusion that the world is all separated and disjointed. And that you are only something in the world. You forget by doing that, that you are, that your physical organism. Let me put it this way, is something that the whole. Cosmos is doing. The real you is all that there is, the whole works. There's no real separation. I mean, when I say there are there's no separation don't imagine that I'm saying that there aren't any skins, there aren't any outlines, there aren't any surfaces or lines. Yes of course there are.

But the basic lesson in metaphysics is that for every inside there is an outside that's really all you need to know. Once you really understand that you have mastered all philosophies. That the inside and the outside go together in other words people think that I'm in the inside and you're on the outside. But where would my inside be without the outside. See, imagine a bottle, which has an inside but no outside. It won't work. There's no such thing. Imagine an object, with no external space around it. It wouldn't exist.

So the space and the object go together just in the same way as your front and your back go together. And that's it only you see we're taught by pointing out what things are important and what and not, to ignore that. So ignoring it, is in Sanskrit ignore and it's our video and the Buddhists say video is the beginning of the trouble.

You just ignore are the inside and the outside go together. So, the the the work of Zen is to get people un-hypnotized by this sort of thing, back to the point where they started in babyhood, but they never cultivated it because they were developed along other lines. To its call to regain one's original treasure. That you received from your father and mother. Or what is sometimes called to get the unborn mind. That's a curious phrase, the mind that didn't arise. That is to say what you are fundamentally, as distinct from what you pop up and declare yourself to be. Imagine for example, a big sow with many tits on it, all these passages to a central source of. And so they unite together under the surface well in the same sort of a way you see we are all, united like that. We are channels. Through which it is happening.

Only, we are sensitive only on the tip of the nipple. [laughs] We are all our concentration is there at that point. And so, we've lost the realisation of being the whole thing. That happened very very early in our infancy. Now when you get it back, you don't become incapacitated. In other words, it isn't as if you lost sensation and the comprehension of what we call the different things and events in the world their names their places all that sort of practical knowledge. The knowledge in other words that is helpful for survival. You don't lose that. That you see all these separate things, and people and events, in a new context. You might say, against a new background. In which you see that they're all one. Or if I'm going to get very very technical as the Indian logicians like to, he would say they are non-dual. Because the word one is still a dual word. It has an opposite one as opposed to many or to none. Whereas this whatever it is, that we're all on. Doesn't have an opposite, because it's everything, so the word one isn't quite the right word for it so they use the word non-dual which is a kind of a fancy word. They use it. I mean non-dualism is of course the opposite of dual. But they have a convention about it. Imagine, when you draw on a flat surface, and you want to represent the third dimension of depth. You do it. Still using lines on the flat surface, but by a convention that we all agree on

certain slanting lines indicate this dimension, and we all know that so in the same way in Indian philosophy certain words are used. To designate a dimension not in our ordinary way of thinking our ordinary where thinking is either this or that we think in dualities, and that may have something to do with the fact that our brain as two sides, and we have two eyes two ears and so on two nostrils. This, and the way our ribs are formed growing out of the spine and two legs and two arms. That probably, that structure is connected with the way we think. Either this or that. When you have what's in the left hand all you have what's in the right?

And so, we can't talk about, we can't say anything sensible about everything, about the universe. Because we can't find something that's not the universe. So then what we do is we take a dualistic word and say, it is to be understood that this word refers. To what is beyond all dualistic ideas. See, look at it this way. In order to make a word mean something. I have to be able to say what is excluded from the meaning of this word. It's like a box. If the box is there, there must be what's inside the box, and there must be what's outside the box. Now I want to talk to you about a box which is the ultimate box, the class of all classes, as logicians say, and there isn't anything outside it. Everything is in this box. Well, a logician would say that's absurd there could be no such box it wouldn't be a box. Unless you can show me that it has an outside I'm sorry.

Well, I'm going to get tied up with this fellow I want to say yeah. My box has an outside. And the outside and the inside, however, go together. Actually the box I have here. Is constructed in a Q peculiar way you know what a mobius strip is don't you? You take a strip of paper, you twist it once and you draw in the two ends have a continuous strip. Now this has a very strange property. It has only one side and only one edge. You can hold that strip of paper between your fingers and say well look here, I've got one finger on one side and one on the other. It obviously has two sides. Say wait a minute. Take a pencil light. Bright red pencil and run it along that so-called one side that you think you have there, and keep going. And you'll find when you have followed the pencil back to the place where you started. That you never took it off the paper to go around to the other side.

In the same way, you run your finger along one edge of it and you keep running and you'll get back to the point where you started from and you will have covered the whole thing, both sides. Both edges. Now, just put that now into three dimensions, instead of two. And you have what's called a Klein bottle. If you I think somewhere around the house I'll dig it out we have the Life magazine book on mathematics and has a beautiful drawing of a Klein bottle in it. That has the same property in three dimensions. Now imagine a world which has the same property in four dimensions. And you got something like what our universe is. It's outside is the same as it's inside. Crazy. And you you see, it's difficult to talk about that in the kind of language that we have. Just in the same way mathematicians affair especially in with mathematics applied in physics, have ideas, which they can express in their formulae, but which they can't talk, they can't tell the layman about. Because in order to instruct the layman as to the meaning of these concepts they have to put them into our ordinary three-dimensional sensory images and they always distort it.

So you see, the view that's why it said that Zen cannot be explained in words. Although it is in a way explained very clearly in words in all these little stories. Nevertheless, these stories are not intelligible until you have what I can only call a new dimension of consciousness. You see, a lot of people don't really have depth perception. They would look at the moon and see it as a disk. They don't see a ball, the same way a lot of people attend there. They hear noises, but never hear tunes. It's something like that. Suddenly, one day, you say, 'Good heavens the moons of all. Are you suddenly become alive to what it is that people dig in music.

Well, in just that sort of way, you can become suddenly alive. Till then, I'll just call it the oneness of everything that's going on. And you'll see that that's all you. And you are eternal. Your what there is. And there's nothing to be afraid of. Because of where we're coming and going we go through a whole spectrum of feelings from the most rapturous pleasures, to the most ghastly agonies, and it's all as insubstantial as weaving smoke. And just go, you know, just get with it and go. And then you have the basic understanding of Zen.

Now, all that I've said that's far is simple introduction to what Zen is about. If this way of understanding things. Arose independently in both India and China. In India in what we call the tradition of the opening shots in Vedanta and yoga and so on. Then in Buddhism, in China in the form of Taoism and. And they reached each other eventually. And the confluence of the Buddhist and the Taoist traditions, came to be Zen. And this, the formation of Zen really began in about four hundred fifteen A.D. In China. With the students. Of a great Hindu monk. Camara Gita. And. In the following, two hundred years. Three hundred years, it slowly took form and took form. Until a very remarkable man by the name of Hui Neng. HUI, NENG, who died in seven hundred thirteen A.D. was the man who put it on the map. Who. As it were. Brought all the threads together. And could be called the real founder of Chinese Zen. Now we're going to do in the course of the seminar we're going to look at the work of Wayne and. That I want first before we. Look at him to look at some of the earlier people especially Dogen. Was a couple of generations before spiritual generations that is, Master-pupil, master-pupil, who wrote the most succinct summary of Zen. That exists which is called the Hsin Hsin me. That is to say the treatise on trust in the mind. Mind with a capital M.. Which means many things mind is used in Zen they use the word Shin and when a Chinese says shin he points here. Japanese the heart mind. The psychic center of gravity. But it means mind in a. Much wider sense than that. It means mind in the sense of do mind? Mind out. And it also means mind in the sense of space. Everything that we see is on the Mind. Like the sound of the radio is on the diaphragm of the loudspeaker. It's a very wide sense of the word. Well let's have an intermission now.

This morning, I simply tried to give you a general survey of what Zen is about, by way of being an introduction. And I was discussing the peculiar reasons for the interest in Zen in the West, stressing the extraordinary way in which the sort of, now you see it, now you don't, implication of zen literature has fired people's imagination, curiosity. That the feeling, there is a new vision of the world in it the aspect of its unity as distinct from our ordinary vision of the world in the aspect of its multiplicity, and broken-upness, fallen-apartness. And that this is something that you might somehow suddenly catch at any minute. It isn't that then is an easy thing or that it's a difficult thing. It might be either. And, but it exercises this peculiar fascination, by saying that the vision of the world and its unity is

terribly obvious. It's right under your nose only, you're looking too hard in the wrong place, so you don't see it. And so this is always the same puzzle as if I said to you. If you came here you know, and said well we want some philosophical enlightenment or whatever, and I looked at you in a funny way and said 'But you've forgotten something.' You know as if you hadn't got your pants on or something. What have you forgotten? You know. Who do you think you are, any how? I'm I'm just me. Oh now come on don't give me that line. What do you mean I'm just poor little me, ahhh nuts. Don't put on that act. And they're essentially you see it's that kind of Upaya. Which is in teacher use, is a Sanskrit word meaning pedagogical techniques. In spiritual disciplines. In politics it means cunning but in the vocabulary of butism or endures and it means. The expert cunning used by a teacher to surprise and trick is students out of their egocentricity. And Zen, therefore in all these koans, dialogues, rough czars and practices and so on it's all. It's a colossal hoax, but a very beneficence one.

So now, true Zen, came to birth in China as a result of a sort of interplay between Buddhism and Taoism. Now Taoism, is a kind of, exists in a sort of contrapuntal relationship to Confucianism. Confucianism is the philosophy of social order. And it is a very literary kind of attitude to life. Confucianism centers around the idea that sanity is grounded in words, numbers and ritual. You might say Confucianism is a social ritual, rather than a religion. It's based on the idea that you've got to find the right names for things, and it's terribly important to name things properly. Exactness of languages is critical. And so also music has to be just right. So Confucianism makes for a very high order of civilised conventional living. Not I might say, in passing, without a certain humor. Their humor is all through the Chinese nature. Confucius was a profoundly humorous man, but in a very cool way. He didn't have Chuang Tzu's belly laugh.

But you see they stick to Confucianism is the idea of what is called Jen. This is Romanized J E N But it's this character and shanks. And it means. Human heartedness. To be a reasonable person is the highest of all virtues and that really it means, the it involves, for example, the ability to come off it. To avoid fanaticism, to accept the fact that all human beings are good-bad. That we all have in ourselves an element of the rascal. And that you should simply get along by recognizing that so that if somebody picks a

fight with you, you work out a compromise you realize that he picked a fight center because he had emotions and he was human and he was greedy or whatever it is and so are you. And so you work out a compromise. And the Confucian would say that the human being as he is, both bad and good, is more trustworthy and reliable than a person who pretends that he's not like that. A person who pretends that he is good and moral and in all things model of integrity is a very dangerous man. Confucius said the goody-goodies are the thieves of virtue. So jen is the Confucian norm.

But then they like to, live a very artificial style of life, with a great deal of formality and good manners and propriety and Confucians are rather much Puritans when it comes to sex. On the other hand the Taoists represent the opposite pole. They make fun of all attempts to pin things down in words, because they say with what words would you define the right words, and with what words will you define those. They know that a dictionary is circular. Have you ever played a game called Vish? Short for vicious circle. What you do is this: You have a number of people sitting around a table each one with the standard college dictionary. And there's a referee. And at the word go a certain word is given. And everybody looks up that word. Then they look up the key word in the definition of that word. And then they look up the key word in the definition of that word and so on, when they get round to the Start word again they call up Vish the person who calls out this first is the winner of the game. But the referee is to decide whether you played fair, you know, whether you really look up a significant word in each clause. And you have to keep both you have a pad to keep a record of your steps the words you look up.

So that anyone challenges you the referee can judge. So Taoism is the force in Chinese culture which represents disillusion with the social game. You see Lao Tzu himself, by legend, who was supposed to have lived around six hundred B.C. to be a contemporary of Confucius but probably lived rather later than that. He was supposed to be the court librarian. And who became absolutely sick of the intrigue and the flattery and the insincerity of court life, and decided to quit. Just go off by himself and I can the mountains. But he was stopped at the gate by the captain of the guard who said, 'We can't let you go unless you first leave behind. A compendium of your wisdom.' So he's supposed to have sat down in the court in the gate house, and

written the stanzas of the Tao Te Ching, translated over seventy times into English alone. And then the guard let him go. And he disappeared into the mountains.

So the idea of, to put it very baldly, the idea of Confucianism is that all details of living should be done in a state of highly controlled consciousness. And should be just so exactly right according to the rules. The counter idea of Taoism is that it's better to let everything happen by itself. Trust your impulses, trust your instincts, trust your natural urges, let go of it all. Now, these two ways of describing Confucianism and Taoism are exaggerated. I'm caricaturing them for the sake of contrast. For example, a Taoist is not really a person who believes in pure laissez faire. What he is trying to say, the principle in Taoism called Wu-Wei which means non-interference, non-aggression, non-assertion. He's saying don't act against the grain of things act with it. Wu-wei is applied in Judo.

Now judo isn't as you know a highly effective form of interfering with things. But it does it on the principle of going with the grain. In other words, if, in Judo. There is a form of Judo. Which is called JunoKata And it's slow motion judo, to demonstrate the principles. And in one of these Juno Kata exercises... There is the always the attacker and the defender, and the attacker begins. By going at you like this. And this is the lead. Now what does the defender do? Instead of hitting back at that lead, he does this. He takes the hand of the attacker and pulls it off like this. Then he catches the other hand. And bends the fellow across and caught. In another one the attacker, does this, going to the jaw. The defender catches this upswinging hand, like this carries it right on twelve the fellow around and locks thus. The attacker is now bending backwards like this, but he is facing this way, and his right arm is thus caught. So these are the formal exercises which demonstrate the principles, the principle of Judo is. Overcoming nature. By cooperating. Same way as a sail tacks against the wind.

So you see it isn't quite not doing anything. It's as we say striking while the iron is hot taking time by the forelock etc etc. There is a tide in the affairs of men which taken at its flood leads on to fortune. And that's Taoism. But Taoism does tend, to be the attitude of skepticism towards the social and commercial rat race. And says really, do we have to play that game?

Wouldn't you actually be better off living in a kind of dignified poverty. And so easy in a way, Taoism is a philosophy for old people. After you've sowed your wild oats, and you made something in life and had children and so on and you become an old gent and others had enough of that. And so, you asked the question now, behind this facade I put on this role I've been playing and pretending that I'm someone who am I really? And what is all this thing about.

So the Taoist is a kind of a mountain man. He goes to the mountains. And you know that lovely Chinese poem. It's called Seeking the hermit. 'I asked the boy beneath the pines and he says the master's gone alone, herb-gathering somewhere on the mount, cloud-hidden, whereabouts unknown.' And so, you know, there's this notion you know the old man mysterious old man somewhere up there on Mount Tamalpais. And there's trails it and by that missed all that ours really dig that and that's the landscape paintings of the China of the old masters. Sitting. On craggy canyons drinking sack a of whatever plum wine or whatever. That's their idea of a good life.

Now, both the Confucians and the Taoists. Are not. Although there's a certain Puritanism in Confucian ethics. They all believe in the physical world. As a good thing. The Taoist loves nature the Confucian is particular about parents and family and all that. The Buddhists of India on the other hand, tended, very often to be anti-physical. I mean in other words, to be celibate to be interested in getting out of this state of consciousness, in which the world appears to us in its multiplicity. The Chinese never could get on with that. They didn't see any sense in that Indian attitude. So when Buddhism came to China, the Chinese did a flip with it. And they wanted a kind of Buddhism which although it was sort of monastic in the Indian tradition, was not monastic in the way that it is in India. Or in Burma, Solon.

Buddhism, for the Chinese is to some extent a thing which you go into for a time. And you'll attain enlightenment. And then you can come back as it were, and do anything you want. You can have family you can be a tramp, you can just play it anyway. But they feel with it in into the whole tone of the Mahayana type of Buddhism even in India, is that once enlightened you want to come back. So the situation of a Buddhist monk in the Far East is

generally speaking, that he's not quite like a monk as we understand monks in the West. Monks in the West take a life of ours. They vow poverty chastity and obedience until they die. But in the Far East, a Buddhist monk may go into the discipline for a number of years. And then return to lay a life with no bad feelings in fact he may be considered a considerable success in having done so.

So, that kind of trend in the Confucian and the Taoist attitudes, when it coalesces with Indian Buddhism, produces something very different from anything you'll find in India. And Zen., uniquely and outstandingly represents this sort of attitude. So, too, when these Indian monks, worked with their Chinese opposites the scholars to translate the Buddhist Sanskrit texts into Chinese. It was obvious that they would find equivalent words from the vocabulary of Taoism and so, for example, when any Chinese master is addressing his students, the phrase which he is liable to use, in saying students he says W. Tao you'll means. We translated Oh you'll followers of the way. Of the doubt. The way of nature. But the Buddhist Marga, the path, the Noble Eightfold Path. The road, the path, finds the Chinese equivalent in Tao. But Tao means far more than Marga. Tao has overtones which the word Marga doesn't have in Sanskrit. Marga is simply something like a message. A course of discipline a set of stages but without. Means. The fundamental way of the world. What is innate, so that if you can find out what is innate in you to do or to be, and follow that, you are following the Tao. You're not following any laid down set of rules but Marga, in Sanskrit, means a set of rules.

So you see what happens now Furthermore say Dalia is to say little character Lou. Which. This follower actually means. Slow. So you get Fung Yu which means the flow of the wind. And thus has come to mean elegance of a certain kind. Supposing somebody is sitting by the stream. Like here on a misty evening and a bird is crawling in the distance and he's sitting there fishing. But he's not fishing just to catch fish. He's not just a peasant who needs fish. He's a poet, who . doesn't care whether he catches a fish or not it just loves to be there and dig that scene that's feng yu. It's a it's a word that means everything of the Feng which means ordinarily wind also means atmosphere in the sense that when you say a place or a room has a certain atmosphere. That restaurant has atmosphere feng. There's also... The

Chinese word.. Japanese would say. Fooshu, the atmosphere of our school. In other words, the Zen school, has a certain flavor to it which you recognise in the way a man walks or a style.

So it's enlightened experience, it's satori, has a certain style to it that is different from other people's in life and although they're all. Fully enlightened. Soul you know the funnel you is the flow So, when you translate from Sanskrit. 'Follower of the path' and you come out with a goal you'll a Tao Yu Japanese say Do Yul. You get an entirely different meaning. Somebody who flows with the Tao. So is then monkeys called in Chinese. Yung Swe. Cloud water man. Union cloud sway water. Because he rests like a cloud he has no attachments or sea and he flows like water. He may be called in Sanskrit, 'One who has entered the stream.' That's the technical meaning for somebody who's started on the way of Buddhism. He has entered the street. But this doesn't have the same quality of meaning as yung swe. He has entered the stream in the sense that he is crossing the stream, from the shore to the other shore. But yung swe means he is going with the stream. If you have read that marvelous book of Herman Hesse called Siddharta, where he ends up with the enlightenment of his hero by watching a river. And get and learning from the river you know exactly what the Taoist means by flowing with the Tao. Because he sees across the river a simultaneously at its source and at its goal, and that all the forms in it are forms of the whole river, and at the same time there's nothing individual about them well I mean the form is individual but at the same time it isn't a lump of water you know a wave isn't a lump of water, it's water passing constantly, flowing through, the way of the wave stays there but the water flows through it, so that's what he learned from the stream. So you see, how the Chinese language. When you turn Sanskrit words into it the Chinese language with the background of meaning that these words have acquired from Taoist philosophy made a complete change in the nature of Buddhism.

Also, there's another thing to it. The Chinese call the bluff on a lot of Indian nonsense. I have to explain this by telling a sort of a modern anecdote. Joseph Campbell, who is as you know the editor of all the works of Heinrich Zimmer, and actually wrote them him self out of Zimmer's notes. Went to India. And he went to the greatest living guru in India today, who is

an ex policeman. And, said to him, 'The Sutras say that all things are Brahman. Isn't this also true of the illusion, of the of the Maya?' Isn't that the for the way you know we feel every day and just ordinary kind of human beings isn't that the Brahman too? And this man said You know it's interesting that was the first question I asked my teacher. He said, Of course they are. Well, Joe said, Nobody in India teaches that anymore. So, the guru took Joseph downstairs to all his students and said I want you to meet a great rishi sage, from America and he really has found it and you should. He will get now give you a lecture or something and it was....

In other words, the Hindu tends to say, 'Yes In fact all this well that you see now before your eyes is the divine ultimate Nandu all reality.' But of course. You have to find out that it is. And when you do it will disappear. You will go into what they call Nirvikalpa samadhi. That means., technically it means being in a state of Samadhi without having concepts, but they mean something else by it, they mean, as if all the shapes that you saw before you were suddenly dim out. And instead there is nothing but light as any. Maybe this is the light is slightly Violet but I don't know any way that every kind of sense you are in a sensual experience disappears. Now then, the way in which you have to argue this with the Hindu Swami and take this line is to say but your position is still dualistic. Because you moved from the vision of form, to the formless vision. This isn't and this is just changing places, this is not liberation, it's somewhere else on the wheel. And you know, they have to admit it. And I once had an argument with a swami in which I brought up a point we were discussing this morning. He was referring to the Brahman the ultimate reality, as the One, as one is as distinct from multiplicity I said I'm one as has an opposite. And the Brahman has no opposite. What you think you said is if you argue just like a Hindu.. Well he knew very well and he was using loose language and, as we all do.

So, this this was the thing you see historically in the development of Indian philosophy that took place between about one hundred and four hundred A.D.. That they face the fact that looking for a state of consciousness that's radically different from this state now is just an escape. It hasn't really come to terms with the problem. The problem is, you see that the state of consciousness you're in now however last up it may be is in Hindu

language the player Vishnu. You are all Vishnu playing that you're in this mess which is the part of the cosmic dance.

So, if that's the case they get to say I mean get with it, be that. So, the Chinese caught on to this. An when you could say, this very moment, this very world, this very body is the point. Now. and it, but if you see a you're seeking something beyond all the time you never get with it you never here. So they say they saw that very clearly. So this man son son who I was talking about at the end of this morning session who is one of the first I would say really articulate people about zen. Who wrote the Shin Shin Ming. He starts out by saying the Great Tao, or the perfect Tao, is without difficulty. Except that it avoids picking and choosing. Only when you neither love nor hate does it appear in all clarity. A hair's breadth of deviation from it and a deep Gulf is set between heaven and earth. If you want to get hold of what it looks like, don't not be anti or pro anything. The conflict of longing and loathing, this is the disease of the mind.

OK, Now if you take that quite literally, if you try to avoid picking and choosing, that's another kind of choice, isn't it? If you say, I ought not to love anything, I ought not to hate anything, I ought not to take any extreme attitudes, you're still choosing. If I say, in psychological jargon, for psychiatric health, you ought to accept yourself. You know. Accept everything that happens well among the things that happen is the very concrete fact that there are things you don't accept. And that you can't accept, so you have to accept that. Now do you see what this does? It's a very interesting technique. It's saying that you are, each one a Buddha, enlightened, even before you've accepted yourself. Now you don't have to do anything about it. But it's terribly difficult for human beings to resist the temptation to do something about it. So it says, OK do that. If you want to practice yoga, meditation, go ahead, if you feel that would make you better do it. But the point is that doesn't it is really nothing to do with there's nothing not to do either. You won't get this by sort of acting spontaneous in a funny way but you can do that if you wanted to. But you are it right where you stand, without making a single move. And that's what's meant you see you profoundly, by avoiding picking and choosing. Actually, there's nothing in it there's nothing you can do about it. You may get the illusion that you

are picking and choosing makes a real difference, that your choices really do change the nature of things, but they don't.

And so, so long as you want to hang onto that illusion and play it, there you are, but actually, you are as you live and all sit around this room at the moment in the various stages of what you may consider subjectively to be goodness and badness sickness and health, sanity and insanity. Every one of you, is as much of a splendid accomplishment as the shape of the clouds. And just as natural. You know, with all the funny hairdos and artificially and everything, we are all like the birds. Only we have a complicated way of pretending that we aren't so that we figure out with something special and that's it too, you see But, it is a tough job getting anybody to see that. So what do they do? They have all these techniques, and they put you through the mill. Because people won't accept this vision, until they feel they've paid for it. Until they feel they if they finally discover after enormous effort, like the student I told you about this morning, there isn't anything to realize. It really is fantastic. See so all this is very direct and simple so not picking and choosing doesn't mean that you have to cultivate being detached. You can try that sure. But then you find you're terribly attached to your non-attachment. Like you're proud of your humility or something like that. It just goes round and round and round, so you know come unstuck. Well you always were unstuck, because you're in the flow, and nothing is stuck it all is changing, changing journey one is nothing but a flow of change there isn't anything to hang on to and nobody to hang on to it. You know, here is decaying hand grasping at smoke. It's all falling apart, and there's nothing anybody can do about it because what anybody is who perhaps could do something about it that is falling apart too. That's what's meant by the doctrine of Anatman, there is no. The Buddhist idea that there is no permanent self because it's all falling apart.

So cheer up you know it's great [laughs]. So, not knowing the profound meaning of things, we disturb our original peace of mind to no purpose. Original peace of mind is what I was referring to as the child's in the infants the baby's fundamental knowledge of, the unity of the world. The oceanic feeling Freud calls it. Perfect like great space the Tao lacks nothing, and has nothing in excess. Truly, because of our accepting and rejecting we don't get the suchness of things. You see, I explained suchness this morning, how

it's the way everything is just like that, and that we pick out some things as significant and other things as not significant. And this prevents us from seeing that all the insignificant things are in a way significant, and all the significant things are in a way insignificant. See, that I go on living is for me, significant. Until I don't anymore. But that means I'm going to run around as it is it is it talk a lot and work and eat and entertain and do this that and the other and it is it's a great dance. Actually, it has no more ultimate meaning than somebody sitting down to be able to be a little bit in the little of the little ones and master said 'From the bathtub to the bathtub I have uttered stuff and nonsense.' That was his death verse and the bath tub in which the baby is washed at birth the bath tub in which the corpses washed before burial all the time he's been talking nonsense. And so all these birds are going around. I don't want to always go and beings are going making this great hullabaloo and building houses and all that kind of thing and it's all, well it's just suchness, that's the point.

So neither follow after, nor dwell with the doctrine of the void. I mean, don't get hooked on the idea that things are empty, and therefore that this is a way of saying that the world is a ghastly sham and something you ought to avoid. That's what this means. So don't try to catch hold of this doctrine as if it would do you some good. And on the other hand don't. Dwell with it, don't get attached to it. For if the mind is at peace, these wrong views disappear of themselves. The mind at peace is not quite what we ordinarily mean by peace of mind. Oh, he quotes a thing here, on the comment neither follow after nor dwell with the doctrine of the void, this verse. From another early Chinese Zen master: 'Getting rid of things and clinging to emptiness is an illness of the same kind. It is just like throwing oneself into a fire to avoid being drowned.' When activity is stopped, there is passivity. Now when activity is stopped and there is passivity this passivity again is a state of activity. You see, if you practice detachment and being calm in mind and free from all worldly passions this in its own turn is a worldly passion, since you are attached to this new status. See that's the Chinese criticism of the Hindu viewpoint. Stay where you are. If you try to be spiritual. This is putting legs on a snake. And the snake doesn't need any legs and is only confused by them when it gets them. But you may have to try to be spiritual or whatever the equivalent of this is psychoanalyzed, integrated, clear, all the words that are used. You may have to try to do that

to find this out. But that everything you add in this way by clinging to some idea of detachment, spiritual freedom, Nirvana, whatever. All that in the end is an artificiality that will be sloughed off. So you might say to you Spiegelberg's phrase Zen is the religion of no religion. That the the highest perfection of religion. Is just not to have any noticeable religion. See the gulls don't have a religion, they don't preach, they don't pray, they don't recite sutras. But the human beings have to do this thing and have Buddhas and all that and. When you really get the point, none of that's necessary. But then you can have it just for kicks.

Uncarved Block

Now what I want to talk to you about this afternoon are some of the aesthetic principles underlying both Chinese and Japanese arts. And there deriving from these Taoistic and Buddhist philosophies that have inspired them. And to speak about them tell it technically. In the language of Taoism, there are certain words used which are the foundations of their aesthetic ideas. One of these words is the uncarved block. And another is unbleached silk. And as I already intimated in talking to you about the Taoist view of the relationship of man and nature, the Taoists make a distinction between the natural and the artificial, and seem to be all on the side of the natural and rather against the artificial. Although you must be cautioned against taking this too seriously. Too literally. You might say, of course, that the distinction between the artificial and the natural, is an artificial distinction. Because really, and truly, a human building is no more no less artificial than a bird's nest. But the Taoists use a kind of art. And a kind of poetry which you could call indicative. That is to say, while understanding that everything that man does is natural, some things that he does a more natural than others. That is to say, they look more natural they they go that way.

And so the idea of unbleached silk. Means silk in the raw, raw silk, natural silk. And so in the same way the uncarved block is the sort of stone that would be selected for a Chinese or Japanese garden. Chinese stones tend, as I see it to be rather more elaborate. Rather more fussy than Japanese stones and I think that in the art of bun seche which means growing rocks. The Japanese are a bit more sophisticated than the Chinese although this doesn't

often happen. But the Japanese are masters of growing rocks. So, this rock that you would find in a Japanese garden, is the uncarved block, even though it may have been. What has happened really it's what we call in the Western *objet trouvé*. Where the artist instead of making something selects it. He finds a glorious thing and shares his finding with other people and that finding is a work of art. And you see that is connected with the whole thought in this tradition of aesthetics in the Far East, that superb art is a work of nature. It is not something imposed upon nature, even though as you've seen, in many Japanese gardens, that there are very complex espalier work. On trees and that an enormous amount of pruning and trimming is done, and in fact the discipline of the garden is amazingly complicated, and requires a great deal of care.

But the object always is, through the discipline of the art to make the garden seem more natural than it would look if you left it to itself. Understand that, is to work upon nature with skill and craft, but to move in the direction in which nature is already going. So that, the uncarved block may be extended into a sculpture. But what the carver, to make the block uncarved, even when the sculpture is finished, what the sculptor is going to ask the block in the first place, is what do you want to become? In other words, along what lines have you already started in the direction of the sculpture, and I will and I will cooperate with you and bring it to completion. So that's the principle, really, you see that underlies judo. Judo means the gentle way, the gentle Tao. And it is the art of going along with nature, that is also called Wu Wei, or Mui in Japanese. And no doing nothing literally not being because after all it's man's nature to act and you can't do nothing literally. But to act mui without really it's as to act without feeling that your actions are separate from nature. When you feel that everything you do is simply part of the course of things, then the way in which you do things is changed. You wouldn't think so, it isn't logical that it should be. But nevertheless if you really feel, that you can't deviate from the Tao, that it lies behind it. We think that you do your type of action in your style of behavior will in fact be changed. And it will be in that it will tend to be in the direction, of your seeming to other people in some ways to be more passive, than you might ordinarily be. And the difficulty here is that. Westerners, when they hear about Buddhism and Taoism and the sort of thing, they interpret it one-sidedly as passivity. And don't see that what sometimes looks like passivity,

is cleverness. You as businessmen often know if you leave letters unanswered for a month when you return to the many of them have already answered themselves. And sometimes, when you sit and do nothing you avoid making very serious mistakes. Which would have arisen if you had acted prematurely earlier if you had done something about it. I've practiced this in activity of this kind for many years and I've always been accused of being lucky. Because when I should have done something and been up and at it I was supposed to go and sit and do nothing and then when it turned out all right, this is terrible. Just like no I know you haven't said. That's why I'm still married to you!

But anyway this is so in that so. This tendency to look inactive and to go in the direction in the arts of a kind of primitivity to which we know in the words Shibui. The quality course in Japan is a certain kind of sophisticated primitivity. Listen to these contradictions, these paradoxes the sophisticated primitivity controlled accident. Where you see a. Man and Nature are really collaborating, man as the controller the reason, the logical being and yet at the same time. Not ruining life. By making it all logic and all control. To have logic and to have control, that is to say in short to have order, you have to have randomness. Because where there is no randomness, order cannot manifest itself.

Well now., in the vocabulary of Japanese aesthetics, there are a number of terms which you should understand thoroughly, and which are basic. The first is *sabi*. And that goes along with something that rhymes with it *wabi*. So often Japanese people speak of *Wabi Sabi*, or *Sabi wabi* as a kind of mood of the art of certain art feeling or of Zen taste. And then there is *aware*, which I've mentioned in passing. As another kind of mood there is *Yugen*. There is *furyu*. Such words which designate the basic moods of painting and poetry and so on. Now to begin with *sabi*. The basic feeling of *Sabi* is loneliness. One of the great paintings that illustrate *Sabi* is the lonely crow on a tree branch. It is the feeling of the hermit. It is the feeling which the garden artist tries to create, when in a crowded country, he wants to give you the sensation of being way off in a mountain landscape. So this sense, you see, of solitariness, of being able to wander off on your own, is *Sabi* and is a thing of course that any sane person has to have. One has to have

privacy, you have to have space in which to be alone, so as not to become a rubberstamp.

You see it's often thought that Eastern philosophy is against individuality. And this is not true. The unity of man in the universe is not a loss, or a merging of personality in something impersonal. It's more like the fact that when individuality, when personality, is known and experienced as an expression of the whole cosmos, then the person becomes more individual not less individual but he becomes individual in a non strident way. In a way that has in it, the spirit of the uncarved block, and the unbleached silk. And so, one of the qualities of this is solitariness. The great Chinese poem which has *sabi* in it it preeminently, is asking for the master. I asked the boy beneath the pines he says the master's gone alone. Herb-gathering somewhere on the Mount cloud-hidden, whereabouts unknown.

So all the whole idea you see of zen that. Wherever you stand, if you realize Zen, you create a mountain. Every Where is the mountain solitude even in the middle of an uproar this is *Sabi*. And for this reason then an enormous amount of the subject matter of Far Eastern painting and poetry is solitude. The love of solitude. Now there is next, *wabi*. This is a more difficult idea. Let's imagine that you are feeling very bad about something, you're depressed, the world is too much with you. Just, you're sick of life. And then quite surprisingly, you notice a small weed. Growing underneath the hedge. And this weed is really after all not just to be dismissed as a weed, but some rather lovely design that is in the nature of this plant. Or supposing you are bothered by financial uproar, wars, politics, and everything like that, and you are sitting on a beach and you become aware of the water endlessly crossing pebbles. And you get a sense that this goes on forever and ever and ever it is long before you were thought of, long before all human history, empires, schemes and so on and will endure long after. But it's something that strikes you that is very simple, very ordinary, like the water on the pebbles, or like the little weed under the hedge. That suggests a kind of amazing eternal reliability of nature. That in a very humble form goes on and on and on and whatever human beings may do this everlasting sanity persists. Now that strange flip, from the mood of depression to the mood of a certain consolation in this weed is *wabi*.

Now, don't let me be too dictatorial. I'm trying to explain these things through examples rather than through trying to give you philosophical definitions. It's better to give examples than to pin it down with abstract terminologies. Wabi comes out in the haiku, very much a Brushwood gate. And for a lock this nail. This is wabi. This is all there is, the path comes to an end among the parsley. Which has a touch of you again but also wabi because the parsey is just well everybody has parsley in the garden.

Now, next, this word aware. A W A R E. is very much connected with the Buddhist feeling for the transience of life. That everything is change, and nothing at all can be held onto or possessed. This feeling of transience, is at the root of the philosophy of poverty that exists in Buddhism and it has a curious difference in it from the Christian philosophy of poverty as say explained by Sir Francis of Assisi. It's cognate, it it's like it but a little subtle difference. Somehow one feels in the Christian emphasis on poverty that poverty contrasts with the richness as good to evil. In other words, poverty is unpleasant, but it's something you ought to share with the poor who live unpleasant lives. So if you are to expiate your sins, well you ought to be poor. And to, live roughly. And so, for this reason, in Buddhism, one would not say so much poverty, as one would say simplicity. Not going without, not clinging to things because it's good for you. But because it is actually the happiest way to live. Because nothing is more terrifying than the state the chronic anxiety, which one has if you are subject to the illusion that something or other in life could be held onto and safeguarded. And nothing can.

So the acceptance of everything flowing away is absolutely basic to freedom, to being an unsui, a cloud water person who drifts like cloud and flows like water. But in this, we mustn't take ourselves too ridiculously. I mean, naturally, all human beings have in them certain clinging. So you can't let go totally. You wouldn't be human if you did. You can't be just a leaf on the wind or just a ball in a mountain stream to use as an poetic phrase because if you were that you wouldn't be human just as I pointed out that a person with no emotions who is completely controlled his emotions as a stone Buddha. So a person who would be completely let go. Would also be some kind of an inanimate object.

So Zen very definitely emphasizes, being human. Being perfectly human as its ideal and so to be perfectly human. One must have not a state of absolute detachment. But a state of detachment which contains a little bit of resistance. A certain clinging still, they say in India are Divan Mukta, a man who is liberated in this world that he has to cultivate a few mild bad habits in order to stay in the body because if he were absolutely perfect he would disappear for manifestation. And so the, the yogi, great yogis maybe he smokes a cigarette or has a bad temper occasionally something that keeps him human. And that thing little thing, isn't very important it's like the salt in a stew. It's the, it grounds him. Well, this is another way of saying that even a very great sage, a great Buddha, will have in him a touch of regret, that life is fleeting, Because if he doesn't have that touch of regret, he's not human and he's incapable of compassion towards people who regret very much that life is fleeting.

So the mood aware, is that touch of regret. Of nostalgia. Of, you know that poem which speaks of the feeling of a banquet hall deserted. Here it is, been a great banquet you know and that's all the guests have gone home and there are empty glasses and dirty plates and crushed napkins and all sorts of things all over and somehow the echo of voices and merriment is still there. And so this mood. A lottery comes up so even a very great person. You're should feel that because the prize otherwise is not to be human.

So for this reason, Buddhist and Taoist poetry is not unemotional. It's not, dehumanised. And so somehow speaks very much to us as people. And, does not have in it the feeling that we ought instead to turn into saints or Superman. That's the main thing about this philosophy of life. The next word, the special term is furyu. Know who you means literally. Wind flow who is the character for wind the real means flowing. And the dictionary's translated elegance, and this won't do. furyu, fiirst of all you must remember that the word wind is used in Chinese and Japanese a light to indicate atmosphere. The atmosphere of a place. So when a person has say a certain school or philosophy. It's called The Family wind. That means that the atmosphere the slant the attitude of this particular school. So that meaning of wind, atmosphere comes into the expression furyu. And who are you is, like this. Here is a land of fishing. And he's sitting in the evening in the twilight on the edge of a river, with his fishing rod in a lonely little

boat tied up by the bank. Now if this man is fishing with his mind intent simply on catching fish this is not for you. But if he's also digging the atmosphere. It's *furyu*. To flow with the wind you see to dig the atmosphere American offers the most beautiful possibilities of translation for in our incomparable slang for some Oriental ideas. *furyu* is there to you know to get with it, to flow with it, and not again you see in the sense of the merely passive leaf flowing on the wind. But, *furyu*, has in it you see a touch of self-consciousness, like that man fishing. Now, you would think if you started Taoist philosophy that this would be very bad. Chuang Tzu somewhere says that. A comfortable belt is one that you don't feel. And you're unaware of it. That's not the most comfortable belt. That comfortable shoes, would you be completely unconscious of comfortable shoes, no! Something better than comfortable shoes are shoes that you know are comfortable. So in the same way, Self-consciousness adds something to life. It's one thing to be happy, and not know it. It's another thing to be happy and to know it. It's like one's voice in the shower room or bath tub has more resonance than one's voice in the open air. And that's why temples of cathedrals and resonating boxes for guitars and drums and things are created to give this little quality of echo. For all echo is a certain kind of feedback which enables you to reflect upon what you're doing and to know that you know. So one might say that ordinary people are Buddhas but they don't know it. And the Buddha is one who knows he's a Buddha. Only, they don't let you settle for this comfortably, and easily, because really to know is also defined as not to know. In the Upanishads, it is said that if you think you know what Brahman is you have yet some started to be done. For those who know Brahman do not know Brahman and those who do not know Brahman really know. Now all this paradoxical language is intended to keep you confused. So that you can't say I've got it. So, but disposition is is not one sided. There is something about being human, about being self-conscious you see that is not a. Me. Stake of nature. Not a completely evil fall into self-awareness but self-awareness although it creates all kinds of problems because through self-awareness we him in the human being is in some sense a cell frustrating mechanism. He knows that he is going to die, and the price of being able to control the future, is to know that in the long run you won't be able to and worry about that. But also with self-consciousness goes the possibility of resonance, of

realisation, of becoming enlightened, liberated, and knowing it, and therefore able to enjoy it.

So, furyu adds this to the dimension of going with it. Something more than the mere passive it of going with but knowing that you're going. Now. But it does at the same time it isn't entirely wrong that the dictionaries have translated it elegance. It you could say it for you. Is style. When we say somebody really has style. Now but this designates a particular kind of style. It is the style. Of. What one might call. The elegant poor man. The interesting Pratik bum. The the rich pauper you see. Now you find that a good deal in. The things that we've been seeing. We've gone to many temples. Well, nobody really owns anything. And yet in a way they're like serious. This is for you. The next word Yugen. F U R Y U furyu. I have spoken about you again but I haven't told you. The basic symbol of Yugen as the flower which grows from a rock. And so there is something about that which is improbable mysterious contradictory that a flower could come out of a rock. But Yugen, more than any other of these terms defies translation. The two characters which I shall draw for you shortly. Are rather interesting one the first character yu, shows the basic form of a mountain. And then the mountain is combined with characters indicating dark, darkness, you see in the character for mountain, which is simply it's just it's just like this there are these things the other the valleys and the dark is put in the valley say in each case.

Now, you get so the idea of the deep valley. There's a poem which says, 'The wind drops but the petals keep falling. The bird calls and the mountain becomes more mysterious. Little sounds emphasizing silence little motions emphasizing stillness.' This quality you see, is in this word yun. Gen is in Chinese Guan, which means the the original deep deep mysterious darkness out of which everything arises the depth. Yakob Erm I would say urgrund. The. In the Book of Genesis. And darkness covered the face of the deep or the Spirit of God moved upon the face of the waters those waters of chaos the primeval blackness, which is the same blackness as your head. You know, how your head appears invisible to your eyes. That is gen, it is darker than darkness, because it isn't it is blacker than black, you see, it is practically nothing that's it so mysterious, so when you put these two characters together you get yugen. And so yugen is first of all,

suggestiveness. I was looking around one of the temples a few days ago, where I noticed that, you couldn't figure out how big it was. Or it didn't have any limits. Because always everyone wore say of a room seemed to be a screen which led to something else beyond. And at the back of every garden, there seemed to be a little gate that led to some other courtyard. And everything led into something else and I said to the priest, I don't know whether I'm going to go exploring on art or just leave it alone and think that well here I left Kyoto and I never did find out what was through that little gate. And so what. Forever there will be magic behind there, which I didn't define, I didn't draw in. And so this whole temple was was done that way. All sorts of suggestions, of little avenues disappearing, like a mountain path winding up among the trees where does it go? True, if you follow it, you will eventually go up out of Kyoto here and get down to absolute and then I was you find yourself back in the suburbs. But there is the sense of that disappearing mountain path, like we've got going up here that it goes to the place. And everybody has in the back of their minds, an image of the place, that you want to go to, or some no not really an image though it's always slightly indefinite there's the certain feeling of there ought to be somewhere the thing I've always wanted. We get disappointed, of course, because as we get older we feel that perhaps that doesn't exist at all. That one just has to put up with the second best or with something half a loaf is better than no bread. But still I find that Far Eastern art is very, very full of hints about what is sometimes called Horison. Horison is the magical island somewhere out in the Pacific. Which is the paradise island. And all these Chinese paintings of wonderful floating Pagodas and terraces with scholars sitting around drinking wine and so on are hints of the Paradise world. And that somewhere then, these little steps lead up to that thing. And you've seen these steps, Japan is full of them, as you just go along in the train and look up the hills and there are arches, steps disappearing into the hills all of which suggests the feeling I'm not with that thing. So yugen, as it were comes around full circle to subbie. The wonderful lonely place. At the end of the road. Where there won't be any mother-in-law to bother you. Any of that sort of dreadful social difficulty. But solitude which fits befits a bearded old gentleman. Now of course, you see all these things are symbols. On one level, they're very human, and they reflect our perhaps childish and immature desires to be really alone, to have that Paradise thing. And realistic people say well you ought not to bother yourself or fool

yourself with such fantasies and nowadays I find that we feel very guilty about thinking of paradise. Of horizon, or whatever it is, the enchanted garden. I think na-ah. Reality is what you read about in the newspapers and you've got to face it. And everything isn't pleasant I know there's the hard boiled school of zoologists for example who insist that birds hate flying. You know, everybody is always envied a bird, and wanted really to live on long wings you know and so there comes up somebody who is usually some wretched academician who says, 'No now we've discovered by measurements that birds loath flying.' I'm going to feel very satisfactory when you found that out because you've smashed an ideal. Oh for the wings of a dove, far away would I roam in the wilderness build me and theirs and remain there forever at rest I'm quoting the Psalms. But, apparently doves just hate this chore of flying.

Now it is just in the same way as it's ridiculous to try to be so inhuman as never to feel any regrets about the passing of time of life. And so on, it's likewise inhuman, not to have the paradise fantasy of the mysterious place round the corner, just over the crest of the hill. Just behind the island in the distance. You see, because that place is really the big joke, that's you. That's why, you have found that at the end of the line, when you get through the last tory and up. Alas their way you are liable to be confronted with a mirror. And so, everybody is seeking seeking seeking seeking seeking, for that thing that you've got to have, you see, well you've got it. And but nobody's going to believe this. But there it is, the real the real thing that you are is the Paradise land if you're looking for at the end of the line. And it's far, far more reliable than any kind of an external scene which you could love and cling to hold on to. Of course the whole fascination of life is that that seems perfectly incredible.

So, I think these terms are the crucial ones. Let me repeat them briefly, you've got, firstly the uncarved block. And the unbleached silk, these are the prototypes. Then you have sabi. The mood of solitariness. Wabi, the flip from disillusion with everything, to the sudden recognition of how faithful the weeds are. How the sparrows chirping in the eaves suddenly take your mind away from important and dreadful business. Aware, the the regret of the passing of life, which somehow makes that very passing beautiful. Fuyu, getting with it. And living with style. That is to say with rich

poverty. Elegant simplicity. Yugen, the aesthetic equivalent of... Well let me put it this way. There was a philosopher by the name of Vandal Lew who once said that the mystery of life is not a problem to be solved but a reality to be experienced. That's yugen. And that mystery that deep deep ever so deep thing which is before all worlds is you. The unrecognized Self. So let's have a brief intermission.

Zen Bones

Once upon a time, there was a Zen student who quoted an old Buddhist poem to his teacher, which says:

The voices of torrents are from one great tongue, the lions of the hills are the pure body of Buddha. Isn't that right? he said to the teacher. It is, said the teacher, but it's a pity to say so.

It would be, of course, much better, if this occasion were celebrated with no talk at all, and if I addressed you in the manner of the ancient teachers of Zen, I should hit the microphone with my fan and leave. But I somehow have the feeling that since you have contributed to the support of the Zen Center, in expectation of learning something, a few words should be said, even though I warn you, that by explaining these things to you, I shall subject you to a very serious hoax.

Because if I allow you to leave here this evening, under the impression that you understand something about Zen, you will have missed the point entirely. Because Zen is a way of life, a state of being, that is not possible to embrace in any concept whatsoever, so that any concepts, any ideas, any words that I shall put across to you this evening will have as their object, showing you the limitations of words and of thinking.

Now then, if one must try to say something about what Zen is, and I want to do this by way of introduction, I must make it emphatic that Zen, in its essence, is not a doctrine. There's nothing you're supposed to believe in. It's not a philosophy in our sense, that is to say a set of ideas, an intellectual net in which one tries to catch the fish of reality. Actually, the fish of reality is more like water—it always slips through the net. And in water you know

when you get into it there's nothing to hang on to. All this universe is like water; it is fluid, it is transient, it is changing. And when you're thrown into the water after being accustomed to living on the dry land, you're not used to the idea of swimming. You try to stand on the water, you try to catch hold of it, and as a result you drown. The only way to survive in the water, and this refers particularly to the waters of modern philosophical confusion, where God is dead, metaphysical propositions are meaningless, and there's really nothing to hang on to, because we're all just falling apart. And the only thing to do under those circumstances is to learn how to swim. And to swim, you relax, you let go, you give yourself to the water, and you have to know how to breathe in the right way. And then you find that the water holds you up; indeed, in a certain way you become the water. And so in the same way, one might say if one attempted to—again I say misleadingly—to put Zen into any sort of concept, it simply comes down to this:

That in this universe, there is one great energy, and we have no name for it. People have tried various names for it, like God, like Brahman, like Tao, but in the West, the word God has got so many funny associations attached to it that most of us are bored with it. When people say God the father almighty, most people feel funny inside. So we like to hear new words, we like to hear about Tao, about Brahman, about Shinto, and ___-___-___, and such strange names from the far East because they don't carry the same associations of mawkish sanctimony and funny meanings from the past. And actually, some of these words that the Buddhists use for the basic energy of the world really don't mean anything at all. The word tathata (तथाता), which is translated from the Sanskrit as 'suchness' or 'thusness' or something like that, really means something more like 'dadada,' based on the word tat (तत्), which in Sanskrit means 'that,' and so in Sanskrit it is said tat tvam asi (तत् त्वमसि तथामि), 'that thou art,' or in modern America, 'you're it.' But 'da, da'—that's the first sound a baby makes when it comes into the world, because the baby looks around and says 'da, da, da, da' and fathers flatter themselves and think it's saying 'DaDa,' which means 'Daddy,' but according to Buddhist philosophy, all this universe is one 'dadada.' That means 'ten thousand functions, ten thousand things, one suchness,' and we're all one suchness. And that means that suchness comes and goes like anything else because this whole world is an on-and-off system. As the Chinese say, it's the yang and the yin, and therefore it

consists of ‘now you see it, now you don’t, here you are, here you aren’t, here you are,’ because that the nature of energy, to be like waves, and waves have crests and troughs, only we, being under a kind of sleepiness or illusion, imagine that the trough is going to overcome the wave or the crest, the yin, or the dark principle, is going to overcome the yang, or the light principle, and that ‘off’ is going to finally triumph over ‘on.’ And we, shall I say, bug ourselves by indulging in that illusion. ‘Hey, supposing darkness did win out, wouldn’t that be terrible!’ And so we’re constantly trembling and thinking that it may, because after all, isn’t it odd that anything exists? It’s most peculiar, it requires effort, it requires energy, and it would have been so much easier for there to have been nothing at all. Therefore, we think ‘well, since being, since the ‘is’ side of things is so much effort’ you always give up after a while and you sink back into death. But death is just the other face of energy, and it’s the rest, the not being anything around, that produces something around, just in the same way that you can’t have ‘solid’ without ‘space,’ or ‘space’ without ‘solid.’ When you wake up to this, and realize that the more it changes the more it’s the same thing, as the French say, that you are really a train of this one energy, and there is nothing else but that that is you, but that for you to be always you would be an insufferable bore, and therefore it is arranged that you stop being you after a while and then come back as someone else altogether, and so when you find that out, you become full energy and delight. As Blake said, ‘Energy is eternal delight.’ And you suddenly see through the whole sham thing. You realize you’re That—we won’t put a name on it— you’re That, and you can’t be anything else. So you are relieved of fundamental terror. That doesn’t mean that you’re always going to be a great hero, that you won’t jump when you hear a bang, that you won’t worry occasionally, that you won’t lose your temper. It means, though, that fundamentally deep, deep, deep down within you, you will be able to be human, not a stone Buddha—you know in Zen there is a difference made between a living Buddha and a stone Buddha. If you go up to a stone Buddha and you hit him hard on the head, nothing happens. You break your fist or your stick. But if you hit a living Buddha, he may say ‘ouch,’ and he may feel pain, because if he didn’t feel something, he wouldn’t be a human being. Buddhas are human, they are not devas, they are not gods. They are enlightened men and women. But the point is that they are not afraid to be human, they are not afraid to let themselves participate in the pains, difficulties and struggles

that naturally go with human existence. The only difference is—and it's almost an undetectable difference—it takes one to know one. As a Zen poem says, 'when two Zen masters meet each other on the street, they need no introduction. When fiends meet, they recognize one another instantly.' So a person who is a real cool Zen understands that, does not go around 'Oh, I understand Zen, I have satori, I have this attainment, I have that attainment, I have the other attainment,' because if he said that, he wouldn't understand the first thing about it.

So it is Zen that, if I may put it metaphorically, Zhuang Zhou said, the perfect man employs his mind as a mirror. It grasps nothing, it refuses nothing. It receives but does not keep. And another poem says of wild geese flying over a lake, 'The wild geese do not intend to cast their reflection, and the water has no mind to retain their image.' In other words this is to be—to put it very strictly into our modern idiom—this is to live without hang-ups, the word 'hang-up' being an almost exact translation of the Japanese *bono* and the Sanskrit *klesa*, ordinarily translated 'worldly attachment,' though that sounds a little bit—you know what I mean—it sounds pious, and in Zen, things that sound pious are said to stink of Zen, but to have no hang-ups, that is to say, to be able to drift like a cloud and flow like water, seeing that all life is a magnificent illusion, a plane of energy, and that there is absolutely nothing to be afraid of. Fundamentally. You will be afraid on the surface. You will be afraid of putting your hand in the fire. You will be afraid of getting sick, etc. But you will not be afraid of fear. Fear will pass over your mind like a black cloud will be reflected in the mirror. But of course, the mirror isn't quite the right illustration; space would be better. Like a black cloud flows through space without leaving any track. Like the stars don't leave trails behind them. And so that fundamental—it is called 'the void' in Buddhism; it doesn't mean 'void' in the sense that it's void in the ordinary sense of emptiness. It means void in that is the most real thing there is, but nobody can conceive it. It's rather the same situation that you get between the speaker, in a radio and all the various sounds which it produces. On the speaker you hear human voices, you hear every kind of musical instrument, honking of horns, the sounds of traffic, the explosions of guns, and yet all that tremendous variety of sounds are the vibrations of one diaphragm, but it never says so. The announcer doesn't come on first thing in the morning and say 'Ladies and gentlemen, all the sounds that you

will hear subsequently during the day will be the vibration of this diaphragm; don't take them for real.' And the radio never mentions its own construction, you see? And in exactly the same way, you are never able, really, to examine, to make an object of your own mind, just as you can't look directly into your own eyes or bite your own teeth, because you ARE that, and if you try to find it, and make it something to possess, why that's a great lack of confidence. That shows that you don't really know your 'it'. And if you're 'it,' you don't need to make anything of it. There's nothing to look for. But the test is, are you still looking? Do you know that? I mean, not as kind of knowledge you possess, not something you've learned in school like you've got a degree, and 'you know, I've mastered the contents of these books and remembered it.' In this knowledge, there's nothing to be remembered; nothing to be formulated. You know it best when you say 'I don't know it.' Because that means, 'I'm not holding on to it, I'm not trying to cling to it' in the form of a concept, because there's absolutely no necessity to do so. That would be, in Zen language, putting legs on a snake or a beard on a eunuch, or as we would say, gilding the lily.

Now you say, 'Well, that sounds pretty easy. You mean to say all we have to do is relax? We don't have to go around chasing anything anymore? We abandon religion, we abandon meditations, we abandon this, that, and the other, and just live it up anyhow? Just go on.' You know, like a father says to his child who keeps asking 'Why? Why, Why, Why, Why, Why? Why did God make the universe? Who made God? Why are the trees green?' and so on and so forth, and father says finally, 'Oh, shut up and eat your bun.' It isn't quite like that, because, you see, the thing is this:

All those people who try to realize Zen by doing nothing about it are still trying desperately to find it, and they're on the wrong track. There is another Zen poem which says, 'You cannot attain it by thinking, you cannot grasp it by not thinking.' Or you could say, you cannot catch hold of the meaning of Zen by doing something about it, but equally, you cannot see into its meaning by doing nothing about it, because both are, in their different ways, attempts to move from where you are now, here, to somewhere else, and the point is that we come to an understanding of this, what I call suchness, only through being completely here. And no means are necessary to be completely here. Neither active means on the one hand,

nor passive means on the other. Because in both ways, you are trying to move away from the immediate now. But you see, it's difficult to understand language like that. And to understand what all that is about, there is really one absolutely necessary prerequisite, and this is to stop thinking. Now, I am not saying this in the spirit of being an anti-intellectual, because I think a lot, talk a lot, write a lot of books, and am a sort of half-baked scholar. But you know, if you talk all the time, you will never hear what anybody else has to say, and therefore, all you'll have to talk about is your own conversation. The same is true for people who think all the time. That means, when I use the word 'think,' talking to yourself, subvocal conversation, the constant chit-chat of symbols and images and talk and words inside your skull. Now, if you do that all the time, you'll find that you've nothing to think about except thinking, and just as you have to stop talking to hear what I have to say, you have to stop thinking to find out what life is about. And the moment you stop thinking, you come into immediate contact with what Korzybski called, so delightfully, 'the unspeakable world,' that is to say, the nonverbal world. Some people would call it the physical world, but these words 'physical,' 'nonverbal,' are all conceptual, not a concept either, it's (bangs stick). So when you are awake to that world, you suddenly find that all the so-called differences between self and other, life and death, pleasure and pain, are all conceptual, and they're not there. They don't exist at all in that world which is (bangs stick). In other words, if I hit you hard enough, 'ouch' doesn't hurt, if you're in a state of what is called no-thought. There is a certain experience, you see, but you don't call it 'hurt.' It's like when you were small children, they banged you about, and you cried, and they said 'Don't cry' because they wanted to make you hurt and not cry at the same time. People are rather curious about the things they do like that. But you see, they really wanted you to cry, the same way if you threw up one day. It's very good to throw up if you've eaten something that isn't good for you, but your mother said 'Enough!' and made you repress it and feel that throwing up wasn't a good thing to do. Because then when you saw people die, and everybody around you started weeping and making a fuss, and then you learned from that that dying was terrible. When somebody got sick, everybody else got anxious, and you learned that getting sick was something awful. You learned it from a concept.

So the reason why there is in the practice of Zen, what we did before this lecture began, to practice Za-zen, sitting Zen. Incidentally, there are three other kinds of Zen besides Za-zen. Standing Zen, walking Zen, and lying Zen. In Buddhism, they speak of the three dignities of man. Walking, standing, sitting, and lying. And they say when you sit, just sit. When you walk, just walk. But whatever you do, don't wobble. In fact, of course, you can wobble, if you really wobble well. When the old master Hyakujo was asked 'What is Zen?' he said 'When hungry, eat, when tired, sleep,' and they said, 'Well isn't that what everybody does? Aren't you just like ordinary people?' 'Oh no,' he said, 'they don't do anything of the kind. When they're hungry, they don't just eat, they think of all sorts of things. When they're tired, they don't just sleep, but dream all sorts of dreams.' I know the Jungians won't like that, but there comes a time when you just dream yourself out, and no more dreams. You sleep deeply and breathe from your heels. Now, therefore, Za-zen, or sitting Zen, is a very, very good thing in the Western world. We have been running around far too much. It's all right; we've been active, and our action has achieved a lot of good things. But as Aristotle pointed out long ago—and this is one of the good things about Aristotle. He said 'the goal of action is contemplation.' In other words, busy, busy, busy, busy, busy, but what's it all about? Especially when people are busy because they think they're going somewhere, that they're going to get something and attain something. There's quite a good deal of point to action if you know you're not going anywhere. If you act like you dance, or like you sing or play music, then you're really not going anywhere, you're just doing pure action, but if you act with a thought in mind that as a result of action you are eventually going to arrive at someplace where everything will be alright. Then you are on a squirrel cage, hopelessly condemned to what the Buddhists call samsara, the round, or rat-race of birth and death, because you think you're going to go somewhere. You're already there. And it is only a person who has discovered that he is already there who is capable of action, because he doesn't act frantically with the thought that he's going to get somewhere. He acts like he can go into walking meditation at that point, you see, where we walk not because we are in a great, great hurry to get to a destination, but because the walking itself is great. The walking itself is the meditation. And when you watch Zen monks walk, it's very fascinating. They have a different kind of walk from everybody else in Japan. Most Japanese shuffle

along, or if they wear Western clothes, they race and hurry like we do. Zen monks have a peculiar swing when they walk, and you have the feeling they walk rather the same way as a cat. There's something about it that isn't hesitant; they're going along all right, they're not sort of vagueing around, but they're walking just to walk. And that's walking meditation. But the point is that one cannot act creatively, except on the basis of stillness. Of having a mind that is capable from time to time of stopping thinking. And so this practice of sitting may seem very difficult at first, because if you sit in the Buddhist way, it makes your legs ache. Most Westerners start to fidget; they find it very boring to sit for a long time, but the reason they find it boring is that they're still thinking. If you weren't thinking, you wouldn't notice the passage of time, and as a matter of fact, far from being boring, the world when looked at without chatter becomes amazingly interesting. The most ordinary sights and sounds and smells, the texture of shadows on the floor in front of you. All these things, without being named, and saying 'that's a shadow, that's red, that's brown, that's somebody's foot.' When you don't name things anymore, you start seeing them. Because say when a person says 'I see a leaf,' immediately, one thinks of a spearhead-shaped thing outlined in black and filled in with flat green. No leaf looks like that. No leaves—leaves are not green. That's why Lao-Tzu said 'the five colors make a man blind, the five tones make a man deaf,' because if you can only see five colors, you're blind, and if you can only hear five tones in music, you're deaf. You see, if you force sound into five tones, you force color into five colors, you're blind and deaf. The world of color is infinite, as is the world of sound. And it is only by stopping fixing conceptions on the world of color and the world of sound that you really begin to hear it and see it.

So this—should I be so bold as to use the word 'discipline'—of meditation, or zazen, lies behind the extraordinary capacity of Zen people to develop such great arts as the gardens, the tea ceremony, the calligraphy, and the grand painting of the Sum Dynasty, and of the Japanese Sumi tradition. And it was because, especially in tea ceremony, which means literally chanoyu in Japanese, meaning 'hot water of tea,' they found in the very simplest of things in everyday life, magic. In the words of the poet Hokoji, 'marvelous power and supernatural activity, drawing water, carrying wood.' And you know how it is sometimes when you say a word and make the word meaningless, you take the word 'yes'—yes, yes, yes, yes, yes, yes, yes, yes.

It becomes funny. That's why they use the word 'mu' in Zen training, which means 'no.' Mu. And you get this going for a long time, and the word ceases to mean anything, and it becomes magical. Now, what you have to realize in the further continuance of Za-zen, that as you— Well, let me say first in a preliminary way, the easiest way to stop thinking is first of all to think about something that doesn't have any meaning. That's my point in talking about 'mu' or 'yes,' or counting your breath, or listening to a sound that has no meaning, because that stops you thinking, and you become fascinated in the sound. Then as you get on and you just—the sound only—there comes a point when the sound is taken away, and you're wide open. Now at that point, there will be a kind of preliminary so-called satori, and you will think 'wowie, that's it!' You'll be so happy, you'll be walking on air. When Suzuki Daisetz was asked what was it like to have satori, he said 'well, it's like ordinary, everyday experience, except about two inches off the ground.' But there's another saying that the student who has obtained satori goes to hell as straight as an arrow. No satori around here, because anybody who has a spiritual experience, whether you get it through zazen, or through LSD, or anything, you know, that gives you that experience. If you hold on to it, say 'now I've got it,' it's gone out of the window, because the minute you grab the living thing, it's like catching a handful of water, the harder you clutch, the faster it squirts through your fingers. There's nothing to get hold of, because you don't NEED to get hold of anything. You had it from the beginning. Because you can see that, by various methods of meditation, but the trouble is that people come out of that and brag about it, say 'I've seen it.' Equally intolerable are the people who study Zen and come out and brag to their friends about how much their legs hurt, and how long they sat, and what an awful thing it was. They're sickening. Because the discipline side of this thing is not meant to be something awful. It's not done in a masochistic spirit, or a sadistic spirit: suffering builds character, therefore suffering is good for you. When I went to school in England, the basic premise of education was that suffering builds character, and therefore all senior boys were at liberty to bang about the junior ones with a perfectly clear conscience, because they were doing them a favor. It was good for them, it was building their character, and as a result of this attitude, the word 'discipline' has begun to stink. It's been stinking for a long time. But we need a kind of entirely new attitude towards this, because without that quiet, and that non- striving, a life

becomes messy. When you let go, finally, because there's nothing to hold onto, you have to be awfully careful not to turn into loose yogurt. Let me give two opposite illustrations. When you ask most people to lie flat on the floor and relax, you find that they are at full attention, because they don't really believe that the floor will hold them up, and therefore they're holding themselves together; they're uptight. They're afraid that if they don't do this, even though the floor is supporting them, they'll suddenly turn into a gelatinous mass and trickle away in all directions. Then there are other people who when you tell them to relax, they go like a limp rag. But you see, the human organism is a subtle combination of hardness and softness. Of flesh and bones. And the side of Zen which has to do with neither doing nor not doing, but knowing that you are It anyway, and you don't have to seek it, that's Zen-flesh. But the side in which you can come back into the world, with this attitude of not seeking, and knowing you're It, and not fall apart—that requires bones. And one of the most difficult things—this belongs to of course a generation we all know about that was running about some time ago—where they caught on to Zen, and they started anything-goes painting, they started anything-goes sculpture, they started anything-goes way of life. Now I think we're recovering from that today. At any rate, our painters are beginning once again to return to glory, to marvelous articulateness and vivid color. There's been nothing like it since the stained glass at Chartres. That's a good sign. But it requires that there be in our daily use of freedom, and I'm not just talking about political freedom. I'm talking about the freedom which comes when you know that you're It, forever and ever and ever. And it'll be so nice when you die, because that'll be a change, but it'll come back some other way. When you know that, and you've seen through the whole mirage, then watch out, because there may still be in you some seeds of hostility, some seeds of pride, some seeds of wanting to put down other people, or wanting to just defy the normal arrangements of life.

So that is why, in the order of a Zen monastery, various duties are assigned. The novices have the light duties, and the more senior you get, the heavy duties. For example, the Roshi very often is the one who cleans out the benjo, the toilet. And everything is kept in order. There is a kind of beautiful, almost princely aestheticism, because by reason of that order being kept all of the time, the vast free energy which is contained in the

system doesn't run amok. The understanding of Zen, the understanding of awakening, the understanding of— Well, we'll call it mystical experiences, one of the most dangerous things in the world. And for a person who cannot contain it, it's like putting a million volts through your electric shaver. You blow your mind and it stays blown. Now, if you go off in that way, that is what would be called in Buddhism a pratyeka-buddha—'private buddha'. He is one who goes off into the transcendental world and is never seen again. And he's made a mistake from the standpoint of Buddhism, because from the standpoint of Buddhism, there is no fundamental difference between the transcendental world and this everyday world. The bodhisattva, you see, who doesn't go off into a nirvana and stay there forever and ever, but comes back and lives ordinary everyday life to help other beings to see through it, too, he doesn't come back because he feels he has some sort of solemn duty to help mankind and all that kind of pious cant. He comes back because he sees the two worlds are the same. He sees all other beings as buddhas. He sees them, to use a phrase of G.K. Chesterton's, 'but now a great thing in the street, seems any human nod, where move in strange democracies the million masks of god.' And it's fantastic to look at people and see that they really, deep down, are enlightened. They're It. They're faces of the divine. And they look at you, and they say 'oh no, but I'm not divine. I'm just ordinary little me.' You look at them in a funny way, and here you see the buddha nature looking out of their eyes, straight at you, and saying it's not, and saying it quite sincerely. And that's why, when you get up against a great guru, the Zen master, or whatever, he has a funny look in his eyes. When you say 'I have a problem, guru. I'm really mixed up, I don't understand,' he looks at you in this queer way, and you think 'oh dear me, he's reading my most secret thoughts. He's seeing all the awful things I am, all my cowardice, all my shortcomings.' He isn't doing anything of the kind; he isn't even interested in such things. He's looking at, if I may use Hindu terminology, he's looking at Shiva, in you, saying 'my god, Shiva, won't you come off it?'

So then, you see, the bodhisattva, who is—I'm assuming quite a knowledge of Buddhism in this assembly—but the bodhisattva as distinct from the pratyeka-buddha, bodhisattva doesn't go off into nirvana, he doesn't go off into permanent withdrawn ecstasy, he doesn't go off into a kind of catatonic samadhi. That's all right. There are people who can do that; that's their

vocation. That's their specialty, just as a long thing is the long body of buddha, and a short thing is the short body of buddha. But if you really understand that Zen, that buddhist idea of enlightenment is not comprehended in the idea of the transcendental, neither is it comprehended in the idea of the ordinary. Not in terms with the infinite, not in terms with the finite. Not in terms of the eternal, not in terms of the temporal, because they're all concepts. So, let me say again, I am not talking about the ordering of ordinary everyday life in a reasonable and methodical way as being schoolteacherish, and saying 'if you were NICE people, that's what you would do.' For heaven's sake, don't be nice people. But the thing is, that unless you do have that basic framework of a certain kind of order, and a certain kind of discipline, the force of liberation will blow the world to pieces. It's too strong a current for the wire. So then, it's terribly important to see beyond ecstasy. Ecstasy here is the soft and lovable flesh, huggable and kissable, and that's very good. But beyond ecstasy are bones, what we call hard facts. Hard facts of everyday life, and incidentally, we shouldn't forget to mention the soft facts; there are many of them. But then the hard fact, it is what we mean, the world as seen in an ordinary, everyday state of consciousness. To find out that that is really no different from the world of supreme ecstasy, well, it's rather like this:

Let's suppose, as so often happens, you think of ecstasy as insight, as seeing light. There's a Zen poem which says

A sudden crash of thunder. The mind doors burst open,
and there sits the ordinary old man.

See? There's a sudden vision. Satori! Breaking! Wowee! And the doors of the mind are blown apart, and there sits the ordinary old man. It's just little you, you know? Lightning flashes, sparks shower. In one blink of your eyes, you've missed seeing. Why? Because here is the light. The light, the light, the light, every mystic in the world has 'seen the light.' That brilliant, blazing energy, brighter than a thousand suns, it is locked up in everything. Now imagine this. Imagine you're seeing it. Like you see aureoles around buddhas. Like you see the beatific vision at the end of Dante's 'Paradiso.' Vivid, vivid light, so bright that it is like the clear light of the void in the Tibetan Book of the Dead. It's beyond light, it's so bright. And you watch it

receding from you. And on the edges, like a great star, there becomes a rim of red. And beyond that, a rim of orange, yellow, green, blue, indigo, violet. You see this great mandala appearing this great sun, and beyond the violet, there's black. Black, like obsidian, not flat black, but transparent black, like lacquer. And again, blazing out of the black, as the yang comes from the yin, more light. Going, going, going. And along with this light, there comes sound. There is a sound so tremendous with the white light that you can't hear it, so piercing that it seems to annihilate the ears. But then along with the colors, the sound goes down the scale in harmonic intervals, down, down, down, down, until it gets to a deep thundering base which is so vibrant that it turns into something solid, and you begin to get the similar spectrum of textures. Now all this time, you've been watching a kind of thing radiating out. 'But,' it says, 'you know, this isn't all I can do,' and the rays start dancing like this, and the sound starts waving, too, as it comes out, and the textures start varying themselves, and they say, well, you've been looking at this this as I've been describing it so far in a flat dimension. Let's add a third dimension; it's going to come right at you now. And meanwhile, it says, we're not going to just do like this, we're going to do little curlicues. And it says, 'well, that's just the beginning!' Making squares and turns, and then suddenly you see in all the little details that become so intense, that all kinds of little subfigures are contained in what you originally thought were the main figures, and the sound starts going all different, amazing complexities of sound all over the place, and this thing's going, going, going, and you think you're going to go out of your mind, when suddenly it turns into... Why, us, sitting around here.

Thank you very much.

Biting an Iron Bull

This seminar is about a very sticky problem, which is to say the problem to which the Buddha primarily addressed himself, which is that of agony, suffering. But before we get into that. We have to be clear about certain basics. And these basics have to do not so much with concepts and ideas. As they do with the state of mind. Would call it also a state of feeling the state of sensation the state of consciousness. And, we need to understand that even be in that the fall we can really go very far.

And this is an extraordinarily difficult state of mind to talk about even though in its nature it's extremely simple. Because, it is in a way like we were when we were babies. When we hadn't been told anything and didn't know anything, other than what we felt, and we had no names for it. Now of course as we grow older, we learn to differentiate one thing from another, one event from another and above all, our selves from everything else. Well and good. Provided you don't lose the foundations. Just as mountains are differentiated, but they're all based on the earth so the multiple things of this world are differentiated. But, they have as it were, a basis. There is no word for that basis, not really, because words are only for distinctions. And so there can't really be a word not even an idea, of the non-distinction. We can feel it, but we can't think it. But we don't feel it like an object. You feel you're alive, you feel conscious, but you don't know what consciousness is because consciousness is present in every conceivable kind of experience. It's like, the space in which we live, which is everywhere. It's like a fish being in water and presumably a fish doesn't know it's in the water because it never goes out. A bird, presumably, knows nothing of the air. And we really know nothing of consciousness, and we pretend space isn't there.

So however, when you grow up, and become fascinated, which is really the right word, spellbound, enchanted, by all the things that adults say that you. You forget the background. And you come to think that all the distinctions which you have been learning are the supremely important things to be concerned with. You become hypnotized. And so when we are told to pay attention to what matters, we get stuck with it and that's what and but as I'm is called attachment. Attachment doesn't mean that you enjoy your dinner. Or that you enjoy sleeping. Or beauty. Those are responses of our organism in its environment as natural as feeling hot near a fire or cold near ice. So are certain responses of fear or of sorrow. They are not attachment. Attachment is exactly translated by the modern slang term hang-up. It's a kind of stickiness, or what in psychology would be called blocking. When you are in a state of wobbly hesitation, not knowing how to flow on, that's attachment. What is meant by the Sanskrit word klesha.

So, when the chicken has its big foot to the chalk line it's got a hang up. It's stuck on that line. And so in the same way, we get a hang up on all the various things that we're told as we grow up by our parents, our aunts and

uncles, our teachers and above all, by our peer group. And the first thing that everybody wants to tell us is the difference between ourselves and the rest of the world, and between those actions which are voluntary, and those which are involuntary what we do on the one hand and what happens to us on the other. And this is of course immensely confusing to a small child. Because it's told to do all sorts of things that are really supposed to happen. Like going to sleep, like having bowel movements, like not loving people. Like not blushing. Stopping being anxious, and all sorts of things like that.

So what happens is this. The child is told in sum, that we, your parents, elders and betters, command you to do what will please us only if you do it spontaneously. [laughs] One hundred and I want everybody is completely confused. We go through life with that burden on us. So, we therefore develop this curious thing. We develop a thing which is called an ego. And I've got to be very clear here what I mean by an ego. And ego is not the same thing as a particular living organism. From my philosophy, the particular living organism which is inseparable from a particular environment. That is to say, from the universe as centered here and now. As something real which isn't a thing, I call it a feature of the universe. But what we call our ego is something abstract. Which is to say, it has the same order and kind of reality. As an hour, or an inch or a pound, or a line of longitude. It is for purposes of discussion, it is for convenience, in other words, it is for social convention, that we have what is called an ego. But the fallacy, that all of us make is, is that we treat it as if it were a physical organ. As if it were real in that sense. When in fact it is composed on the one hand. Of our image of ourselves. That is our idea of ourselves, as when we say to somebody, you must improve your image.

Now this image of ourselves as obviously not ourselves any more, than an idea of a tree is a tree. Any more, than you can get wet in the word water. And, to go on with our image of ourselves as extremely inaccurate and incomplete. With that some God the gifted ears to see ourselves as others see us we done. So my image of me is not at all your image of me and my image of me is extremely incomplete in that it does not include any information to speak of about the functioning of my nervous system, my circulation, my metabolism, my subtle relationships with the entire surrounding human and non-human universe. So, the image I have of

myself as a caricature. It is arrived at through mainly, my interaction with other people, who tell me who I am in various ways, either directly or indirectly, and I play about with what that picture is of me and they play something back to me so that we set up this conception, and this started very, very early in life. And I was told, you see, and you were told, that we must have a consistent image. You must be you you have to find your identity. In terms of image and this is an awful red herring. A lot of the current quest for identity among younger people is a search for an acceptable image. What role can I play? Who am I in the sense of what am I going to do in life and so on. Now while that has a certain importance. If it's not backed up by deed but not has it's extraordinarily misleading. So that for on the one hand there is this image which is intellectual emotional. Imaginative. And so forth.

Now we would say I don't feel that I am only an image. I feel there's something more real than that because, I feel, I mean I have a sense of there being a particular sort of, how do we say a center of something, some sort of sensitive core inside the skin. And that corresponds to the word I. And let's take a look at this. Because the thing that we feel as being myself is certainly not the whole body. Because a lot of the body can be seen as an object. In other words, if you stand, stretch yourself out, lie on the floor and turn your head and look at yourself you know you can see your feet and your legs and all this up to here and finally it all vanishes and there's a sort of a vague nose in front. And you assume you have a head, because everybody else does, and you looked in a mirror and I told you you had a head which would never see it just like you can't see your back. So you tend to put your ego on the side of the unseen part of the body. The part you can't get at, because that seems to be where it all comes from and you feel it. But what is it that we feel? Because if I see clearly, and my eyes are in functioning order, the eyes certainly are not conscious of themselves no spots in front of them no defects in other words in the lens on the retina or in the optic nerves that give hallucinations. So also, therefore, if my ego my consciousness, is working properly, I ought not to be aware of it. As something sort of there. Being a nuisance in a way in the middle of things because your ego is often hard to take care of.

Well what is it that we feel? Well I think I've discovered what it is. It's a chronic habitual sense of muscular strain, which we were taught in the whole process of doing spontaneous things to order. When you're taking off in a jet plane, and the thing is gone rather further down the runway than you think it should have without getting up in the air, you start pulling at your seat belt. Get this thing off the ground, perfectly useless. So in the same way, when our community tells us, look carefully. Now listen, pay attention, we start using muscular strains around our eyes, ears, jaws, hands, to try to use our muscles to make our nerves work. Which is of course futile. And in fact it gets in the way of the functioning of the nerves. Try to concentrate.

And then when we try to control our emotions we hold our breath pull our stomachs in, tighten our rectal muscles. To hold ourselves together, pull yourself together, I mean really, what do you do? What is the child understanding that he does it, must get and pull himself together. This is useless. So everybody, chronically pulls himself together so that it's so funny if you get a person to just lie on the floor and relax, but there's the floor and he was firm as can be holding you up. Nevertheless, they will detect that the person is making all sorts of tensions lest he should suddenly turn into a nasty Jell-O on the floor. So that chronic condition which in Sanskrit is called Samkoca which means contraction. Is the root of what we call the feeling of the ego so that in other words this feeling of tightness is the physical referent for the psychological image of ourselves. So that we get the ego as the marriage of an illusion to a futility, even though the idea of an 'I' with a name, with a being, is naturally useful for social communication. Provided we know what we're doing and take it for what it is.

But we are so hung up on this concept. That it confuses us, even in the proposition that it might be possible for us to feel otherwise. Because we ask the question if we hear about people who have transcended the ego. Well we ask how do you do that? Well I say, 'What do you mean?' You how do you do that. Because the you you're talking about doesn't exist. So you can't do anything about it, any more than you can cut a cheese with a line of longitude. That sounds very discouraging doesn't it? But let's suppose now you are babies again and you don't know anything. Now, don't be frightened, because anything you know you can get back later. But for the time being. Here is awareness, and let's suppose you have no information

about this at all, no words for it. And that my talking to you is just a noise. Now don't try to do anything about this, but don't make any effort. Because naturally, by force of habit, certain tensions remain inside you, and certain ideas and words drift all the time through your mind. Just like the wind blows or clouds move across the sky. Don't bother with them at all. Don't try to get rid of them. Just be aware of what's going on in your head. Like it was clouds in the sky. Or the crackling of the fire. There's no problem to this. All you have to do really is look and listen, without naming, and if you are naming, never-mind. Just listen to that.

Now, you can't force anything here. That you can't, willfully stop thinking and stop naming is only telling you. That the separate you doesn't exist. It isn't a mark of defeat. It isn't a sign of your lack of practice and meditation. That it runs on all by itself, simply means that the individual separate you is a figment of your imagination. So you are aware at this point of a happening. Remember you don't know anything about the difference between you and it. You haven't been told that. You have no words for the difference between inside and outside. Between here and there. And nobody has taught you, that what you see out in front of you is either near or far from your eyes. Watch a baby put out a finger to touch the moon. You don't know about that.

Just, therefore, here it is. We'll just call it this. And if you will feel it. The going on, which includes absolutely everything you feel. Whatever that is, it's what the Chinese call Tao, what Buddhists call suchness, tathata. And it's a happening. It doesn't happen to you. Because where is that. You what you call you was part of the happening. Or an aspect of. It has no parts, it's not like a machine. And it's a little scary because you feel who's in control around here. Why should that be anyone. That's in a very weird notion we have that processes require something outside them to control them. It never occurred to us that processes could be self-controlling, even though we say to someone 'Control yourself!' We know what you know all of the think about self-control We split a person into. So there's a you are separate from the self that's supposed to be controlled well how can that achieve anything. How can a noun start a verb? Yet it's a fundamental superstition that that can be done.

So you have this process which is quite spontaneous going on. We call it life, it's controlling itself. It's aware of itself, it's aware of itself through you, you are an aperture through which the universe looks at itself. And because it's the universe looking at itself through you, there's always an aspect of itself that it can't see. So it's like that snake you see that is pursuing its tail. Cause the snake down see its head, like you can.

So therefore, we always find as we investigate the universe, make the microscope bigger and bigger and bigger and we will find evermore minute things. Make the telescope bigger and bigger and bigger, and the universe expands, because it's running away from itself. It won't do that, if you don't chase it. Ha ha ha ha ha ha ha. So, the universe is chasing its own tail. Here this is the thing we're talking about this Tao. It's a game of hide-and-seek. Really, when you ask the question who is doing the chasing? You are still working under the assumption that every verb has to have a subject. That when there is an action, that has to be a doer. But that's what I would call a grammatical convention leading to what Whitehead called the fallacy of misplaced concreteness. Like the famous It in 'It is raining.'

So when you say that cannot be knowing without a knower. This is merely saying no more than there can't be a verb without a subject. And that's a grammatical rule and not a law of nature. Anything you can think of as a thing, as a noun, can be described by a verb. And there are languages which do that. It sounds awkward in English. But face it, when you look for doers as distinct from deeds, you can't find them. Just as when you look for stuff, underlying the patterns of nature, you can't find in his stuff you just find more not patterns. There never was any stuff, it's a ghost. What we call stuff is simply patterns seen out focus and it's fuzzy so we call it stuff. You know that cakewalk.

So you know we have these words energy, matter, being, reality even Tao. And we can never find them. [They] always elude us entirely, although we do have the very strong intuition that all this that we see is connected are related. So we speak of a universe, although that word really means one turn. It's your turn now. Or like you make one turn to look at yourself. But you can't make two terms and see what's looking. It's very simple therefore. You only have to understand that you can't do

anything about it. And as they say in Zen, you cannot take hold of it, but you can't get rid of it. And in not being able to get it, you get it. So all these trials that gurus put their students through have as their ultimate object convincing you that you can't do anything. Only it's convincing you very thoroughly, it's convincing you in more than a theoretical way. Now perhaps I shouldn't tell you that. But you see I'm not a guru. In that, I don't give individual spiritual direction to people. And I give away the guru's tricks. That may not be very good, but on the other hand, those tricks are only necessary in the sense that, I would say to someone it's necessary for you to go to a psychiatrist if you think you must. And if you're not going to be satisfied without going to Japan and study ins and Buddhism from an Roshi, 'OK you better go.' It isn't necessary unless you say it is. If that's the only thing that will satisfy you, and you feel that deep down inside you you've got that yearning therefore you've got that yearning. But on the other hand you have and you haven't. And I'm not going to put you down on that account you see. The particles What do you want to do? What is it in you to do?

But there it is. That you can struggle and struggle and struggle. And indeed will do so, as long as you have the feeling inside you to missing something. And, people, your friends, all sorts of people will do the utmost to persuade you that you're missing something. Because they're missing something, and they think they're getting it through a certain way and therefore to assure themselves that like you to do it to. So there's this thing, and you see a clever guru beguiles his students, by letting them have the feeling of success and accomplishment in certain directions. A guru gives people exercises A. that are difficult but can be accomplished and B. that are impossible. You will always be hung up on the impossible ones but the possible ones you will feel get a feeling of making progress, so that you will double your efforts to solve the impossible exercises. And then they range things in many many ranks and levels through which you can advance. This stage of consciousness that state of consciousness all think of the degrees of Masonry or so on, ranks or learning things, the different belts you get in Judo market. You can do that. And gives people the sets of competing with themselves or even with others. Because of the feeling inside that there is just something I'm missing. And of course, if you are learning any sort of

skill, and you haven't perfected the skill, there is indeed something you're missing.

But in this thing that we're talking about, that isn't true. Because you, as the Buddhists say, are Buddhas from the very beginning. And all that searching is like looking for your own head. Which you can't see, and therefore might conceivably imagine that you're lost. So, that indeed is the point. That we don't see what looks. And therefore, we think we've lost it. And so, we're in search of the Self the Atman. Well that's the one thing we can't find. Because we have it, we are it! But we confuse it, with all these images. So therefore, if you understand perfectly clearly that you can't do anything. To find that very very, important thing. God, enlightenment, Nirvana. Whatever. Then what?

Well, I find you know it's so stupid, because even if I tell myself well there's nothing I can do about it. Why did I say that? You see. Why did I say that? Why did I go out of my way to tell myself there's nothing I can do about it? Because, in the back of my mind, there's the funny little feeling that if I did tell myself that something different but how easy all right. So even that doesn't work, nothing works. Now and absolutely no. Nothing works where are you. Well here we are I mean you know this is feeling something going on oh well doesn't stop dead when there's nothing you can do. Because there's something happening.

Now just there. That's what I'm talking about, there's the happening. When you are not doing anything about it you're not not doing anything about it you just can't help it it goes on despite anything you think or worry about or whatever, now there is the point. Right there. And remember, although you will think that first that this is a kind of determinism, there are two reasons why it isn't. One, there is no-body being determined. Now, other people think of determinism, as the direction of what happens by the past. The causation of what happens by the past. Now, if you will use your senses, you will see that that is a hallucination. The present does not come from the past. If you listen, and only listen, close your eyes. Where do the sounds come from, according to your ears? You hear, you hear them coming out of silence. The sounds come and then they fade off. They go like echoes or echoes in the labyrinths of your brain, which we call memories. The sounds

don't come from the past. They come out of now and trail off. You can do that later with your eyes. You can see, like when you're watching television, there's a vibration coming out of the screen to your eyes. And it starts from there somehow. Because we see the hands and then they move, we think that the movement is caused by the hands, and that the hands were there before and so can move later. We don't see that our memory of the hands is an echo of their always being now. They never were, they never will be, they're always now. So is the motion. And that that is recollected is the trailing off echo like the wake of a ship. And so, just as the wake doesn't move the ship, the past does not move the present. Unless you insist that it does. And if you say, 'Well naturally I'm always moved by the past.' That's an alibi. And it completely fails to explain how you never learn anything new. And that's why all the psychologists who are mostly behaviorists are completely bogged down in trying to find a theory of learning. Because according to the the theory of learning that we have, everything they knew that you assimilate is really only learned when translated into terms of what you already know.

So in that sense, learning becomes like a library, which increases only by the addition of books about books already in it. And a lot of libraries are indeed like that. So, that's what we call scholasticism. So then, you become aware that this happening isn't happening to you, because you are happening. The only you there is, is what's going on. You know, feel it. And disregard these stupid distinctions that you've been taught I mean stupid relatively speaking. And feel it genuinely. When you feel genuinely, you get down to rock bottom all that isn't there. That's a game that's been erected on. And it isn't determined. In other words, you get this odd feeling of a synthesis between doing and happening. In which doing is as much happening as happening and happening is as much doing as doing. And if you're not very careful at that point you'll Plame yourself God Almighty, in the Hebrew-Christian sense. Like Freud alleges, babies feel that they're omnipotent. And in a way they are. I am omnipotent insofar as on the universe. But I'm not omnipotent in the role of Alan Watts. Only cunning.

So now then, this sensation of that happening is basic to all we would want to explore. It's there as you see you can't do anything. And that as you see you can't do anything, you don't go and distract yourself with something

else, like committing suicide. Or getting drunk, or any sort of distraction. Because if you do that, you will miss what follows, from the feeling of what is going on when you're not doing anything. When you're not able even to not do anything. See, this is a sticky place. You can't get in, and you can't get out. That's why it's called in Zen it's called the mosquito biting the Iron Bull. Or the man who swallowed a ball of red hot iron that she can't gulp down can't spit out. It's that difficult What are you to do or not do not tell Suzy that dilemma. That what you saw was you just isn't there at all. I don't make it difficult because that's a form of evading it. Don't make it easy, that's a form of evading. It's neither difficult no easy because if it were difficult it would have to be difficult for someone if it were easy it would have to be easy for someone. And the someone we're talking about is just the one that isn't there. And if you think it is there, okay, it's a free country you can have that thought but it's a thought. In other words your ego is a thought among thoughts it is not in fact the controlling thinker, or the feeler or the sensor. It's one of them.

And so therefore all this thing is going along. And as I say we get anxious because we feel nobody is in control but nobody ever was. Now in your lives as far a reasonably orderly life I mean that have been some catastrophes and messes, but it's amazing how we have got this far I mean the thing looks after itself. And you well remember that a lot of times that when you thought you were in charge and doing something sensible, you did something extremely foolish and when you thought you did something extremely foolish, it turned out to be a blessing. And that's the way things go.

Now of course, this is a dangerous way of speaking, to people who are in the process of young people especially, who are still in the process of learning elementary competence in the culture, learning the taboos and the conventions. Because we take their minds off the happening. To do that, well it isn't necessary to do it that way. It isn't really necessary to turn a child into a moron in the process of becoming an adult, but that's what we do. Because we teach a child to be a child. And that that prevents them from growing up. It's a method of keeping them off the labor market. But if you take that to speak to a child from the beginning as if it were an adult, and talk not baby talk, but straight language, your child will become Master of

English language, say about three years old. Certainly in talking it. And will be able to tell you a lot of funny things you don't know. But then, the trouble is you have to send the thing to school. Where if it is that advanced it will be regarded as a freak. And have a very bad time of it so it will have to conceal itself as a moron. But sometimes children are brought up without that interruption of being a child. You know with all the cutie pie stuff and that's what bores me about Christmas it's a way of commercializing childhood. So there's our basic part of departure. And I will have an intermission in which we will have coffee and...

The World as Just So

A lecture on Zen is always something in the nature of a hoax, because it really does deal with a domain of experience that can't be talked about. But one must remember, at the same time, that there's really nothing at all that can be talked about adequately. And the whole art of poetry is to say what can't be said. So every poet—every artist—feels, when he gets to the end of his work, that there's something absolutely essential that was left out. So Zen has always described itself as a finger pointing at the moon.

In the Sanskrit saying *tat tvam asi*, 'that art thou,' Zen is concerned with 'that.' 'That,' of course, is the word which is used for 'Brahman,' the absolute reality in Hindu philosophy. And you're it—only in disguise, and disguised so well that you've forgotten it. But unfortunately, ideas like the Ultimate Ground of Being, the Self, Brahman, Ultimate Reality, the Great Void—all that is very, very abstract talk, and Zen is concerned with a much more direct way of coming to an understanding of 'that.' Or 'thatness,' as it's called; *tathātā* in Sanskrit.

So Zen has been summed up in four statements:

a direct transmission outside scriptures and apart from tradition,

no dependence on words and letters,

direct pointing to the human mind,

and seeing into one's own nature and becoming Buddha, that is, becoming enlightened—awakened—from the normal hypnosis under which almost all of us go 'round like somnambules.

It's extraordinary how much interest has existed in Zen in the United States, especially in the years since the war with Japan. And, naturally, I've often meditated on the reasons for this interest. I think, first of all, the appeal of Zen lies in its unusual quality of humor. Religions aren't, as a rule, humorous in any way. Religions are serious. And when one looks at Zen art and reads Zen stories it is quite apparent that something is going on here which isn't serious in the ordinary sense, however sincere it may be.

The next thing I think has appealed to Westerners is that Zen has no doctrines. There is nothing you have to believe, and it doesn't moralize at you very much. It's not particularly concerned with morals at all. It's a field of inquiry rather like physics. And you don't expect a physicist to discuss authoritatively about morals even though, as a human being, he has moral interests and problems. But as a physicist he is not a moral authority. Or, if you go to an oculist, or ophthalmologist, to have your eyes adjusted—that is so you can see clearly. And Zen is spiritual ophthalmology.

Another thing that appeals very much to Western students about Zen is that they read their Zen from Suzuki, and from some of my writings, and from R. H. Blyth, and these people present a rather different kind of Zen from that which you will find today in Japan. They present what is essentially early Chinese Zen from the old writings, ranging from about shortly before 700 A.D. to 1000 A.D. And that Zen has a very different flavor from modern Japanese Zen, and so, of course, many of the people who go to study Zen in Japan disapprove of Dr. Suzuki thoroughly. And also, naturally, of my exposition of Zen, because we don't make a great fetish of studying Zen by sitting.

In Japan, today, they sit and they sit and they sit. R. H. Blyth asked a Zen master, What would you do if you had only one half hour left to live? And he [the Zen master] said, I would do zazen, which means he would sit like a Buddha, here, and practice meditation. And Blyth had given him several choices: Would you like to listen to your favorite music? Would you have a dinner? Would you get drunk? Would you like the company of a beautiful

woman? Would you take a walk? What would you do? Or would you just go on with your daily business as if nothing was going to happen? In other words, would you wind up your watch? So he [Blyth] was very disappointed in this answer. And he said, You know, sitting is only one way of doing Zen.

Buddhism speaks of the four dignities of man: walking, standing, sitting, and lying. And so zazen is simply the Japanese word for 'sitting Zen.' There must also be walking Zen, standing Zen, and lying Zen. You should know, for example, how to sleep in a Zen way: that means to sleep thoroughly. Zen has been described as, When hungry, eat. When tired, sleep. And when the student got that description he said, Well, doesn't everybody do that? And the master said, They don't. When hungry, they don't just eat but think of 10,000 things. When tired, they don't just sleep but dream innumerable dreams.

So, in a sense, this sounds like the old Western truism whatever your hand finds to do, do it with all your might. But that's not the same thing as Zen. A lot of people like to see if they could sum up Zen in that way. In the Latin motto of the school I used to go to in England: age dum agis, 'act when you act,' or while you act.

There's a famous story which beautifully illustrates the current relationships between East and West. Paul Reps, who wrote—or rather, drew—a lovely book called Zen Telegrams, once asked a Zen master to sum up Buddhism in one phrase. And he said, Don't act, but act. So Reps was simply delighted because he thought the master had said, Don't act but act. And that, of course, would be the Taoist principle of wú wéi (無爲), of action in the spirit of not being separate from the world. Realizing so fully that you are the universe, too—that your action on it is not an interference, but an expression of the totality. But the master's English was very bad indeed, and Paul Reps had misunderstood him. He had said, Don't act bad act. And, you know, that is the sort of attitude that all clergy develop over the centuries. You know how it is when you go to church—if you do—so often the sermon boils down to, My dear people, you ought to be good. And everybody knows that—but hardly anybody knows how, or even what, 'good' is.

The fascination of Zen, to the West, is that it promises a sudden insight into something that is always supposed to take years and years and years. The psychoanalysts—if you're mixed up—they tell you the troubles you've got yourself into over all these years can't be undone in a day, and therefore it will take many, many sessions—maybe twice a week for several years—for you to get straightened out.

The Christians say that if you embark on a path of spiritual discipline, you get yourself a spiritual director and submit yourself to the will of God, but you may not get into the high states of contemplative prayer for very many years. The Hindus, the Vedanta society people, the Buddhists also say it'll require many long years of meditation, very hard concentration, very difficult practice, and stern discipline. Then, maybe, you'll make enough progress in this life to become a monk in your next life, and then you'll make enough progress to enter some of the preliminary stages leading to Buddhahood, but it's all likely to take you many, many incarnations.

But when this artist, Hasegawa, was asked, How does one see into Zen? he said: It may take you three seconds, it may take you thirty years. I mean that. And so, you see, there is always the possibility that it may take only three seconds. Zen literature abounds with stories, you see, in which there's a dialogue—or what is called in Japanese *mondō*, which means 'question-answer'—between a Zen teacher and his student, and these dialogues are fascinatingly incomprehensible. But it always seems to be that [at] the end of this swift interchange, the student gets the point. Sometimes he doesn't.

I gave a book of these dialogues, once, to a friend of mine who was deeply interested in Eastern philosophy. He said, I haven't understood a word of it, but it has cheered me up enormously. So this book—called the *Mumonkan*, which means 'the barrier with no gate,' or 'the gateless gate'—contains such stories as the student—I say student rather than monk, because Zen students are not monks in our sense of the word 'monk.' Our monks take life vows of poverty, chastity, and obedience, and to make the grade you're expected to spend your whole life in the monastic state. But I call the Zen monk a student because he's more like a student in a theological seminary. He may stay much longer than the usual three years; he may stay thirty years or so, but it's always possible for him to leave with dignity, and to

graduate, and to go into lay life, or to become a regular priest who keeps charge of a temple, can get married and have a family, and only very few graduates of a Zen monastery become rōshi. Rōshi simply means ‘old teacher’—that is, the man in charge of the spiritual development of the students.

So one of these students in the book says to the master Jōshū, I have been here in this monastery for some time, and I’ve had no instruction from you. The master said, Have you had breakfast? Yes. Then go wash your bowl. And the monk was awakened. Now, you may think that the moral of the story is, do the work that’s nearest though it’s dull at times, helping, when you meet them, lame dogs over stiles [Charles Kingsley].

Or that the bowl might be a symbol of the great void, the all-containing universe, and that—probably—the monk had washed it already, because they immediately—after eating in Japan and China, in a monastery—they take tea and pour it into the bowl and swill it around, wash it and wipe it out. So maybe he had already washed the bowl. And in that case you might think that the master was saying, Don’t gild the lily. Don’t—to use a real nice Zen phrase—don’t put legs on a snake. Or a beard on a eunuch. No, the point of that story is so clear that that’s what’s difficult about it.

And all these stories resemble jokes in this sense. A joke is told to make you laugh. When you get the point of the joke, you laugh spontaneously. But if the point has to be explained to you, you don’t laugh so well; you force a laugh. There is some kind of sudden impact between the punchline and the laugh, and so in exactly the same way with these stories, there is expected to be something else than laughter, which is sudden insight into the nature of being. ‘Nature of being;’ that sounds—again—very abstract, but it was go wash your bowl.

So, another story in this book concerns a master who said, When a cow walks out of the enclosure—the corral—the horns and head, the four legs, and the body all get through, but not the tail. How is it that the tail can’t get through? And nobody could answer this.

Another story tells of a certain master called Bǎizhàng, who was so good that he had hundreds of students, and they couldn’t all be housed in one

monastery. So he had to find one of the students who could also be a master. And so he arranged a test. He put down a pitcher in front of them all and said, Without making an assertion, or without making a denial, tell me what is this? And the senior monk said, It couldn't be called a piece of wood. And the teacher didn't accept this answer. But the monastery cook came forward and kicked the pitcher over and walked away, and he got the job. And the commentator remarks, Maybe he wasn't so smart after all, for he gave up an easy job for a difficult one.

When an inquirer about Zen came to a master, often—you know—they approach a Zen master with a kind of key question. What is the fundamental principle of Buddhism? Or, Why did the bearded barbarian come from the West? Because Zen is supposed to have been brought into China by a Hindu named Bodhidharma. Bodhidharma is always represented as having a huge bushy beard and very fierce eyes. Now, Bodhidharma always insisted that he had nothing to teach. And so, why did he come? That's one of the fundamental questions.

You might say to me—I've often said when I'm giving a lecture—I'm not trying to improve you, I'm not trying to persuade you to a certain point of view; that is to say like a preacher would convert somebody. In fact, I have nothing to tell you at all. Because were I to presume that I had something to tell you, I would be like a person who picked your pocket and sold you your own watch. So you might say, then, why do I talk? You might ask the sky, Why are you blue? The clouds, Why do you float around? Birds, Why do you sing? And we've been busy trying to invent explanations for all this. And so there's this great Zen saying; one of the old masters said, When I was a young man and knew nothing of Buddhism, mountains were mountains and waters were waters. But when I began to understand a little Buddhism, mountains were no longer mountains and waters no longer waters. In other words, when one starts scientific and philosophical inquiries, everything gets explained away in terms of its causes or other things that go with it. Or one sees that all the things in the world—what we think are separate things—are, as 'things,' illusions; there is nothing separate. So—but he said at the end, But when I had thoroughly understood, mountains are mountains and waters are waters. So this is what's called direct pointing.

A Zen master was once talking with me, and he said, When water goes out of the wash basin down the drain, does it go clockwise or anti-clockwise? And this was all phrased in the middle of a very ordinary conversation and, you know, it just seemed like a speculative question. And I said, Oh, it might go either. He said, NO! Like this! Now he said, Which came first, egg or hen? I said, Bwock bwock bwock bwock bwkeeeeeeeek! Yeah, he said, that's the point.

Now, it is saying too much—I warn you—to say that Zen is trying to point to the physical universe so that you could look at it without forming ideas about it. That is saying too much, but it is the general idea. It's in the direction of being the right idea. Zen people speak of the virtue of what they call mushin, which means 'no mind,' or munen, 'no thought.' That red lantern says munen on it. No thought. This is not an anti-intellectual attitude. The ordinary simple person is just as bamboozled by thinking as a university professor. You can think intellectually in a 'no think' way; that's the art. It doesn't mean not to have any thoughts at all, it means not to be fooled by thoughts; not to be hypnotized by the forms of speech and images that we have for the world. Not to be hypnotized by them into thinking that that is the way the world really is. So, if I say, This is a fan, it isn't. To begin with, 'fan' is a noise, and this doesn't make the noise 'fan,' but just 'whoosh.' But it can be many other things than a fan. It can be a back scratcher, very well. All sorts of things. Don't let words limit the possibilities of life. Actually, this fan has an inscription on it, written by a Zen Master who is 100 years old, and it says, I don't understand, I don't know anything about it.

So that goes back to the story of Bodhidharma: that, when he first came to China sometime a little before 500 A.D., he was interviewed by the Emperor Wu, of Liang. The emperor was a great patron of Buddhism and said, We have caused many monasteries to be built, monks and nuns to be ordained, and the scriptures to be translated into Chinese. What is the merit of this? And Bodhidharma said, No merit whatever. Well, that really set the emperor back, because the popular understanding of Buddhism is that you do good things like that—religious things—and you acquire merit, and this leads you to better and better lives in the future so that you will eventually become liberated.

And so he was completely set back, so he said, What is the first principle of the Holy Doctrine? And Bodhidharma said, Vast emptiness and nothing holy. Or, In vast emptiness there is nothing holy. So the emperor said, Who is it, then, that stands before us? The implication being: aren't you supposed to be a holy man? And Bodhidharma said, I don't know.

So the poem says:

Plucking flowers to which the butterflies come,

Bodhidharma says 'I don't know.'

And another poem like it:

If you want to know where the flowers come from,

even the God of Spring doesn't know.

So anybody who says that he knows what Zen is, is a fraud. Nobody knows. Just like you don't know who you are. All this business about your name, and your accomplishments, your certificates, what your friends say about you—you know very well that's not you. But the problem to know who you are is the problem of smelling your own nose.

When the great Japanese master Dōgen came back from China in about the year 1,200 A.D. to bring his school of Zen into Japan, they asked him, What did you learn in China? He said, The eyes are horizontal, the nose is perpendicular. This man went on to write a tremendous book about Zen. They are so contradictory, these people. Don't expect consistency out of a Zen master. Big, big book called the Shōbōgenzō. I talked with a Zen master about this book—in Japan—and he said, Oooh, that's a terrible book! It explains everything so clearly! It gives the show away. He said, You don't need any book for Zen.

So, you see, it is this kind of way of going about things, this method of Zen, that has so fascinated the West. And everybody who reads about Zen wonders if somehow, you see, this understanding is right under your nose. You know how it is: sometimes, you get a crowd of people to come into a

room, and you put something in the room that's absurd—like, suppose there was a balloon floating on the ceiling—people could come in and not notice it at all. Or, you know, somebody puts on something weird—some kind of a funny necktie, or something—and you say to a person, Well, haven't you noticed? A woman in a new dress. You know? Haven't you noticed? You say, Well, no. Wh—what is it? You know? It's right under your nose. It's staring you in the face, but you don't see it. And Zen is exactly like that.

It is very obvious. The master Bokuju was asked, We have to dress and eat every day, and how do we escape from all that? In other words, how do we get out of routine? And he said, We dress, we eat. He said, I don't understand. Bokuju said, If you don't understand, put on your clothes and eat your food.

Another Zen master, in quite recent times, was interviewing a student—you see, all these stories I'm telling you are connected, and what I want you to do is to grasp, intuitively, the connection—was interviewing a student—Western student—and he said, Get up and walk across the room. He got up and walked and came back. He said, Where are your footprints?

Another monk asked Jōshū, What is the Way? Tao, in Chinese. The Tao. He said, Your everyday mind is the way. How do you get in accord with it? He said, When you try to accord, you deviate.

So here is this extraordinary phenomenon. Now, let me say—having presented you with all these fireworks—let me say a few sober things about Zen as a historical phenomenon. Zen is a subdivision of Mahāyāna Buddhism. And, as you know, that is the school of Buddhism which is concerned with realizing Buddha-nature in this world; not necessarily by going off to the mountains, or by renouncing family life, everyday life, et cetera, et cetera—as if that were an entanglement—but realizing, in the midst of life, the possibility of becoming a Buddha.

And so, the great ideal personality of Mahāyāna Buddhism is the Bodhisattva—a word now applied to somebody who has attained Nirvāṇa, but instead of disappearing, comes back in many, many guises. There's a famous painting of one of the Bodhisattvas in the form of a prostitute. And Bodhisattvas in Zen art are often represented as bums. There's the beautiful

one over there, painted by Sengai, of the bum Hotei—or Bùdài in Chinese—who is always immensely fat. And he's saying, Buddha is dead. Maitreya—who is supposed to be the next Buddha—hasn't come yet. I had a wonderful sleep and didn't even dream about Confucius. And he's just stretching and yawning as he wakes up.

So Zen is Mahāyāna—Indian Mahāyāna Buddhism—translated into Chinese and therefore deeply influenced by Taoism and Confucianism. Zen monks brought Confucian ideas to Japan. And the origins of Zen lie actually around the year 414 A.D., at which time a great Hindu scholar by the name of Kumārajīva was translating—with a group of assistants—the Buddha sūtras into Chinese. One of his students taught that all beings whatsoever have the capacity to become Buddha, to become enlightened—even rocks and stones—and that even heretics and evil-doers have the Buddha-nature, or Buddha potentiality, in them. And everybody said he was a dreadful heretic. But then a text called the Nirvāṇa Sūtra came from India, which said precisely that. So everybody had to admit that this man was right. He also began to teach that awakening must be instantaneous; it's a kind of all-or-nothing state. I don't mean that there aren't degrees of its intensity—but once you see the pinciple, you see the whole thing. As they say: when the bottom falls out of the bucket, all the water goes together. Those men, then, promulgated the way of sudden awakening. Bodhidharma came later, and he is supposed—in legend—to have been followed by a line of six patriarchs, of which he was the first.

The second was named Eka—I'm using the Japanese pronunciation—who was formerly a general of the army. Then the third was Sōsan, who wrote the Xìnxīn Míng, which is the most marvelous little summary of Buddhism in verse. And so on, until they came to Enō, the sixth patriarch. You know—perhaps, more familiarly—his Chinese name, Huìnéng. He died in 715 A.D. He's the real founder of Chinese Zen; the man who synthesized the whole thing, and was the—at least, his collected discourses are contained in what is called the Platform Sūtra. And any student of Zen should read the Platform Sūtra.

But Enō really fused Zen with the Chinese way of doing things, and he emphasized very thoroughly: Do not think you are going to attain

Buddhahood by sitting down all day and keeping your mind blank. Because a lot of those students who practice Dhyāna—which is Sanskrit for Chán, which is Chinese for Zen, which is, in turn, Japanese—it means ‘meditation’—or ‘contemplation,’ perhaps, would be a better translation in English. And everybody thought that the proper way to contemplate was to be as still as possible. But, according to Zen, that is to be a stone Buddha instead of a living Buddha.

Now, I can knock a stone Buddha on the head, clunk, and it has no feelings, and so it’s a stone Buddha. There was a famous Zen master called Tanka, who went to a little lonely temple on a freezing cold night. And he took the Buddha image—one of the Buddha images—off the altar, split it up, and made a fire. And when the attendant of the temple came in the morning—horrified! Broke the image, and Tanka took his stick, started raking in the ashes. And the temple priest said, What are you looking for? He said, I’m looking for the śarīra, that is to say, the jewels that are supposed to be found in the body of a genuine Buddha when he’s cremated. So the priest said, You couldn’t expect to find śarīra from a wooden Buddha. In that case, said Tanka, let me have that other Buddha for my fire.

That’s, you see, the difference between living Buddha and stone Buddha. But a person who thinks that, in order to be awakened, you have to be heartless—to have no emotions, no feelings, that you couldn’t possibly lose your temper, or get angry, or feel annoyed, or depressed—those people haven’t got the right idea at all. If that’s your ideal, said Enō, you might just as well be a block of wood or a piece of stone. What he wanted you to understand is that your real mind—while all those emotions are going on—is imperturbable. Just like when you move your hand through the sky you don’t leave a track. The birds don’t stain the blue when they pass by. And when the water reflects the image of the geese, the reflection doesn’t stick there.

So, to be pure-minded, in the Zen way—or clear-minded is a better way of translating it—is not to have no thoughts; it’s not a question of not thinking about dirty things. One great master of the Tang dynasty, when asked, What is Buddha? believe it or not, answered, A dried turd. So it’s not that kind of purity. It is purity, clarity, in the sense that your mind isn’t sticky. You don’t

harbor grievances. You don't be attached to the past. You go with it, with life. Life is flowing all the time. That is the Tao: the flow of life. You are going along with it whether you want to or not. You're like people in a stream. You can swim against the stream, but you'll still be moved along by it and all you'll do is wear yourself out in futility. But if you swim with the stream, the whole strength of the stream is yours. Of course, the difficulty that so many of us have is finding out which way the stream is going. But certainly, as it goes, all the past vanishes. The future has not yet arrived. And there is only one place to be, which is here and now. And there is no way of being anywhere else. None whatever. If you understand that thoroughly, your task is finished. You then become instantaneous and also momentous.

So this was Enō's principle. As I said, he died in 715 A.D., and he left five very great disciples who taught, substantially, the same sort of thing. But as things go, then, these disciples had disciples, and those disciples had disciples, and there's a genealogy. And Zen broke into what are called Five Houses. And these—some of them didn't go on. Zen went on in two main forms: one is called, by the Japanese, Rinzai Zen, after the great master Rinzai, who lived towards the end of the 9th century, and the Sōtō School comes from another line, and they have a slightly different emphasis. Sōtō is more serene in its approach; Rinzai more gutsy. Rinzai people use the kōan method in Zen studies. Sōtō people don't—at least not in the same way.

But this period between the death of the sixth Patriarch, Enō, and about the year 1,000 A.D., is the golden age of Zen. These were the really formative years. And after that, Zen began to decline in China. It became mixed up with other forms of Buddhism, and it suffered the fate of many, many forms of meditation-type, or Yoga-type, discipline. It got a little bit sidetracked into occult and psychic matters; what are called, in Buddhism, siddhi, or the development of supernormal powers. For Zen, this is completely beside the point. But it got involved with Chinese alchemy, with Taoistic alchemy, and all sorts of foolishness in that direction.

But a very strong strain of Zen went to Japan. The first being in about 1,130 A.D., the monk Eisai, and then about 1,200 A.D., the monk I told you

about, Dōgen, who founded the great, beautiful, gorgeous, galluptuous monastery at Eihei-ji—which exists to this day. Now, in this golden age of Chinese Zen, the main method of study was walking Zen rather than sitting Zen. All monks were great travelers, and they walked for miles and miles through fields and mountains, visiting temples to see if they could find a master who would cause their spark to flash. To get what is called in Mandarin wú—or in Japanese, satori, or in Cantonese, ng.

This always rather fascinates me; the way this character is written. The word ‘I,’ in Chinese, is sometimes represented by this right-hand side of the character alone: five mouths, five senses. This one means your mind or heart, the heart-mind, xīn. Now, when we say something very surprising happened, My heart came into my mouth. Here it comes into all five. So this character means ‘awakening’—it’s the same, in a way, as the Sanskrit bodhi—awakening from the illusion of being a separate ego locked up in a bag of skin; discovering that you are the whole universe. And, of course, if you do discover that, and you see into it all of a sudden, it’s a shock—because your whole common sense is turned directly inside out. Everything is the same as you’ve always seen it, but completely different. Because you know who you are; you know that—what the devil were you worrying about? What was all that fuss? What was all that to do? Well, you see, it was part of the game. Everything, from one point of view, is fuss and to do. To do, to do, what is there to do?

But when you wake up, you see, and discover that all this ‘to do’ wasn’t you—what you thought was you—but was the entire works, which we can just call ‘it.’ That you’re ‘it,’ and that ‘it’ is it, and everything is ‘it,’ and ‘it’ does all things that are done—then that is a great surprise. But it sounds tasteless. It sounds empty, it sounds void, because if I say Well, you’re all ‘it,’ that is a statement without the slightest logical sense—because we don’t know what is ‘it’ unless there’s something that isn’t ‘it’. But if it’s both all is’s and all isn’t’s, then we can’t think about it. Nevertheless, it is highly possible to see that that’s so in a way that’s so vivid it brings your heart into all of your five mouths.

Having discussed basic principles of what Zen is about, I’m passing on to the more practical side of it. A Zen monastery is not a monastery in the Christian sense. It’s more like a theological seminary, except that it

practices more than it teaches. A typical institution consists of a campus, and on the campus there are many buildings. First of all, around the edges, you will invariably find independent temples that were founded in times past by noble families, because one of the things that Buddhists did when they came to the Far East was they exploited ancestor worship.

This was very clever of them: this being the great religion of China, the Buddhist priests performed services like [?] masses for the repose of the souls, or for good incarnation—reincarnations—for one's ancestors, and they made quite a thing out of that. And so they have memorial services for the departed, and that's one of the principal functions of temples in Japan. People don't go to temple in the same way as Westerners go to church. They make pilgrimages to temples and—say, at a great temple like Eihei-ji—you will find, on a Sunday morning—or practically any morning—a swarm of about 500 people attending the 4 a.m. service of chanting. Chanting the Buddhist scriptures. But they are, kind of, in and out of their temples. They have special services, they have memorial services, weddings, funerals, or everything like that, but they don't have a parish kind of church community as we find it in the West.

Although, when Buddhism—through the Japanese immigrants—exports itself to the United States, they immediately copy the Protestant church institution and sing, Buddha loves me, this I know, for the sūtra tells me so. It's terrible. And all the young men—nisei, who have never been in Japan—the one thing they can't stand is sūtra chanting, because they don't know what it means, and the priests don't know what it means a lot of the time. And so—but it's beautiful to listen to, and they haven't got an educated Western ear yet to appreciate that kind of oriental music.

Well, now, aside from these many temples, each of which is in charge of a priest with his family—and some of them are having a hard time making a go of it these days, so they become restaurants for very elegant food, or museums, and all sorts of things.

Now, the central—the guts of the Zen temple is what's called the sōdō. Sō, in Japanese, is the saṅgha, the order of followers of the Buddha; dō simply means 'hall.' So the 'saṅgha hall,' or sōdō, is the center. And this consists of a number of rooms, but the main one—the actual sōdō itself—is a large,

long, spacious room, with platforms on either side and a wide passage down the center. The platforms are six feet wide and each contains a number of tatami mats, which are measured six by three, and every monk is assigned to a mat. And on a shelf behind the mat, against the wall, he has all his possessions, which are very simple. And so the mat is his sleeping place and his meditation place. There is an image of the bodhisattva Manjushri in the hall, more or less in the center of the passage between the platforms. Manjushri is a bodhisattva—called a monju in Japan—who holds in his hand a sword, and this sword is the sword of wisdom, or prajñā, which cuts asunder all illusions. That is the dwelling place and the meditation place of the monks, and then they have, of course, kitchens, and a library, and they have special temples that the monks use for various services.

Then, aside from that, there are the quarters of the kansho, who is the abbot, or administrative head, of the temple, and then the quarters of the rōshi, who is the spiritual teacher. There isn't, in the Zen—not in the Rinzai Zen School, at any rate—exactly a hierarchy. Every temple is independent. There's no Pope, no Archbishop, but there is a fraternal relationship between all the temples of the Rinzai sect. The Sōtō sect have a little bit of a hierarchy, but still, on the whole, the kansho—or administrative head of the temple—is the big boss. The rōshi is the respected boss, the man everybody's terrified of—at least on the outside, at any rate.

Now, if you want to get into one of these institutions and study, they make it difficult. It's so different from the welcome attitude you get when you go into a Christian church. Here, they repel you. Westerners, of course, are treated with a certain amount of courtesy that is not ordinarily accorded to Japanese—but even then it's made difficult, because they realize that a Westerner who's taken the trouble to learn Japanese, and to get himself over the oceans, and to live under unfamiliar conditions is certainly pretty serious about it. And there are a number of Western Zen monks. So funny—there's one at Taihei-ji, who comes from San Francisco, and he's tremendously tall, and to see him with all the others is quite amusing.

Anyway, the formal approach is that you arrive in your traveling gear at the gate, and the Zen monk's traveling gear is most picturesque: he wears a great mushroom on his head; enormous straw hat, about so wide, and then

he has a black robe—shorter than a kimono—and he has long white tabi socks underneath, and geta, which are the wooden sandals with bridges on them to keep you high up a bit. Or he may wear just plain waraji, which are straw sandals. Then he carries, on the front, his little box in which are his eating bowls, his razor, his toothbrush, and such necessities of life.

When he arrives he's told that the monastery is very poor and they can't afford to take on any more students, and that the teacher is getting old and it might tax his strength, and things like that. So he has to sit on the steps, and he puts his traveling box in front of him, he takes off his big hat, and he lays his head on the box—his forehead—and waits there all day. But he is invited in for meals to a special little guest house, because no traveling monk can be refused hospitality. And he is admitted at night into this special place, but he's expected not to sleep, but to spend all night in meditation. In olden times this went on for at least a week or ten days to test this fellow out. Then, finally, the assistant to the rōshi comes and tells him that the rōshi maybe will have a talk with him

IV

ENTERING THE TEMPLE

So, you must remember the aspect of a rōshi to this young monk: he's a formidable fellow; usually an older man who has about him something that is difficult to put your finger on. There's a certain fierceness coupled with a kind of tremendous directness, a sense of somebody who sees right through you. And so he really poses to this young fellow, What do you want? Why did you come here?

But he said, I came to be instructed in Zen.

And the teacher says, Well, we don't teach anything here. There isn't anything in Zen to study.

Well, the student knows—or thinks he knows—that this 'not anything,' which is studied in Zen, is the real thing; that's—of course, as a Buddhist, he knows—that what isn't anything is the universe, the great void, the śūnyatā. And so he isn't phased by that.

He says, Well, nevertheless, you do have people who are working here and meditating under your instruction, and I'd like to join them.

Well, maybe. But strictly on probation.

And then, of course, all the details are taken and he pays a ridiculously small fee—in modern Japan, at any rate—to be able to stay in the monastery. It's very, very inexpensive.

Now the teacher comes back and says, Now, you want to study Zen. Why?

Well, because I'm oppressed by the rounds of birth and death—in other words, by the vicious circles of life in which I find myself—by suffering, by pain, and so on, and I want to be emancipated.

The teacher says, Who is it that wants to be emancipated?

That's a stopper.

There was a good old story about one of these preliminary interviews. The master asks, first of all, very casual questions. Where is your hometown? What's your name? What did your father do? And where did you go to college? Why is my hand so much like the Buddha's hand? And suddenly, you know, in mid-stream of an ordinary conversation—clunk!—the student is blocked. And so there is devised the kōan—in Chinese: gōng'àn—and this means, literally, the word 'kōan' means a 'case,' in exactly the same sense as we talk about a case in law which functions as a precedent for future cases. 'Kōan' should be translated 'case.' The kōans are based on stories, mondō, of the conversations between the old masters and their students.

But you can make a kōan immediately by such a question, Why is my hand so much like the Buddha's hand? Or, Who are you that asked this question? If the student tries to verbalize on that and say, Well, I am so-and-so, he asks, Who knows that you are so-and-so? How do you know that you know? Who knows that you know? Find out! In other words, the basic kōan is always Who are you? Who is it that wants to escape from birth and

death? And I won't take words for an answer. I want to see you! And all you're showing me at the moment is your mask.

So, then the student is sent back to the monk's quarters, the sōdō, and the chief of the sōdō is—called the jikijitsu—is then put in charge of him, and he teaches him how to behave, what the rules are, how to eat, and how to meditate. In the Zen sect they sit on [a] padded cushion about the thickness of the San Francisco telephone directory—which is an admirable substitute. And then, with crossed legs in the lotus posture—with the feet resting on the thighs, like you always see a Buddha—they sit for half-hour periods. That's supposed to be the length of time it takes for a stick of incense to burn.

And then, when wooden clappers are knocked together, they all get up and they walk round and round the room—quite fast, kind of a slam, slam, slam, slam, slam, slam, slam, slam, slam pace—and this keeps you awake. Then, at a given signal, they go back and meditate again.

And, constantly, there is a monk, one on each side, carries a long, flat stick shaped almost like this fan—in the sense that it's thin at one end and rounded at the other—and if this guy sees a monk who's slouching, or sleeping, or goofing off in some way he very respectfully bows before him. And the monk rests his head on his knees, and this fellow takes the stick and hits him vigorously on the shoulders, here, like this. Now, most apologists for Zen say this is not punishment, it's simply to keep you awake. Don't you believe it. I've investigated this, and it's the same as the British boys' school—only it doesn't have the erotic qualities that the British floggings do. Zen people are cool about it. But it is a kind of a fierce thing.

Anyway, the point of the meditation, the zazen, is that—perhaps at the beginning—one does nothing more than count your breathing—so many breaths in, counting in tens—just to allow your thoughts to become still. Zen people do not close their eyes when they meditate, nor do they close their ears. They keep their eyes on the floor in front of them, and they don't try to force away any sounds that are going on, or any smell, or any sensation whatever. Only, they don't think about it. And this can become an extraordinarily pleasant occupation. All the little sounds of distant traffic, of

birds, of somebody carpentering somewhere and the hammer going, dog barking, or—especially—rain on the roof; gorgeous. They don't block that out.

But as time goes on, instead of counting breathing they devote themselves to the kōan problem which the rōshi has assigned. What is the sound of one hand? Who were you before your father and mother conceived you? When Jōshū was asked, Does a dog have Buddha nature? he replied, No. What is the meaning of 'no,' or mu? All sorts of these problems.

V

ANSWERING THE KŌAN

And so, as time goes on, everyday the student goes to the teacher for what is called sanzen. 'Sanzen' means 'studying Zen.' And he has to present a satisfactory answer to the kōan. Now, sanzen is the moment in the monastery when no holds are barred, although there's a very formal approach to it. The monk has to stop outside the master's quarters and make this mokugyo. He does that three times. And at a signal from the master, which is ringing a bell in reply, he goes in and sits down in front of the master, and bows right down to the floor, and then sits up, and he repeats the kōan that he's been given. And he's supposed to answer it.

Now, the master, if he's not satisfied with the answer, may simply ring his bell, which means: interview over, nothing doing. Or, if he's still not satisfied, he may try to do something to hint the student as to which way to go, or puzzle him further; some sort of comment. But what happens is this—do you see what kind of a situation has been set up here?—the student is really being asked to be absolutely genuine. If I said to you, Now, don't be self-conscious. I want you to be perfectly sincere. And, as a matter of fact, I'm a mindreader, and I know whether you're being sincere or not. I can see right down to that last little wiggly guzzle in the back of your mind. And if you think I can, you see, I'm putting you in a double bind. I'm commanding you to be genuine. How can you possibly do that on command? Especially when the person you're confronted with is a father figure, an authority figure. And in Japan, the sensei—the teacher—is even a more authoritative

figure than one's father, which is saying a lot. But you are being asked, in the presence of this tiger, to be completely spontaneous.

Or—it isn't put in that way, you see, though. I mean, I'm describing this from the standpoint of a psychologist observing what's going on here. No, the thing you've got to do is you've got to hear the sound of one hand. And as your answers become more and more rejected, you get more and more desperate. And there is built up the state that is called the 'great doubt.' The students do everything, you know? They read all the old Zen stories, and they come in with pieces of rock and wood, and they try and hit the teacher, they do everything—and nothing, nothing will do.

I remember I had a friend studying in Kyōto, and on the way to the master's quarters you pass through a lovely garden with a pool. And he saw a bullfrog in the garden. And he grabbed this bullfrog—they're very tame in Japan—put it in his sleeve in his kimono, and when he got in to give an answer to his kōan he produced the bullfrog. And the master shook his head and said, Nu-uh. Too intellectual. Of course, he meant not so much what we mean by 'intellectual,' but 'too contrived,' 'too pre-meditated.' You know, you're just copying other people's Zen antics, and that's something you just can't get away with.

Well, there does come a critical point of total desperation. And when the student reaches that point the teacher really starts encouraging him. He says, Now, come on. You're getting warm. But you must be ready to die for this. You must—students have even been put into the position that if they don't get it in so many days, they're going to commit suicide. And they have to stimulate this intense period—a thing called sesshin. Don't confuse the word 'sesshin' with the English 'session.' 'Sesshin' means 'studying' or 'observation of the shin'—the heart, the mind. The heart-mind.

And this time they only sleep four hours a night. And they meditate solidly all through the day. They go for the sanzen interview twice a day—every one of them—and it's a tremendous workout, and will last about five days. Five or six days. And in that period the pressure is really on. Everybody is worked into a pitch of, kind of, psychic fury; they have to get this thing answered.

There's a man in Japan today who has a five-day Zen system, and he practically guarantees that you have satori in his five days. I just got a book about it, written by a British—I haven't had a chance to read it yet.

Well, I had a—someone I knew of—who was over, studying Zen on a Fulbright grant, and the grant was winding up and he still hadn't got the sound of one hand. He said to the master, Look, my grant's running out and I can't stay here, and I've just got to get this thing. So, just a day before he left, he suddenly realized that there was nothing to realize. And that was it. You know, here he had spent his whole life thinking that there's something deficient in me. See? There's something wrong. Something I ought to find out to get this problem of life cleaned up.

Well, you know what you do. Rinzai, the old Chinese master, said, Zen teaching is like using an empty fist to deceive a child. Or like trying to stop a child crying by giving it a yellow leaf. See, the child wants gold, and so you give it an autumn leaf and say, Here, darling. There's some gold. Be alright. Or, with your closed fist you say, What have I got here? The child comes and tries to see and pull your fingers open. Then you hide it behind your back, and under your leg, and behind the chair; child gets absolutely fascinated. The longer you keep this up, the more the child is sure there is some real goodie inside the hand, and then at the end—psh—nothing. And that's Zen.

VI

SEEING PAST THE ILLUSION

So there comes a time, you see, when the student can go in front of the master and not give a damn. Because he sees—he's seen the point. There wasn't a problem. He made up the problem himself. He came and projected it on this master, who knew how to handle that kind of person by making him much more stupid than he was before—until he sees the essential stupidity of the human situation where we are playing a game of one-upmanship on other people and on the universe.

How to get the better of life? Well, what makes you think you're separate from life so that you can get the better of it? How can you beat the game?

What game? Or, who will beat it? This illusion of beating the game, of finding the thing out, of catching it by the tail, is therefore dissipated by the technique of the kōan. It's called—working on a kōan is like a mosquito biting an iron bull. It's the nature of the mosquito to bite. It's the nature of an iron bull to be unbiten. Or they say it's like swallowing a ball of molten lead. You can't swallow it down, you can't cough it up; you can't get rid of this thing. That's the great doubt, you see? But this is an exaggerated form of what everybody is ordinarily trying to do: to beat the game.

So, at that moment the student has heard the sound of one hand, or discovered who he was before father and mother conceived him, or what 'no' means. So the teacher says, Good. Now you have found the frontier gate to Zen. You've put your foot in at the door and you're across the threshold. But there's a long way to go! And now you have found this priceless thing out, you must redouble your efforts. So he gives him another kōan.

Now, the student may be able to answer that one instantly, because it's simply a test kōan. See, there are five classes of kōans. The first class is what you call the hīnayāna kōans, and the other four are the mahāyāna kōans. Hīnayāna is to reach Nirvāṇa. Mahāyāna is to come back and bring Nirvāṇa into the world as a bodhisattva.

So once you get the Great Void, you see there's nothing to catch on to—you are the universe, it doesn't matter whether you live or die—that's Nirvāṇa. All clinging to life—everything like that—you see, then, that it's hopeless and you give it up. Not because you think you ought to give it up; because you know there is no way of catching it. There's nothing to catch hold of. There's no safety in the cosmos. So you just have to give up.

Then, the next class of kōans are such things as asking for miracles. In that class comes, Take the four divisions of Tokyo out of your sleeve. Or, Stop the booming of a distant bell. Blow out a candle in Timbuktu. But as they go on in various ways they are concerned with all kinds of problems, and how Zen understanding deals with those problems. Until we get, in the end, to the study of morality and rules of social and monastic life. That's the last thing, and the Zen way of understanding it.

Now, this may—this takes very, very differing periods of time. Some people get through in as little as ten years; the whole thing. There is a very brilliant Westerner by the name of Walter Nowick, who has just about completed the whole thing. And he's a musician and pianist, and he'll come back to this country as the first accredited Zen master of the West. And he'll set up his little sōdō on a farm, and wait and see what happens.

The day of graduation comes, and then everybody turns out, and there's a great hullabaloo, and they salute the departing monk, and he goes out. He may just become a layman, as I said, or become a temple priest, or he may be, himself, a rōshi.

VII

THE DECLINE OF MODERN TEMPLES

Well, now, the essential of this whole system, as you see, is to use a hair of the dog that bit you for the cure of the bite. It's homeopathic. When people are under delusion they cannot be talked out of the delusion. No amount of talk could persuade anybody that his ego is an illusion, because he knows it's there. He knows I am I, and simply won't believe you if you tell him that this is nothing but posthypnotic suggestion.

So the only way to convince a fool of his folly is to make him persist in it. As Blake says, The fool who persists in his folly will become wise. Why, some psychiatrists I know—I know when they get a person who over-eats and is tremendously fat, the first thing they do is they make them put on fifteen more pounds. And get an alcoholic terribly drunk, oh, and sick, and just as awful as can be, you see? Really make him go at it, see? That's a method that's used. Sometimes works, sometimes doesn't; it's a rather desperate method, rather dangerous method. Zen is dangerous, too. People could easily go crazy under this sort of strain without a good advisor.

Well, it is clear, of course, that this method of Zen training is most unsuited to the modern age. And this is witnessed, too, by the fact that the temples are relatively empty. Myōshin-ji, the biggest one in Kyōto, is built to house 600 monks. There are only 80. And you might think that was quite a crowd, but it isn't—compared with the old days.

To young people in Japan today this is all incomprehensible. They see no point in it. A few—a few, yes, but they are mostly clergy's sons carrying out the family tradition, and that's very bad indeed. To be sent to a monastery, virtually. The only possible success can come for someone who goes because he feels that nothing else in the world will satisfy him. He just has to do it.

And so the traditions, as in all these ancient organizations, have become very fixed. A lot of it is meaningless. It is certainly not going to last; not in that form. It's falling apart right under our eyes. It's old and it's set in its ways.

Also, since the time of Hakuin, the kōans have been given fixed answers. That is to say, there is a sort of prescribed way in which to answer, and you've got to hit on the right one. And then, after you've answered it, you have to find a poem from a little book called the Zenrin-kushū, which means 'the Zen Forest Anthology.' And there are little couplets, and you've got to find one which represents the meaning of your kōan. I mean, you know, Take the four divisions of Tokyo out of your sleeve, nothing could be simpler. But some monk has recently threatened to publish all the answers to the kōans, so that the masters would have to get on their toes and invent new ones.

I know a rōshi who invents new ones, and the moment they open their mouths he stops them, No! No, no, nope! Too late! You know, he says—you could ask Christians, What's the first word in the Bible? And things like that. It becomes much more lively, you see, when there is this quick interchange of the teacher and the students. But—in modern idiom—who the devil wants to know about Joshu's mu anymore, or some ancient fellow's questions? Couched in language, incidentally—this is part of the problems they have—the language of these kōans is very archaic. I mean, What is the sound of one hand? Well, there's a Chinese proverb which says, One hand won't make a clap. So if you don't know that proverb—if that's a proverb that's in everyday use and I say to you, What is the sound of one hand? then it has some sense.

But there are all kinds of, shall I say, references—allusions—in the old stories, and they therefore don't necessarily fit our world, or the Japanese

world of date. You have to take the kōans out of everyday life; things that are going on now, you see? It's like asking—what's that man who advertises Schweppes, commander... Whitehead—Why has commander Whitehead no beard?

VIII

THE TRUTH OF BIRTHLESS MIND

There was, though—you see—there was a division in the history of Zen. There was a critical point in the 17th century when there were two very great masters: Hakuin and Bankei. Now, the 17th century is tremendously important in Japanese history because that was a time of what you might call the democratization of culture. Bashō invented haiku poetry so that everyone could be a poet. Not necessarily for publication, but for one's own fun. People didn't write poems for publication, necessarily—they wrote poems for parties. And he invented the 17-syllable haiku as a result of his Zen feeling for nature so that he could put this within the reach of everybody.

What had happened to poetry before that time was that it had become so obscure, and so effete, and so sophisticated that only great literati could do it at all. This happened to Chinese poetry; there were so many references to other poems it was like reading T. S. Eliot. You know, the Four Quartets. You could get an annotated Four Quartets showing you the sources of all the phrases he's borrowed, and sometimes you have to know the source in order to see what he means by it.

All shall be well, and

All manner of thing shall be well.

Alright, that's straight from the Revelations of Divine Love by the dame Julian of Norwich, but whoever would know that? You have to understand the scene she was digging in order to know, really, what Eliot's getting at in that All shall be well. And he's full of that. He quotes the Bhagavad Gita, he quotes everybody. So, if we all had to write that way, nobody could be a poet unless he was a great scholar.

So Bashō popularized the haiku, and the haiku are originally based on the Zenrin poems. They take their flavor from that. There is one, you see: Those bird calls, mountain changes to be more mysterious. The first line of that says, The wind drops, but the flowers keep on falling. The bird calls, and the mountain becomes more mysterious. And so haiku developed from that kind of short insight, that glimpse of nature.

Now, while Bashō was taking poetry to the peasants, Bankei was taking Zen to them as well—to the farmers. And he ran his Zen on an entirely different system. He talked, mainly, about what he called fushō. Fushō is the unborn; that which has not yet arisen and which, as a matter of fact, never does arise. And so he said there is in you the unborn mind which was given to you by your parents. Let me just read you a few quotations from him to show you what sort of a person he was :

[from Zen: Poems, Prayers, Sermons, Anecdotes, Interviews]

The mind, begotten by and given to each of us by our parents, is none other than the Buddha-mind. Birthless and immaculate, sufficient to manage all that life throws upon us. A proof: suppose at this very instant, while you face me listening, a crow caws and a sparrow twitters somewhere behind you. Without any intention on your part to distinguish between these sounds, you hear each distinctly. In doing so you are hearing with the birthless mind, which is yours for all eternity.

Well, we are to be in this mind from now on, and our sect will be known as the Buddha-mind sect. To consider my example of a moment ago, once again, if any of you feel you heard the crow and the sparrow intentionally, you are deluding yourselves, for you are listening to me, not to what goes on behind you. In spite of this there are moments when you hear such sounds distinctly, when you hear with the Buddha-mind of non-birth. Nobody here can deny this. All of you are living Buddhas, because the birthless mind which each possesses is the beginning and the basis of all.

Now, if the Buddha-mind is birthless, it is necessarily immortal, for how can what has never been born perish? You've all encountered the phrase "birthless and imperishable" in the sūtras—not born, not dying—but hitherto you've not had the slightest proof of its truth. Indeed I suppose like

most people you've memorized this phrase while being ignorant of the fact of birthlessness.

When I was twenty-five I realized that non-birth is all-sufficient to life, and since then, for forty years, I've been proving it to people just like you. I was the first to preach this greatest truth of life. I ask, have any of you priests heard anybody else teach this truth before me? Of course not.

—Verse 3

A priest said to him, Once in the Buddha-mind, I am absent-minded.

Bankei says, Well, suppose you are absent-minded as you say. If someone pricked you in the back with a gimlet, would you feel the pain?

Naturally!

Then you are not absent-minded. Feeling the pain, your mind would show itself to be alert.

—Verse 7

A layman says, Though I undertake Zen discipline, I often find myself lazy, weary of the whole thing, unable to advance.

And he replies, Once in the Buddha-mind there's no need to advance, nor is it possible to recede. Once in birthlessness, to attempt to advance is to have receded from the state of non-birth. A man secure in that state need not bother himself with such things: he's above them.

—Verse 9

The Buddha-mind in each of you is immaculate. All you've done is reflected in it, but if you bother about one such reflection, you're certain to go astray. Your thoughts don't lie deep enough—they rise from the shallows of your mind.

Remember that all you see and hear is reflected in the Buddha-mind and influenced by what was previously seen and heard. Needless to say,

thoughts aren't entities. So if you permit them to rise, reflect themselves, or cease altogether as they're prone to do, and if you don't worry about them, you'll never go astray. In this way let one hundred, nay, one thousand thoughts arise, and it's as if not one has arisen. You will remain undisturbed.

—Verse 13

The only thing I tell my people is to stay in the Buddha-mind. There are no regulations, no formal discipline. Nevertheless they have agreed among themselves to sit in Zen for a period of two incense sticks daily. All right, let them. But they should well understand that the birthless Buddha-mind has absolutely nothing to do with sitting with an incense stick burning in front of you. If one keeps in the Buddha-mind without straying, there's no further satori to seek. Whether awake or asleep, one is a living Buddha. Zazen means only one thing—sitting tranquilly in the Buddha-mind. But really, you know, one's everyday life, in its entirety, should be thought of as a kind of sitting in Zen.

Even during one's formal sitting, one may leave one's seat to attend to something. In my temple, at least, such things are allowed. Indeed it's sometimes advisable to walk in Zen for one incense stick's burning, and sit in Zen for the other. A natural thing, after all. One can't sleep all day, so one rises. One can't talk all day, so one sits in Zen. There are no binding rules here.

—Verse 16

And so that's what happened, you see? Bankei was the abbot of Myōshin-ji—the rōshi—and he stopped the monks from using the kaiseki stick to hit them when they weren't meditating or sleeping in meditation, because he said, Even a sleeping man is still a Buddha, and you shouldn't be disrespectful. And he attempted a Zen of no methods. You can meditate if you want to, that's fine. But that's like polishing a brick to make a mirror. And he used to say, too, that trying to purify your mind is like trying to wash off blood with blood.

But Bankei's Zen was elusive. Hakuin had 80 successors, Bankei had none. And some people think that that was the most admirable thing about him. In this morning's talk I was going into some of the fundamental features of Zen, and today I want to concentrate on that aspect of Zen practice which is called in Chinese yìzhí zǒu, or 'going straight ahead.'

A master who was once asked, What is the Tao—the Way? replied, Walk on. Actually, Go! As we say, Go, man! Go! Go, go. And it is this aspect of Zen which is what is truly understood by 'detachment,' or having a mind that isn't 'sticky' and that isn't stopped at any point in its whole working. To be stopped at a certain point is what is called 'having a doubt,' as when one fumbles, or wobbles, or hesitates about something—trying to find the right solution for the circumstances by thinking it out in a situation where there really is no time to think it out. So that when a Zen teacher asks his disciple a question, he expects an immediate answer, as it were, without thought or premeditation.

They speak in Zen—they use a phrase to have a mind of no deliberation. And they also speak of a kind of person, a man who doesn't depend on anything—that is to say, on a formula, on a theory, on a belief—to govern his action. And this person who doesn't stick anywhere is like Dante's image at the end of the *Paradiso*, where he says—in the presence of the vision of God—But my volition now and my desires were moved as a wheel revolving evenly by love that moves the sun and other stars. And the image of the wheel which is not too tight on its axle, and not too loose—that is really with the axle—is the Zen principle of 'not being attached;' 'not being sticky.'

It's very difficult for us to function in that way because we've been brought up to believe that there are two sides to ourselves. One, the animal side, and the other, the human and civilized side. And these are expressed in what Freud calls the Pleasure Principle, which he classifies with the animal side—with the Id—and the other the Reality Principle, which he puts on the side of society and the super-ego. And man is so split, that he is in a constant fight between these two. Theosophists sometimes speak of our having two selves: the higher self, which is spiritual, and the lower self, which is merely psychic; the Ego. And therefore, the problem of life is to

make the 'oneself,' the 'higher one,' take charge of the lower, as a rider takes charge of a horse.

But the problem that constantly arises is: how do you know that what you think is your higher self isn't really your lower self in disguise? When a thief is robbing a house and the police enter on the ground floor, the thief goes up to the second floor, and when the police follow up the stairs he goes higher and higher until, at last, he gets out to the rooftop. And in the same way, when one really feels oneself to be the lower self, that is to say, to be a separate Ego, and then the moralists come along—they are, of course, the police—and say, You ought not to be selfish! then the Ego disassembles and tries to pretend that he's a good person after all.

And therefore, one of the ways of doing this is for the Ego to say, I believe I have a higher self.

And I would say, Why do you believe that? Do you know the higher self?

No. If I knew it I would behave differently. But I'm trying to get there.

Well, why are you trying to get there?

Well, then the police wouldn't come around. Then the moralists wouldn't preach at me. Then I could feel that I was doing my duty, behaving as a proper member of society.

But all this is a great phony front. If you don't know that there is a higher self and you believe that there is one, on whose authority do you believe this? You say, Oh, such and such a teacher—Buddha, Jesus, Śaṅkara, the Upanishads—said that we have a higher self, and I believe it. Catholics sometimes say they believe their religion because they're told to, and they have to be obedient. The catechism starts out—I mean the Baltimore catechism—it starts out, We are bound to believe that there is but one God, the Father Almighty, creator of Heaven and Earth, et cetera. And they make jokes about Protestants and say, They don't have real authority in Protestant church because everybody interprets the Bible according to his own opinion. But we have an authoritative interpretation of the Bible. But this

always screens out the fact that it is fundamentally a matter of your own opinion, that you accept the authority of the Church to interpret the Bible.

You cannot escape, in all matters of belief, from opinion. In other words, it must become clear to you that you, yourself, create all the authorities you accept. And if you create them in order to dissimilate, in order to pretend that your motivations and your character are different, that you would like them to be different—this is the same old principle of the separate self trying to improve itself so that it will live longer, or survive in the spiritual world, or attain the riches and the progress of enlightenment. And the whole thing is phony.

So, in Zen, a duality between higher self and lower self is not made. Because if you believe in the higher self, this is a simple trick of the lower self. If you believe that there is no really lower self—that there is only the higher self, but that somehow or other the higher self has to shine through—the very fact that you think that it has to try to shine through still gives validity to the existence of a lower self. If you think you have a lower self—or an ego—to get rid of, and then you fight against it, nothing strengthens the delusion that it exists more than that.

So this tremendous schizophrenia in human beings—of thinking that they are rider and horse, soul in command of body, or will in command of passions, wrestling with them—all that kind of split thinking simply aggravates the problem, and we get more and more split. And so we have all sorts of people engaged in an interior conflict, which they will never, never resolve. Because the true self—either you know it or you don't. If you do know it, then you know it's the only one; and the other, so-called lower self, just ceases to be a problem. It becomes something like a mirage. And you don't go around hitting at mirages with a stick, or trying to put reigns on them. You just know that they are mirages and walk straight through them.

But if you were brought up to believe yourself split—I remember my mother used to say to me, when I did naughty things, she said Alan, that's not like you. So I had, you know, some conception of what was like me in my better moments—that is to say, in the moments when I remembered what my mother would like me to do. And so that split is implanted in us

all. And because of our being split-minded we are always dithering. Is the choice that I'm about to make of the higher self or of the lower self? Is it of the spirit, or is it of the flesh? Is the word that I received of the Lord, or is it of the Devil? And nobody can decide. Because if you knew how to choose, you wouldn't have to.

In the so-called Moral Re-Armament movement—which is a very significant title—you test your messages that you get from God in your quiet time by comparing them with standards of absolute honesty, absolute purity, absolute love, and so on. But, of course, if you knew what those things were, you wouldn't have to test. You would know immediately. And do you know what those things are? The more one thinks about the question, What would absolute love be?—supposing I could set myself the ideal of being absolutely loving to everybody, what would that imply in terms of conduct? Well, you can think about that until all is blue, because you could never get to the answer.

The problems of life are so subtle that to try to solve them with vague principles, as if those vague principles were specific instructions, is completely impossible. So it is important to overcome split-mindedness. But what is the way? Where can you start from if you're already split? A Taoist saying is that when the wrong man uses the right means, the right means work in the wrong way. So what are you to do? How can you get off it and get moving? Fundamentally, of course, you have to be surprised into it.

Winthrop Sargeant not so long ago interviewed a great Zen priest in Kyōto, who posed to him, Who are you?

And he said, Well, I'm Winthrop Sargeant.

And the priest laughed. No, he said, I don't mean that. I mean who are you really?

Well, then he went into all sorts of abstractions about his being a particular human being, and so on, who is a journalist, and so on, and the priest just laughed and said, No.

Then the priest just tossed off the conversation, and a little later made a joke, and Sargeant laughed. And he said, There you are!

There was an army officer who once came to a Zen master and said, I have heard a story about a man who kept a goose in a bottle, and it was growing very rapidly, and he didn't want to break the bottle and he didn't want to hurt the goose. So how would he get it out? The Zen master didn't answer the question at all, but simply changed the subject. Finally, the officer got up to leave and he went over to the door, and suddenly the Zen master called out, Oh, officer? And he turned around and said, Yes? The master said, There! It's out!

So, in the same way, if I say to you, Good morning, you say, Good morning. Nice day isn't it? Yes. Or if I hit you—you know, boom!—you say, Ouch! And you don't stop to hesitate to give these answers or responses. You don't think about it when I say Good morning, unless you're a psychiatrist. What could I be meaning? So you respond. So, in exactly the same way, that kind of response, which doesn't have to be a deliberate response, a response of a no-deliberating mind, is a response of a Buddha-Mind or an Unattached-Mind. But you must not imagine that this is necessarily a quick response. Because if you get hung up on the idea of responding quickly, the idea of quickness will be, itself, a form of obstruction.

Very often, when Dr. Suzuki is asked a question—very complicated question by some philosophy major from Columbia, when he's giving lectures there—he's silent for a full minute, and then says, Yes. And this is exactly as spontaneous a response as it would be if he had answered immediately. Because during the period of silence, he's not fishing around to think of something to say. He is not at all embarrassed of being silent, or at not knowing the answer. So if you don't know the answer, you can be silent. If nobody asks a question, you can be silent. There's no need to be embarrassed about it or to be stuck on it. But you cannot overcome being stuck if you think that, somehow, you would be guilty if you were stuck.

When you are perfectly free to feel stuck or not stuck, then you're unstuck. Because actually, nothing can stick on the real mind, and you will find this out if you watch the flow of your thoughts. There is an expression in Chinese which means 'the flow of thoughts,' or what we call in literary

criticism ‘stream of consciousness.’ And they put the character for thought (念) three times: niàn, niàn, niàn. And so you will notice that thought follows thought follows thought when you are just ruminating.

And those thoughts arise and go like waves on the water; all the time, they come and go. And when they go, they are as if they had never been here. So, actually, this shows your mind doesn’t stick. Really. You can get the illusion of it sticking by, for example, cycling the same succession of thoughts over and over again. And that gives a sense of permanence in the same way as when you revolve a cigarette butt in the dark, you get the illusion of there being a solid circle although there is only the single point of fire. And it is from this connecting of thoughts that we get the sensation that behind our thoughts there is a thinker who controls them and experiences them. Although, the notion that there is a thinker is just one member in the stream of thoughts.

For example, if you get a certain kind of rhythm that goes ‘diggy diggy diggy diggy boop diggy diggy diggy diggy boop diggy diggy diggy diggy boop diggy diggy diggy diggy boop,’ the ‘boop’ is part of the rhythm. But it can be used as a cue. So you get—in relation to ‘diggy diggy diggy diggy boop’—you get ‘thought thought thought thought thought thinker thought thought thought thought thinker.’ And if this happens regularly enough and long enough, you get the illusion of there being someone who thinks apart from the stream of thoughts that come and go; the stream of experiences. And we use such absurd phrases not only as ‘thinking our thoughts,’ but ‘feeling our feelings,’ ‘seeing sights,’ and ‘hearing sounds.’ But you must understand: it is perfectly obvious that seeing a sight is seeing; hearing a sound is hearing; feeling a feeling is feeling. So, in the same way, thinking a thought is thinking.

But you get split-minded, you see, and so you get ‘I’ and ‘me,’ and the ‘I’ who ought to—or must—control ‘me’ as a sensation of some real entity that stands aside from thoughts and chooses among them, controls them, regulates them, and so on.

Actually, this is a way to have one’s thoughts not controlled. The more there is this duality of the separate ‘thinker’ standing aside from the thoughts—

the separate ‘feeler’ watching or feeling the feelings—the more the stream of feelings is coaxed into self-protective activity; into getting more and more like a stuck record, the purposes of which are to protect and to aggrandize and enlarge the status of the supposed ‘thinker.’

When Jōshū, who was a Tang dynasty Zen master, was asked—he had made some reference to the enlightened mind being like the mind of a child—and they said, Well, what is the mind of a child?

And he said, A ball in a mountain stream.

Why?

Thought follows thought instantaneously without interruption.

So the saying: Walk or sit as you will. But whatever you do, don’t wobble.

Now, we can see this very clearly from confusions we can get into in activity. I have just said, We can see this very clearly from confusions we get into in activity. What kind of a statement is that? When I raised the question—what kind of a statement was it that I just made—I’m beginning to talk about talking. And one can do that, provided you don’t try to do it while you are making the original statement.

If I want to say something about what I’ve just said, then I must do it later, mustn’t I? But not at the same time. I cannot say You are a fool, and at the same time say I’m giving you an insult in so many words. I cannot say—or, in mathematics—I cannot write down a certain equation, and as I’m writing in down, simultaneously, state what kind of an equation this is. Unless, of course, I invent an exceedingly complex language which talks about itself as it goes along. But in the ordinary way, people get completely mixed up by that. In the middle of being about to say to somebody anything, you start to think about whether this is the right thing to say. And you start wobbling. You get, in other words, too much feedback. And too much feedback makes any mechanism go crazy.

So, in the same way, when you are very, very aware of the difference between the deeds and the doer, and the doer—while doing the deeds—is

always sort of commenting on them; the doer really never gets with it! In other words, you are about to strike a nail and you wonder—as you are about to hit it—Is this the right place to put it? And so you've probably hit your thumbnail instead of the nail, because you don't go right through with hitting that nail. This is not saying—let me mark this again—it is not saying that there should be no criticism of thought. But if you criticize thought while thinking, as if there were a critic thinker standing aside from the stream of thought, then you get all balled up. And that is exactly what happens in the process of attachment, or what are called in Buddhist *kleśa*, which mean 'disturbing confusions of the mind.'

And, you see, this kind of confusion is something to which the human organism is peculiarly liable, because the human organism has language, has—you see, thinking is silent language, and I mean 'language' in the most inclusive sense of the word: not only words, but also images and numbers; notation. Just because, then, we can talk about anything. We can talk about talking, we can talk about thinking, we can talk about ourselves, as if we could stand aside and say, 'Said I to myself' said I. All we are actually doing is making a second thought, or thought stream, which comments on the one that went before, and then pretending that the second stream is a different stream than the first. That's because there are built into our minds all kinds of phony images about memory.

We think, for example, of memory by analogy with engraving. In order to remember something we write it down. And so we have a flat and stable piece of paper, and we make marks on it with a pencil, and they stay there. So we begin to think, Isn't mental memory something of the same kind? Is there something stable, upon which the passage of thoughts makes an impression? We say, He impressed me very much; this was a lasting impression on my mind, as if we were tablets. Indeed, the philosopher Locke used the expression *tabula rasa*, or 'clean slate,' to describe the mind of a child. This is a mind which has not yet collected any memories, as if there were some sort of surface which accumulated these things and preserved them, and that's me.

But, you see, this superstition is related to a much more ancient superstition that the world consists of two elements, one of which is 'stuff,' and the

other of which is 'form.' This is a myth based on a model of the world which is fundamentally ceramic. God formed Adam out of the dust of the ground. And so there is a 'stuff,' and so there are 'forms' engraved in it, or imposed on it, or stamped on it like a seal is stamped on wax.

What is stuff like apart from form? What is form like apart from stuff? All those problems—which have bothered people for centuries—are based on asking the question in the wrong way; on having used the wrong image for the process. Actually, since nobody ever saw a piece of shapeless stuff, and nobody ever saw a piece of stuff-less shape, the whole thing really is saying that they are the same. And there isn't any necessity even to think of a difference between them. Even the contrasting words, 'form' and 'substance,' or 'form' and 'matter,' are a nuisance.

There is process. There is the flow of thought. The flow of thought doesn't have to happen to anyone. Experience does not have to beat upon an experiencer. There is, all the time, simply the one stream going on, and we are convinced that we stand aside from it and observe it, because we've been brought up that way. But, you know, in your stream of thought and experience, I am an object, and a very fleeting and passing one. And also, in my stream of experience you, also, are people who come and go. We are all, you see, living in the same world. We think there is me, and there is an external world around me, but I am in your external world and you are in my external world, and if you think about that you see that we are all in one world going along together. There isn't really the 'internal' and the 'external,' there is simply the process.

It's very important to get rid of that illusion of duality between the thinker and the thought, so find out: who is the thinker behind the thoughts? Who is the real, genuine you? And so, one of the methods that is used is shouting. The Zen master would say to a student, Now, I want to hear you. I want to hear you say the word 'moo,' and really mean it! Because I want to hear not just the sound, but the person who says it. Now, produce—for me—that.

He goes, Moo!

And the Zen teacher says, No, no! Not yet.

Moo!!

And he says, It's only coming from your throat. I want to hear your belly, you know?

And always, you see, it'll never come while the person is trying to make a differentiation between a 'true' moo and a 'false' moo. To act with confidence, you just do it. But since people are not used to that, it is necessary to set up protected situations in which it can be done.

If we just—in the ordinary way of social intercourse—acted without deliberation, we would get into amazing confusions, as when people say, Always speak the truth. Never tell a white lie. And they say exactly what is true and what they think about other people. Well, they can raise a great deal of trouble. But the experience of Zen has been that there should be a kind of enclosure in which this kind of behavior can be done until the people are expert in it and know how to apply it in all situations.

And you will find, in everyday life, that there is a very clear distinction between people who always seem to be self-possessed, and people who are dithering and nervous and don't quite know how to react in any given situation; always getting embarrassed because they have their life too strongly programmed. You said—I mean, this is a common marriage argument—You said you would do such-and-such a thing at such-and-such a time! And now you've changed your plans! Not that the change of plans really caused any inconvenience, but just the feeling that when you say you will do something at a certain time, you ought to do it at that time come hell or high water! Well, that's being very unadaptable. That's being a stone—kind of sticky—thing. If it, after all, doesn't matter when we do it and somebody is offended because the time has been changed, that's simply because they are attached to punctuality as a fetish.

And this is one of the great problems. This causes many automobile accidents. Men rushing home to be on time for dinner, when they stayed late either working, or they had to stop for a drink at some bar, or when a girl feels that she has a fussy husband and she feels she has to have the dinner ready at exactly a certain moment, she ruins the cooking. He'd rather have a faithful wife and a bad cook. I hope I'm not treading on any toes.

So, you see, we spend an awful lot of energy trying to make our lives fit images of what life is or should be which they could never possibly fit. So Zen practice is in getting rid of these images. But it's so explosive, socially, to do that, and it so worries people they get vertigo, they get dizzy, they don't know which end is up. And this happens, you know, if you've ever been in one of those Blab-Lab sessions, where they call them 'tea groups'—I think, or something like that—where people gather together without any clear idea of what this gathering is about. They know it's somehow self-exploration, but just how do you begin on that? And so, somebody starts to push his idea, and then somebody else says, Well, why are you trying to push your idea on us? And then they all get into an argument about the argument, and the most amazing confusions come about—but sometimes they all see what idiots they're being, and then they learn to live together in a really open and spontaneous way.

The function of a Zen teacher is to put his students in all kinds of situations where, in the normal course of social relations, they would get stuck. By asking nonsensical questions, by making absurd remarks, by always unhinging things, and above all, keeping them stirred up with impossible demands: to hear the sound of one hand, to—without moving—stop a ship sailing out to the water, or to stop the sound of a train whistle in the distance. Magic. To touch the ceiling without getting up from one's chair, to take the four divisions of Tokyo out of your sleeve, to take Mount Fuji out of a pillbox; all these impossible questions are asked, and in the ordinary way of interpreting these questions we think, Well, now—gee, how could we do that? See? That's a very difficult question that's been asked. And you have to think, What would I do to do that?

Because we are caught up in a certain way of discourse which the language-game that we play—and the social games, the production games, and the survival games that we play—are good games. But we take them so seriously that we think that that is the only important thing. And this is to unstick us from that notion and realize that it would be just as good a game to drop dead now as to go on living.

Is a lightning flash 'bad' because it lives for a second, as compared with the sun that goes on for billions of years? You can't make that sort of

comparison, because a world of lighting goes also with a world where there's a sun—and vice versa. So, long-lived creatures and short-lived go together; that's the meaning of that saying: Flowering branches grow naturally. Some short, some long.

So this, then, is a scene in a Zen community where spontaneous behavior is encouraged within certain limits. And as the student becomes more and more used to it, those limits are expanded. Until, eventually, he can be trusted to go out on the street and behave like a true Zen character, and get by perfectly well. You know what occasionally happens on the street when two people are walking down the sidewalk straight at each other, and they both decide to move to the right together and then to the left together, and they somehow get stuck and they can't pass each other. Zen teachers will pull just exactly that sort of stunt, when going down a path, and meet one of their students—to see if they can get him in a tangle, and can he escape from it?

And you will find, in everyday life, that there is a very clear distinction between people who always seem to be self-possessed, and people who are dithering and nervous and don't quite know how to react in any given situation; always getting embarrassed because they have their life too strongly programmed. You said—I mean, this is a common marriage argument—You said you would do such-and-such a thing at such-and-such a time! And now you've changed your plans! Not that the change of plans really caused any inconvenience, but just the feeling that when you say you will do something at a certain time, you ought to do it at that time come hell or high water! Well, that's being very unadaptable. That's being a stone—kind of sticky—thing. If it, after all, doesn't matter when we do it and somebody is offended because the time has been changed, that's simply because they are attached to punctuality as a fetish.

And this is one of the great problems. This causes many automobile accidents. Men rushing home to be on time for dinner, when they stayed late either working, or they had to stop for a drink at some bar, or when a girl feels that she has a fussy husband and she feels she has to have the dinner ready at exactly a certain moment, she ruins the cooking. He'd rather have a faithful wife and a bad cook. I hope I'm not treading on any toes.

So, you see, we spend an awful lot of energy trying to make our lives fit images of what life is or should be which they could never possibly fit. So Zen practice is in getting rid of these images. But it's so explosive, socially, to do that, and it so worries people they get vertigo, they get dizzy, they don't know which end is up. And this happens, you know, if you've ever been in one of those Blab-Lab sessions, where they call them 'tea groups'—I think, or something like that—where people gather together without any clear idea of what this gathering is about. They know it's somehow self-exploration, but just how do you begin on that? And so, somebody starts to push his idea, and then somebody else says, Well, why are you trying to push your idea on us? And then they all get into an argument about the argument, and the most amazing confusions come about—but sometimes they all see what idiots they're being, and then they learn to live together in a really open and spontaneous way.

There was a very interesting dinner party once where a Zen master was present, and there was a geisha girl who served so beautifully and had such style that he suspected she must have some Zen training. And after a while, when she pours to fill his sake cup, he bowed to her and said, I'd like to give you a present. And she said, I would be most honored. And he took the iron chopsticks that are used for the hibachi—the charcoal brazier; moving the charcoal around—he picked up a piece of red-hot charcoal and gave it to her. Well, she instantly—she had very long sleeves on her kimono—she whirled the sleeves around her hands and took the hot charcoal, withdrew to the kitchen, dumped it, and changed her kimono because it was burnt through. Then she came back into the room, and after a suitable interval she stopped before the Zen master and bowed to him and said, I would like to give you, sir, a present. And he said, I would be very much honored. Of course, he was wearing a kimono, or something like this. And so she picked up a piece of coal and offered it to him. He immediately produced a cigarette and said, Thank you, that's just what I needed.

Now, you know, in the same way that we have this in our culture: certain people who are comedians, who know how to make jokes and gags in a completely unprepared situation. Face them with anything and they somehow come through. So that is exactly the same thing in a special domain as Zen. Only, a master of Zen does this in every life situation. But

the important thing is to be able to do this—this is the secret—you must remember: you can't make a mistake.

Now, that's a very difficult thing to do, because from childhood up we have had to conform to a certain social game. And if you are going to conform to this game you can make mistakes or not make mistakes. And so this thing has gone into us all the time. You must do the right thing! There's certain conduct appropriate here. There's certain conduct appropriate there. And that sticks in us and gives us a double-self all our lives long, because we never grow up.

Do you realize that the whole of life plays a game, which is a childhood game? There are three kinds of people: top people, middle people, and bottom people. And there can't be any middle people unless there are bottom people and top people. And there can't be any top people unless there are middle and bottom people, and so it goes. And everybody is trying to be in a top set. Well, if they are going to be there there's gotta be people in the bottom set. And there are people who do the 'right' thing and people who do the 'wrong' thing. Here in Sausalito—we have this very, very plainly—there are the 'right' people, the nice people who live up on the hill. Then there are the 'nasty' people who live down here on the waterfront, and they grow beards and they wear blue jeans and they smoke marijuana. And whereas the other people on the top of the hill drive Cadillacs, and have wall-to-wall carpeting, and nicely mowed lawns, and their particular kind of poison is alcohol. Now, the people who live on the top of the hill know that they are nice people, but they wouldn't know they were nice people unless they had some nasty people to compare themselves with.

Every in-group requires an out-group. Whereas the nasty people think they are the real far-out people, whereas those people, those hillbillies, are squares. And they wouldn't be able to feel far-out unless there were squares. See? These things simply go together. But when that is not seen we play the games of 'getting on top of things' all the time, and so we are in a constant state of competition. As to—if it's not I'm stronger than you, it's I'm wiser than you, I'm more loving than you, I'm more tolerant than you, I'm more sophisticated than you. It doesn't matter what it is, but this constant competition is going on.

In terms of that competition we can, of course, lose place and—in that sense—make mistakes. But what a Zen student is, is a person who is not involved in the status game. That's the real meaning of a monk. He is not 'keeping up with the Jones,' and to be a master he must get to the point where he's not trying to be a master. The whole idea of your being better than anybody else simply doesn't make any sense at all; it is totally meaningless. Because, you see, everybody manifesting the marvel of the universe in the same way as the stars do, and the water, and the winds, and the animals. And you see them all as being in their right places and not being able, really, to make mistakes—although they may think they are making mistakes or not making mistakes, and playing all these competitive games. But that's their game!

Now, I only say if that game begins to bore you, and it begins to trouble you and give you ulcers and all kinds of things, then you raise the problem of getting out of it, and therefore you start to become interested in things like Zen. That is simply a symptom of your growing in a certain direction where you are tired of playing a certain kind of game. You are as naturally flowing in another direction as if a tree were putting out a new branch. So because you say, Oh well, we people are interested in higher things—you see, that depends, still, on the differentiation of rank between the superior and the inferior people. But when you begin to see through that and grow out of that, you don't think any more of this 'superior' and 'inferior' classification. You don't think, We are spiritual people who attend to higher things as distinct from these morons who are only interested in beer and television. This is simply our particular form of life. Like there are crabs, and there are spiders, and there are sharks, and there are sparrows, and so on.

The trouble with the human being is like the trouble with certain animals. Like the dinosaur, who evolved to the point where he was so big that he'd have to have two brains—a higher self in the head and a lower self in the rump. And the difficulty was to get these two brains coordinated. But we have exactly the same trouble, and we are suffering from a kind of 'jitters' that comes from being two-brained. Now, you see, I'm not saying that that jitters is bad—it's a potential step in evolution and an opportunity of

growth. But remember, in the process of growth, the oak is not better than the acorn; because what does it do? It produces acorns.

Or you could say—just like I sometimes love to say—that a chicken is one egg’s way of becoming others. So an oak is an acorn’s way of becoming other acorns. Where is the point of superiority? The first verse of the poem I just quoted—The flowering branches grow naturally. Some short, some long—the first verse is,

In the landscape of spring

there is nothing superior

and nothing inferior.

The flowering branches are naturally

some short some long.

So that’s the point of view of being an outcast, in the sense of being outside the ‘taking seriously’ of being involved in the social game, and therefore being threatened by making mistakes, of doing the wrong thing—that is to say, of carrying into adult life one’s childhood conditioning where somebody is constantly yammering at you to play the game.

So therefore, the preachers and the teachers take the same attitude towards their adult congregations that parents take to children, and lecture them and tell them what they should do. And judges in courts feel also entitled to give people lectures because they say those criminal-types haven’t grown up—but neither have the judges. It takes two to make a quarrel. So one can begin to think in a new way—in polarity-thinking. Instead of being stuck with the competitive thinking of the good guys and the bad guys, the cops and robbers, the capitalists and the communists, all these things which are simply childishness.

Now, of course, you recognize that the moment I say that it’s like talking in English in order to show that the English language has limitations. And I am talking in a language that seems competitive to show that the

competitive game has limitations. As if I were saying to all you cats here, Look, I have something to tell you. And if you get this, you will be in a better position than you were before you heard it. But I cannot speak to this group—or to society, or this language-speaking culture—without using the language, the gestures, the customs, et cetera, that you have.

The Zen masters try to get around this by doing things—suddenly—that people just don't get. Well, what is this? Therefore, that is the reason why—this is the real reason why—Zen cannot be explained. You have to make, as it were, a jump from the valuation game of 'better people' and 'worse people,' 'in-groups' and 'out-groups,' and you can only make it by seeing that they all are mutually interdependent. So if we take this situation—let's say I would be talking to you and saying, Look, I have some very special thing that you've got to take notice of. Therefore I am the in-group, and I'm the teacher and you are the out-group. I know perfectly well that I cannot be the teacher unless you come here, and so that my status and my position is totally dependent on you. It isn't something, you see, therefore I have first and then you get. These things arise mutually. So if you wouldn't come, I wouldn't talk. I wouldn't know what to say, because I borrowed your language.

So that is the insight: that things go together. Then, when you see that—and aren't in competition—then you don't make a mistake. Because you don't dither. When I first learned the piano and played these wretched scales, the teacher beside me had a pencil in her hand and she hit my fingers every time I made a wrong note. The consequence was, I never learned to read music because I hesitated too long to play the note on time. Because I was always, Is this pencil going to land? See? And that gets built into your psyche. And so, people are always—although they are adults, and nobody is clubbing them around and screaming at them any longer—they hear the echoes of that screaming mama—or that bombinating papa—in the back of their heads all their life long. And so they adopt the same attitudes to their own children, and the farce continues.

Because there is no—I mean, I don't say that you shouldn't lay down the law to children if you want them to play the social game. But if you lay down the law to your children, you must make provisions later in life for

them to be 'liberated.' To go through a process of curing them from the bad effects of education. But you can't do that unless you, too, grow up, you see? As we grow up. Says I, including myself.

So that is the thing. Now, therefore, in the Zen scene, you would think that the master as we know him and we read about him is an extremely authoritative figure. That's the way he deliberately comes on at the beginning. He puts up a terrific show of being an awful dragon. And this screens out all sorts of people who don't have, somehow, the nerve to get into the work. But once you are in, a very strange change takes place: the master becomes the brother; he becomes the affectionate helper of all those students, and they love him as they would a brother, rather than respect him as they would a father. And therefore, the students and masters, they make jokes about each other; they have a very curious kind of social relationship which has all of the outward trappings of authoritarian, but everybody knows on the inside that that's a joke.

Liberated people have to be very cool. Otherwise, in a society which doesn't believe in equality and cannot possibly practice it, they would be considered extremely subversive. And therefore, great Zen masters wear purple and gold and carry scepters and sit in thrones, and all this is carried on to cool it. The outside world knows, They're alright, they have discipline, they have order, they are perfectly fine.

Taoism

Swimming Headless

This morning, I was giving you a talk on the fundamental basic attitudes expressed in Lao Tzu's Tao Te Ching. The title of the book Tao, Te, Ching, introduces now the second word in the title. I've been dwelling this morning on the first word which is Tao. And so comes up the second word. And this word, again is, faces us with some serious problems of translation. Ordinarily translated virtue. Ordinarily translated virtue, but virtue as we understand it today isn't at all appropriate. The nearest kind of... When we speak of the healing virtues of a plant that's nearer to the meaning of this word death. The Japanese pronounce it toku, the Cantonese duk and the Northern mandarins approximately 'duh'. And in the section of the Lao Tzu where this is really introduced, the text says something like this. The superior virtue, not virtue, that's it has virtue. Inferior virtue can't let go of virtue, thus not virtue. And we more or less paraphrase that by translating superior virtue is not conscious of itself as a virtue and therefore it is virtue but inferior virtue is so hooked up with being virtuous, or hooked on being virtuous, that it's not virtue.

Now then therefore, this word is a connection of virtue and magic. It means the Superior, the excellence of things, in the sense that. A tree excels at being a tree. And nobody really knows how it does it. There is no way of imitating a tree except, the only way is to be one. And so in the same way when a human being shows extraordinary skill something, it seems that it comes natural to him. It seems that he doesn't achieve it, by any kind of artificiality. If there is some discipline in it, it's concealed. So excelling in something naturally, and yet it's something that is so difficult to understand that it seems that it has been done by magic, is the meaning of this word. So what Te is is, the state of affairs, a way of talking about, particularly a human being, who has learned to live in harmony with the Tao. Now of course, everything is fundamentally in harmony with the Tao. In the book called The Journey on, or the unwobbling pivot, it is said the dollar is that

from which nothing can depart. That from which things can depart is not the Tao. Fundamentally you see, you can't get away from it it's like a situation in which we are all floating. In a tremendous river. And the river carries you along, anyhow. Now some of the people in the river of swimming against it, but they're still being carried along. Others have learned that the art of the of the thing, is to swim with it. And they are carried along too, but they know it, you see they know they are carried along, whereas the people who are swimming against it think they're going in the opposite direction. But they're not really. So that was a sort of discussion we were having this morning when I find invariably whenever I talk about these things, Americans raise moral issues. Because we are a people incredibly bamboozled by preachers. And so this always comes up. Bamboozled, preachers Yes. And have chronic guilty consciences, and so those questions are always raised. For this you see explains, part of the situation that you you have to flow with the river. There is no other way. But that you can swim against it and pretend not to be flowing with it, but you still are. So, but a person who is not making that pretense anymore, who knows that you have to go with the river and swim with it, suddenly he acquires behind everything that he does the power of the river. The person swimming against the river you see, does not by his action express the force of the river the person swimming with it he goes along and he has that whole river behind him but he subtly directing it because you can change direction in the course of the river you can go to the left or to the right as a ship can use a rudder and still go along with the current, or more skillful still, as a sail boat can tack, because when a sailboat tacks and goes in a direction contrary to the wind. It still is using the wind to blow it along and that is the most highly skillful art of all that is Taoism in perfection. The art of sailing. Very intelligent.

I remember once, I was looking in the open air, and one of those glorious little thistle-down things came and I picked it up like that and brought it down. And it looked as if it was struggling to get away just as if you caught an insect by one leg. Like a daddy longlegs or something of that kind. It seemed to be struggling to get away and I first I thought well it's not doing that that's just the wind blowing. Then I thought again. Really? Only the wind blowing? Surely, it is the structure of this thing which in cooperation with the existence of wind, enables it to move like an animal. But using the

wind's effort. Not its own. It is more intelligent being than an insect in a way because. Insect uses effort like a person who rows a boat uses effort but the man who puts up a sail is using magic. He lets nature do it for him, with the intelligence to use a sail. So in just this way there is the meaning of Te, is that kind of intelligence, which, without your using very much effort, gets everything to cooperate with you. You, for example, never force other people to agree with you but you give them the notion that the idea you wanted them to have was their own. This is a feminine art, preeminently. A woman, who really wants a lover does not pursued him. Because then most men feel that she's aggressive and if she's aggressive she obviously is a woman who has had difficulty in finding lovers, and therefore there must be some undesirably secret thing about her. But if she as it were, makes a void, then and this is slightly difficult to get, then people get excited they know she is a highly prized object, and so they pursue. The same way when you want to teach a baby to swim. You could, a thing you can do is to put the baby in the water and then move backwards in the water and create a vacuum and this pulls the baby along. It helps it to learn the feel of the water and how to swim it's the same principle.

So also, clever difficult to-get-ness is one of the very best means. Acquiring immense publicity. To take the case of T.E. Lawrence. Who published the Seven Pillars of Wisdom in a limited edition. And this was, it became an extraordinarily celebrated book, costs hundreds of dollars a copy to find one on the market and they waited and waited and built this up and built this up and built it up and finally they published a general edition, and it was a knockout, because the first the first one had been sort of secret and difficult to find and if you have patience, you see, you can always do this. There's so. The whole art of the ruler you see that the Tao Te Ching is a book written, for several purposes. You may take it as a guide to mystical understanding of the universe you may take it as a dissertation on the principles of nature, almost a naturalistic, a handbook of natural law, we would say. Or you may also take it as a political book. A book of wisdom for governors. And, the principle which it advocates, basically, is the virtue of governing by not ruling. Look at it in this way. Supposing the president of the United States were as unknown to you by name as the local sanitary inspector. The man who looks after the drains and the sewage disposal and all that kind of thing. This is not a glamorous figure, you see, but for that

very reason, he probably does his job more efficiently than the president, because the president wastes enormous amount of time in interviewing various groups from the Elks and the Girl Scouts, conferring honors and all this kind of thing. The poor man's life must be an utter torment because he's so well known and therefore has absolutely no time to give to the government of the country. I mean think of his mail. And all the people who have to be employed sifting that out, and assessing it, so that if he were someone quite anonymous, and that we didn't have to think about, he would be a very very good ruler. In just the same way, for example, you don't have to attend, unless you're sick, to the government of your own body. It happens automatically This is this expression ziran, of itself, and it goes on day after day after day and the better it is the less you have to think about it. When you see well, you do not see your eyes. If there is something wrong with your eyes, you start seeing spots, and those spots are spots in your eyes. When you hear well, you never hear your ears. But when they start singing, you know? Then you are starting to hear your ears and your ears are getting in the way of their own hearing.

So on the deepest level, a person as a whole, can get in the way of his own existence. By becoming too aware of himself. And then he lacks this quality, Te. Now, the Taoists then propose that there be something to help people get back to Tao, and be able to be in the state of Te. So that they wouldn't get in their own way. And, this is connected with the idea of being empty. The emptiness being somehow vacant, was the secret of the thing. The highest kind of knowledge is not know-how, but no-how, and no hyphen H.-O. W. to be able to do it no how. Without any method. To achieve this, something is practiced which is called fasting the heart. The heart. In Chinese, is a word which doesn't mean heart in the physiological sense. You see, it's part of the Te character. Shin. It's usually located about here. And it means heart and mind it's equivalent to translated as mind and in all the Zen texts where the word mind is used, no mind, Musha in it is this character. The psychic center. Now the best kind of heart is absence of heart. In English, the word heartless has a very bad connotation, as does the word mindless. A heartless person is an inconsiderate, unfeeling person, a mindless person is an idiot. But a person who has mushin, or no mind or no heart in Chinese, is a very high order of person. It means that his psychic center doesn't get in its own way. It operates as if it wasn't there. Chuang-

Tzu says that the highest form of man uses his shin like a mirror. It grasps nothing, it refuses nothing it receives but does not keep.

And the poem says when the geese fly over the water and there are reflected in the water that the geese do not intend to cast their reflection and the water has no mind to retain their image. So, the whole thing is you see to operate in the world as if you were absent. Now this is built into us physiologically, fundamentally, let me ask you simply: what is the color of your head from the standpoint of your eyes? Your eyes don't see your head, do they? You look all around you see everything else but your head you don't see. Do you feel that your head is black. No, hasn't any color at all. Outside, you see, all field of vision is an oval two eyes and this creates two centers of an ellipse so there's this whole field of vision now experiment what is beyond the field of vision. What color is it where you can't see. It isn't black. This is an important point. It's no color at all. Beyond that and in this way you can get an idea of what is meant by that character that I discussed this morning Schwann which although it formally has a meaning of darkness this one. Although it formally has the meaning of darkness and the Deep and the obscure, it actually refers to this kind of no color, which is the color of your head so far as your eyes are concerned.

Now, so in this sense, the invisibility of one's head, almost the not having of any head at all, is the secret of being alive. To be headless, you might say, to have no head. In just the sense I'm talking about, is our way of talking about the Chinese expression mushin, no-mind. Now, as a matter of fact if you want to see the inside of your head all you have to do is keep your eyes open. Because everything that you're experiencing in the external visual field is a state of your brain. All these colors and shapes are the way in which the brain nerves translate the electrical impulses in the external world. Being in the world outside the envelope of skin.

So, they translate all what is going on outside into impulses which are to us shape and color. But shape and color are states of the nerves, so what you see when your eyes are open is how it feels inside your head. You think your head is a blank. But actually, it's being a blank. You don't see your brain as an external, undulating, corrugated structure, you see your brain as everything outside. So, in this way, the emptiness of one's head, is the

condition of seeing. The transparency of the eye lens is the condition of seeing colors it has no color itself. Eckart said this, because my eye has no color it is able to discern color. This is in Germany in the Thirteenth century. That this is fundamental Taoist idea of being absent, as a condition of being present. Being not there. So, Chuang Tzu says, 'when your belt is comfortable you don't feel it.' When your shoes are comfortable, it is as if you want wearing any. Likewise, your clothes you see the more you are aware of these things, the less properly they are made. Or, the less properly they fit.

But, we raise an objection to this, a very simple objection. If I don't know I'm there, I seem to be missing everything. We want to know that we know. If we're happy and we don't know we're happy. We might just as well not be happy to be happy. And to know that you're happy is really the overflowing of the couple's life. Of course the penalty for that is to be miserable and to know that you're miserable. Some people are miserable without knowing it. But, you know my Limerick, 'There was a young man who said though it seems that I know that I know what I would like to see is the eye that knows me, when I know that I know that I know.'

And this is the great human predicament the development of self-consciousness the development of the possibility of reflecting upon one's own knowledge. And this is simultaneously a blessing and a curse. And Taoism does not escape this problem, I mean it doesn't, it doesn't avoid this problem, it deals with it. But it doesn't deal with it obviously. So we get back to this fundamental verse about the nature of Te. What is highly virtuous is a virtue that is not conscious of itself as virtue. The moment it's conscious of itself as such you see it it fails. So in this way, we love to see a child dancing all by itself. Lost in the dance and not performing for an audience, and we say oh oh if only I could dance like that. If only I could become like a child again: innocent. But then soon, when I went parents notice how beautifully a child dances and they all approve of it and say to this child, 'Dance for us,' the child begins to lose this power. And it puts on as it knows its notice. And we don't like that and say that's affectation that showing off that's phony. What we want you to do is to dance as if you had no audience. Not even yourself. Which of course puts the child in a double bind, because it says to the child we require you to do something that will

be acceptable only if you do it as if it wasn't required. We do that all the time to our children and to each other. You must love me. After all, you promised to do so when we got married to you and so on. So, this is the difficulty. But somehow, a very great artist in the maturity of his life somehow is able. At least to give the impression. That he does what he does without playing to the gallery. Without self-consciousness. It seems perfectly natural. So how does he get there? There was a Taoist sage later that Lao Tzu. His name was Lieh Tzu We Romanize that as LIEH. Lieh. And he had a reputation for being able to ride on the wind. So light. And says in one place it's easy enough to stand still the difficulty is to walk without touching the ground. Because in the state of being in accord with the Tao, there is a certain feeling of weightlessness, parallel to the weightlessness that people feel when they get into outer space, or when they go deep into the ocean. This is of course connected with the sensation that you're not carrying your body around. I described this morning the sensation that an expert driver has, when he really is with it on a car. That the hill lifts him up and drops him down the other side. That he and the road are all one process. And that's equivalent to the sense of weightlessness. And so this is connected, this is inner meaning of riding on the wind when Suzuki was asked what is it like to have such tare he said it's just like ordinary everyday experience except about two inches off the ground. And so we say in our own songs, 'Walking on air and never a care, something is making me sing Tralalala, like a little bird in spring. A person who has mushin on no mind or no heart in Chinese, is a very high order of person. It means that his psychic center doesn't get in its own way. It operates as if it wasn't there. Chuang Tzu says that the highest form of man uses his shin like a mirror it grasps nothing it refuses nothing it receives but does not keep. And the poem says when the geese fly over the water and they are not reflected in the water, that the geese do not intend to cast the reflection and the water has no mind to retain their image.

So, the whole thing is you see to operate in the world as if you were absent. That this is fundamental dollars idea of. Being absent. As a condition of being present. Being not there. Chuang Tzu Says, 'When your belt is comfortable you don't feel it.' When your shoes a comfortable it is as if you want wearing any. Likewise, your clothes you see the more you are aware of these things. The less properly they are made. Or the less probably they

fit. But we raise an objection to this very simple objection. If I don't know I'm there, I seem to be missing everything. We want to know that we know. If we're happy and we don't know we're happy, we might just as well not be happy. To be happy and to know that you're happy is really the overflowing of the cup of life. Of course, the penalty for that is to be miserable and to know that your miserable some people are miserable without knowing it. But, you know, my Limerick there was a young man said though, 'It seems that I know that I know what I would like to see is the I that knows me when I know that I know that I know.' And this is the great human predicament the development of self-consciousness, the development of the possibility of reflecting upon one's own knowledge. And this is simultaneously a blessing and a curse.

So, when the human being developed the power to be aware of himself. To know that he knows. In other words, when the cortex was formed over the original brain. He fell from grace. That was the fall of man. Because, when he felt he had the sensation of being in charge of being in control of himself and you could only have that sensation when you are aware of what you're doing, he got anxious. Am I aware enough of myself? Have I taken enough factors into consideration? Have I done all that should be done? And then he started trembling. This was the fall of man, of course, this is what is meant. Lao Tzu says, 'When the great Tao is lost there came a duty to man and right conduct.' In other words nobody talks about how you ought to behave. Unless things have gone radically wrong. There wouldn't be any conception of faith for ministers of the of the state unless there are a lot of lousy politicians around. No one would talk about filial piety, unless there were wayward sons and daughters.

So there is constantly in the tradition of Taoism, the idea that all moral preaching is confusion. There's a marvelous case of this in the Chuang Tzu's book. Where there's an alleged conversation between Confucius and Lao Tze, in which allowed SAS Confucius to explain to him what is charity and duty to one's neighbor. And Confucius gives him a little sermon on being, giving up one's self interest and working for others and Lao Tzu says, 'What stuff.' So regard the universe. He says, 'The stars come out invariably every night. The sun rises and sets the birds flock and migrate. Without exception all flowers and trees grow up words without exception.'

You, by or talk of charity and duty to one's neighbor you're just introducing confusion into the empire you already attempt to eliminate self is a positive manifestation of selfishness. You are like a person beating a drum in search of a fugitive. The modern equivalent of that would be the police car. About to raid a bad night club and coming with that siren full on its name. And everybody in the club gets out. So, they all talk about selfishness. All talk about, success in becoming virtuous, or enlightened or integrated on non neurotic or self actualized that's used all the terms that are being used, all this talk. Attests to the fact that it hasn't happened. And will in fact get in the way of it's happening. Well to go back to Lieh Tzu, who succeeded in riding the wind what happened? Lieh Tzu found a very great master, and went to study with him and the master lived in a small heart. And sat outside the heart. And the master paid absolutely no attention to him. This is sort of the way with Taoist masters, because why would they want students. They have nothing to teach. So, after a year sitting outside, Lieh Tzu went away. Then he just fed up with waiting so long. Then he sort of got regretful about this and thought he really should make a try. So we went back to the master who said why the ceaseless coming and going. So he sat there and tried to control his mind, in such a way that he would not think of the differences between gain and loss. In other words, try to live in such a way that nothing is either an advantage or a disadvantage.

Once upon a time, there was a Chinese farmer, whose horse ran away. And all the neighbors came around to commiserate that evening so sorry to hear your horse has run away that's too bad and he said maybe. The next day the horse came back bringing seven wild horses with it and everybody came around in the evening and said 'Oh isn't that lucky. What a great turn of events you've now got eight horses' and he said 'Maybe.' The next day, his son tried to break one of these horses and ride it and was thrown and broke his leg and they all said Oh dear that's too bad and he said 'Maybe.' The following day the conscription officers came around to recruit to force people into the army and they rejected his son, because he had a broken leg and all the people came around and said Isn't that great and he said 'Maybe.' You see, that is the attitude of not thinking of things in terms of gain or loss, advantage or disadvantage, because you don't really know. The fact that you might get a letter from a solicitor I mean from a law office tomorrow. Saying that some distant relative of yours that left you a million

dollars. Might be something you would feel very very happy about but the disasters that it could lead to what are believable. [crowd] Internal Revenue. To mention only one possibility.

So you never really know. Where the something is fortune or misfortune. But we only know the momentary changes and it as it alters our sense of hope about things. That Tao is wise enough eventually you see to understand that there isn't any fixed good or bad. And so his point of view is what is called non choosing. Well anyway he attempted to keep his mind in a state of non choosing, and this was a very difficult thing to do, to overcome one's habits of feeling and thinking in this respect, and after he had practiced this for a year the master looked at him. And you know sort of recognized he was there. After another years practice, he invited him to come and sit inside his hut. And then, however something changed and Lieh Tzu didn't try anymore to control his mind what he did was he put it in this way. 'I let my ears hear whatever they wanted to hear. I let my eyes see whatever they wanted to see. I let my feet move wherever they wanted to go, and I let my mind think of whatever it wanted to think.' And then he said it was a very strange sensation because all my bodily existence seemed to melt and become transparent. And to have no weight, and I didn't know whether I was walking on the window the wind was walking on me. Now that's the fasting of the heart. In the ordinary way, you see, you say, well that made quite an impression on me. As if you were a slate. Or a blackboard upon which life makes an impression, as the chalk does on the slate on the blackboard. And so we say 'Well here are these events and I'm the observer of all these events, and I remember them and they make an impression on me.'

But in the psychology of Taoism, there is no difference between you as observer. And whatever it is that you observe. The only thing that is you, is the observation of life from a certain point of view. I said a little while ago you think your heads are empty and blank. But the actual inside of your head is felt in terms of everything you see on the outside. We make an opposition, you see between the thinker and the thought the experiencer and the experience the knower and the known. Because we think about knowledge in terms of certain metaphors, the metaphor of the Stylus on the writing sheet. The reflection on the mirror. All those sort of images come

into our idea of knowledge. But in the Taoist theory of knowledge, it's quite different. There isn't a knower facing the known. It would be more like saying that if there is any knower at all it contains the known. Your mind if you have one is not in your head, your head is in your mind. Because your mind. Understood from the standpoint of vision is space.

The Chinese use this word Hoo. Which means sky, space and sometimes emptiness. And there is a saying. That form. Or you know shape and color was of this is one word in Chinese that means really both shape and color. And this and this are said to be identical. Space or emptiness is precisely shape color and shape color is precisely emptiness. This is actually a Buddhist saying from the Tridarya Sutra. So that, all that we call space contains the myriads of shapes and colors and bodies and weights and so on. It doesn't reflect them as a mirror. But it is the absence, which guarantees their presence, and it's their presence which guarantees its absence. So there's this mutual relationship again the book the mutual arising expression between voidness and form, between existence and nonexistence being and nonbeing. These are never felt as alternatives or things, that are in the some kind of contest.

So then, when it is said that there is not any thinker behind thoughts not any experiencer who has experiences, this is a way of saying. That experiencing, knowing is not an encounter, between strangers. Western thought concentrates very much on knowledge as an encounter and it is thus that we talk about facing facts. Facing reality. As if somehow or other the know and the known came from two completely different worlds and met each other like that. Whereas actually, the phenomenon of knowledge is almost the precise opposite of that. Instead of being a collision between the two wandering bodies in space, knowledge is much more like the expansion of a flower from the stem in the bud. Where the opposite points of the flower are the knower and the known. They are the terms of something which as it were, lies between them. Let me repeat. We tend in all our letters and common speech to think of life as an encounter between the knowing human being, the knowing mind and the world. They think of it not as an encounter but as an expression. Not an impression. An expression. Of a process that has polarized itself coming out from the center and expressed itself in terms of opposites but of course this is the basis of

the whole young un principle of. You know this jolly old thing. And where you've got two interlocked. What are they, fishes? Commas. Fascinating emblem. You call it a monad. Yes but there it is. This is a helix essentially, this grip. And this is the formation of spiral nebulae. And it's the position of sexual intercourse.

I here, this is my I and you with your I. I'm trying to get to the middle of you you're trying to get in the middle of me. And neither one of us exists without the other. This is yang, and yang the white in the in the dark. Yang the word young originally means. Or is associated with the south side of a mountain which is sunny yet in the north side which is dark. Yang is the north bank of a river which gets the sun yet as the south bank of a river which is in the shade. Now you see, you don't get a mountain with only one side. The mountain if it's a mountain a tall goes up and down. It's like the wave you don't get a wave which has a crest with no trough, or a trough with no crest, you can't have half a wave.

So, yang and yin are quite different from each other. But just because they are different, they're identical. And this is the important idea of the identical difference the saying goes in both dollars and Buddhism difference is identity, identity is difference. The Chinese word for is, is not quite the same as our word. This word which is usually used has rather the meaning of that, that. So they say would say difference that identity, identity that difference. And so this doesn't mean quite, is exactly the same as, it means rather is in relation to. Or goes with. Necessarily involves. Difference necessarily involves identity, identity necessarily involves difference.

So yang and yin. There is no Yang without yin, no yin without yang. When I was first studying these things I was terribly bothered by how on earth I was going to see this multiple differentiated world as a unity. What what was going to happen? What would it be like to see that all things are one? The sages keep saying all things are one. And they all look to me so different. Because here was all this teacher ch-ch-ch-ch, going on around one and it was doing it in different ways all these people came on in different ways and they had all their houses and all their cars and all that this and that and the whole world book full of the most bony prickly differences. And I thought well I was supposed to happen is a supposed to

be a kind of as if your eyesight got blurred and all these things I went blahhh and flowed together. What is it what does this experience of Nirvana, liberation and cetera supposed to be? Because so many of these especially Hindu sages write about as if he was just this kind of dissolution of everything. They said it all becomes like a slug with a small salt on it. Well I it took me a long time. And suddenly one day I realized, that the difference that I saw between things was the same thing as their unity. Because differences. Borders. Lines, surfaces, boundaries. Don't really divide things from each other at all they join them together. Because all boundaries are held in common. It's like, let's think of a reversal of territory which is all been divided up into property. Your property my property etc etc No the fences but we hold that if I live next to you your fence is my fence. We hold the boundary in common. We may make up silly arrangements as to who is responsible for the maintenance of this fence, but nevertheless, we hold our boundaries in common. And we wouldn't know what my plot of land was or where it was, unless we knew the definition of your plot of land in your plot of land that is adjoining. So boundaries are held in common. And I could see then that it, that my sense of being me. Was exactly the same thing as my sensation of being one with the whole cosmos. I didn't need to get some other weird sort of different odd kind of experience to feel in total connection with everything. Once you get the clue, you see, that the sense of unity is inseparable from the sense of difference. You wouldn't know yourself or what you meant by self, unless at the same time you have the feeling of something other.

Now it's, the secret is that other eventually turns out to be you. I mean that's the element of surprise and life. When suddenly you you find the thing most alien. We say now what is most alien to us. Go out at night and look at the stars and realize that they are millions and millions and billions of miles away. Vast conflagrations out in space, and you can lie back and look at that. Say, Well surely I hardly matter. I'm just a tiny tiny little peekaboo. On this weird spot of dust called Earth, and all that going on out there. Billions of years before I was born billions of years after I will die and nothing seems stranger to you that more different from me. But there comes a point if you watch long enough when you'll say, 'Why that's mean. It's the other. That is the condition of your being yourself. As the back is the condition of

being the front. And when you know that. You know, you know you never die.

Wisdom of the Ridiculous

During the last two sessions, I've been talking to principally about the philosophy of the Lao Tzu book The Tao Te Ching. And now I want to shift today over to Chuang Tzu. This Chuang Tzu, so far as we know. Lived about three hundred B.C.. Maybe a little earlier than that. And he is a very very remarkable person because the Chuang Tzu book he's also more exactly his name is. Chuang Tzu. But his book, sometimes called simply The Chuang Tzu book is quite unique in the whole history of philosophy, because he's almost the only philosopher from the whole of antiquity, who has real humor. And therefore he's an immensely encouraging person to read. But part of his humor is the art of exaggeration. And you always have to allow for that. You always have to realise that he's slightly pulling his own leg he is that as in a group of people who are enthusiasts for something it but have humans who very often find that when they're talking among themselves, they carry their own ideas to ludicrous extremes and roar with laughter about it. And Chuang Tzu does that.

Now for example, he has a great deal to say about the value of the useless life. The whole notion of something of life any moment in life or any event in life being useful, that is to say serving the end of some future event in life is to a Taoist absurd. Because nothing is useful at all, the universe is viewed as purposeless and useless, through and through because it's a game. More than that game. Doesn't really convey the sense of this. When a Taoist sage wandering through the forest, he isn't going anywhere. He is just wondering when he watches the clouds he loves them because they have no special destination. He watches birds moving around he watches the waves lapping on the shore, and just because all this is not busy in the way that human beings are busy. Because it serves no end other than being what it is now it is for that reason that he admires it, and it is for that reason that you get the peculiar styles of Chinese painting in the Tan Son and later dynasties, where nature in its wayward wandering nature is the main subject.

When we say that something is without purpose and that's a put down phrase and say well it's no future and what's the use now we say what's the use? And, we need very much to realise that that question. Reflects our insanity. What's the future in it? What's the use? The joy for the Darwinist is that things have no use and the future is not important. Now, you can exaggerate this and Chuang Tzu does, in a very humorous way by describing the ideal useless man he's a hunchback. And he's so deformed that his chin rests on his navel and so on and, but he says now this man is very admirable. He has found the secret of life because when the social service workers come around he's the first to get a free hand out. And when the military officers come around to conscript people for the army, he's the first to be rejected. Therefore, he lives long. And he also describes a case of some travelers came across an enormous tree, fantastic thing. And they said never did anyone see such a tree, so they went up and looked at it and first they tested the leaves and found that they were rough and disagreeable and no good to eat. Then they looked at the branches, and found that they were all twisted and absolutely no good for using as sticks. Then they examined the wood and found it was full of pity and absolutely useless for a carpenter. So nobody had disturbed this tree. It was not used for cutting down any purpose whatsoever and so it grew to an enormous size and was of great age. Chuang Tzu is here pulling our legs. He is not exactly asking us to take all that literally but this is his way of doing things then also he describes the behavior of the higher form of man and he says, the man of character that is. In this case the word we were discussing yesterday the man of character lives at home without exercising his mind and performs actions without worry. The notions of right and wrong and the praise and blame of others do not disturb him. When within the four seas, all people can enjoy themselves that is happiness for him when all people are well provided, that is peace for him. Sorrowful in countenance, he looks like a baby who has lost its mother appearing stupid he goes about like one who has lost his way. He has plenty of money to spend and does not know where it comes from he drinks and eats just enough, and does not know where the food comes from. This is the demeanor of the man of character. Then

By contrast, the hypocrites are those people who regard as good whatever the world claims as good and regard as right of whatever the world claims as right. When you tell them that they are man of Tao, then that

countenance countenances change with satisfaction when you call them hypocrites then they look displeased. All their lives they call themselves men of Tao, and all their lives they remain hypocrites. They know how to give a good speech and tell appropriate anecdotes in order to attract the crowd, but from the very beginning to the very end they do not know what it's all about. They put on the proper garb, and dress in the proper colors and put on a decorous experience in order to make themselves popular, but refuse to admit that they're hypocrites. But this explanation of the man. Who is stupid, in countenance in appearance and is wandering about as if he had lost his way and doesn't know anything across it based on the text and Lao Tzu, where he says the people of the world are merry making as if partaking of the sacrificial feasts as if mounting the terrace in spring I alone am mild like one unemployed. Like a newborn baby that cannot yet smile, unattached like one without a home. The people of the world have enough and to spare, but I am like one left out I heart must be that of a fool, being muddled nebulous. The vulgar are knowing Luminous. I alone am confused the Volga are clever selfish assured I alone depressed patient as the sea adrift seemingly aimless the people of the world all have a purpose I alone appear stubborn and them kooks I alone differ from the other people value of drawing sustenance from the Mother, capital M that's Mother Nature.

So, there is about Taoist sage, you see the can the character of the Taoist sage as depicted by to answer something of the fool. Because, the fool is the person. Who doesn't know enough to come in out of the rain doesn't compete. Everybody else gets before him to the prizes the material prizes of life and even to the spiritual prizes. The fool, you see, is the person who isn't going anywhere. He sits by the road and go to be able to be a little bit even to be the fool is like a Mongolian idiot child who isn't interested in survival. Who will take a plate of food and run his finger around in it and make a wonderful slosh with the stew, you and then watch it drip from the tip of this thing where he won't eat for quite a while of the neo play with it in all sorts of ways then his attention will be distracted by something else and he will chase after that, you see. So long as you don't cross him this is the case of the Mongolian idiot he remains the most wonderfully friendly swinging kind of a cat, but he has no ambition, he doesn't fight for himself. And nobody can ever get him to. So, the fool has always been used as a kind of analog of the sage. As a Hindu verse which says sometimes naked

sometimes mad, now as a scholar, now as a fool thus they appear on Earth the free men. And if you read the biographies of the early life of Sri Ramakrishna. They are absolutely wild.

Now, not all of this you see again just as in reading Chuang Tzu, you mustn't take it too literally. These things are said by way of a kind of over stress to correct. Another kind of over stress in the opposite direction. When a Japanese scholar many years ago explained the teaching of Buddhism to me, he said something I had never heard anybody else say, that the Buddha taught for example that life is suffering in order to correct the wrong view that it ought to be pleasure. He said that everything is impermanent. In order to correct the wrong view that reality lasts forever in time. So, the idea of the Middle Way is set to correct another. This is a very common Asian technique and it is found especially in Zen where teachers when they are asked about something sacred will always answer in terms of something secular. What is the Buddha? The tree in the Guard. Then when you ask about something secular they answer in terms of something sacred see. As there's a master and his student working in the field and they are using a knife to prune, and the student suddenly says to the Master give me the knife and he gives it to him point first. And so he says, but please let me have the other end the teacher says What would you do with the other end? see the question immediately it turns into a kind of a metaphysical thing.

So this play back and forth between the extremes has as its interior design. The awakening of the mind to polarity. That I was talking to you about yesterday. This thing of mutual arising. Chuang Tzu tells a story about this. He says a certain keeper of monkeys said with regard to their ration of nuts that each monkey should have three in the morning and four at night. But at this the monkeys were very angry so the keeper said they might have four in the morning and three at night, with which arrangement they were all well pleased. Now the number of nuts was the same, he goes on to say, but there was an adaptation to the likes and dislikes of those concerned. But this there is the way of conduct of the sage.

That basically Chuang Tzu's philosophy is a philosophy of relativity. He makes a great deal of the point that there is no absolute standard of great or small. Of important or unimportant. There is a story, for example, of a sort

of off on telly bill at a banquet, and the speeches are being made after dinner. And somebody gets up and says that the human being is the highest of all human, of all creatures, that the whole world serves humanity and a lot of pompous nonsense. And the small boy gets up and says that since Tigers feed on human beings it's quite obvious therefore that human beings exist for the service of tigers. For Chuang Tzu, you must get the point of view that small things are as big as big things can be, and big things are as small a small things can be everything can be looked at as great or small, important and unimportant. And all the steps between. Because his conception of the world is essentially cyclic. In his idea of the circle and Taoist and Zen teachers have a whole method of teaching by circles and drawing circles. The center of a circle, is any point on the circumference.

You can begin anywhere. There's a koan in Zen Buddhism which asked the question. Indra built the seamless tower. Where did he start? Now, a seamless tower is like a sleeve with no no seam on it. It's a continuous cylinder of cloth. So the continuous cylindrical tower, is the seamless tower where you start?

So, in the same way where does the circle start? At the Circle of Life the cycle of life the interdependence of. The bees and the flowers the into dependence of long and short you see it's all circular. And so, there is there is no where and there is everywhere that it can begin. In the same way, when he discusses the organs of the body, he makes a catalogue of all these organs and says 'Now which do you prefer?' Which one comes first and which one follows? Which one rules and which ones are serves? he said it seems that there may be a governor in all this but nobody could ever find it. This is a very strange passage in Chuang Tzu, which I have seen translated in many different ways there is an absolutely absurd translation of drunks on the market now published in mentor books by a professor of Chinese at Harvard, and it is absolutely ridiculous. The whole thing is made by a man who is I'm sure in an ex-missionary and keeps talking about God. Well there is no expression in Chuang Tzu for God. There is this expression. Which has almost the same meaning as spontaneity of itself so. This means such that something is so through the power of heaven.

Now heaven. Tien. Mean simply the universe. As you look out from Earth which is as it were the center of the base. Of everything else the whole expanse of the cosmos is tien, heaven. And there is no. Connection in the idea of heaven was some sort of personal ruler of the universe. So, the notion of God you see as we understand it is really very foreign indeed to Taoist thought. And when you see somebody translating this as God it gives a very wrong impression of this teaching for example there is a passage in which. Shun asked Jun, Can one get the Tao, so as to have it for one's own. And they say age and says. Your body is not your own. It is the delegated image of. John. And you know missionaries translate God, because they read in the Bible man is made in the image of God. Your life is not your own it is the delegated adaptability of heaven. Your offspring are not your own They're the delegated seeds of heaven. You move you know not how you are at rest, you know not why. These are the operations of the ways of Tao so how could you get Taos so as to have it for your own.

Similarly, there's a passage that says when a drunk man falls out of a cot though he may suffer he does not die. Because his spirit is in a condition of security he does not suffer from contact with objects of resistances. If such security may be got from wine how much more from. Can run. From being in accordance with the spontaneous rhythm of the universe. That's really what it means. But in the anxiety of missionaries and missionaries have been you see the great Western, they've been the foundation of Chinese scholarship in the West. To translate the Scriptures into Chinese they studied Chinese they were the first people to study Chinese and they have constantly therefore had an interest in slipping Chinese. Christian ideas into Chinese classics just in the same way as when you read Monya Williams's Sanskrit dictionary, which is the base dictionary for Sanskrit study for centuries, it's all made up with a missionary bias. But this the notion you see, of God in the sense of the person or ruler of the world, is totally foreign to Chinese thought. There isn't even an idea in Chinese thought of the law of nature as we have it. See the the motions of the body, the harmony of the organism, is not what it is in obedience to a law.

The Chinese do have an idea of law. This is the word tze. This is an interesting character. Nowadays written this way. But originally written like this. Because it's or this is a drawing of a sacrificial cauldron, with a knife

beside it. And it comes from a time when the laws were inscribed on the sacrificial cauldrons, so that when people came to offer their sacrifices, they would read the laws. Certain sages objected to this, and said that if the people know what the laws are, in the fixed terms of writing, they will develop a litigious spirit. That is to say, they'll start haggling about what it really says, and as you know that is the principal occupation of lawyers. And they said that the thing is that you mustn't write it down like that. And so, the Tao is described. As wutze. That we would translate literally Lawless. But it means of course transcending this kind of law which is a specific law, positive law, I think is the correct legal term.

So there is no notion in the Taoist philosophy, or if one might almost say in Chinese philosophy as a whole for there certainly includes Confucianism, no notion whatsoever of the world as responding to a boss. So the body, in other words, does not have in it a ruling organ its order is the consequence of, or the operation of every part of it existing together simultaneously arising mutually. There's no governor. Now the difficulty, you see, in Chuang Tzu's philosophy the difficulty with human beings is they begin to think in terms of governing. And ruling and they set out to dominate themselves and their surroundings. And invariably, this leads to a mess. He tells the story of an ancient man by the name of Polo. Polo was a great horse trainer. This is where we get the word polo from. But he said Polo absolutely ruined the nature of horses. Horses were nice charming creatures like Dean Swift's winners, before polo interfered and ruined their nature. Then he says in other places a good carpenter doesn't need a square or a compass. He works without it. And this is fantastically true of Japanese carpenters. You should see, one of the fascinating things in going to Japan is these old style carpenters, working from the roughest architectural plans you would imagine. And with the strangest instruments, but they have an uncanny knack, by fitting things by feel and by eye. A great story is told of the ceremonial raising of the ridgepole of a new temple. And it was being done by a certain Guild of carpenters and there was a rival guild in town which had not got the contract and they were very sore about it so during the night one of the members of the rival guild came and he chopped off six feet or so, of the ridgepole. And so when the master craftsman came in the morning and all the priests that arrived for the ceremony of raising the roof beam. He looked at it and said, 'Somebody has interfered with us. It must

be our enemy guild. They've cut off six feet of the roof beam anyway he said 'Never mind I will put it right.' And he took his hammer and ceremonially struck to be then said 'raise it and it was raised and it fitted exactly. So, the story, of course, is that the master carpenter knew that this would happen and he made the beam too long. That those sort of stories are always associated with the art of carpentry. He needs no square you see because. His sense of skill, that is in his organism, in his nerves, in his senses, is much more subtle than anything that can be made with instruments. There are all kinds of stories about the artists of the Far East excelling in this sort of thing, of knowing with tremendous precision exactly where something should go.

So, a master is decorating a ceremonial tea room and he's with his student and the student wants to know where to put a hook for hanging a bamboo vase for flowers on the wall. And the master says there, and the student makes a little mark somewhat later a student rubs up the mark, gets rid of it. But he remembers by a tiny little secret prick in the cloth where it should go. And then he says to the teacher, 'Excuse me sir but I forgot where you said that things should go,' and the teacher says it was there and he put his finger exactly on the same spot. That's the sort of thing that is admired. Without the slightest calculation you see.

Now he goes on and says. The Chuang Tzu explains at length that music has been ruined by the five notes. Says the five notes will make a man deaf and the five colors will make a man blind. And what does this mean. It's. Well it's the think is that if you think there are only five notes you can't hear. If you think there are only five colors you can't see. The moment you say this is a problem we have in music. That we've got a notation. Which is our chromatic scale. And the staff the way we can write music is limited to that possibility. But there are all kinds of subtleties between every one of our notes. The same way in writing our rhythm we have to go in steps from whole note, half note, quarter note, eighth note, sixteenth note, and so on and we can increase the value of each by one half by dotting it. But that's the limit of our rhythmic expression, whereas in all Oriental music, you have an infinite continuum both of tone and of rhythm. They make the most extraordinarily complicated rhythms, and the way you learn music is not

from notation, not from measures, but from the living body of your teacher demonstrating the ways of playing instruments.

So you follow the teacher, the man, instead of what it says in a book. So, the whole principle then is one of, not a success in life, through not pushing it around, through not trying to govern it. He tells a story as a matter of fact Chuang Tzu has a very funny trick a lot of his wisdom he puts into the mouth of Confucius. And he said to Confucius was one day doing this and he ran into Lao Tzu and they had an argument and loud so one but then the next time he talks about Confucius teaching Lao Tzu's doctrines. And this to the immense confusion of everybody but it said one day Confucius was standing by a river where there was a tremendous cataract plunging down, and he suddenly saw an old man coming out of the forest, who fell into the river and suddenly disappeared into the Cataract. And he said, 'Oh dear too bad, probably some old fellow tired of life who want to put an end to it all the next moment way down stream the old man gets out of the water and starts bouncing along and Confucius is amazed, and he sends one of his disciples at to catch this fellow for you disappears he said sir I was thinking that you would be going to commit suicide and I suddenly find that you came out of that cataract alive. Do you have some special method by which you do this? No, I have no special method said the old man I just go in with the world and come out with this well because I don't resist the water I entirely identify myself with water. So you see, here he is utterly utterly relaxed, just rolling around in the torrent and not resisting in any way, and so he has preserved. He goes with the stream rolls with the punch, or whatever you want to call it. Again, of course, there is exaggeration in a story of this kind. Just as the exaggeration in the story of the hunchback in the tree and so on. Because true Wu-wei, or letting go, noninterference, doesn't mean, for example, flabbiness. A lot of people when they think they're relaxing merely become flabby. And if that is so, you know, you would. The perfectly relaxed person would slowly become Jell-O. and would spread out on the floor and finally drip through into the basement. Relaxation you see is simply something that happens when there's too much yang in you, too much of the Positive. You need to balance after the yin. And the trouble is that human beings in their anxiety to control things exhibit too much again too much aggressiveness too much of the male principle, they need the balance of the female. And so, all these

exaggerations in the direction of let things go, let things happen, don't interfere. Stressing the yin point of view to compensate for the excessive yang. And furthermore the difficulty always comes I remember reading a book called You Must Relax, The difficulty always arises when one feels, I must relax. I've got to let go and let things happen. How on earth do I do it. I, even in trying to relax I'm all tense because I'm anxious that it must happen and maybe it won't and how do you do it you see. If you can't achieve wu wei like that. What you have to understand is that you don't you don't have to do anything there is no method as the old man said. That the meaning of wu tze, sir when you call the Taoist will sir or lawless it means there is no method in it. That you can master and do it what you have it's all based on understanding of what our psychologists call insight. You have to find out that there is nothing that you do. As a source and cause of action separate from everything else. When you know that, that there is no separate acting you, then there is no need to try to relax. The thing you have to see is that the flow of the Tao, as I said yesterday with the illustration of the people swimming in a strong stream that the flow of the Tao goes on anyway. Just like the flow of time for example, you can get out of the present moment. You can think about the past, and you can think about the future. But since you do that thinking now. The present is inescapable. All right now, the present moment does, doesn't it has a sense of flow. Time is going along, life is going along time actually the clock time is simply a measure of flow, a way of going to tick tick tick and counting the ticks and say well we've lived through so many ticks.

But nevertheless this is the real time as distinct from this ticking thing is it is a flowing, and yet it still isn't that fascinating. If it moves but you're always there it's always now. You never get out of now. All right now if you can feel that see that you can't get out of nothing. And you never will. I think now realize that what we call now is the same thing as Tao. The Tao, the course of things the eternal now the presence of God. Anything you want to call it see that's now, and you can't get out of it. So there's no need to get with it, because you can't get out. See, that's beautiful you just to relax and you're there.

So that's the principle of flowing. You can make all kinds of there are a clever ways of postponing finding this out. It's terribly simple, but you can

say well this is a very spiritual matter and I'm an evolved person and it'll take me a great deal of time to realize this in a more than an intellectual way. That's an excuse, for playing your own game. And not finding this out. There are all sorts of elaborate ways of doing that and you can put it off by indulging in the most complicated systems, of spiritual culture and yoga, and so on and so forth and that's all right I have no objection to your putting it off of that's what you want to do. But actually, it's always here now just as you can't get away from now you can't get out of the Tao. That's the humor of the whole thing. And that's why Chuang Tzu has this beautiful light touch. He says, 'The Heron is white without a daily bath. The crow is black without being painted in ink.' And this is the same as saying, you know, as in Zen. In this spring landscape, there is nothing superior, nothing inferior Flowering branches grow naturally. Some short, some long. Or they say a long thing is the long body of Buddha, short thing is the short body of Buddha. There are therefore you see blogs and brunettes. Fat people and skinny people tall people and shot people. Cultured people involved or people.

Even the Christian hymns there's the rich man in his castle the poor man it is gate. God made them high and lowly and order their estate you know? We don't sing that now because we've got too much social conscience. In fact, in I think time I probably read this passage yesterday maybe I didn't, but Chuang Tzu has this to say about it. Those who say that they would have right without its correlate wrong, or good government without its correlate misrule do not apprehend the great principles of the universe or the nature of all creation one might as well talk of the existence of heaven without that of earth or of the negative principle even without the positive which is clearly impossible if people keep on discussing it without stop. Such people must be either fools or knaves. Of course, one could always reply to Chuang Tzu, that there have to be fools and knaves so that we can recognize the existence of sages.

Yes, he has it in another way here. Speech is not mere blowing of breath it is intended to say something only what it is intended to say cannot yet be determined. Is their speech indeed? Or is there not can we or can we not distinguish it from the chirping of young birds? How can Tao be so obscured should be a distinction of true and false? How can speech be so

obscured that there should be a distinction of right and wrong? Where can you go and find Tao not to exist? Where can you go and find that words cannot be proved? The Tao is obscured by an inadequate understanding, and words are obscured by flowery expressions hence the affirmations and deny. Aisles of the Confucian and the modes in schools each denying what the other firms in the firm in what the other denies each denying what the other firms in affirming what the other denies brings us only confusion. There is nothing which is not this there is nothing which is not that. What cannot be seen by that, the other person, can be known by myself. Hence I say, this emanates from that that also derives from this this is the theory of the interdependence of this and that. Nevertheless, life arises from death and vice versa, the possibility arises remember possibility and vice versa affirmation is based upon denial, and vice versa. Which being the case the true sage rejects all distinctions and takes his refuge in heaven. That's in the universe.

For one may base it on this yet this is also that and that is also this this also has its right and wrong and that has its right and wrong does then the distinction between this and that really exist or not? When this the subjective, and that the object of are both without their correlates. That is the very axis of Tao and when that axis passes through the center at which all infinities converge affirmations and denials alike blend into the infinite one and so it is said that there is nothing like using the light. And see the axis of the opposites is the perception of that polarity. The difference between them is explicit but the unity of them is implicit. The difference the Expos it difference between two ends of the stick but the implicit unity that they are ends of the same stick you see? So that's the axis the axis of Tao, is the what you might call it the secret conspiracy. That it lies between all poles and all opposites which is implicit. Esoteric, or whatever you want to call it that they're fundamentally one.

So that unity, whether it's between you and the universe. Or whatever polarity you want to take is not something that has to be brought into being. If one brings it into being one assumes that it doesn't exist that's called in Zen, putting legs on a snake, or a beard on a eunuch. There's something unnecessary, you see? So it exists, it is always there and you can see it so vividly and actually put your almost almost put your finger on it and sense

it, if you understand that the movement of the Tao, is exactly the same thing as the present moment. Now because if you try to grab the present moment. And get to get ready, get ready, with the art of the written Clapper and say now. It's gone. [laughs] The finer and finer you draw the hairline on the watch, to know exactly where now is you can venture get the point where you can see it all the. But if you leave it alone and you don't try to grab the moment as it flies but it's always there so you don't have to mark it, and have to put your finger on it. Because it's everything that there is and so the present moment suddenly expands, and it contains the whole of time all past or future everything you never have to hold on to it.

It is believed generally in India. That when a person sets out on the way of liberation, his first problem. Is to become free from his past karma. The popular theory of karma the word that literally means action or doing, in Sanskrit, so that when we say that something that happens to you is your karma It's like saying in English it's your own doing. But in, the popular Indian belief, karma is a sort of built in moral law or a law of retribution, such that all the bad things you do and all the good things you do have consequences which you have to inherit, and so long as karmic energy remains stored up, you have to work it out. And what the sage endeavors to do is a kind of action which in Sanskrit is called Nishkama karma. Nish come out means without passion or without attachment karma, action. And so, whether he is whatever action he does, he renounces the fruits of the action, so that he acts in a way that doesn't generate future karma because future karma continues you in the wheel of becoming Samsara, the round and keeps you being reincarnated. Now then, in that case, when the time comes that you start to get out of the chain of karma, all the creditors that you have start presenting themselves for payment. In other words, a person who begins say to study yoga, has felt that he will suddenly get sick or that his children will die, or that he loses money, or all sorts of catastrophes will occur because the karmic debt is being cleared up, and it is in no hurry to be cleared up, if you're just living along like anybody, but if you embark on the spiritual life, a certain hurry occurs, and therefore since this is known it's rather discouraging to start these things.

The Christian way of saying the same thing is that if you plan to be, to change your life. Shall we say to turn over a new leaf, you mustn't let the

devil know. Because he will oppose you with all his might if he suddenly discovers that you're going to escape from his power. So for example, if you have a bad habit say you drink too much, and you make a New Year's resolution that during this coming year you'll stop drinking. That's a very very dangerous thing to do, because the devil will immediately know about it. And what will happen will be this. He will confront you with the prospect of three hundred sixty five drinkless days. And that will be awful, you know, just overwhelming and you won't be able to make much more than three days on the wagon.

So in that case you compromise with the devil and say just today I'm not going to drink you see but tomorrow maybe you will go back. Then when tomorrow comes you say, Oh just another day and it's trial that's all and the next day you say a one more day won't make much difference so you only do it for the moment and you don't let the devil know that you have a secret intention of going on day after day after day after day. But of course, there's something still better than that. And that is not to let the devil know anything. And that means of course. not to let yourself know. One of the many meanings of that saying Let not your left hand know what your right hand is doing is just this. And that was why, in the Zen discipline, a great deal of it centers around acting without premeditation. As those of you know, who read Harigal's book Zen in the Art of Archery. It was necessary to release the bowstring without first saying now. There's a wonderful story it may also have read by a German writer Von Kyss, about them a boxing match with a bear. The man can never defeat this bear because the bear always knows his plans in advance, and is ready to deal with any situation. The only way to get through to the bear would be to hit the bear without having first intended to do so. That would catch him.

And so this is one of the great great problems in the spiritual life or whatever you want to call it. Is to be able to have intention and act simultaneous. By this means, you escape karma and you escape the devil. So you might say that the Taoist is exemplary in this respect. That this is getting free from karma without making any previous announcement. Of simply, supposing we have a train and we want to unload the train of its freight cars. You go to the back end, and you can unload them one by one, and shunt them into the siding, but the simplest of all ways of unloading is

to uncouple between the engine and the first car, and that gets rid of the whole bunch at once. And it is in that sort of way you see that the Taoist gets rid of karma without challenging it. And so it has the reputation you see, of being the easy way. There are all kinds of yogas and ways for people who want to be difficult. And one of the great gambits of a man like Gurdjieff, was to make it all seem as difficult as possible, because that challenged the vanity of his students. If some teacher some good to says, Really this isn't difficult at all it's perfectly easy. Some people will say oh he's not really the real thing. We want something tough and difficult when when we see somebody starts out giving you a discipline that's very very weird and rigid people think now there is a thing, that man means business see, and so they flatter themselves by going to such a guy that they are serious students, whereas the other people are only dabblers and so on. All right if you have to do it that way, that's the way you have to do it. But the Taoist is the kind of person who shows you the shortcut. And shows you how to do it. By intelligence rather than effort because that's what it is.

In so many athletic and artistic skills, you'll find a teacher, who teaches you how to do it without forcing it. I once started the piano. I'm absolutely no good at it now because I don't practice. Involved in other things but I had an absolutely superb teacher. For a while. He was a very very great musicologist you know there was nothing sloppy about his standards. They were of the highest perfection. But when I first went to him, he said Let me see what you can do so I played him a scholarly Sonata. He said, 'Yeah but the trouble with you is you're trying too hard. You're hitting the piano and you should never hit a piano.' He said, 'actually, all you've got to do in order to play a piano is to drop your hands on it' and you need to have relaxed arms so he made me practice for a while he felt my muscles to see what I was relaxed or not and he's not just dropping out on the piano I don't care what notes you get but just drop your hand let it fall so there's enough energy in the weight of your arm to play as loud as you will. Or a soft as you will But just let it drop, you so that's all you have to do is drop your hands and you kept feeling my arms he said no no you're getting too tense you must pretend you are Lao Tzu. And he was there were a very educated man he knew about these things and, then he said Now after dropping your hands all you've got to do is hit the right notes. I'm and he said you know. The same thing is involved in making a very complex trill and he

demonstrated he has dropped his hand on the piano and at the same time his fingers went for a look like that and there was this magnificent ornamentation. And then we went on with practice this for some time he said Now let's get around it in the right notes and, he found immediately I had a block on reading music, because when I was a small boy and started piano, at the age of roughly eight, I had a pestiferous teacher, who was the mistress in this private school I went to in England. And she used to sit beside you would hit your fingers with a pencil every time you made a wrong note. Gregory Bateson, I think was taught piano and as a child in such a way and he has a total block on reading music. He really has got a brilliant mind, you know, he's a mathematician and great anthropologist, ethnologist and so on the other total block to reading music. And so this man had to teach me to overcome my block. And he said now, first of all, feel perfectly free to make mistakes. Everybody is going to make some mistakes, and it doesn't matter if you make a mistake, and if you do make a mistake, don't don't go back and do it over again but just go on.

So play as slowly as you, like don't hurry it just so long as you keep the relative rhythm, the relative values of the thing, go slow and take it easy. Another thing is to not to pay so much attention to the notes, but to the distances or in intervals between them, because that is the significant jump. And this sort of overcomes to the difficulty of key signatures, where we start out with is it learned we started out learning music with this weird system, that the lines on the staff really represent the major scale of C.. And that therefore, when you put a key signature at the beginning, you remember that every time you... Supposing you're playing an F. every time you hit B. It should be B. flat. While that's extremely tedious way of learning music, and you just have to think in different keys that's the only way to adjust to a key signature and play in the thing according to the intervals appropriate for that key. But you see, in this instance, this man although he was a great perfectionist and was highly skilled in music, he used intelligence first of all, to give you a shortcut, and then he also used relaxation to enter into a difficult thing by the easiest route.

Did I tell you yesterday that incident about the seed? Catching the seed by its hairs I did, yeah? Well, see I was making the point there about intelligence that, when the wind blows and the seed responds like a living

animal. You can say that it's not a living animal that it's only a seed with whiskers on because those whiskers on the seed are a manifestation of the intelligence of the seed, in the same way as the sail manifests the intelligence of the sailor.

So, Taoism is in that sense what everybody's looking for. The easy way in, the shortcut, using cleverness instead of muscle. So the question naturally arises, isn't it cheating? When in any game, somebody really starts using his intelligence, he will very likely be accused of cheating. And to draw the line between skill and cheating is a very difficult thing to do. And I'm sure if you've read Life magazine recently or aware of the tremendous controversy going on in the bridge world, because a champion team. A couple of partners, has been accused before the whole bridge world of cheating. And what they did I mean after all in bridge bidding is a way of letting your partner know what's in your hand.

Philosophy of the Tao

The subject of this seminar is going to be Taoism as contained in the teachings of Lao Tzu and Chuang Tzu, who Lived approximately four hundred years or more before Christ. Separated probably by one hundred years from each other, as is often repeated. Lao Tzu started out. By explaining that which can be explained is not the eternal Tao. And then went on to write a book about it. Also saying, those who say do not know, those who know, do not say. Because there's nothing to be explained. You must remember that the word explain means to lay out in a plane. That is to put it on a flat sheet of paper. All mathematics is done on a flat sheet of paper, until very recent times. But it makes a great deal of difference because this world isn't flat. If you draw a circle on a flat sheet of paper, it has an inside, and an outside which are different. On the other hand if you draw a circle around a donut, the inside and the outside of the same.

So, what we are first of all saying, is that the Tao, whatever that is, cannot be explained in that sense. So it's important, first of all, to experience it, so we know what we're talking about. And, in order to go into Taoism at all, we must begin by being in the frame of mind, which can understand it. You cannot force yourself into this frame of mind. Any more than you can

smooth disturbed water with your hand. But let's say that our starting point is that we forget what we know, or think we know. That we suspend judgment, about practically everything. Returning to what we were when we were babies. When we have not yet learned the names, or language. And although we have extreme this sensitive bodies, very alive senses, we have no means of making an intellectual or verbal commentary on what is going on. Now can you consider that as your state? Just plain ignorant. But still very much alive. And in this state you just feel what is without calling it anything at all. You know nothing at all about anything call the next world in relation to an internal world. You don't know who you are, you haven't even got the idea of the word you or I. It's before all that. Nobody has taught you self-control.

So, you don't know the difference. Between the noise of a car outside. And the wandering thought that enters your mind they're both something that happens. You don't identify. The presence of the thought which might be just an image. Of a passing cloud in your mind's eye. Or the passing automobile they happen. Your breath happens. Light all around you happen. Your response to it by blinking happens. So you simply are really unable to do anything. There's nothing that you're supposed to do, nobody has told you anything new, you're unable completely to do anything. But be aware of the buzz. The visual buzz, the audible buzz, the tangible buzz. The smell of all bugs it's gone. Watch it. Don't ask who's watching it you know information about. That it requires a watcher for something to be watched, that's somebody's idea. You don't know that. And loud so says the scholar learn something every day the amount of Tao unlearns something every day. Until he gets back. To non-doing. And that's what we're in at the moment. Just simply. Without comment. Without idea in your head. Be aware of. What else can you do? Don't try to be aware, you are.

You will find of course, that you can't stop the commentary going on in your head. But at least you can regard it as interior noise. Listen to your chattering thoughts as you listen to the singing of a kettle. We don't know what it is we're aware of. Especially when you take it all together. And there's this sense of something going on. I want to even say that this is what I said, it was going on. That's an idea. It's a form of words. Obviously I

wouldn't know if anything was going on unless I could say something else wasn't. I know motion by contrast with the rest.

So while I am aware of motion, I'm also aware of rest so maybe what's at rest isn't going on and what's motion is going on, so I won't use that concept because I've got to include both. And if I say Well here it is, that excludes what isn't, like space. And if I say this it, it excludes that. I'm reduced to silence. But you can feel what I'm talking about. That's what's called Tao in Chinese. That's where we begin.

Tao means basically that way. And so course. The course of nature. Of which allowed Lao Tzu says, Which means. That Tao means. The way of functioning of the Tao is a yawn is all of itself so. That is to say is spontaneous. Watch again what's going on. If you approach it with this wise ignorant. You will see that you are witnessing it happening. In other words, in this primal way of looking at things, there is no difference between what you do on the one hand, and what happens to you on the other. It's all the same process. Just as your thoughts happen, the car happens outside. The clouds, the stars. When a Westerner hears that, he thinks of fatalism, or determinism. That's because he still preserves in the back of his mind, two illusions. One is, that what is happening is happening to him. And therefore he is the victim of circumstances. But when you are in primal ignorance there is no you different from what's happening, and therefore it's not happening to you. It's just happening. So is you ,you know, what you call you what you later call you was part of a happening. You're part of the universe, although the universe strictly speaking has no parts. We only cause certain features of the universe possibly you but you can't disconnect them from the rest without causing them to be not only nonexistent, but never to have existed.

So, when you have this happening the other illusion that Westerner is liable to have, is that it's determined in the sense that what is happening now follows necessarily from what happened in the past. But you don't know anything about that in your primal ignorance. Cause and effect. Why, obviously not. Because if you are really naive you see. that the past is the result of what's happening now. It goes backwards into the past. Like a wake goes backwards from a ship. All the echoes are disappearing finally,

go away and away in away, and it's all starting now. What we call the future, is nothing. The great void, and everything comes out of the great void. Thus the way a naive person. As I explained if any of you were at my lecture last night. If you shut your eyes and contemplate reality only with your ears, you'll find there's a background of silence, and all sounds are coming out of that. They stop out of silence if you close your eyes listen just listen. You see the Bell came out of nothing floated off off off off and then stopped being a sonic echo and became a memory, which is another kind of echo. Awake, it's very simple. It all begins now. And therefore it spontaneous. Isn't determined. That's a philosophical notion. Nor is it capricious. That's another philosophical notion, as we distinguish between what is orderly and what is random. Because we don't really know what randomness is. If you talk to a mathematician about randomness he'll make you feel quite weird.

What is so of itself sui generis in Latin. That means coming into being spontaneously on its own accord the real meaning of virgin birth sui generis. That's the world that is the Tao. That makes us feel scared, perhaps, because we say well of all this is happening spontaneously who's in charge? I'm not and that's pretty obvious. But I hope with God all somebody's looking after all this. Well why should there be? Someone looking after him, because then there's a new worry that human other thought of. Like who takes care of the caretakers daughter while the caretakers visit taking care. Who guards the guards? Who supervises the police? Who looks after God? God doesn't need looking after. Oh, well then nor does the Earth. Tao, because Tao is a certain kind of order. And this kind of order is not quite what we call order, when we arrange everything geometrically in boxes or in rows. That's a very crude kind of order. But when you look at a plant it's perfectly obvious that this plant has order. We recognize at once that that is not a mess. But it is not symmetrical. And it is not geometrical looking. It looks like a Chinese drawing. Because the Chinese appreciated this kind of order so much. That they put it into their painting non-symmetric or. In the Chinese language this is called Li. And the character. For Li means originally the markings in Jade also means the grain in wood and the fiber in muscles. We could say too, that clouds have Li, marble has Li. The human body has Li. And we all recognize it. And the artist copies it, whether he is a landscape painter or a portrait painter or an

abstract painter, or a nonobjective painter. They all are trying for Li. And the interesting thing is that although we all know what it is there's no way of defining it.

But because Tao is the course. We can also call Li the watercourse. Because the patterns of Li are patterns of flowing water. And we see those patterns of flow memorialized as it were, in sculpture. In the grain and wood which is the flow of sap. In marble. In bones. In muscles. All these things are patterned according to the basic principles that is the Taoist principle of flow. There is a book called sensitive chaos by Theodore Shrank with many many photographs and studies of flow patterns. And there in the patterns of flowing water you will see all kinds of motifs from Chinese art. Immediately recognizable, including the S-curve in the circle the yang-yin. Like this.

So Li means then, the order of flow. The wonderful dancing pattern of liquid. Because Lao Tzu likens the Tao to water. The Great Tao, He says flows everywhere to the left and to the right. Like water I'm contemplating that it loves the nourish is ALL THINGS. But does not lord it over them. Because he says elsewhere water always seeks the lowest level which men abhor. Because we are always trying to play games of one upmanship and be on top of each other. Lao Tzu explains that the top position is the most insecure. Everybody wants to get to the top of the tree, but then if they do, the tree will collapse. The fallacy of American democracy. You too might be president. The answer is no one but a maniac would want to be president. Who wants to be put in charge of a runaway truck?

So Lao Tzu says the basic position is the most powerful. And this we can see it once in Judo. Or in Aikido. Which are, wrestling arts, or self-defense of Arts where you always get underneath the opponent. And so he falls over you. If he attacks you, the moment he moves to be aggressive, you go either lower than he is, or in a smaller circle than he is moving. And you have spin if you know aikido. You're always spinning, and you know how something rapidly spinning exercises centrifugal force So somebody comes into your field of centrifugal force you get flung out. But by his own bounce.

It's very curious. So for the watercourse way is the Way of the Tao. Now, that seems to light Anglo-Saxon Protestant into Irish Catholics. Lazy.

Spineless, passive. And I'm always being asked when I talk about things, if people did what you suggest, wouldn't they become terribly passive? Well from a superficial part of you, I would suggest that a certain amount of passivity would be an excellent corrective for our kind of culture. Because we are always creating trouble. By doing good to other people. You know we wage wars for people's benefit. And. Educate the poor. For their benefit. So that they desire more things which they can get. I mean that sounds rather callous. About our rich people are not happy. Whereas the poor people of height are. To judge by the way they live. And we think. We're sorry really not for the poor but for ourselves. Guilty. So a certain amount of doing nothing and stopping rushing around would cool everything. But also it must be remembered that passive it is the root of action. Where do you suppose you're going to get energy from just by being in a Jedi. No you can't get energy that way. That is exhausting yourself. To have energy you must sleep. But also much more important than sleep is what I showed you at the beginning. Passive a theory of mind mental silence. Not you come as I try to explain be passive as an exercise that's good for you. You can only get to that point by realizing there's nothing else you can do. So for God's sake don't cultivate passivity as a form of progress. That's like playing because it's good for your work. You never get to play.

So in the same way to try and force the issues wears you out. And when you force a lock, you usually bend the key. So you jiggle gently, until you find the right opening. So in the same way, anybody who knows how to conduct business always jiggles the key to find the right moment to turn the lock, and then it all happens as if it were natural and none of it will forced. So therefore, the watercourse will give you the sense that your life is a flowing. The flowing is equally you and what is not you. Or called not you. It's the process that's happening. And when you understand, that you'll stop asking questions about it. You will see that all asking of questions about it is so, shall I say tautological. You get explanations, but don't explain. All explanations of what's happening call for further explanations, because big explanations have little explanations upon their backs to bite them, and little explanations have lesser explanations and so ad infinitum. This is the analytical process that produces the atomic universe. The electronic universe the protonic universe and so on and so on. And if you go the other direction, you will find the solar system in a galaxy, the galaxy in a system of galaxies and then goodness knows what. Because obviously the universe,

as it seeks to know itself, must run away from itself. As your eyes revolve when you turn to look at them. You are the universe. You are apertures through which it is aware of itself. Holes in the wall, as it were. And so as you look. Now you see it, now you don't. It's very simple. So you will find, therefore that the big quest. What is it? What am I supposed to do? What is human destiny? Why are we here? These questions will slowly disappear and that itself will be the answer. The answer will be this is why. And this is what is going on that cannot be described the Tao. The Tao is simultaneously departing and arriving. Always. That's the meaning of the eternal Tao, the eternal Tao.

Well then, to go with the water course, is called by a Lao Tzu wu-wei. Wu means not. Wei has a complex of meanings. Which can be action. Striving. Straining. Doing. Or best, forcing. Not forcing is wu wei. So he says Tao or wu wei does nothing but nothing is left undone. In other words, Tao accomplishes all things without forcing them. So therefore when you master. That's the wrong word, because it has the idea of superiority. When you come to wu wei, by as it were coming down. You are working on the same principle as the Tao. And so this is likened poetically to the difference between a willow and a pine when it snows. The pine is a rigid tree and the snow and ice piles up on the branches until they crack. The willow is a springy tree, and when the weight of the snow is on the branch the branch drops in the snow falls off on the branch comes up again that's wu wei.

Chuang Tzu tells a lovely tale that a sage was wandering along the bank of a river near an enormous cataract. And suddenly, way up beyond the cataract he saw an old man roll off the bank into the cataract. And he thought that's too bad, he must be old and ill, and is making an end of himself. But a few minutes later, the old man jumped out of the stream way down beyond the Cataract, and went running along the bank so the sage and his disciples went scooting after him and said This is the most amazing thing we ever saw how did you survive? Well he said there's no special way, I just went in with the swirl and came up with a whirl. I made myself like the water so there was no conflict between myself and water. So, in the same way, when a baby is in an automobile accident you find often that the baby isn't uninjured, because the baby didn't go rigid to protect itself. So likewise when you learn to fall in Judo, you learn to curl up limply, and yet

make your arms very heavy so that they flop with an immense thud on the floor and that making heavy is again like water. And this absorbs the shock.

So, it isn't you see, you must realize that the watercourse is not complete limpness, because water has weight and therefore strength. And that really all energy, the secret of wuwei is that all energy is gravity. We, as a planet, would if we encountered some obstacle in space. There would be an enormous release of energy. The obstacle would feel that it was being hit by some colossal force. But the planet is falling around the sun. And the sun is falling around something else, the whole universe is falling. But since there's nowhere for it to drop it's sort of not falling at anything, just falling around itself. Sometimes there are collisions, but everything's got so much space that the very rare. Maybe the ones that didn't have space have been eliminated. And became all the dust that's in the sky. But, all energy is gravity, that's the secret of judo, it's really the secret outlay of the puzzle of the relationship of gravity to energy. It's the real secret of $E=MC^2$.

So now if you want to see to find an intelligent solution to a problem be. The work is done with your brain. You have all the necessary intelligence inside this bone. Only most people never use their brains, they use their minds instead. And think that they use their minds like they use their muscles, that you can strain your head, and work very hard with it as if it were a muscle to achieve a result, but that doesn't work that way. When you want to find out the answer to something, what you do is you contemplate it. You visualize your problem, your questions as well as you can, and then simply look at it. Because you don't try to find a solution, because any solution that comes in that way is liable to be wrong. But when you have watched it for a while, the solution comes of itself. And that is the way to use your brain, it works for you, in the same way as your stomach to just steal food. Without your having to supervise it consciously. But all our attempts to supervise everything consciously have led to things that aren't too good for our stomachs and so forth you know how it goes.

The reason for that is quite simple. That conscious attention, employing words. Can not think of very much. We ignore almost everything while we're thinking. We think along a single track. But the world isn't going on along a single track, but the world is everything all together everywhere.

And you just can't take that into consideration, there isn't time but your brain can because the brain is capable of handling innumerable variables at once, whereas your conscious attention is not or rather small strictly speaking verbal symbols are not capable of handling any more than one very very crudely simple track. That's why we have to trust our brains. Because you see, we are much more intelligent than our understanding of ourselves. When a neurologist admits that he has only begun to scratch the surface of understanding the nervous system, he is actually saying that his own nervous system is smarter than he is. It's outwitted him so far. And that's remarkable, isn't it. So you see, what you are, is necessarily more art than anything you can understand. For the simple reason that an organism which completely understands itself would be comparable to lifting yourself up by your own bootstraps. Or kissing your own lips.

So, there's always this element of the nothing or unknown in any process of consciousness or knowledge. And if that irritates you, remember you are really addressing yourself to a stupid problem. Because fire doesn't need to burn itself. Any more than a light needs to shine on itself. So for light to ask, what am I? Although it sounds like a sensible question, isn't. Because how could you answer it? Let me demonstrate this to you in another simpler way. For many many hundreds of years, human beings have wanted to know what is-ness. What is matter. Substance. Obviously, it seems there must be a basis, for all the shapes that we see. After all, clay is the basis of vessels. Iron is the basis of tools, wood is the basis of furniture. But what is the basis of that? What is the substance common to everything? Well we tried to find out and that was the reason at least in the beginning of things why physicists try to find out what matter energy is.

Well, when you consider the problem, consider the question. Ask yourself, what sort of answer you're looking for? Supposing you found out what matter is, in what sort of language would you be able to describe it? And you realize that you couldn't. Because all that language can describe, whether the language be of words or of numbers, is pattern, form. We can measure form. We can outline it. We can explain it. But we couldn't possibly explain stuff. Just basic oomph. There would be no way of talking about it. Therefore we're asking a silly question. We're asking for a

question to be answered in terms which couldn't answer that kind of question.

So therefore we might say, you don't need to relive the idea of stuff, of matter, because what you've got is form and I could say it's the form that matters. In anything. And you know you take a double take on that. When you look at the world as form you will not ask questions about what is it made of. What are the shapes made of there because they're not made it says Tao WuWei and Wu Wei way means also not making. Making is different from growing. When a plant grows, it is not patched or put together. All the so-called parts of the plant grow out of it, whereas when you construct a machine, you assemble the parts and put them together. This is not the way a plant works, it's not the way you work. When you eat your food, it is ridiculous to suppose that this is the raw material of parts which are going to be one hundred manufactured in a factory and distributed to screw on different parts of your body. It's a silly image.

So, you don't ask therefore what are things made of? The next thing you don't ask is how do they go together? Because here becomes a very very fascinating thing, that what we are unaware of is that so-called separate things are joined by space. We always think of space as separating. But that which separates also joins, that was why the word cleaves is so important. It means to stick to and to divide. So we are cleft by space. When you look at a distant galaxy we call it a nebula. Because we are seeing it from a long way away. When however, we get close to it, the nebula disappears, and we see individual stars. We are living in the middle of one. From a long way away, all the stars in our galaxy appear to be a thing. But right close up, we don't see that thing. What is it that keeps all these stars together? Oh, we say gravity. Gravity is a word for something that means simply we don't know what it is. Like the ether, that was once supposed to be the fluid through which light was transmitted, and was discovered not to exist. That we could somehow do without it, that light went through nothing, through space. Marvelous. Apparently.

So, here are all sorts of things not joined to each other by strings, and yet they constitute a thing. And so, when we get down to our own atomic structure, we are, if we were looked at closely enough, we would be like

galaxies. With our atoms vastly distant from each other. What holds us together? Isn't that the wrong question. Because what is what matters is the form. It is your shape. Now, if I saw you, sometime again and I meet you again, how do I know you? It's I recognize your shape. If I haven't seen you for some time, when I meet you the second time. There is nothing of you that I knew before. All your so-called substances changed. Just as if I visit a waterfall, a few seconds later, you know, it's not the same water. It's falling the same way, the same style, and so in the same way when I meet you today yesterday the day before you were doing you were the same style of the same pattern. But it's all different.

So, that pattern can come to an end. And then after a while it can happen again. Just as if you take a newspaper photograph and look at it under a magnifying glass. What you saw with the naked eye as a clean line will appear to be a series of dots. And the dots are like one another. And there's no strings joining them. Change or level of magnification and there's a line. You can magnify in time, as well as in space. Only you do it a different way, to magnify anything in time, you speed up the time. So we take a fast motion picture of a bean. And we put the bean in on us. And we expose one frame per day. And then when we run the movie we suddenly see the bean moving. It puts out a little feeler and the feeler goes , And all the stalks, and leaves open. Out comes a bean, and it eventually crumbles. Fades out why we saw it just. We saw happening which we would never notice with the naked eye to slow. Now that is using magnifying time.

Now therefore, let us suppose, we had human faces, thousands of faces. Which suddenly began as a little fetus cells. And we got some rapidly into baby face into child adolescent adult old first and skull and dust,going you're a little a little all these faces coming and going to making their gesture of going through the whole lifespan. Well we would watch and we would begin to see patterns of continuity. Which, things are moving much too slowly to see these and things are moving too complicated to see them but stand off at a distance as it were and you would see the same rhythms occurring again again and again and again. So that they would appear from that distance off from time that speeded up to be a simple continuity, back to continuity from here to care. Which looked at closely as follows traits. So you would get what we call a naive language the reincarnation of forms.

You consider there's this kind of a wiggle that is recognizable as me, would happen again and again and again. With no spook traveling from one happening to the next, that wouldn't be necessary, anymore than it's necessary to have a line joining one dot in the press photograph with another dot so that they will make continuous sense of the do. From level. You know, when you watch television, you are actually watching a moving dot. It moves so fast that it creates the image. Now let's supposing you had a different kind of vibe altogether that had no memory and that. You would look at the television screen and you would see this dot dancing walk all across and leaving no trace. You say well kind of the funny thing is that doesn't make any sense. But seen another way you see all that picture makes sense. So you see you don't have to all these mysteries like our reincarnation. You don't need any spooky knowledge to understand them. It's all right out in front of you, and you will discover that as I talk to you I'm not going to tell you were saying that you didn't already know. All this was plain to you, all I would do is put it into words and such a way that you would be able to say well that's what I thought but I could never explain it. Yesterday I talked to you about the three basic principles of Taoist philosophy. Namely Tao itself, the course of nature. Wu wei, not forcing, in other words, the watercourse character of the course of nature. Te, which is virtue, of the seemingly magical power. Which comes. Of hollowing the water cost. Of taking the line of least resistance, which argues always, a higher order of intelligence, because it's more intelligent to sail a boat than to row. Even though it's a lazier way of doing it. Use the wind, use the, it's like in the same way for technology. We haven't really walking up to the fact that it would be much more intelligent to use the sun, the wind, and the tides as a source of energy rather than fossil fuel.

But once again, to understand anything about this philosophy, you really need to be in a state of wise ignorance. I am often cast among people, who are frantically conceptualizing, and defending their frameworks of conceptualization. Who have a very fixed, elaborate theory, of the nature of the universe, of man's destiny, and of the way to its fulfillment. And you will find too that these conceptions of man's destiny are very ambitious. But once you're in that framework of conceptualization. You become increasingly abstracted from the natural world, as if you were a person who lives in books, rather than in life or lives in the movies rather than with

People. Because you begin to fall into the fundamental fallacy of civilization, which is to value the world of symbol above the world which symbols represent. And of course we in our culture have taken that to the wildest extremes. So that you don't exist unless you possess a birth certificate or a passport, which is a piece of paper. So that the record of what happens is far more important than what happens, therefore we waste incalculable energy on recording. On filling out income tax forms. On seeing that in a university, the registrar's records are properly protected books a bit and the library can go to hell. But they keep safes for the students records.

So in the same way, a lot of people don't believe that they are real, unless they can read about themselves in the newspaper. And a lot of people feel uncomfortable if something fantastic occurs and there's nobody there with a camera to take a picture of it. And so children commit crimes in order to get their names in the newspaper. So that they know they're there, because their parents all the time are using appearance in the newspaper as a standard of importance and so obviously you are not important unless you too appear in the newspapers. In the record, you will go down to history. And so too, we are making records on films, and all sorts of tapes of what we call vanishing civilizations, vanishing cultures, vanishing art, vanishing species. And we seem to think, well it's all right, they can vanish, just so long as we have been recorded. Now now anyway all anymore but you can read about them in the Encyclopedia Britannica. And this confusion of the world of representations with the world of nature is just disastrous. So therefore, it's tremendously important for us to get back to the world of nature. You may have a concept that the world of nature is unspiritual. A lot of people too. And a lot of people are at odds with their bodies. But what they are at odds with, as I think I tried to point out yesterday. Is not this. But their idea of this. A lot of people resent physical change. They resent the idea of the dissolution process that is involved in physical change. That you get older. And therefore, from a conceptual point of view, you get uglier. And that just isn't true. If you are alive and alert old people are not arguing at all. Just by virtue of being old. Only you see we have very very rigid concepts of where in physical beauty consists.

So, it's important to abandon those ideas. At least occasionally. Because, if you are very attached to them, you can always take them up again later. But you see, if you think all the time it's like talking all the time. I am found by you as a very talkative person. But I assure you that I'm a good listener. In social gatherings I'll often hold the floor, only because. Somebody hasn't yet produced something more interesting than the minute some of the does I'm very silent and attentive. Because if I talk all the time I won't hear what anyone else has to say.

Likewise, if I think all the time, I won't have anything to think about except thoughts. And that leaves me high and dry. I become like a library, and all the books that are constantly added to it are about the books already in it. And that is pretty much what our big libraries are doing. So, it would be as if a painter never saw anything but art galleries. As if a musician listened to nothing but concerts. And so, very simply, this is being out of touch with the world that is naturally with us. I won't even say presented to our senses, that is too conceptual. Lao Tzu said, the five colors may command blind. The five tones make a man deaf. Because if you think there are only five colors, you are blind, and if you think there are only five tones are there. There is as we know an infinite continuum of sound colors. And the spectrum is merely a matter of convenience and classification.

So, likewise, when you read in ancient texts of mysticism that it's necessary to go beyond the senses, that's very easily misunderstood. It is not so much the senses, that is to say the eyes the ears and cetera, which falsify. It's our conceptions of what the eyes and ears bring to us. In other words it is not the percept, but the concept wherein we find the root of Maya, Illusion or of course magic. Because you can use conceptualization creatively if you know what you're doing. That's very important. But if you don't know what you're doing, your concept of reality can completely delude you.

So begin again with seeing what happens if you are just generally aware of yourself and your surroundings. Without taking any idea whatsoever about it seriously. And using no words you see. And using no words. Because of the time being you listen to my words as if they had no meaning. As if I were just making noises at you. And in this marvelous state of ignorance, there will be nothing called time. Nothing called space. Nothing call self

and nothing called other. There is just that happening. And it's not supposed to be anything particular. Whatever state of feeling you find yourself in. That is the way it's going. That's this. And you have no standards whereby to criticize it, to approve of it or disapprove of. It's quite simply what there is. And sometimes it's delightful. I won't make a discipline out of it, because that would put you off.

Sometimes it's delightful simply to sit. And be that. Of course in the fancy world it's called meditation.

See It's awfully important that we know what we're talking about. That I cannot only tell you about Tao, but show it to you. And that's the way to show it. See that's extraordinarily simple. And because of our concepts, what makes this difficult to understand, is that our minds are caught up. In two questions. Why we are doing it, and what's the use of it. It's amazing how we are conditioned to turn everything into profit. And feel guilty if we're not, now that's a very dangerous thing to say to children.

We all have a kind of a conscience in us. I'll call it the commercial conscience. Which is saying in what way is this bettering your situation? If not financially, are you improving your mind? Are you becoming more spiritual? Whatever that is. And so we don't understand, that any state that we could truly cause meditation, or I prefer the the word contemplation rather than meditation. You cannot be in that state for a purpose. Or, in a state of mind that is expecting a result to flow from it because the moment you do that, you are not in that state, you are bothering about concepts instead. This is as it were the one thing that, the one science as it were that has no goal, in the sense of objective in the future.

The stream begins in the mountains and runs down to the ocean and we are apt to say the stream is moving to the ocean as its goal. But when it gets to the ocean the water is again evaporated by the sun's heat, and it returns to the mountains, and it comes down again. Because the stream has no purpose to reach the ocean. Indeed, the stream is simultaneously in the sky, in the mountains on its course, and in the ocean, it's in all places at once. And therefore it is not going anywhere. It is simply going.

So when a Zen master was asked the question. What is Tao, he said walk on. And really nothing will stop that. One cannot not walk on. The flow is there whether you resist it or whether you don't. And when you resist it, you're like somebody swimming against the current. Which is a fast way to drown. And the skill of it lies in sailing, is to go intelligently with the current. Steering it and using it. But it bothers us, us especially Western industrial people very much indeed to consider a philosophy of no purpose, because when we say of something it has no future in it, that's equivalent to saying it's bad. But people use the word purpose of the word meaning in different ways. And often when we speak of a meaningless life or a purposeless lives, in a negative, derogatory way. We are meaning actually a person who lives life for extremely short-term purposes. The same sort of restlessness that is encouraged in you by turning over the pages of such a magazine as Life. Now you realize that a magazine of that character is designed, really, to keep you away from any sort of serenity. No article in it is satisfactory in the sense of giving you anything to chew on. It ends too soon it. Gives you just a flip here, a flip there, never goes into anything deeply it gives you a set of impressions. And you get pictures in it that are exciting or sensational or unusual which might momentarily entertain you, and you go through a whole issue and remember nothing. But it keeps you in a state of pacified agitation while you're flying on an airplane waiting in an office. Thumbing through something before breakfast sort of thing. And this is the entire characteristic of a person who lives for short-term purposes. And that normally is what one would call the meaningless life. In contrast to that, a meaningful life is generally understood to be one devoted to long term purposes. But, you know what we call serious things. But the Taoist standpoint, is neither of those. Because probably a Taoist will have thought through. The question what do I want, very carefully, and have realized there's something spurious, about most of our long term purposes. Because when you think realistically, and long termishly about the state of human civilization. You see not much more than muddling through a mess. You will then say, 'Well, what are we talking about then when we talk about a meaningful life?'

I think we should have a little bit more precision here than we usually do. In a very strict sense, words have meaning. And reality is meaning. And therefore has none. The word, the idea, which is a complex of words, or

other symbols. The functions as a pointer to something other than itself. And that other is its meaning. So when you asked the question, what do trees and rivers mean, the answer is they don't, because they're not words, because they're not signs. Unless you say, a river is a sign of rain. This is a kind of redundant statement because a river is rain a raining off the earth.

So a river, the splendor of the river is that it is the meaning and has none. And therefore, there is a quality of meaninglessness of having no meaning, and yet of being meaning, to all nature. Wittgenstein makes the remark that it is curious that. When after a long questing, there are people who feel that they understand the sense of life. Nevertheless, they cannot say wherein that sense consist. I experience something, some human being, or some quality of light. Or tree or flower, or work of art, that I find is important. And I might use the word it has tremendous meaning for me and yet when I asked what that is, I am at a loss for words. Because actually, in a very high sense, nature is nonsense. And in this way also, music is nonsense. Especially classical music. Whether it be the classical music of the West, or the classical music of India or China. Because all classical music is nonrepresentative. Not symbolic. It does not represent anything other than itself, it is happening of sound. And it is like ferns which are vegetable paddlings like crystals which are chemical patterns. And like animals, you see, with their marvelous routines. And when we look at the routines of the animals and the plants. We with our purpose of minds say, all this is for the purpose of survival. Now for the survival of what? We have already defined the entire organism in terms of the purpose for survival. All the parts of a plant are shown to have roles in the survival process so the survival process has as its fundamental purpose the continuation of the survival process. We, with our purposive minds say, 'All this is for the purpose of survival.' Now for the survival of what? We have already defined the entire organism in terms of a purpose for survival. All the parts of a plant are shown to have roles in the survival process. So, the survival process has as its fundamental purpose the continuation of the survival process. And is it not. Nothing has been said. It's purely tautological. We're going on so as to go on. And this is a purely I would call it an engineering approach to nature, where the engineer looks at the situation in standpoint of efficiency. And there has no *raison d'être* in his thinking for inefficient processes.

So therefore, if I would be going from here to there, the engineer wants me to go in the shortest possible distance and the quickest possible time. And will take a straight route rather than a wiggly one. And one goes wiggly however, not merely to say fit better to the contours of the land, but to enjoy wiggling. Enjoyment of wiggling is really fundamental to life. It isn't wiggly just because that's the easiest way for it to be. It is wiggly for the pure love of wiggling. Why do we wear shirts like you're wearing covered with interesting floral wiggles? Somehow those Wiggles please the eye, and are restful. Whereas, plain surfaces and straight lines are not always restful, and that's very skillfully handled. Because they make the I go...see. Whereas in a floral setting they are I could wander. Cos the let's over do it like Victorian wallpaper. Because that kills everything with too much of it. The Japanese do it so skillfully by using the emptiness and displaying against this a very clear wiggle, as in a flower arrangement or a calligraphic painting.

So the space and the wiggle complement each other. So, likewise if you are running, the engineering mentalities go-jogging. And they plod plod plod crowd crowd glug glug glug. Chunking along a course. But one who really understands running, dances the course. Who and he will be swerving and. Just on his toes, delightfully going. And, he will really be a more effective runner than a jogger. Because he's not doing it out of a sense of duty, and he doesn't have getting there in mind. And if you have getting there in mind, the whole journey is a chore. That's why when you're travelling in a car or by any other means. You wear yourself out by being in a hurry to get there. Absolutely arrive exhausted. Because all along you've been pushing at it. And there was no need to. You would be amazed if you set out to go somewhere in no hurry. How astonishingly soon you seem to arrive. If you go out in a hurry, it'll take forever to get there.

So what is, to understand the Chinese and Japanese appreciation of natural form which they derive essentially from Taoism. Secondarily from Zen. Because Zen is Buddhism as influenced by Taoism. You find increasingly that what characterizes their whole approach to art is the purposelessness of nature. In other forms of religious art, you find very symbolic style figures paintings, sculpture. And these figures are normally symmetrical. But what you find in the Taoist and the Zen feeling for nature is that the focal point of

reverence, of fascination, will be the unsymmetrical. It could be simply a rock of peculiar shape that has been set in space in a certain way. The rock, the bamboo etc, is not intended to have any symbolic meaning whatsoever.

It's the same, likewise with the Zen stories. When somebody asks what is the fundamental meaning of Buddhism. And the master says, 'I didn't feel like wearing shoes today.' I know very well that ignorant Chinese people will look for symbolism in this, and will explain it by some sort of allegorical performance, but that is not the meaning of it at all. This is not the sense of a Zen remark. You cannot understand the sense of the Zen remark without being rather stupid. That is to say being, taking it simply for what it is. He wasn't talking about not wearing any shoes. To lead you around. Through a kind of symbol that is a code known only to the initiates. Will be no point in such a thing. But simply talking quite directly. That's the reason, that is the fundamental meaning of Buddhism. Because, the fundamental meaning is again the Tao, and I've shown you what the Tao is. The happening. Get with it. How can you not?

So those works of art give the feeling. So supposing a wall such a favorite scene is painted as a mountain landscape. And somewhere in a tiny little human figures. It's a poet wandering along. Through pine trees beside a stream. Where is he going? Where is the stream going? Where the clouds going? Where are the birds going? We don't know, really. They are wandering on. And so you get the quality which the Japanese call Yugen. Yugen is made of two characters. Which mean mysterious and deep. But the Japanese dramatist Soami said 'Now Yugen is when you are watching wild geese and they are suddenly hidden by a cloud. When you are looking at ships far out to sea. And they are hidden by a far off island. Yugen is to wander on and on in a great forest without for a return.'

Now, in these poetic expressions, you get a feel of a certain kind. I got plenty for nothing, nothing got plenty for me. so this is the same sort of thing. Another Chinese poem that starts out my thoughts will wander in the great void. This is Yugen. Yugen therefore, is the sensation of life. Of nature, going but going nowhere. But it's not the sort of nowhere that we imagine when we see a sign which says. No thru road. Or when we come to what we call a blank wall. Going nowhere is going into pregnant space

where we do not know as it were, what will come of it. It's when space is used to let your imagination flow into it without being specific. When a certain kind of music hints at something, but never spoils it subtly by explaining it. It is for the same reason that a joke is funny when a joke is not explained. And you do not even explain to yourself why you laugh. Because that would spoil it.

And so, in the same way there is this mysterious, which is not defined. But which you understand and see the beauty of it just as you see the humor of the joke. Without defining it, and that is winds eventually there is no adequate philosophy of humor. And certainly no funny philosophy if you know. A lot of philosophers and psychologists written about the psychology of Laughter in an extremely boring way. And in a way it is as futile to discuss aesthetics in a kind of philosophical way as if we were trying to find out the formula for creating the beautiful object. But the poets, the Japanese and Chinese. Repeatedly bring up images which evoke the model of purposelessness. Now let me give you an illustration. In Japan and in China. They love building temples on the sides of mountains. And especially forested mountains in Japan. You'll get a it's a tree very like the Sequoia It's called a Cryptomeria. And there are vast cathedral-like forests on the sides of mountains Well you see a great gate at the bottom of the mountain. And all kinds of ornate carvings in the gate, because it's in the ancient Ton Dynasty Chinese style which is the style of Japanese temple architecture and there are clouds and dragons and up sort of girls of all sorts of wonders in this gate, and you go through and there's a ground set of stone steps, flanked by guardian dogs and bronze lanterns going up up up marvelous approach and at the top of it is another such gate with maybe a great sliding doors in it, and you go beyond that and there is a courtyard surrounded with maple trees in front of the Cryptomerias. And there is the temple. Splendid great building you go inside and there is a marvelous golden altar. With borders and incense and golden lotus flowers and candles and very very splendid butter. Sitting on his Lotus throat smiling down at you. Well after that somehow or other these things are all rigged so that you find yourself behind the temple have lowered bellow there's another flight of steps going up not perhaps quite so grand. And you go up and up and up and up. And at last a different kind of Temple confronts you this may be a Shinto temple. And this will be very simple construction. Or it might be, the Hermitage,

the personal house of the chief priest. The gate to this is more rustic. And there may be a small garden round it, leading you to a further ascent of steps beyond. And you go up and up and up once again. And, here is a graveyard. They don't have sort of ugly tombstones like we do, they have simply square pillar with the name of the deceased written on in Chinese characters, sometimes they're wooden And there's the sense of the graveyard, somehow it's not quite as depressing. Because somehow the graveyard simply says it all flows away. And right at the back of the graveyard. There's another shrine. And you get to that. And what is in it in the place of honor. A mirror. And then oh my goodness, there's still another flight, going up. Just, very crude, small steps going get higher into the trees. And suddenly, the trail vanishes, into the bushes. And a Haiku poem says, this is all there is. The path comes to an end among the parsley. And don't remember that as a child? Of exploring around somebody's garden and there are all sorts that we look at things you see from the low down and you don't look over the top of everything like an adult. So you explore a little ways that go around through bushes, and here's a trail and finally it just vanishes. Into, it might very well be parsley. And I, so vividly remember that, how magical. That was. I felt I could disappear at that point and never be discovered. That there were all sorts of secrets hidden in those bushes. I never specify what they were. That was the whole point.

We cannot conceive the real thing that we want. It would spoil it to do it, because then it would become a mere conception. What we're looking for is the great surprise. You see, and to the degree that we preconceived it, it will fall flat. The whole principle of the universe, you see. If Taoist principle is spontaneity. It is to accomplish, a miracle without doing anything. Without planning it. And you will see here a coincidentia oppositorum. As you can find out for example by exploring, the relationship between doing and happening, you can explore the relationship of freedom and necessity. And you can see that, as you can't visualize one without the other, that there could be a state in which you can see all process, as simultaneously free and necessary. That's a contradiction in ordinary logic. But when we say of something that it happens necessarily, we are separating this happening from a cause. And that is a purely conceptual separation. Strictly speaking, everything that happens is part of the same event as its cause. Like I was showing you that the river is all one event, you can't say that the river is

caused by its source. And if it wasn't flowing, there would be no water in the ocean to pick up. That sort of thing.

So, you can get to a point where you understand that it's only you look at your behavior at the Tao, from one point of view and you can see it's free that is to say it is emerging now from the void. Quite freely, quite spontaneously. For look at it from another point of view, and you can see that everything that happens happens necessarily. Actually, the truth is neither one nor the other These are just different ways of classifying, ways of looking at it. It's like what you call in mathematics finding a limit. That is to say if I have a magnet has North Pole and South Pole must start at the North Pole. Chopping cut off sections cut off sections approaching the South Pole. At every point that I cut off a piece, I will have an off power. It will still be enough all the way until I get right to the end when the whole magnet has been chopped up. And it disappears Okay, let's do the other way I begin from the South Pole every time I chop getting closer to the north a piece left is still south. That's the idea of a limit. So in the same way, if you approach the world from the end called necessity, and you'd start chopping chopping chopping to get to the end called freedom. It will always be a necessity if you approach it that way you'll see everything is happening necessarily then if you turn it round to begin at the end called freedom it will always be freedom until you get to necessity and the thing disappears. For this reason, now then, the poet who speaks next to the musician most eloquently about Tao, doesn't philosophize. The poet merely gives the image. This is all there is, the path comes to an end in the parsley. That one could say. Enough said.

Way Beyond Seeking

One of the first things which everybody should understand. Is that every creature in the universe that is in any way sensitive and in any manner of speaking conscious regards itself as a human being. That is to say. It knows and is aware of a hierarchy of beings above it and a hierarchy of beings below it. If you take such a tiny creature as a fruit fly which lives only a few days. It is aware of all sorts of weird little animals and objects and spores floating in the atmosphere which we don't even notice unless we've got a microscope around very few people have. And it criticizes them as

being inferior animals and all that sort of thing whereas human beings are things that it doesn't comprehend and that it is as much outside its. Intellect as a question is outside ours. And we see these far off objects floating in the heavens and we have only the vaguest idea of what they may be actually we may all be some kind of. Atoms within the hair on somebody's nose. In another dimension, and all these galaxies being the constituent elements who knows? But there is, I think, a fundamental principle that everybody must understand in order to know what is the meaning of the Tao, or the Chinese sense of the course of nature and that is the principle of relativity. It's absolutely fundamental to an understanding of Taoist philosophy of relativity. That is to say that wherever you are, and whoever you are and whatever. But you are you're in the middle. You know pig-in-the-middle, that's the game. And you have you see just in the same way as when you stand say on the deck of a ship and you can see a horizon all around you to exactly the same distance you're in the center of a circle because your senses extend a certain direction in all directions and therefore give you the impression of being in the middle. Everything in the world feels like that, and also it has its own kind which look natural to it you see spiders and hydras, and sea urchins and so on don't look very natural to us. We say well, I wouldn't want to look like that. But they say when they see us. Well what kind of an awful thing is that and what a lot of nonsense it does. You see if your dog watches you when your typewriting. Look at you and... Human beings, especially cats. Dogs are dogs have tried to catch on to human beings in a sort of a funny way, but cats look at you and think you are out of your mind You're absolutely crazy what do you sit there all day for feverish Lee pecking away at a typewriter say or doing something busy like that when you could sit in the car up and and purr. You just, from the cats, cats point of view you don't understand what life's about all.

But all cats and cat company cats in cat company they feel that they are people. Because the definition of a person is where you look from. And of course that is the meaning of the very interesting Buddhist idea. You can only become a Buddha, that is to say you can only become enlightened, liberated and aware of your unity with the universe, from the human position. And Buddhism calls itself the Middle Way, because it is the way for someone in the middle and that's everyone. So there is believe it or not, a form of yoga, ways of liberation, for worms, for fruit flies for snails, for

spiders, for birds, for everything. And they you see in their situation. Feel just as cultured as we can possibly think. And they have their distinctions and their snobberies, just in the same way that we do. Because you see, they dig all sorts of things that we don't even notice. We think a person is cultured because they play the piano or the violin or they read poetry and they have a lot of big library and they have paintings all around, and they have a fancy house and so on and we say well there's a person of culture and we can see at once that this is really some rather elegant human being. But when you get down into the world of fishes, they have exactly the same thing only instead of depending on collecting a lot of books and things like that it is the precise way, the very subtle wiggles of the tail. That little tremors of vibration that makes one fish a very superior fish as compared with other fish and all the other fish look at that one and say oh by to be like that what a genius. To be able to do just that little extra thing see because they're very sensitive, even airplanes in formation can't begin to do what birds and fish can do in in the communal swirling dances that they do. Now, let me just interject something here that is rather important. Biological existence is such that you have the klil to live. And vegetarians have no way out because plants also are forms of life and in to the degree that they are aware and they are aware to a certain degree they think they're human. And when you chew up plants, you are making a bit very painful experience for cabbages and carrots and things like that, and you can't get out of it.

And the only possible solution of the dilemma that we are in ethically, that we have to eat in order to to live, that being is killing. The only possible solution to this dilemma is to reverence food and to cook it as well as possible and enjoy it to the fore there is no other ethical response that is in any way across the situation and also you must as a human being remember that you aren't the only pebble on the beach. That you belong just as much as the fish and the cows and the apples. You belong to a mutual eating society. And something in the end is going to eat you.

Now, human beings are not as a rule eaten by large creatures we've got rid of them. Things like lions and tigers that chew up on human beings and not many of them around we are eaten instead by tiny creatures, and that the morticians are a very vicious group of people because they are trying to deprive all those microorganisms of the proper human food. When they

bury them in formaldehyde and encase them in concrete things with complicated bronze caskets where instead of giving the worms a ball, they just do nothing, they just rot there. Becoming, becoming slowly more and more sort of attenuated and parchment like. Instead of. Continuing into the flow of the course of life, which is the proper thing to do to make an act of respect to the earth from which you have gained all these life, and give yourself back to it when you die. After all, it's only courteous. And this keeps the thing the thing running.

So we should start a campaign at once to abolish the whole mortician business and put it in an entirely new lines, where dead human beings are buried in a great fields, about three feet underground which are left for a long time until all stinks and everything and vanished and this is the most beautiful soil for growing corn and lettuce and artichokes and vines and everything beautiful. So you go back into the cycle.

But now, here is a very strange thing. That every creature therefore, which feels that it is human. And which knows that it's there in the same way as you know your here. Experiences being here as constituting a sort of blockage. Now, practically there are very few human beings that don't feel this. And I'm sure there are very few creatures that don't feel it in some way too. The sensation of a certain tension, which constitutes the feeling of I-ness, of thereness, of being here. Because after all every creature is a particular form. Everything is individual. Not only you as a turtle organism standing here but all the components cells of your body. Each one of them has some sort of a feeling of its own. And it is individual. You can look at a microscope at the right level of magnification and you can see that thing there. With its own little life, and if you examine the stream of your blood you'll find it full of all kinds of organisms that are having all sorts of conspiracies and games and plots and eating each other and doing these things that like we do. Only, we really realize that we wouldn't be healthy as a total organism unless there were all these wars and fights and plots and politics going on between the various cells in our blood. But from their point of view, you see, they feel a little bit put-out. Because they're being organized. And we're in the same situation because very slowly, the human beings on the surface of the planet are realizing themselves into a total planetary organism with an electronic nervous system. You see, in science

fiction which was published round about the 1920s. It was always expected future human beings would have enormous heads because they would have very big brains and they would be very wise.

It didn't work that way. What happens is that the human race is building a brain outside its body. That is to say an interlocking electronic network of telephonic, television, radionic communications, which is rapidly being interlocked with computers, so that you will, within a few years, be able to plug your own brain into a computer. You will have a little gadget here, behind the hearing aid and that will be integrated with your brain in such a way that you can plug in right here. That will only be an intermediate stage, because just in the same way as when we thought that all communications by electricity had to go through wires and then we got rid of the wires and got radio and television.

So in exactly the same way we will eventually get rid of telephones and radio and television and we'll communicate by some entirely new method that is at present called E.S.P.. But that will mean, that absolutely nobody has a private life anymore. Everybody will read automatically everybody else's thoughts you won't be able to defend you'll have no defenses everybody else will see right through you. And some people will protest and say well this is terrible there's no privacy anymore that means there's no me. Well that's what's happening to your own selves in your own neurons and they objected at some time in the course of the evolution we're getting our private life taken away we're being organized into a body. And we're doing the same thing. Only we got to try and see if we can be clever about it, and that is to say to do two things at once. To have this tremendous openness to each other whereby I don't care if you read my thoughts and you don't care if I read yours, but at the same time nevertheless each one of us retains a peculiar individuality. Almost in the same way as nothing could be more unlike a stomach than a heart. And nothing could be more unlike a kidney than pituitary gland. And nothing could be more unlike intestines than a rib cage. You see, there's a lot of differentiation inside the body. Despite the fact that it is a completely. An organism functioning all together.

So then, the problem though, as I said is that for each individual which is outlined which is a separate thing, or rather I would instead of using the word separate I would like to use the word distinct separate as I use the word means disjointed cut off from, distinct, means a feature of something where an absolutely distinguishable pattern is part of a larger pattern of a whole. So something can be distinct without being separate, in just the same way as back and front can be very different and yet inseparable.

So then, there is then this this sensation of a practically every living being of constituting. A center of tension and of resistance. That is to say, of being a little bit blocked or shall I say of being in the way. Being in one's own way. Imagine the opposite. Let us suppose for example that you got up in the morning with a feeling of total transparency. There's no resistance in your organism to the external world. You just float through it. You're part of it, it's part of you and just in the same way for example that when you seen if you see well. We were aren't aware of your arms but if there's something wrong with your eyes when you see spots in front of you. Then you are looking at your eyes and your eyes are getting in your own way.

So, the Taoist sage Chuang Tzu says, that when clothes fit well. You are not aware of them when your girdle or belt fits properly you are not aware of it good shoes your unconscious thoughts and so in exactly the same way the perfect form of man is unaware of self because he doesn't get in his own way he is sus in this sense completely transparent. Now, you are thinking I'm trying to sell you a bill of goods. That I'm going to teach you some technique so that you can feel perfectly transparent. And that this is the proper way to feel this is the way you ought to feel I was not that simple.

Point is, to begin with, if you do in and really rather natural way feel alone. And feel a little bit vulnerable. That you've got a soft skin and you've got a weak heart and you've got you know, all those ills that the human body is ere to, going on inside you let's begin with that. Let's begin with the way in which we do in fact constitute a sort of block in the middle of things and that fact we heard a bit and through hurting a bit we know we're here. See, people go very often to extreme measures to know that they're there. I was in Mexico two years ago, and I trying to find out what was really behind all the blood and gore in Mexican Catholicism. Why they love pictures of

Christ that is sold in the little shops where he's green, and his face is contorted with horror and blood pouring down a crown of thorns with the longest spiky a strong you ever saw sticking in and these crucifixes where they have carefully modeled sauce on them and all that kind of thing and then that Guadalupe these girls. Kneeling walking for a mile right down the avenue to the altar in that thing what is it all about why the answer is quite simply if you hurt, you know you are there. And this is part of the whole meaning of penances, and all sorts of trials that people go through and all kinds of adventures and all sorts of very very difficult massage experiences and so on is that as a result of this, it becomes quite apparent that you do not truly exist. You are there. You are a kind of an obstacle to the flow of life, and as life impinges upon you Wammo, you rebound and you hurt a bit and so you you are there.

Now then, although people cultivate this, they say are in general they rather it would be not that way. We would like to forget our selfs. And so ever so many people say well I want somebody to lose myself in. I want something to belong to. I want to join a religion where I can sort of feel that I take part. I mean something, or I go to the movies to forget myself. I read a mystery story to forget myself. I get drunk to forget myself. Because the peculiar quality of the drug called alcohol is that it turns you off. It makes you increasingly insensitive to pain and to being, and so on, so that you can get a certain vague sense, a rather misty sense of floating. When Gurdjieff had a boy he was training, he was making him wait table one evening and he suddenly before dinner filled him with an enormous amount of vodka. And the boy went around all evening in the sort of floating state and a Gurdjieff said to him afterwards, 'Now listen. When you can feel like that naturally all the time you've learned my discipline.' But here it, is so as things stand. One ordinarily doesn't feel that way and therefore takes alcohol or something in order to disappear in order to feel less, this sensation of resisting the world.

Do you know if you study your body and its dynamics, you will find that you are fighting all the time? Most people are some aren't but most people are fighting the external world all the time. My friend Charlotte Silva often tries an experiment where she makes a person lie down on the floor and says to the now look. The floor is solid and it will hold you up. You don't

have to do anything to stay where you are just lie on the floor. And then. She looks at the person or may touch them slightly and say Do you realize you're making all sorts of efforts to hold yourself together. Because you're basically afraid that if you don't do that you will just go blue there and disappear into a kind of formalist all over the floor but you won't see your skin your bones your muscle tone us and everything is all there naturally, and it will hold you together there's nothing to worry about and all you have to do is lie on the floor. And you don't have to make any special efforts to stay together. But very many people are afraid that they will fall apart or somehow disintegrate if they don't make efforts to hold themselves together, or else that they will be disintegrated by some outside agency if they're not constantly on the alert like this particularly if it's better all around you see to protect themselves.

Now, I'm not a preacher. That's the most important thing to understand about me. I'm not saying you shouldn't do that. But I'm inviting you to become immensely aware of the fact that if you do that at all, that you do it. And that you have therefore that sense of being alone, of being a particular separate form that is unlike any other form on Earth. That's just you. And concentrate on that. After all, for many people, they define this as their problem. So you ought to be able to feel it without the slightest difficulty because of the driver asking you to feel some transcendental sensation or something of that kind, and it is just a very ordinary sense of being you and being alone.

Now, as you focus on that sensation of distinctness, we'll even call this one separateness because we do. We have been brought up to feel separate, we have been brought up to feel actually disjoined from the external world although that is pure mythology and doesn't exist at all. You are as much part of the external world as a whirlpool is part of a stream. But we are brought up not to notice that. But if you've been brought up that way, and you don't notice that you're as much part of the world as a whirlpool is of a stream, you feel this intense separateness. The thing to do with all feelings that you don't like, is to experience them as deeply as possible. And go into the inmost depths of loneliness, and indeed that are say the inmost depths of selfishness. Are you selfish? You know, lots of people try to pretend they aren't. And say well I try not to be but I guess I don't succeed all the time.

And so, Krishnamurti you know is a very devil because he always roots it out he shows all the people who are very good and have the highest ideals and who are doing everything that they are really doing it for the most the same sort of motivation as other people are robbing banks. And only they're giving it a name so as to conceal it better. See, that's like culture. Culture is a way of more clever way of concealing the fact that you have to eat. You like the Queen of Spain who are into debt is. The here eight hundred sixty is came in with these enormous skirts and floated in the room. And, you know was sort of coming on like she was an angel. And somebody when they were first invented gave her a present of beautiful silk stockings. A dozen pairs and sent them to the Queen and I magisters Chamberlain replied with a better returning the stocking thing Her 'Majesty, the Queen of Spades does not have legs.' light Look ma no legs. I managed to float along as the same because I'm an angel.

So you see it that way in which all kinds of high culture are subtle ways of concealing, and pretending that we do without the sings that the lower classes whether of humans or of animals do see we pretend that we don't just like you don't go around crudely taking a bull and banging it on the head with a mallet or sticking a knife through it and tearing it apart and eating it. All the dung from way off from the stockyard. And it comes to us in the butcher shop as a completely neutral looking thing called a steak. Steak has absolutely nothing to do with a cow or steak or something wrapped up packaged like that and they all t-t-t-t down like that and over here they pick up a steak and test it think thinks poor Cow. Like a cow, it doesn't remind you of one in any way. So that's culture.

But you see however much you mask it under lofty ideals. I mean that the most religious people in the world the greatest saints are the various rascals. I've known lots of them. I'll tell you in confidence I've known a lot of clergyman. And the filthiest stories I have ever heard in my life were totally.

So, in Hebrew theology incidentally. That there is a thing called the yetzer harah. And in the beginning of time when God created Adam he implanted in him the yetzer hara and the yetzer hara means that wayward spirit. He put something funny in man so that man would be a little odd and it was a result of the yetzer hara that Adam was tempted by Eve who was tempted

by the serpent to eat that famous fruit. And, but the Hebrew believes that everything that God created is good. Including the Yetzer Hara. Because if it hadn't been for the yetzer hara, there would have nothing ever happened. Everybody would have obeyed God and God would have said well this is kind of a bore. Now that you see, you can't you can't just get up to someone and say disobey me, because if they do there are varying you. See that's a double bind. Say to somebody disobey me but God is much more subtle than that. He didn't tell Adam to disobey he told him to obey. But suddenly he put this yetzer hara thing in like that so that, God would say well I'm not responsible. For this thing's going to happen on its own because what everybody wants is something to happen on its own. And everybody wants that. Because you see, this sensation of being you. This curious lonely center of awkward sensitivity, subject to the most peculiar feelings and pains and anxieties and all that sort of thing all that. Is an essential prerequisite for feeling something else. These two experiences go together.

If you want to... In other words if you want to be omnipotent and you want to live in a universe where nothing happens except what you exactly what you will to happen. In other words you say I would like to be God if you think that's the way God is and everything is there for totally under my control. Everything is absolutely transparent to my intelligence. I have no problems. A lot of people coming on like they think they have attained the state, and that's a lot of bunk nobody wants to be in that position. Because it wouldn't be anything to it. Because once everything is under your central control, what is nothing is happening. It's a bore from beginning to end. So what any one, or any being whatsoever, who has a sense of centrality, who has a sense of self who has a sense of identity that sense of identity is inseparable from something else going on. That is defined as not being me. As not being under my control, and that may jump at any time. It might even eat me.

So, what I want to first of all to understand is that these two sensations. One, of being the lonely central sensitive vulnerable self, living in the midst of a world that feels other. That is not under your control. I want to try and show you that these two sensations are really one sensation, or rather two aspects of one sensation. You couldn't have the one experience without the other experience. Now this is a rather good thing to know. Because it means

that you won't panic if you discover this people who suffer from chronic anxiety are always in Doubt, you see, about this relationship between what I feel as myself and what I feel or something else.

Let's suppose you are anxious about your relationship with other people. You walk into a room like this restaurant here, and you sit down at dinner and some stranger opposite to you. You know nothing about the stranger, and you begin maybe you feel a little reluctant to open conversation. You don't know what kind of a whether this person is going to be sane or some kind of a crackpot, or some kind of awful stuffy square, or you don't know what it is. So you start dancing around a little but you get the feeling you see. And now I better watch myself because I do after all want to make a good impression. I don't want to make an enemy. So you watch yourself, and, this is a funny thing then begins called self-consciousness. And people say sort of Ha-Ha to each other and the usual way in which strangers come on.

And, there is also there are there is there is involved in this encounter the secret game is that people are playing all the time. To defend themselves by putting other people down. This is really a very wicked game but, every cretin see every every living being, if the truth be told is a manifestation of everything that there is an art of what it is what we call God in old fashioned language. Every human being is, and every one I as I look around I can see every one of you as the the Divine Being coming at me in a different way. Crazy.

But the thing is that what we do is to try and prevent people from realizing that this is so by pointing out to them in the most subtle ways their limitations. And seeing if we can phase them. Put a person off a little bit, make the man uncertain, make them unsteady. It's like all sorts of games that you can play where if a person wavers he loses. But people play that with each other all the time. And the reason they do it is not the reason they think. It is that the game if everybody were perfectly clear that they were a manifestation of the Divine Being, nothing very much would happen. But so as to keep everybody a little bit unclear about it, the whole thing bugs itself and creates these little doubts. So what we are beginning with this is little doubts, you see, these sensations of blockage of not being very sure of

yourself, but knowing very much indeed that you are yourself and that you're alone and it's all up to you. That terrible feeling of responsibility.

So but, what I'm trying to point out to you is if you intensify that feeling, and bring it to its highest pitch, you will immediately realize that you are aware of it only by virtue of the entire sensation of something else. Something defined as not you. So, the feeling of not you and the feeling of you, are relative. They go together, and you can't have the one without the other, and if you can't have the one without the other that means there's a secret conspiracy between the two. They're really the same, but pretending to be different. Because the whole idea is, if there wasn't a difference you wouldn't know anything was happening. I mean if it was all the same it's like that song of Bob Dylan's which says something like, 'Well I'm just like Guy Like you I was like anybody else no use me talking to you, because you just like me.'

So, the whole point is that of everybody of us all but the same and all share the same ideas exactly and so on, there'd be no nothing to talk about, because everybody would be a bore. There'd be just yourself echoing back at you. You would feel like a madman and a hall of mirrors where everything you went as was just yourself seeing in all directions that you well that's not fun. But, you may think that I'm speaking in favor of some kind of schizoid pluralistic universe. No, the whole point is this that a difference. And every kind of variety of differentiation is the way through which unity is discovered. I mean this business about. [french] is very important. And the fact that men and women, for example, as a primordial kind of difference, never can really understand each other is tremendously exciting. Because of that and that's a way by which something happens. If it makes a difference then it's there. If it doesn't make a difference it doesn't matter and what doesn't matter doesn't exist because it has no matter.

So however, it is, wherever you notice a difference, the difference has two sides. What it is, and what it's not. And these two sides, since you can't have the one side without the other side, they're really one. Because they go together inseparably. So, when you get this extreme sense of your own existence as a rather painful fact in the middle everything else. The everything else feeling and the you feeling, are two poles of one and the

same process so that the real you is what lies between these poles and includes both of them. Now this is the fundamental principle of the whole way in which ancient Chinese thought developed. The philosophy of the yang and the yin. This is one of the oldest ideas in the universe. I mean, no that's a rather too big language. On this planet. And, the philosophy which I shall have occasion to speak of a little bit more later of the Book of Changes, the I Ching, is based entirely on this. That the universe, is the interplay of difference, and the primordial difference is between up and down., band front black and whitee. Is and isn't, male and female, positive and negative. So the word yang in Chinese means or refers to the south side of a mountain, which is the sunny side. The word yin refers to the north side of the mountain, which is the shady side. Did you ever see a South-sided mountain only, with no north side. Or in it may also young may refer to the north bank of a river which gets the sun and you into the south bank of the river, which gets the shade. And so, you will remember this. And one half of course is colors, dark. As it were, two fishes interlocked. And they are chasing each other. They actually form now you see more complicated symbols in which they form a helix. This is a helix. And the Spiral Nebulae are shaped this way, in the form of a helix and this is the position of man and woman making love fundamentally. Where I am trying to get inside you, and you're trying to get inside me, and we're trying to get into the middle of each other, but somehow or other a difference and we can never quite get there. Just like if I want to see the back of my head I can go around and around and I can chase it but I never quite catch up with it. But that's what makes everything work. It is said in the the Vedanta sutras without. The Lord of the supreme no of all things who is the knower in all of us doesn't know itself. In the same way that fire doesn't burn itself and a knife doesn't cut itself.

So, nothing to God even, you see, would be more mysterious than God. Do you know somehow how you surprise yourself. For example, when you feel your own pulse. And you suddenly feel this life going on in, which you're not willing. Are all sorts of ways in which you can say you have the belly rumbles and you didn't intend to have the bed around bills and suddenly it happened or you had hiccups. And now are you having hiccups or not? Is this something you're doing, or is it merely something that's happening to you, as if it was raining in the rain was happening to you. This is a very

debatable question. Consider breathing. Are you breathing, or is it breathing you. Well you can feel it either way you can decide to breathe and feel that you're breathing in just the same way that you walk when you want to on the other hand when you forget about breathing altogether it still goes on and so it seems to be something that happens to you which is it? Do you grow your hair or does your hair just grow by itself? What enables you to make a decision. When you decide, do you first decide to decide, or do you just decide. Now how do you do that nobody knows you see.

When Chuang Tzu tells a story that one philosopher asked, another how can one get the Tao which is the power of nature so as to have it for one's own. And the other philosopher answers. Your life is not your own it is the delegated adaptability of Tao. Your offspring are not your own, they are the outputs of Tao. You move you know not how, you are addressed you know not why. These are the operations of Tao. So how could you have it for your own. And there's a funny thing then. We can experience ourselves through and through, as something that just happens. Look look, at it this way. If you feel your body, your skin, your solidity our view. And regard what marvelous eyes you have, which are the power which generate light and color. Out of all these electrical quanta in the external world. And these ears. These beautiful shells that you wear on the side of your head. With their little spiral bones, cochlea inside you know all that marvelous. But you really don't you don't feel responsible for this. You don't know how it's made it is made. But it's you. That's what you are. That extraordinary pattern, beautiful, gorgeous. Wonderful arabesque of tubes and bones and cartilage and myriads of interconnecting electronics and nervous systems and everything wonderful to see.

But the point, most people, don't don't notice they don't say this is me they say well it's some kind of very clever machine which a lot God made out of his infinite wisdom and put me in it. And this is a very limited view. Because the extraordinary thing is you see, that this is you. This extraordinary marvelous goes on, you see, but you can feel it all of it as if it was just happening to you. But if you want to feel it that way then you've got to go the whole way and you've got to feel that your decisions just happened to you. And that the thing that you call yourself to which things happen is just something that happens. You're going to you don't know how

you managed to be and you go how you happen to be conscious. That just happened too. So happenings happen to happening. So you can really yourself completely irresponsible like that so. There's nowhere. Or, when you get that way. That's a very interesting road to run. But you can try the other way. You can extend it and say, now look here. If, I really am my eyes, and although I don't understand them I mean that is sad I can't describe it in lines and words. This is mean. Extraordinary thing, but it is.

Well I don't understand how it happens. But then, you see, that's the whole point as I made a little while ago that the very Lord God Himself doesn't understand how he happens, because if he did. What would be the point? There would be no mystery we no possibility of surprises. That's why there has to be young and human Yang is bright and it understands everything yin is dark and damned if she will be understood. But there are two phases of the same being so your yang side is your conscious attention, all the bright things you know, and all the information you have and all the know-how and that you know what to do and your yin side is the other side of the young which enables the young to function because you don't know why the young inside of you function that is the conscious, bright, intelligent side of you. It all depends on something you don't understand at all. Because if it didn't, it wouldn't be there. Just like you wouldn't be here unless there was something else. So they move together.

And therefore, if you will accept the idea that you are your own eyes and your own heart and your own ears with that wonderful little spiral cochlear inside and all these amazing gadgets where you are all that. But you don't know anything about it, but you are it. Now therefore, by a little extension of the imagination you can very well see that if all those the bones and subtleties inside you feel other than your conscious ego. But nevertheless are one with it the same argument will go for all the other things going on around you. The sun shining, the stars twinkling, the wind blowing, and the great ocean restlessly pounding against these clips. That's you too. You don't control it of course, because it has to be something about you you don't control or you wouldn't you. Now see that all all that is a lesson elementary in relativity. And relativity, I've talked about it in this way which is kind of unscholarly and so on, but I want to get the message across the idea across because to understand the principle of relativity is the

absolute foundation of the philosophy of the Tao. Lao Tzu takes it up in a second chapter, when he says when all the world understands beauty to be beautiful, there is already arguments when all the world understands goodness to be good there is already evil. Thus to be and not to be, arise mutually. High and Low are posited mutually. Long and short are compared mutually. And he goes through a whole list of opposites, and show how they create each other.

It's like that wonderful little parable. The Chinese character of a man looks more or less like an upturned V. And Lafcadio Hearn in one of his books tells the story of a Japanese girl telling our little sister the meaning of the character of a man by taking two sticks of wood and balancing them together on the ground, two sticks of firewood, so that they form the upturned V. and she says to her little sister this is the character from man. Because neither stick will stand up unless it has the other to help it. And so you know we we must dig up the other. About the profound meaning underneath this is there is no self without other. And no man and ever don't create get back the original plan every creature in the world feels it's a man I don't mean a male, but a human. And that is because it is in the Situation, where the thing it feels as itself as it separate identity is supported by the equal and opposite sensation of other. Center, periphery. Here, there now, then. Is, isn't. Or whatever. These two, the yang and the in the yin, two poles that hold each other up. So the sand poem says. When misfortune comes, treat it as a blessing. When fortune comes treat it as a disaster. Once upon a time there was a Chinese farmer, who lost a horse, ran away and all the neighbors came around that evening and said, 'That's too bad.' And he said, 'Maybe.' The next day the horse came back and brought seven wild horses with it. And all the neighbors came around and said, 'Why that's great isn't it?' and he said, 'Maybe.' The next day his son was attempting to tame one of these horses and was riding it and was thrown and broke his leg. And all the neighbors came round in the evening and said, 'Well that's too bad isn't it?' and the farmer said maybe. And next day the conscription officers came around looking for people for the army and they rejected his son because he had a broken leg and all the neighbors came around that evening and said Isn't that wonderful and he said, 'Maybe.'

This in a way in a certain sense reflects a fundamentally Taoistic attitude, which is that the whole process of nature is an integrated process of immense complexity. And it is really impossible to tell whether anything that happens in it is good or bad. Because you never know what will be the consequences of a misfortune. Or, you never know what will be the consequences of good fortune. I know a woman who was quite happy until she inherited two million dollars. And then she became absolutely miserable because she was afflicted with paranoia that everybody was going to take it away from her, especially the government. And on the other hand, you've all known cases where some sort of ridiculous inconvenience or accident, served to preserve you from a worse one or else it was an occasion on which you met someone you fell in love with or formed a fast friendship with, you never know what is the chain the pattern the connection between events and it is for this reason that the Taoist has been a critical of two things. One, of words, and two, of interference. He criticizes words because among the confusions who were always literary people they had a thing going all the rectification of names.

Now I have to introduce this a little observation about confusions in general because they have their positive and their negative side but their negative side, but their rather exclusive interest in matters literary. In the history of Chinese civilization, no kind of rigorous scientific advance came through Confucian studies. Because they were scholastics, they were, that is to say. A scholastic is one who knows what's in the book and believes what the ancient texts of the ancient scriptures say and he studies them and becomes proficient like a rabbi or a Christian theologian. But mystics are not interested very much in theology. All mystics have been interested in direct experience, and therefore although you may laugh at them as mystics and say they are not scientific, they are empirical in their approach, and the Taoists, being mystics were the only great group of ancient Chinese people who seriously studied nature. They were interested in it from the beginning, and their books are full of analogies between the principles of a Taoist way of life and the behavior of natural forces of water, of wind, of plants and rocks. In many many passages, Lao Tzu likens the Tao to water, in the fact that it doesn't resist and yet nothing is stronger in the fact that it always takes the line of least resistance that it always seeks the lowest level which men abhor, and many many things are said about water many things are

said about plants many things are said about the processes of growth, about wind, how wind plays music with all the orifices and openings in nature, and blows through them, and makes and brings out their particular hum.

So it was strangely enough, from the Taoists that Chinese people developed as much science as they did develop. But you know, they never developed anything like Western technology. And this is because, or in part because, there are many many reasons, some of them purely geographical. But one of the reasons why the Chinese did not go on to develop an advanced technology, had to do with names and it had to do with a certain attitude to nature.

Now, so far as names are concerned, the Taoists always laughed at the idea of the rectification of names, because they said, 'Now look, when you compile a dictionary, you define your words with other words.' Now, with what other words you go to define the words with which you define the words. So as to be sure you've got them straight. I remember when I was a small boy I wanted to write a book which would preserve for ever the fundamentals of human knowledge. And so the first thing I wrote down in it was the alphabet, and then I scratch my head, as how I would write down how to pronounce each of these letters. And I tried to spell out in letters how to pronounce letters, not realizing of course that this was a completely vicious circle. You have to have something in order to understand words, you have to have something else. And that is a very mysterious matter, the kind of understanding that we have of things, which we then go on to describe in words. And one realizes how much one learns as a child especially from other people which is never explicitly stated. How do you know for example, whether somebody who says something to you is serious or kidding? A great deal of confusion is caused by that even among adults. And how, the processes have been examined and analyzed and studied which are required for understanding the simple sentence. And we don't yet know how the brain of a child accomplishes this extraordinary task. Which when an analyst looks at it, is extremely complicated. But of course you must realize that analysis is a way of making things complicated that we're not complicated in the first place and it was like my task that I set myself as a child the amazingly complicated task of how to write down how the letters were pronounced.

Now, a great deal of academic energy goes into this task, of proving things that everybody knows. But they want to say precisely what thing is it that you know. How can delimit it, how can we pin it down exactly and this of course there's very much involved also with law. And that's why you devised bequeath. You know you got a whole long list of words I devised because we give cetera etc So that can be absolutely no doubt about what you mean, but as a matter of fact the trouble is the more definite you become with words in describing something the more doubt you create. And so the Taoists took a profoundly humorous attitude to the, to the Confucians interest in spelling things out. Because they said you can never do it. Do you ever play a game any of you called Vish? What the rules of this game. You get say there are five people playing and you appoint a referee and each person has a copy of the same dictionary say Webster's Collegiate Dictionary and then you have many words in a hat or something and the referee draws out a word and he says. Escalator. And then, you turn it up in the dictionary and then you get a definition and you look up an absolutely key word in the definition has to be a really crucial word not the or a or something and then you look at up and then you take a key word in that definition and then when you get back to the word escalator you raise your hand and call out Vish, which is short for a vicious circle. And thereby you have won the round and the referee is there to decide that you played fair and that you did take key words from each definition and so on and you didn't cheat.

So, this shows you see how a dictionary unless it has little pictures in it. Which give you another way of understanding things a dictionary is an entirely circular process as simply a self defining affair. So that when you encounter, say I pick up a Chinese dictionary. Or better still for my purposes Supposing I pick up a Finnish dictionary which has nothing in it but Finnish language, it doesn't tell me a thing. Because I haven't got the key and the key to this language is not altogether communicable in language. So for this reason then, the Taoists being thoroughly skeptical of the power of words to describe the processes of the physical world.

Now, the Chinese language as such is a rather peculiar language unlike most other languages in that it neither declines its nouns, nor conjugates its verbs. There are certain ways sometimes of showing whether a verb

indicates the future or whether it indicates the past but in general literally translated Chinese reads like a telegram. And so, the opening of the chapter of the Lao Tzu book on Te, that is to say on power, or virtue. Says in literal English. Superior Te. Not Te, thus this has. Inferior or of virtue not let go of virtue. Thus this not virtue. And this says it so succinctly.. And we have to go away bubbling around and saying, The superior form of virtue is not conscious of itself as virtue, and thus truly is virtue. But the inferior form of virtue so insists on being virtuous that it's not virtue. And that's a very complicated way of saying things as the Chinese says it's so pithily. And so, but on the other hand, the the Chinese language which is not specific in this way that we can be, by declining nouns and conjugating verbs exactly what how and to whom we are have a better language and so do the Japanese, because they have an arrangement for using Chinese in such a way as to decline the nouns and conjugate the verbs. We have a better language for describing technological processes. You know how it is when you get a set of instructions to put something together. First do this, then do that, then do the other things well boy you should get some kind of a Chinese product from Hong Kong we've put together instructions and you just know where, you have to know how it's done before you read it. Oh yes. So. You mean on these sort of emergency instructions yes?

But at the the compensatory delight of this language is that you can say several things at once and mean them all. And, however the point now that we go on to, is the second one. With this realization that language is a net which will never succeed in capturing the world, goes a reluctance to interfere with the processes of nature. Because what you think may be a good thing to do may be good only in the short run. It may turn out to be disastrous in the long run, to give the very simple example which is very close to the hearts of all Chinese and Asian people: the problem of population. What on earth are we going to do about that? Because, in times past the huge populations of India and China were pruned by perennial outbreaks of cholera and other diseases which wiped out millions of people famines and so the population was proved. Now however, with the methods of modern medicine, we begin to stamp out these plagues. But then a new plague turns up in the form of human beings. Too many of them. Well, you mustn't you can't just can't go around in cold blood shooting down people are getting rid of people you regard as not making up to certain standards. It

was somehow better if the cholera did it, because that was impersonal and it bore you know spite. But when human beings have to decide to get rid of each other then there's real trouble.

So a Taoist would be on the whole inclined not to interfere with the course of events, because he feels that they are of a complexity so great that he, with his verbal interpretations, because all that we call scientific knowledge is a verbal interpretation of what's going on, and of certain selection of things that we call good and the selection of certain things that we call bad. Well, he feels that he doesn't really know in terms of words whether a given event is good or bad. He may feel badly about it but he may feel that this is the proper and appropriate way to feel in such circumstances, and that it will go over, it will pass for as Lao Tzu said, 'The fierce gale does not last the whole morning. Nor does pelting rain go on all day.' Maybe you haven't lived in Big Sur. But still in general then he goes on to say if heaven and earth cannot keep up these things along how much less can mankind.

So this then is a basic attitude in Taoist philosophy which goes by the name of Wu Wei. And that is this. That means Wu, that means. Negative. And wei, wei means, doing, interfering, business. Poking into things. So Wu Wei means don't interfere, don't strive, don't, don't really the best meaning of Wu Wei is don't force it. As when for example you're opening a lock and the key doesn't seem to turn if you force it, you'll just bend the key so what you have to do is jiggle pull back and forth jiggle jiggle jiggle until you find the place where the key turns. And that's Wu Wei. Wu Wei doesn't mean total passivity, because you see, on the other side of the picture about interfering with nature. Is that you must interfere, there is no way of not interfering even when you look at something you interfere with it. It is your very existence is an interference with the environment, from a certain point of view.

So, there you are, you're stuck with it. Everything you do alters the balance even if you sit perfectly still you're still breathing, and that alters the, the nature of things going on around you. You're exuding temperature and that changes something. And then when you start eating and doing all sorts of things like that you really do start changing things. So you can't avoid

interfering, and yet the the maxim is don't interfere but it means best that translated don't force it.

So then, what do you do? Well you have to interfere as wisely as possible. That is to say, you have to find out, how to interfere along the lines in which things are already developing. This is like sailing a boat. It is a much smarter to sail than to row, because it takes less energy. You simply use the wind by putting up a sheet. But then, supposing the wind isn't going where you want to go. Then you learn to tack. But you keep the wind in your sails all the time and you use the wind to go against the wind. And therefrom comes the idea of Judo. Judo is the Japanese way of saying the gentle Tao, the gentle way. And, in Judo, the basic principle of the whole thing. Is that. You are not an attacker that underneath judo is a deeper philosophy called Aikido. The way of. And Aikido is that you can never be attacked, because when somebody attacks you, you are not there. Or, you are there, but in the form of a vacuum. So that the attacker get sucked in. So fast by his own force that he falls over. So, in Judo one always uses the strength of the opponent to bring about his downfall. You may add your own strength at a certain point. In other words, when you are throwing someone in Judo. There is a point where his own strength has taken him beyond the peak. You know, when a thing is falling over it reaches a certain peak where it's gone you see, it's all it's on the way down. It is at this moment that you add your strength and saying wowiee see, when there's a curious throw in judo where you are you get a solid you get holding him and you get him up on your foot like this you see and then he is moving in this direction. So, just when he is off balance you go woops, like that and so anyway over on the floor that direction. But he has to be beyond the falling point you see and then only do you use your strength. Because all you have done now in executing this throw, was that you fell backwards with your own weight and he was pushing at you. You see at a moment when he was pushing at you like that it is entirely opportune to put your foot up and fall over backwards and. Because way over. And that's quite a throw to get involved in I can assure you. But Judo, you see is a development out of the Taoist philosophy, by probably, Japanese people. Judo is relatively modern. But, it comes out of all sorts of understandings going back to Chinese ways of doing things and gradually amalgamated into the form in which we know it today. But it is a

basic demonstration of this principle of wu wei, which Jafu has written now in cursive characters.

So, it isn't an attitude of total passivity. It isn't just doing nothing, as it literally says, not do. But it's really not force. So you need always in every situation to find out which way the wind is blowing. Trim your sails to the wind. This is the meaning of it. Well now then, now how do you know which way the wind is blowing? Obviously a scientist would say to you Well we have to make a very careful analysis of the situation and find out just what's going on. And then, this becomes extremely interesting because now scientists are doing this very seriously. And they have devised very important science that we call ecology. And in ecology we study the whole complex of relationships which lie between any organism and its environment. And when we get to the ecology of mankind it is simply fantastic. When you study, for example, the ecology between man and the world of microbes, and you try to decide what are good guys and bad guys among the microbes how to get rid of the bad guys without getting rid of the good guys and then realizing you need some of the bad guys otherwise the good guys fall apart. And some of the killers we use are on the, the level of medicine very much like what D.D.T. is on the level of agriculture it's too indiscriminate. And it gets too many of the good guys along with the bad guys that you become after time very doubtful as to the precise definition of a good guy and a bad guy because you see every group every species has to have an enemy. That's part of the whole mutual eating society arrangement of life. If you don't have an enemy, then you start multiplying too much. Nothing prunes you. Then you start getting in your own way because there are too many of you you start eating up your all your own supplies of food stuff also you get soft. You're not on the . You develop flabby muscles because you never get involved in a fight. And so gradually, the successful group fails. The group which managed to obliterate all its enemies will fall apart. But that's the way things run. And the question is can we run the human race without awful bloodshed and murders and talkers and all that kind of thing can we somehow introduce a new kind of gamesmanship as a substitute for war.

Also you get soft. You're not on the qui vive. If you develop flabby muscles because you never get involved in a fight. And so gradually the successful group fails. With the group which managed to obliterate all its enemies will

fall apart. So, what are we to do about that? See, part of the whole joke of present day international politics is that the United States in order with its vast prosperity and enormous facilities for living the lazy life must have an external enemy to get excited about. And so, even though the Cold War is in a way, total nonsense, and everybody who is in the know about anything knows it. That for example, an atomic war between Russia and the United States will simply end of the human race. But the populace has to be kept bamboozled. And we keep fighting wars like in Vietnam in order to keep everybody excited and in order to make a frackas out and to give the soldiers practice. It's a horrible business, but but that's the way things run. And the question is, can we run the human race? Without the awful bloodshed and murders and tortures and all that kind of thing can we somehow introduce a new kind of gamesmanship as a substitute for war. It's the same thing in business. Exactly. If you wipe out your competitor, then you have no reason to produce anything but a lousy product. And then you may make lots of money, because then you've wiped out your competitors. You've got the whole market, and then you've got this money what you're going to buy with it. Well you know there's nothing to buy said other people's lousy products you wiped out their competitors. Or who cheated the public by packaging the thing to look elegant, but it was nothing inside that's all you got to buy.

So naturally, if you're a success in General Motors you go and buy a Rolls Royce remained. Or you go buy a Mercedes, from Germany because I happen to be better cars. Or if you want to make a lot of money in the clothing industry here making wretched prints and you want some good clothes what do you do when you have to go to Mexico and buy the things peasants wear, because they're still substantial solid, damn good clothes. So you see, there's something always self defeating in these attempts to succeed. Because say nothing fails like success. So, for this reason then, the Taoist always had an attitude of caution. Cautious Lao Tzu says, as one who crosses a river in spring. That means either because of the spring floods or because the ice is still there and you're not quite sure how strong it is. Because it's beginning to thaw.

So, the, what the Taoist tries to develop is a sensibility to the situation. He tries to feel out intuitively what kind of action is required under these

circumstances, because he feels that he can never discover it analytically. With his conscious attention alone. Well now, to talk in modern western terms about how this is done, we must realize of course that we are equipped inside our heads with an absolutely fantastic thing called the brain. With its millions and millions of neurons cells it is as it were, the most amazing computer ever devised. Basic to the Taoist attitude to life is that you have that within you and you may if you don't know anything about brains very much call it intuition or something of that kind but you have within you the most amazing logical analyzer that exists in the known world. And the point is to get it to work for you. And instead of trying with conscious attention alone, which can only think of about three things at a time without using a pencil. That is to say, keep three variables in mind at once. Very few people can do four without using a pencil. You can do four if you're a trained musician where you got for your playing for different lines of a fugue, say you're keeping four variables in mind at once with an organist you can go from four to six because you've got your two feet and they're playing too. But that requires a higher amount of training to be able, with conscious attention to keep these many variables in mind. But the world around us has infinitely many variables going in it, and you can reason out something with your conscious verbal thinking. Say you want to make a contract in business and you figure out how to make it. Whether it will be a good contract, whether it will work but cetera et cetera and you think of all these things and write them down and you make the contract you think that's fine but one of the variables that you couldn't possibly include in the contract was that your partner would slip on a banana skin and break his neck. All sorts of things I mean the contract might make provisions and if your lawyer was thoughtful of what was to be done on the case of the disability of any of the part is there to cetera but eventually there are so many possibilities that can occur that you cannot think of them all.

So then the question arises, is it within the power of the human brain to comprehend, because of its immense complexity, in a kind of are un or subconscious way what the surface consciousness can never grasp and that the Taoist would say certainly it can. But you've got to learn to use your brain. By allowing it. To go to work on your problems without interfering with it and then it will deliver you a decision. And this is why, when you get to when you get to the real study of Taoist and Zen Buddhist practice,

you get to the point where you learn to act without making decisions. Or rather, to use a more exact word, without choosing. Krishnamurti talks a great deal about being choicelessly aware. And he says freedom is precisely the state of not having to choose. Now that sounds quite paradoxical, because we're always talking about freedom of choice. Choice is not a form of freedom in the sense of the word what is choice in the sense of the word choice is the act of hesitation that we make before making a decision. It is a mental wobbling. You know some people when they take up a pen to write they don't just write but they jiggle the pen around indecisively like this, and then start writing. Or a person comes into a room and wonders who to talk to and sort of is in doubt you see in that moment he is choosing. Whereas a person who comes into a room and decides who to approach, he doesn't wait to choose. We say, 'He is decisive.' But that's a funny saying, because it means he doesn't stop to decide. So in the training in Zen Buddhism which is simply a Buddhist extension of Taoism I'm it all it was then Buddhism arose out of the marriage of Buddhism and Taoism in the fifth century A.D.. And over the following centuries.

So they have a way of training you so that you always act without choosing. For example, there was one day a leaky roof. And there were a couple of monks attending the Zen master and he said The roof is leaking. One monk disappeared and came back instantly with a sieve. And put it on the drips another month after some time came back with a bucket. And a master praised the one who brought the sieve. Now, the action wasn't exactly appropriate. I mean, you know to catching rain, but the point was that he was in the spirit of the Zen discipline, by acting without choosing. And you'll notice this with certain people. Certain people never hesitate. They always seem, if something needs to be done, they seem somehow simply to grab something and do it. You know, which is a kind of a Zen capacity.

So what happens is this. That, the teacher of Zen constantly throws curves of his students and puts them in Dilemma situations where they have to act immediately. One of the things of course that you mustn't do is rush because rush is a form of hesitation. You, rushing, when a person rushes to get a train he starts to fall over his own feet see so it really holds him up it's like trying to drive at high speed through the water with a blunt-nosed boat. That's rush. But now what he's trying to get is a kind of a smooth

unhesitating flowing action that is the response to the challenge. And it must be done in the what with what is called, another use of this word mu. This is called Wunyin in Chinese on Muyin in Japanese. And this word now in. Is composed of the character meaning now and the character meaning mindheart Shin. And so has the meaning of a thought, but especially for us, it is well translated by the psychological term blocking. Your blocking. You say to someone when they hesitate, when they dither, when they stop to choose

So the attitude of Moonen or Wunyin is the I'm blocked mind. Where it doesn't hesitate ever. Just as the river doesn't hesitate when it flows, and just when you clap your hands the sound comes out without hesitation and when the moon rises, the water doesn't wait to reflect it, it reflects it instantly. So that instant reflection, or it's a kind of resonance, is what is looked for as a response of the individual to his environment. And he does this to the degree that he knows himself to be one with his environment. Then his, his capacity for response increases in according to the way in which he feels that he is simply all of a piece with it and not something that is in it and with a barrier around him through which messages have to get and then those decisions have to be made up and sent out.

So then, you could say that a kind of extremely subtle sensory awareness has to be developed as between the individual and his environment, so that he feels it out. Now today, this sort of talk is very unpopular, because scientifically-minded people, especially academics scientists. Those who teach in universities, are exceedingly suspicious of intuitive reactions. I say oh wah wah wah, you can get into all sorts of trouble that way. But the thing that they neglect to do to realize is that everybody uses it. Even the most meticulously careful, analytical, rigorous sound scientist uses intuitive judgment after a certain point why? Because you may accumulate data forever. And you may decide that this is on the whole, taking all do things into due consideration and proceed as having been worked out that this is the right thing to do why do you decide then? Mostly because time's up. And somebody is pressing for a decision or else you're bored to death with bringing in data. Because you never know much how much data you need to make a certain decision, and therefore you may go on collecting data to all is blue but in the last analysis you'll work on hunch. And so much is

actually in the end decided by flipping coins. And the pity of flipping coins for making decisions gives you only two choices. Heads or tails. One way or the other the Chinese have a more subtle way of flipping coins. They have a method of a sixty four sided coin, to flip. So that instead of just heads or tails there are sixty four possibilities of coming to a decision when you don't know what to do. This is called the I Ching, or the Book of Changes, where the symbols of yang onion that is to say for Yang and yin. The straight line undivided for year in a line broken in the middle there are sixty four ways of combining six of these lines in a hexagram.

And so, there is a complex method, when you have to make a grave decision for the tossing. You do it by tossing sticks or coins and it gives you one of these sixty four figures. Now, if you are very wise and have started the Book of Change for a long time, you don't need to use the book you just look at what the figure is and you can tell what it means because you see these figures are made up of. Each six hexagram figure is made up of two three-fold components. That has two components, of which this one is water and this one is heaven.

So you will have water over heaven, and a person very skilled in the interpretation will feel out the meaning of water over heaven. But actually, if you are not so skilled, there is the book, and for each of these hexagrams, the book has an oracle. And it tells you in a curiously vague and yet curiously precise terms the meaning of this hexagram. And then you, in the light of your own situation make up your mind what it's saying to you in the light of the problem that you've raised the question that you've asked the decision that you had to make you will find invariably that these sixty four choices are one of them or indeed all of them but you have to pick one of them because you are after all tossing a coin. But it has some peculiarly appropriate thing to say to you under your circumstances, and is just like having a conversation with a very very wise old gentleman.

And you must realize that today in Asia, this book is still widely used for making business and political decisions although people who are Westernized wouldn't let on perhaps that they use it and so anybody who does politics or does business with Asia should be completely versed in this book. To know what sort of thinking, what sort of approach might be

expected under any circumstances. If you could ever find out what hexagram had fallen when a certain politician made a decision that would be immensely enlightening as to his future course of action.

In the same way for example in dealing with Hitler, our strategists I don't know if they did should have been students of astrology. Because he was always consulting astrologers. And therefore astrology would be much more easy to penetrate in the evening because you would know Hitler is looking all the time at his own horoscope. Well we have access to Hitler's horoscope, and so we know what he's thinking about it, but you don't have access to what hexagram Mao Zedong threw when he decided to do something or other.

So it's a little bit more subtle. Well then, I'm making the point then that our scientists are very suspicious of the intuitive judgment. But nevertheless they all use it, in the end. And so, it is made, this suspicion, that science has of intuitive judgment has filtered down to the average person in terms of a mistrust of his own intuition. Of the marvelous analytical powers of his own brain. And so, we are always in a dither of doubt as to whether we are behaving the right way doing the right thing and so on and so forth and lack a certain kind of self-confidence. And if you see, you lack self-confidence, you will make mistakes, through sheer fumbling. If you do have self-confidence you may carry away with doing entirely the wrong thing. In the British have an enormous degree of self-confidence. They know they're right, and they don't even question in there there are certain kinds of British types who are absolutely there aplomb is unbelievable. And you can't shake them, but I wouldn't dream of it. They're not even defending themselves they know there's a ride. And therefore, they can allow any kind of political revolution total free speech all sorts of things can go on which make Americans very nervous, because Americans don't have the same degree of aplomb. They're not quite sure. When you're an aristocrat and you've been brought up for generations in the right schools and there's never any doubt whatsoever you don't even have to mention the fact that you're an aristocrat see I mean that's why aristocrats know how to treat servants. But they never take it out on their servants in the sense of having to emphasize their own superiority. Because they know they're superior. They don't even question

it. Well, this is an extraordinary kind of nerve that they've built up and. So the only way. You know, you can do this.

The first of all in in Zen practice the thing that you have to understand is this. You have to regard yourself as a cloud. In the flesh because you see clouds never make mistakes. Did you ever see a cloud that was misshapen. Did you ever see a badly designed wave? Though they always do the right thing. Now so as a matter of fact do we because we are natural beings just like clouds and waves. Only we have complicated games, which cause us to doubt ourselves but if you will treat yourself for a while as a cloud or wave, and realize that you can't make a mistake whatever you do, because even if you do something that seems to be totally disastrous it all come out in the wash somehow or other. Then, through this capacity you will develop a kind of confidence, and through confidence you will be able to trust your own intuition. Only, the thing that you have to be careful about is, and many people who have not understood Zen properly fall into trouble here is, that when they take the attitude that I can't possibly make a mistake, they overdo it. Which shows that they don't really believe it. So a lot of people come on and say well in Zen anything goes, you're naturally with it anyway you are a buddha anyhow and I'm going to prove I'm a Buddha anyhow by breaking all the rules. And so they put on the weirdest filthiest clothes if you're going to steal things and all kinds of things like that that's overdoing it that shows that you haven't learned, you don't, you're overcompensating. Because before you. Told to do this do that now that and watch and be self conscious and was and so on, and so you just go to the other extreme. But this is the middle way, of knowing it has nothing to do with your decision to do this or not whether you decide that you can't make a mistake or whether you don't decide it is true anyway, that you are like cloud in water. And through that that realization, without overcompensating in the other direction you will come to the point where you'll begin to be on good terms with your own being and to be able to trust your own brain.

But at that level, you are supra-personal. That is to say, when you realize that you stand here as a body. It's as if you see, there was a calling to a certain cosmologist cosmological theories today, a primordial explosion which blew up and created the universe. And you know how it is when you take a bottle of ink and you throw it at a white wash wall. Smash, like that

and go splat all over the place. There's a big blob in the center and then as it goes out it gets all sorts of little curlicues and wiggles. So you see the cosmic explosion is still happening. It takes a long time for that big essential bang for the whole thing to go whoosh. Takes billions of years for it to happen and it's still happening and we're the little curlicues out on the edge, see. And we are connected, we are part of the central explosion that originally happened. That, in a certain sense is in you. You're still manifesting it, you see. So when you consider yourself as a physical being consider this and it is very ancient. Just like you pick up a stone to how old is this stone? Well scientists will say well it's about that comes from those the Plasticine age and it's probably, you know, four million years old. Then you say well where would I wait a minute wait a minute you mean four million years old where did it come from what was it before it was a stone? Well it was something or other. And that goes back back back you see so everything you touch including yourself is incredibly ancient. Goes back to the very beginning of time. So if your mind awakens, you suddenly see all your friends sitting around you looking incredibly ancient. I don't mean in the sense of old I'm haggard but like angels, like eternal beings who were always there from the beginning.

Landscape and Soundscape

I once talked to a woman, just a perfectly ordinary nice LOL, little old lady. And she told me about she'd had an accident in an elevator and she'd broken a leg, and got stuck under the elevator. And she was there for half an hour before anybody could get to us. And she said in that moment she realized that in this whole universe, there was not one single grain of sand that was out of place. And that is a curious vision that comes to people occasionally. When you see suddenly, that you've been looking at things in absolutely the wrong way. And it's it's really weird, you daren't talk to other people after this because then you'll be so misunderstood that you see that the most frightful things that can possibly happen. Fit in with this. It's very strange and very odd, but the reason is of course that when you get rid of the idea of the governor and the governed, the Boss and the employee. The King and the subject, there aren't any victims. Every creature that suffers in this world is unbeknownst, perhaps, to itself, doing it to itself no

one else is responsible. There are no victims. Because the whole thing is a unity. It is of itself everything is of itself self so. No one to blame.

So you see when in nowadays when a child is a juvenile delinquent and people come around the social workers and the police and say Now look here the terrible the child has learned a little psychoanalysis, and can say well it was my parents' fault because they brought me up in a traumatic way. And they got divorced or my father was a drunkard and my mother was a prostitute and what can you expect? So, then the public says Well they we should get after the parents when the parents say because they've done a little Freud. It wasn't our fault but it was our parents were neurotic too. And you see, you pass the buck back back back back back just because in the story of Genesis in the Garden of Eden when Adam was accused of having something wrong with him when the last dog saw him after eating the fruit he said this woman that thou gave this me she tempted me and I did eat. And God looked at the woman said, Well now what about it and she said The serpent tempted me and God looked at the serpent and nobody said anything no the serpent didn't pass the buck he didn't make any excuses because he knew. And there.

But in this way, you see, one passes the buck back all the time, and says it wasn't me I just got involved in this because the you my father and were messing around with my mother and you went too far now you've got a baby, isn't my fault. That's a terribly irresponsible attitude. See because you must recognize that you were your father's own desire. That was you, that glint in his eyes. And that, you go back back back, imagine, an explosion. Supposing I make a splash of ink against the thing and you see from the center. All these spray flows out. And so way back in the beginning of time maybe according to Fred Hoyle, there was a colossal explosion which threw out all the galaxies. And as the explosion goes out, the spray get finer and finer and finer and finer and you look at it as all one thing it's reaching out like you would spread your fingers like that and you every one of you a little reach outs on the end of that big explosion push and you see you go right back to the beginning. You you your bodies are the most ancient things that there are. And it goes like that yep takes millions of years to go splat. But you're in it right there you see, him you did it right in the

beginning you blew this thing up. Self-so. Everything happens of itself. It's a very interesting experiment, to let sound come to your ears.

Now why don't you try, why don't you all just close your eyes, and gently become aware of the whole world of sound around you in you. Don't try to identify the sound. And put names on. And just let them happen. Don't feel that you mustn't make any sounds like belly rumble, hiccup coughing song that's all perfectly part of a part of the scene. Just for a moment let all sound. Happen. Even when I talk, don't make any sense of what I'm saying. Just sound. You should listen like that before you go to sleep at night. And realize that you live in a magical musical continuum all the time. But you see ordinarily, we keep trying to correct what we're listening to. Pay attention to this, ignore that. And say to the children shut up, I can hear myself thinking, you see. But if you really know how to listen, you can concentrate on anything you want to in the middle of a complete pandemonium.

But so in the same way, one could give experimental exercises in listening, in using your eyes, in tasting mean feeling things. For example, picking up rocks and feeling them, because all this is letting yourself function just in the same way as I was discussing yesterday letting your brain give you answers. Because this is an act of faith in one's own being. It is allowing the body to be a democracy instead of a tyranny or shall we say, a republic. There's a certain difference between a Republican a democracy republic is rather more efficiently respectable. So that when that when you allow the body in other words to do what it will do, then you say well it will do it for me will it now wait wait a minute wait a minute who are you? Just as the Tao itself is not something other than the universe. Not a boss over it you aren't something other than but this design which is not just the body but the body and all its relationships to the universe. You don't stand apart from that, you don't have it. You're not in a situation where there's a kind of Inspector which is you which watches everything that goes by like you were watching the traffic Obama street. But we think we are that, and indeed seem to have a positive sensation of being the inspector who watches all this happen. Partly because of memory, which seems to give an impression that one is a static mirror, you see, which reflects everything that goes by. We get this from remembering, and on the other hand we get it

because we are trying to fight change. And resist it. You see, we are resisting all the time. If you were on Earth physically aware of all your muscular reactions, you would find you are going around most of the day doing this you know, fighting something. You can get a person to lie on the ground and say, 'Now look, you're completely supported by this floor. You won't fall down so let's go.' But it's very difficult for people because they're afraid that if they don't hold themselves together they will turn into a nasty goo that will all fall apart and rip through the floor. So everybody is trying to use their skin and their muscle of the whole themselves together whether that's. It will all take care of itself you won't fall apart. So, there's a constant resistance going on, and that resistance is experienced you can be aware of it in terms of a sense of strain here, between the eyes. This is its center. And that constant resistance to life, and the sensation of it, is what you actually feel when you think about yourself. I. It's that feeling of resistance.

Now if you let go, there is no necessity whatsoever for an inspector who watches everything that happens. You are what you experience your experience and you are the same. Your thoughts are you, your feelings are you. So, you would it is no necessity whatsoever to try and stand aside from the standoffish and say, you go away. So, if you can trust yourself, in other words, to the flow of what's going on. You won't need to resist it, and you'll find it works very well, just as your eyes work well when you don't try to force them. Just as the clothes are comfortable when you become aware of them. Now, this isn't the same as numbness, you see, it's quite different because you experience your body. In terms of what you ordinarily call everything else in other words as you look around here we are taught to think what I am looking at is out there. Now imagine this look what. The color of your hair from the standpoint of your own vision. Of your head. You know. Nothing. Now watch. It certainly isn't black is it behind your eyes you don't have a sensation of blackness. Nor of whiteness. There seems to be nothing there at all, as if you had no head from your own point of view. But actually, from the what it what it is how it looks inside your head is what you're seeing out here. Because you see, the optical nerves are back here, and your experience of all the shapes and colors around you is a sensation of the state of your brain. So what you are looking at is inside your head. But then, you can't be said to be looking at it because inside

your head is you. So, all this is how you feel. This is you, only it's true for each person. It's not more especially you are not more specially me than I am you. It's mutual It's like the dew drops on the spider's web reflecting one another.

So it is this then this letting. Your mind. Work by itself letting your eyes see for themselves that. is the preliminary to naturalness, in the way that Taoists understand it. Now let's go on from there to see what they how they express natural. They use two images. One is called the uncarved block. And the other, unbleached silk. And these two images lie at the root of all those great art forms of the Far East that are associated with Taoism and Zen Buddhism. And I'm going to show you the tea ceremony after this because that is the best possible demonstration of this particular mood. Because it combines, it is what you might call the art of the controlled accident. Because it combines discipline with spontaneity. But the mind of the uncarved block is this. Do you know there's a Japanese art called bonsaki?. Which is the cultivation of stones. You might call it the art of growing stones. The Japanese national anthem says, 'May our for a rain a thousand years rain ten thousand. Thousand years until little stones grow into mighty Rock six elevated with ancient mass.' Soldiers at the idea first of all that a stone is alive.

Next, there is a love of stones in their natural shape I have a huge series of slides that I took in Japan and nothing but the stone in gardens. And they have a genius for the selection our marvelous stones that they like stones that you will find in a river which had been worked on with the water until they looked almost like clouds, and they'll take one of these stones and hitch it up on a mule cart and bring it down, and then instead of just dumping it in the garden patching some marks on it, they'll take it away to a corner where it's in the damp and it will grow moss naturally. In Japan, moss grows quite quickly naturally, when the mosses grow naturally on the stone they move it into the place where they wanted it exactly in the garden and then they arrange sand around it in such a way that it looks as if it has always been that. You cannot you see there is nothing that's not natural nothing at all the idea that there is something artificial is a completely artificial idea. Because a skyscraper is really as natural as a bird's nest. But, how to demonstrate naturalness. You see, it's like what is called in

mathematics an asymptotic curve. That is, a curve that approaches the axis of a straight line as a straight line now is a curve going to the straight line it's always getting nearer always getting nearer but never touches it. What we call approximation. So the idea is to make a skillful approximation to the natural. But if it were just natural and only natural it wouldn't call attention to what it's doing. It wouldn't point it out.

And so the idea of the artist then, is when he makes a bowl. Or selects Iraq and puts it in place the. Is that the bowl should get the bowl and the rock should get the rock. They should look so much like. Well that rock you're always looking for. So then, this other word I mentioned that is still unbleached silk. You know how nice and leave silk is what we call natural color especially when you get Shantung which has a sort of texture in it. It has a sort of farewell to the I tell you what is the equivalent in our culture of burlap. Especially the smell of it. And burlap with nubbles and if you know and bits of straw. There's a wonderful feeling about that which is what is meant by says. It's primitive, Yes. But, marvelous.

When, well I'll tell you more about this later but the point is when. The great masters of Taoist and Zen Buddhists got their minds uncluttered and working properly, they suddenly discovered that some of the simplest things of everyday life. Simple utensils that were used in the kitchen the cheapest rice bowls that might be used by a peasant, were extraordinarily beautiful. They were unsophisticated. They were natural. In the same sense we have when a child, aged three starts dancing. There's no self-consciousness, no playing to the gallery and not when the child is just dancing. That's. Naturalness. Now the question is you see, for the adult who is all fouled up. How to recapture that? And this is what the greatest artists sweat blood trying to do. To make their work look. As if it had happened by itself. As if it had just grown there. Now, there are exceptions to this. But the exceptions prove the rule. Beethoven, in some of his Sonatas, a range the fingerings to be as unnatural and difficult as possible, so as to achieve the impression in the playing of the immense effort. But that's the exception that proves the rule. In the ordinary way, the expert musician seems to be using no effort at all it just happens through his fingers but if he wants to portray effort for some artistic reason, then this sort of trickery is introduced.

But the artist works and works and works all his life long to get to will become again as a child to regain original in innocence and naturalness. But you see what happens through that work. In doing the work of the artist becomes the master of a tremendously sophisticated technique. He knows exactly how to control his hand his brush his pain his chisels whatever easy using. About. However much you know how to say something how to express something that doesn't necessarily give you something to express and something to say. You can be a master of the English language and yet only have boring ideas. So then somehow you have to put your technique at the do. Supposal. Of what we call inspiration that means the Holy Spirit. And so in the same way the artist. Who practices for years and years and years. With his brush in the Chinese way. In the end finds that he cannot. Buy any stratagem of his own by any technique or any cleverness he cannot paint. And he has to give up. And then it happens. Well this you see then is what lies behind. All what we can definitely recognize as the naturalistic art of the Far East. Now I hope you know what I'm talking about. Because there are very very different kinds of Far Eastern art for example. The finest pottery of the Song Dynasty. Which will take us back to a thousand A.D.. Is completely unlike what most people think of as Chinese possibly. Chinese Postle in one thinks of white egg shell like stuff with very delicate designs of birds and butterflies and fine ladies and children playing battledore and shuttlecock. But the finest song. Is heavy. Jade green. Soft. Very self-effacing in a way. And it has a certain roughness or take Japanese so-called. Rockall where. There is a bow we will see some which is definitely handmade and bows and doesn't looks as if it wasn't even put on a wheel. And the glazes allowed to drool. And the bottom of the bow the clay has been left exposed. But you see that coloration reminds those artists of autumn. And they want to see that it is clay because a good partner does not force clay. To a bay his preconceived ideas. He evokes the spirit in the clay. To do some magic. So then because the clay did that these artists love the clay. They don't want to make the clay look like something else like Ivory they wanted to look like clay. So with that with clothes these clothes. So with everything would. Wood is loved by such artists they love the grain in the world. And therefore deplore paint. Lacquer there's another thing if you sparingly. But by and large wood is beautiful and you get floor like this you see about a nice thing about the flaws you can see it's wood you can see the grain and you some of the you may have been to the cups or a palace in

Kyoto where they have around them with the most gorgeous grain would you ever saw in your life it is today in shunting. I mean it's like looking at someone or some vision and you know you think you're going to go out of your mind looking at this great goddess stuff and so in the same way in the Japanese typical Japanese house tidy edge of the hour. Call the talk on there is almost invariably a wooden pillar which is made from. A plane tree trunk or branch so that you still see the knots in it and the curves and sometimes. They get I think some rubber exaggerated ones that are absurdly knobbly. But in the same way that we'd today have learned to like driftwood that is the thing in line with this Taoist spirit that. We. Appreciate wood as wood and don't try to make it look like marble or metal or some something else the same is true with paper the Chinese don't like our paper they say it has no character. They like paper with little. Threads in them and. With a texture to it. And they feel that that really is paper the paper gets the paper. And so, feel that our paper has some sort of plastic and none substance. And we are in danger of being engulfed by this through not having a love for the UN carved block and the unbelief silk which are fundamental substantial and natural.

Fanciers of Swords could never make up their minds which of the two was better. But certainly they were the on quest and masters. So a group of samurai one day thought, we've got to put this to the test. We think that probably Mr Matsushima is tops. But Mr Yamaguchi comes so close. So they took a sword by each master, and they went to a stream. And they first of all took Mr Yamaguchi sword. And they dipped it in the stream with the edge facing upstream and they set a piece of paper floating downstream. And as it came to the sword, the sword simply without being moved the paper divided itself down the blade joined together and floated on. Well, that's a hard act to follow. Anyway, they took Mr Matsushima sword, and dipped that in the stream and likewise set a piece of paper floated towards it. And what do you suppose happened just as the piece of paper approached the edge of the sword, it moved to one side provided it and then went back into course and continued And so obviously, Mr Matsushima was the better of the two swordsmiths. Why? Because the highest. Accomplishment in fencing is called the no-sword school. To be so good at fencing that you never have to use a sword. And there are all kinds of marvelous tales about great Samurai trained in Zen and swordsmanship. Who never, never had to use a sword. You may have seen a movie called

Samurai which comes in three parts. Takes you three evenings to see it, and it's the life of Miyamoto Musashi, who was one of the greatest of all Japanese history. He doesn't follow his life all the way through it only comes to the point where he had to deal. With another champion who insisted on challenging him, out of vanity. And how Musashi takes him on, fighting him at first only with an oar that has had the blade chopped off. And, but he maneuvers him into a position on the beach where the rising sun dazzles his opponent. And when his opponent makes a terrific swipe at him, he jumps over the sword, draws his own sword, and kills him instantly. But after that he is very hard to happy that he had to kill such assaults and finally he takes the advice of the Zen Master Takuan, who has all along been trying to dissuade him from a military career. So, sometime later. He was on his way to Kyoto. And this meant that he had to cross Lake Biwa in a small ferry boat that was rowed. And when he was on board another Samurai, who was a very volatile fellow who had had too much sake to drink came aboard and saw. What school of swordsmanship do you belong. Musashi said, the no-sword school. By this time the boat started. Ha, no-sword school like a see ya know sort of go and this drunk drew his sword. And Musashi said, now wait a minute, this is a crowded boat and if we start to do it people will get up not just innocent bystanders. Let's go to that island over there, and we can fight it out.

So he said to the ferryman, over that island. And he changed the course of the boat went to the island this drunken swordsman was so eager to get out and fight it he jumped onto the sound and immediately Musashi took the ferryman's oar and pushed the boat back and left him there, and he said You see my no-sword school.

So if I say to you. I'm you say hi. Say how are you, [you] say fine. There you are see. There's your original self. About if I should say in the middle of a conversation you'll find. Where we've been lately. Oh, went to Mexico for a trip. Where did you go? Oh, I went to Acapulco. Did you enjoy yourself. Not so bad. Why is my hand like buddha's hand? How do you handle that one? And a master, in such a situation, said to...[said] his disciple seemed blocked. He said to him so far your ounces of can quite natural and easy why do you feel some obstruction? When I ask you about my hand being like what has happened? Which in other words indicates,

use your brains. And he won't see, because he's used to linear thinking he's used to keeping on one track now this you notice you see we're all on us and they're caught when there's a conversation going on, we are uncomfortable if somebody changes the subject without ritual preparation. We are likewise uncomfortable when we are in the presence of crazy people, who might change the subject altogether too abruptly, and same way with drunks. Who may not observe the amenities of etiquette in the conversation. Rear all hung up on these tracks which is to have a one track mind. You can't jump. When the hands are clapped, the sound issues without hesitation. When Flint is struck with steel, the spark comes out at once. But he goes on to explain that in such a situation, you must not be in a hurry, because that itself would be a block. And blocking in this sense of the word, is exactly what the Buddhists mean by attachment. When they say, have no worldly attachment, it doesn't mean that you're to give up enjoying a dinner. It means giving up blocking. Getting beyond the state where your flow is interrupted, and so proceeds just as if the wheel were made too tight for the axle.

So, we would quite correctly translate attachment with the American slang equivalent hang-up. So it is the hangup, therefore, the attempt to arrive at the solution. To a problem demanding immediate action by reasoning, by calculation. Which must take us along the linear path. Whereas the event itself lies in a non-linear dimension. Never solve it that way. So also, with a curious property we call beauty. Or for that matter, virtue in human behavior. We know very well when we are in the presence of forced virtue.

So this happens. Once upon a time, the great tea master Rikyu went to the ceremony. And the host was very very proud of a new tea-caddy that he had bought made of pottery. And Rikyu didn't notice it. At least, so he thought. Which showed, because he was looking for it to be noticed, that he wasn't quite on to the philosophy of tea I had a friend, Japanese artist, who one day did a calligraphy for me. He took an ordinary small western house painters brush, about an inch wide. And he did the Chinese characters for one, two, three. That's one stroke These are all horizontal strokes, two strokes three strokes. And there was something dust and plastic about this. The brush you see, was partly sometimes dry, so that you've got hairlines instead of solid black. It so happened that a few days later we were due to receive a visit

from Dr Suzuki, the great Zen scholar. And I said I'm going to hang that picture in my office. And the artist said, I hope [he] won't notice it. Which is because, a fine work of art must so fit its surroundings. As not to stand out like a sore thumb. So in this way, Rikyu didn't notice the tea-caddy. But this so bothered the owner, that after the ceremony was over, he smashed it. However, one of his students knew that it was very valuable and he'd collect all the pieces. And then, he had them restored, by putting molten gold as a cement. This is an old technique. And so, when it is finished, you see the original piece with all these spidery lines of gold across it.

Sometime later, a son of the host brought out this mended tea caddy when Rikyu was having tea. And he said you know, that is most remarkable. When I saw that before, it was good. But now it's perfect. This is what one would call a controlled accident. And all great art is a controlled accident. That is to say, it has in it the component of control, but it also has the component of the accident and of the natural. And it's getting those two together that is the marvelous thing.

It's the same in human relationships. Let's take the relationship of love. If I am in love with a woman whom I can control, she may be, have a flawless body, beautiful behavior. But in. If I control her completely I might as well have a plastic doll. Only if she has a little mole on her cheek. Or something like that, or some kind of unpredictability of character. Then I know she's human. Because the accidental has been introduced into the domain of the orderly. So likewise, when you go into a person's house and everything is spotless everything in its place you feel you by God, If you smoke a cigarette you'll make the ashtray dirty. It's just that terrible. That has not got a quality which in Arabic is called Baraka. Now baraka means Grace, roughly but Baraka is a quality when you say of someone he fits like an old shoe. Or you've got a favorite sauce but that's only dirty but it's marvelous or an old pipe which you smoke, where it's become very suited to you it has Baraka, grace.

So the puzzle, for every artist is how to get grace to strike. How to let an accident happen well once upon a time there was a sculpture contest at the University of Chicago it was at the Chicago Art Institute. And the competition was that every entrant was given a cubic foot of plaster of

Paris. Do something with it. Now, the competition was won by a woman. And she started out by looking at that piece of plaster of Paris and said, this thing is so perfect that it doesn't know what It Wants to be. And so she grabbed it both hands and flung it on the floor in pieces but chipped off and it was cracked and so on then she looked at it again. And she said Now I know what it wants to do. And so, by following the grain which she had introduced into that, she made something beautiful. Now, following the grain is what you do when you do a Rorschach test. You see this blotchy thing, which is the Tao, which is the primordial wiggly universe. And then you see something in it, you see an image in it. And you see a far more beautiful image than you can ever draw. By what we call eidetic vision. And you assist. The piece of wood or stone or whatever it is in which you see that image. To do its thing. Now experiment with yourselves in this. Look when you especially when you wake up first thing in the morning. Look at patterns in drapery. Look at shadows on the wall. And go into that state where you are receptive to seeing images. And you will begin to see all kinds of faces and trees and landscapes. Leonardo da Vinci did this. He used to go out and look at a wall which was weathered made of bricks covered with bird shit, and all kinds of scratches and so on and he would watch it until he saw a vast scene you described seeing a whole battle going on. There was a Chinese Zen monk who had long hair, very unusual. And he used to drink an enormous amount of wine. And then when he was really far-out, he dipped his hair in ink. And then sloshed it over a piece of paper. And then he had dried out. And in the morning, he'd come back and look at what happened and he put himself into the state of mind and you begin to see a landscape. And it's fantastic, when you put yourself to this how detail after detail, it fits in. And all you had to do was make a little touches of the brush to bring it up for everyone to see. And it looks when we go to the caves of Glasgow, and those ancient parts of France and go down and see the prehistoric paintings of animals, that it looks very much like they had followed natural formations in the stone on the wall of the cave which had evoked that imagery of cattle, that to us in conceivably realistic people that primitive.

But we shall always find that when the artist has been following eidetic imagery, and has not been trying to construct the image by himself. Because this whole world is created in that way. We are not aware of this. Because

we are so accustomed to seeing it in the way that we think is real and normal. You can also train yourself to see things which haven't been seen before. This is what many artists do. For example, in the history of Western art, seven hundred years ago there were no landscape painters. Everyone was the portrait painter or they painted scenes of the doings of human beings angels and gods and so forth. And whenever there was landscape it was merely incidental background. Now in the course of time, people got fascinated with the landscape part. And they withdrew the figures and left the background. And so we got landscape painting, and the first people who saw the landscape painting looked at it and said, that's not what I call a picture. Why? Because they had seen landscape hitherto as insignificant background. And it took painters to draw people's attention to the beauty of landscape.

Now, you see what we could do and we are only just beginning to think about soundscape. When we record something, or go to a concert, we have the impression that there is the thing there. And so in radio studios, they cover the walls with soundproof tiles to keep out the sound of traffic. So that you have the thing, the important thing you're supposed to notice is the speech but the odd thing is, you listen to that back in your home. With the windows open you know all street knowledge is a coming in there's no reason why they should have been there in the first place. Well now, let's move to that. Think of soundscape. The hum that's going on behind all the things we're supposed to be doing. And you can realize it's very beautiful just as you can see that it landscapers the hum-scape, you see. And so there is become a school of musical composers like John Cage who treat us to background noise. Or to silent concerts. In which the concert is the sound spontaneously occurring in the auditorium. Now you may say that's not music. Who knows?

Well so, the world then is a humscape, is a landscape. A sky-scape. And over thousands of years, important people, that means strong people decided what was important to notice. And they told their children that that was important. We still do this because when a child. Is messing around. And we've signed the child is scrabbling around making patterns and not. We feel that the child. He's doing something unimportant. We say Stop that. Now learn to use a pencil. A child points and something says. What's that?

And you say, well that's a table, no that. I said so this would John says Yeah because he knows it's all wood but I mean that. We still got a lot. So in this way we learn the official interpretation of the cosmic rorschach blot. Which is based on as I pointed out certain criteria, as that you must survive. It's your duty to live, see. Which is a double bind because it says again you are commanded to do the spontaneous. It's your duty to be spontaneous because all life is spontaneous.

So everybody is in a in a bind about this. But there it is. The the world that we see is a creation of eidetic imagery. So wherever we select the human areas as being significant areas, and so they're called human. Where the Rorschach blot is wiggling in the way that we call human wiggling, where it wiggles very much. And was maximal points of wiggling in our environment or other people. I mean there are other things that wiggle. Cats wiggle, but not quite so interesting. The wind in the trees wiggles, but again it's more predictable. But the human will go is the least predictable way to go in the total Rorschach blot around us. So we call that human. So you see that it isn't that way, that you have performed Maya. The world illusion, but Maya also means art and also means magic. And so the magical evocation of the world of things. From the formless world which means from the world of pure wiggle, is the creation.

Comparative Religion

Four Ways to the Center

You know the more I study people's religions, and I've started them for an awful long time, the less I am inclined to quarrel with anybody's position or belief. Or way of practice. And this is also true of various philosophical systems. It's all right that philosophers should argue with each other. I'm not going to quarrel with that either. But from my standpoint, the more I look at it, the more of the extraordinary variety of human opinions and ways of life, becomes comparable to a flower garden. Where these plants and trees and worms and birds and snails and slugs are playing all kinds of different games.

Now some of you may be unaccustomed to the side there because I see some new faces here. But it's my fundamental philosophy that the universe is essentially a game. We use the word game or we use the word play in varying senses, and it may give the wrong impression because very often people. Assume that when such a word is used it indicates something trivial. As we say it's only in play or only a game and then when you consider what an appalling amount of suffering the universe contains. No one wants to feel that it's worthwhile. You see either you mistake the point of view that if there is this deplorable suffering the universe is one hell of a mess. And the only response that you can make to it is to do battle. Or you may say no it isn't really a mess. Somehow all the suffering amounts to something in the end, it creates energies, it's a kind of a process like an oyster suffering to mature a pearl. And therefore, people who feel bothered about that, can't quite emotionally contain the idea that it's all a game. Because then if that was so I would be the sport of some cosmic process whether God or whatever, that plays with me as a child might torture an insect about a fly by pulling off its wings or burning it with a magnifying glass with the sun, or something like that. Only, as I will develop it, we shall see, that there is no system. In which somebody tortures and somebody else is torturer.

In my view of the world which is a semi-Buddhist semi-Hindu. The Creator and the creature are one. And all beings whatsoever are the masks. And plays. And ploys of the central self. There is just this Self. Which plays itself through all forms through all of us. Endlessly. So, if you look upon the different forms of life. Human, animal, insect, plant or whatever. As comparable to. Mazurkas, waltzes, rumbas, Charleston's, twists, or whatever. Or to poker, bridge, backgammon, chess. Or, if you want to get more highbrow, who can cherish the symphony is part of Peter's few and so on. You can see that everything is a way of dancing. And so, this also applies to people's different religious attitudes. There is the Baptist game, you see, and the Roman Catholic game. The Bible game, the ritual game. These are all ways of doing a dance but the religious ones have a way of trying to express some sort of fundamental attitude to everything that there is.

Now, I was thinking about this in New York recently. My wife and I attended a very marvelous ceremonial. Which is held in Holy Week, and it's called Tenebrae. It's really very simple. But it's extraordinary dramatic. It goes on for about two hours and consists of the chanting of Psalms interspersed with the most gorgeous anthems composed by I think Victoria. And enduring the chanting of the Psalms, fifteen candles on a triangular shaped candlestick like they're standing up so slowly extinguished, until only one is left. And this is supposed historically, to represent the desertion of Christ by His disciples in the Garden of Gerthemane. And at the crucifixion. There that one candle is taken out behind it all time. And the place is totally dark. And the choir sings the psalm. Miserere, have mercy upon me your god after the A great goodness which is a penitential Psalm the fifty first Psalm. For behold I was shaped in wickedness and in sin have my mother conceived me. And then they make an enormous crash, and the candle is brought back put on the stand and everybody goes away. While we they this is a church it's a high a high way out Anglican Church, where they do everything to ultimate perfection in music the ritual is just, there's nothing like it in the world. And so, I began to think about what those people were really doing what are they digging in this rightfu repentance about the death and the crucifixion of Christ. So this led, I mean, to begin thinking about their areas ways or fundamental attitudes that run through all the religions. And I classify them in a scheme and the three R.'s and I use

they are simply as a mnemonic device so that you could remember easily. And we get this scheme. So here is the attitude of repentance. And I question what is its opposite? Well obviously it's opposite is rebellion. I won't give in.

When I was a little boy, and I was taught all sprout at my mother's knee. When we got to the sea the phrase thy will be done, I would never say it. Because I thought that the saying I will be done and I was damned if I were to be done. And now, over here is another attitude, resignation. And over at the opposite side I consider what is the opposite of resignation now this is difficult to find the word for and so I'm using an old word in a new sense reincarnation. This is not being used exactly in the sense of successive lives. But incarnation means, entering into the flesh into life. So reincarnation is when we don't do it once but we say that was that was something and so we do it again. So, no it's the attitude of a child when a child sees you do something that's amazing the child says do it again. And an English poet once said that when the Lord God created the world and commanded the stars and to shine on the planets to revolve around the Sun. He was so fascinated that he said do it again and it kept on happening so he was saying this to express an attitude of what we call lately, getting with it. Of complete affirmation of life.

So, now the point is this that every one of these can be seen as a way leading to a center at which point they all coalesce. And you can get to the center that is to say, to the transcendence of our ordinary sense of isolated individuality. You can get to the center by following any one of these ways to an extreme. Only it's very difficult for a person who follows this way to understand this way. Offer a person who understands this way. To get with this. Or even between right angles, they are a little difficult to understand. And I imagine many of you here what you wouldn't be in this kind of a scene. If for example you understood the way of repentance. And that was the way that you like to follow you would be in church instead. So I'm starting out with this way because it's the most difficult for probably most of you to understand and the most repugnant. The extreme of repentance you know, of course is the penitentiary cult. In Mexico and the southwest here. Among the Indians an extreme of identification with Christ and His crucifixion, kind of self-torture. And the extreme of this way is of course

the penitentiary. The most interesting experiences that many of us that have through exploring the prison world. The world of the asylum, the world of the enemy of society. And that as a kind of yoga you know that San Quentin. Looks like the potent of a classic. The great Tibetan monastery it's the same almost the same architectural design. And there are, I lecture San Quentin about once a year. And the most extraordinary question out of the most attentive audience you could imagine. And lots of. It is a kind of monastery, as asylums for the insane are also signs on the street.

So I'm just saying these general things to give you an outline of the scheme we're going to follow. And then, I'm also going to illustrate these moods, by playing music appropriate to them. It's difficult in a short time that I've had to prepare this to find the music that is perfectly appropriate but this is suggestive and I'm going to say something about that in general later. Now then, let's go back to the fundamental assumption that all people, and this also includes all beings whatsoever but we're talking mainly of course about human beings. All people, are manifestations, disguises, of the total reality behind this cosmos. And that if that is so, there are not any mistakes in the world. When you look at patterns on the foam of the breaking waves on the seashore. And you look at the outlines of mountains, and the grain in wood, and the markings on marble. You notice that it never makes an aesthetic mistake. Never. Also, when you study plants, and you go into relationships with each other and with insects. The fact that these so-called diseases of plants are the full life of some other kind of organism having a ball. And you see this complexly interrelated world and you realize that it all hangs together. That everything outside the human world is a system of balances. Where you couldn't have really any form of life without the other is going on too. There have to be friends and there have to be enemies. Because if there aren't enemies. The friends get too prosperous. And they kill themselves by their excessive exuberance.

So they are constantly being pruned via various kinds of enemy species. And what is when you got down there a new suppose you identify yourself with a certain plant. You would thoroughly object to if you were a lettuce, to the snails eating you up. And also a person who gets identified with lettuces you see you say somebody who grows lettuces or is living gets mad at the snails. But actually, the lettuces need snails. Because that would be

too many lettuces, if there weren't snails. And those lettuces would choke each other. Now of course, a human being comes in and starts organizing the lettuces, you see, so that the seeds don't propagate in the usual way because he puts them out in rows and that's a different kind of a scene and so he objects to the snails. But that's because he's looking at the problem of letters from a partisan point of view and it's quite right that he should do so. What he may not see, because he's taken the side of lettuces against snails. He fails to see, that conflict at one level, is health at another. Just as a conflict going on between microorganisms in your bloodstream is absolutely essential to the health of your organism as a whole. But you don't, you are not aware of that conflict going on, because conscious attention doesn't need to ordinarily to focus upon it. And so you don't get involved and you're not anxious about what party is winning and what party is losing that keeping up a kind of balance.

Now then, to take this a step further, we are all amazingly involved in the process of being human and playing our game and taking our side. And therefore our victories and defeats our sicknesses and our health. Are things we get mighty partisan about, and therefore we cannot see that human behavior is just like everything else. It never makes a mistake. Only, it's never making a mistake must include the feeling that mistakes can be made. See that's where this point of view would differ somewhat from the point of view of a Christian Scientist who strives manfully in a way to as insane as assert that evil is purely illusory. But doesn't quite grasp the point that the illusion of there being something evil is important and good too. But we're not trying to get rid of it you see, because if you get rid of it. You would have problems.

It's...I could say for example that the character. A historical character like Hitler, is someone about whom it is very natural for most of us to feel angry. And that's perfectly right that we feel angry. Although he is as much a natural phenomenon as an earthquake. So, what we have then is a system of a sort of hierarchy of levels. And at the point where you are involved you can't stand aside from yourself and look at it objectively in the same way as you look at the patterns of problem on the seashore, or of the life of the fishes of the type. But to be liberated is to be able to see human life in the same way as you see all other life. And to do that you

have to be able to live as it were, on two levels. The level of involvement and the level of detachment. And therefore, cultivating the level of detachment is something that is done through the mysterious human property of self-consciousness. To be able to know that you know to feel that you feel. And by possessing that faculty which is self-consciousness is being able to reflect upon one's own life, we are able to become, as it were to go to a level at which our own life is seen in its total context in the universe. That is to say, to realize, that your Self is not your ego which is the standpoint at which you are involved in your game and taking sides. But yourself. Is the eternal, immeasurable reality, that is what there is. Only the difficulty here is, that this capacity this capacity of self-consciousness, although it is that which enables us to awaken is also capable of getting us into perfectly frightful messes. Into all kinds of, what must be called feedback snarls, where you know that you know. You can think about thinking and the moment you can think about thinking you can think whether your thinking was right or not did it come off was or did I do the right thinking then you start to worry then you start to worry about the kind of thinking you are doing about thinking.

And so builds up our particular human anxiety. When these creatures that are not self-conscious behave they behave spontaneously that is goes a zoo so our way and do what they have to do. And so if it doesn't work they die, but they don't worry about it in advance. That's that magnificent you see, and human beings have a faint memory kind of archaic sort of. The. Active unconscious Jungian-style feeling that there was a time when we didn't have to worry. And where we could never be in your writing. And most...a great deal of religion you see is an attempt to regain the Golden Age The Paradise Lost. And so it involves as it were an attitude of surrender. Be not anxious for the morrow. What you shall eat, what you should drink or what clothes you will wear. Or consider the flowers of the field. They don't work they don't spin they don't gather into bombs. And yet Solomon in all his splendor was not closed like one of those. And so if God closed the grass of the field which exists today and was thrown tomorrow into the oven. Shall he not much more close you'll faceless ones. I'm translating it myself to put it in a way that doesn't just go so familiar that you don't hear it. Now, I mean that's totally subversive! There's words in the Bible are outrageous. And everybody says well it's all very well for Jesus from the Saints I mean

for all practical purposes that's ridiculous you can't live that way after all you've got to plan for your old age we're going to have a savings account going to Sharon's going to get a job you've got to do all those things. So you have to think about that. Why can't I do that? So you see, in this way, the human being comes to reflect upon himself and begins to see that there's something wrong.

Now there isn't, but it's right that he should feel that something is wrong because it is through this that his capacity for self-knowledge and self-consciousness develops. So you see, there is the sense that somehow or other at some time there was a fall. A point at which we became unnatural. There's a great deal of worry going on about this now, because of the rise of the computer. Do you know this this is terribly interesting that a new form of intelligence to see is come into the world which is in certain directions vastly superior to human intelligence. And people are beginning to worry like anything about whether the machines are going to take over. But we've got to realize that machines aren't...see, machine is becoming a dirty word. Just a machine, mere machinery, but actually there has grown out of us through these things enormous electronic circuits that are new forms of life. And these are all connected with us they're not separate from us they're not something. Like a different order of beings that might come from some other planet and conquer us that the the whole development of the electronic minds and brains that we have are new cortexes. See the cortex overlaps the original central brain. And as it were when you play this game you know but it hands over and over countless children like to play you it's a game called capping with a cortex caps. The central brain that is more like the brain of a of an animal, and enables us to reflect on it now all this machinery that we are making is an extension of our brain, and is a new kind of life. But it worries us. And when we start to do that we get the feeling that something is going wrong. There is been a fall there has been a mistake and exactly the same sensation you see is ancient connected with the development of self-consciousness in the cortex. Something went wrong. Because every time we get that feeling it means that we've taken a new step in controlling things. Instead of relaxing and letting our windows fly us like a moth or a bird we now have these jet plays where we have an elaborate system of anxious people Morning, noon and night checking it that those things go right. And marvelous that they do our friend Ralph

Johnson who often attends these seminars, is an American Airlines captain who saved the jet. The other day and very dangerous for them for the. Fantastic but, here it is.

Now when you haven't yet discovered that the new development such as self consciousness. Is really a new form of nature like a branch coming out of a tree which is a kind of a new development of the trunk and it's something just as healthy and just as splendid as that. Then you'll begin to reproach yourself. And say, 'Oh dear. I am awful.' You begin to be alienated you see, from your own center but do understand that being alienated from your own center is a form of a way of stepping apart so that you can see yourself. That's important, that is resonance. When you sing in the bath tub you find you've got a better voice than when you sing in a nonresident room because you've got a little echo you mustn't get too much echo. But just a little echo is resonance and that's more fun because it's more conscious if you're happy and you don't know you're happy you see you're not as happy as if you know you're happy but if you know you're happy you may spoil it by getting anxious about it. So, this of consciousness is a kind of resonance. But then you see when it gets to the point of this terrible feeling. I can't trust my instincts and I'm out. I've got to decide. I have as it were taken over the prerogatives of God. That's a terrible thing to do, because you can't be genuine anymore. You see, you know that when you love somebody, you also want to get as much out of them as you can. You know that when you act as a responsible citizen you do so. So as to have a good image in your own view of yourself. This is your ego kick, only you dress it up so that it's not an ego trip at all perfectly sincere public service and charity and good feelings towards everybody haha. And so then there begins this awful thing. Repent. Behold I was shapen in sin. And in sin as my mother can see. And so somehow there comes up the state of mind when you appear to yourself as a rotten. Some people when they take L.S.D.. get visions that everything is glorious you see and is light inside it but occasionally, people get the vision that everything is corrupt. That all faces are things that are slowly drooling away into into a sort of pus or rot. And the just everything is falling apart. And they begin to get the feeling that life is a disease we originally had here a nice clean planet with nothing but rocks fire. And it was sterile and nice. And all those dreadful goo develop you. Have the best thing for it is to wipe

it up life is a terrible mistake. And a lot of people feel that. And therefore would want to get away from their bodies to a purely geological Electronic state which is called Spirituality. You know what most people think of a spirituality something totally abstract something mathematical something electronic something that has no no kind of pus or or goo, especially no flesh you see. That's the spiritual state. So that expresses the feeling these people. Fundamentally who are at variance with their essential life.

Now, this is going to get complicated I want. Their ambivalent about it you see in those. Hebrew and Christian and I should add Islamic theology. Sin of which one repents, is a spiritual thing. It does not arise from the body. The author of evil is An Angel. A body, of his being. And therefore he is something closer to say equals MC squared than to a rosebud. But at the same time in practice that's the theory in practice, what so many Jews, Christians and Muslims regard as evil, is the body. The physical world and our involvement in it our interest in it and so you see for this reason materialism is a dirty word. You shouldn't be a materialist although William Temple very wisely said once that Christianity is the most materialistic religion. But... that is true theoretically. Judaism is only equally materially different theoretically. Sometimes more so practically Christian. Because materialism is the love of material.

And as we shall see, it is fundamental to Judaism that God's creation of the world not in the state. But a great good thing in the material world at that. So that, if you can see what I'm pointing out to you is this, how ambivalent we are. We say that evil is spiritual, and yet we treat it as if it were fleshly. As if one couldn't escape from this flesh. The spirit is willing, but the flesh is weak. Within this wall of flesh there is a soul can't see how creditor and with advantage means to pay the I love. See, the wall of flesh, the image of the prison and the soul inside. I'm quoting Shakespeare. Oh this too too solid flesh would melt. And you see when you get sick when you get old, when you find it your body is something tiresome to carry around. It grows up this resentment against physical existence. And so all of these different moods. To one's own perverse so. Horror at being involved in a corruptible body will be involved in the penitential mood.

Now, I presume most of you have had personal experience of this at some time in your lives. It's always puzzling to children when I'll start out on this kick. I know in the Anglican Church. They have a for everybody you know says a general confession that the services and children can never understand that they don't know what all these terrible things that they're supposed to have done are say Almighty and most massive all Father we have heard and strayed from byways like lost sheep we have followed too much the devices and desires of our own hearts we have offended against by holy laws. We have done those things which we ought not to have done and we have left undone those things which we ought to have done, and there is no helping us. Think of it the children, that the most amazing [sic] thing to say. Aura that awful one they have at the Holy Communion. Talking about our sins the remembrance of them is grievous onto us the burden of them isn't tolerable. And then of course it's in the Catholic Church it's a place where they say I confess to God almighty and all the various saints stars Syndic sitting in thought word and deed by my fault by my own fault by now most grievous fault in that it mea culpa, mea culpa, mea maxima culpa for the story is told of an altar boy who didn't understand Latin always is a mere cowboy me a cowboy, me a Mexican cowboy.

But you see, first of all, there is a wonderful security in admitting that you're wrong. Then you're short of the right thing. If you know your rotten and make a great point of it. And if you're suffering. And pain a punishment you see for being wrong then you know it's OK. Oh I bless the good Lord for my boils for my mental and bodily pains for without them my face all congeals and I'm doomed to hell is ne'er ending flames. So the way of the cross is interpreted by many people as this way of life live in chronic frustration. And I've read many manuals on this. The spiritual advice for example, they say when you get a headache don't take aspirin. Live the pain through and offer it to the Lord in union with the sacrifice of Christ on the cross. Always a Ranger life in such a way that it will be a little difficult. That's why some people where I have heard there are always I'm comfortable they always itch. And this this thing they do it to keep them going I mean this keeps you alive you know you are there. I was in Mexico last August studying this because I wanted to go down there and find out why their form of care Catholicism is so agonizing. And I even meditated a

long time and on this in the cathedral in Oaxaca. And, here it was the main altar now not the main altar the chapel where the sacrament is reserved for the central figure behind the altar is a huge crucifix. Of Christ covered in blood and will. The saws are all modeled you know. And then on either side of the walls facing this there are a great paintings one of Christ carrying the cross and being mocked and scourged and the other of the agony in the garden of get seventy and all around in the scars that were there where they sell bonds years of the in the neighborhood of the cathedral you can buy these agonized faces of Christ with the crown of thongs and every thought on the individual is sticking in the middle of cripples of blood the face is kind of green and ghastly. And the people dig this. They love it. They all go walking into the shrine of valet de of Guadalupe you go for a whole mile on their knees you see young girls doing this now. What is this about? Well you see some people don't really feel they exist until they are sitting on the point of the thorn. And they put it that way. Pain..to reality is a measure of pain. The pain in this way of looking at things is the most real thing that there is. Pleasure the pleasures of this world a skate that disappear pass away has nothing to cling to so don't go after pleasure my dear friends. That's all fall out service seat because the real thing in life is pain and so what you do is you train yourself from childhood to deal with pain. We were brought up in a school system where it was simply axiomatic that suffering builds character. So therefore, any time you inflicted pain in on anybody you were perfectly justified in your own conscience because you were doing him a favor. You were building its character for him to do him good it out on the other side of that a hundred.

And so this is based on, this philosophy of pain is reality. Is the ultimate penitential philosophy of go down down down into the most awful. I am wrong see I am a mistake I am responsible for this mistake therefore I ought to suffer. And I go right into that state of mind. And if I've got guts and courage I'll go as far into it as possible. And what will I find out at the end? Now if you go far enough, the trouble is a lot of people don't, and they stay around Middlemount going about their sins them all out as a sort of disgusting. And they never really get down to it. They never find out. Them what our call for the moment the hidden motivation behind all this behind self-renunciation, behind wallowing in the reality of pain. They don't see that it's phony. Because nothing can be more egotistical than true

repentance. As I pointed out you're safe. When you repent and do not. And therefore you can see all for yourself temporarily but in a good test you are. But if you really get down to the bottom of this thing are some of the Christian saints I've done and find out what that repentance is all about and you suddenly see, why it's there all sin all over again what I thought was good was as a matter of fact evil it was the same self-seeking and self righteousness and in a radical pride an irreducible rascality which the Hebrews call the yetzer hara. Which means the evil inclination, but they say that the evil inclination was created by the Lord God. And probably the Lord God as against Iraq himself. That the Lord has his own element of irreducible rascality and that is of course what you might call the dark side the left hand of God. That have town that doesn't know what the right hand do it. Because that mustn't be let out that's the secret you see.

If the game of the cosmos is of the fundamental pattern of hide and seek, then when hide turns up and it's the time for hide to happen. Then darkness has its day. Hide in the dark. But when it's time to seek then light has its day and we find out what was hidden in the dark under the right hand suddenly discovers what the left hand is doing. Now first, it's shocked. What that? What is that by the way. What is the fundamental taboo? The thing you really mustn't do. Freud said if you stack. But because he said that you see we've recovered from. The e pop beer before pride in the a part AF are very different. Sexes and the topic maybe it's incest. Why is incest. It's getting kind of close to home. Going back to mama. Going back about not going back in the ordinary way is going back and I doubt not as a baby and you mustn't do that because why because this is a simply a biological analogue of the great taboo is to discover who you really are. Going back to Big Poppa. And that, that's all, but that's what is discovered when you discover you are a phony...you see what is a phony? A phony is a mask. And the masks used as I've told most of you in classical drama were megaphones. They had mouth pieces so that the voice would be projected in an open air theatre. So we get the phone. And the mask was the person or that's the Latin. For that through which the sound passes so the persona is the mask the phony.

So to discover that you are a phony through and through and through is to discover that you're a big act. That you're a game. And when you discover

that, then you wake up to find out who's the player.

Now I have been discussing four fundamental attitudes that are found in the various religions of the world towards the human predicament. And as you see still on the blackboard, they are given to be four R's instead of the three r's. Repentance opposite rebellion. And resignation opposite reincarnation, the latter word being used in a special sense. Not in the ordinary sense of rebirth, but of an affirmation of the human predicament, of getting with life. And this morning I discussed the attitude of repentance. The frame of mind in which it is self. That there is something profoundly wrong about being a self-conscious isolated individual human being and I tried to show. That when this attitude is carried to an extreme point, it results in your discovering that you are a total phony. And I said that the difficulty of the repentance attitude is that people don't carry it too in the extreme point. And they use the attitude of repentance. And the indulgence in punishment for whatever they think is wrong about themselves. As a kind of lifestyle which assures you that you're in the right. Because you hurt, and because you insist that you're wrong. I've sometimes suggested that this statement I am a sinner is logically equivalent to the statement quote, 'This statement is false' unquote. Because you see, if that is a true statement it's a false statement and if it's a false statement it's a true statement and so on forever. And to say I am a sinner is really the same thing because it imply that the statement itself since it is the statement after sin is a sinful statement. And it's a trap, I call a double-bind. And so I've often twitted my clergy friends about those I am to their greater views from. Gaza clergy aren't as bad as you might think. At least a good many of them, they have trouble in making it with their congregation. And they expect that their congregations will want the good old religion of wallowing in sins because when come many congregations I've found out love to be scolded. And if you make everybody feel temporarily guilty. But also make each individual feel assured that everybody else is more guilty than yours this is an extremely. Much sought after emotional experience.

But the point that I was making was that if you pursue this idea of being sent for being phony being insincere. To its ultimate point where you discover that all you do and all you are is a big act then this raises the question of what is reality? What lies behind phoniness? And so examined there you have an initially attic experience because it leads into the

discovery of the real punish out scroll type primacy that out though. That the real you is not the isolated conscious ego. That is only a game being played all over the place by what there is a part in them. And what there is is...tat. Coextensive with the whole cosmos and is the imperishable reality and everyone is that. But the game, since we've started on the premise that existence is a game. The game is hide and seek the game is pretending that it's not so. We then move on you see to another possible response, not repentance but resignation. I quit the game. I won't to play. There are all sorts of ways of doing this. But basically, this is an aristocratic posture. You ordinary mortals, with all your desire and all your involvement are deluded. You get attached to things. But there are a certain minority of us who are above it all. And we simply resign, we're not going to follow this now this as I say is ours to Craddick but it may be aristocratic in two ways there's the aristocracy of the Hindu sannyasan. The people who are outside and above caste. And there's also the aristocracy are the actual aristocrats I get so mixed up with my British and American pronunciation on the square. The aristocrat who comes on with the pose of always being bored. Who has complete Safwat. Who is imperturbable. Kaiser's study of this mentality is marvelous in his book of Europe the essay on Hungary. That portrays the type he calls the grandstand and he always identified himself with this type in this row. The grand seigneur cannot be fazed. Who can always be can always rise to the occasion under any social circumstances whatsoever without trying to do so, or without apparently trying to do so. In other words if he goes to the opera wearing blue jeans, he will somehow make it apparent that everybody else is improperly addressed. This is a very interesting type of person you know there was an essay written by someone whose name I can't remember in the centennial review. Which contrasted the attitude time of the aristocracy the bush was Dean and the proletariat. I said the heiress the aristocrat lives in the past. Because he is ancient forebears have achieved everything under his very a by the fact of his birth, his existence, he has nothing to ascribe for. And he somehow, he never need overdo it, he's always cool. The bourgeois, on the other hand. Feels that it's necessary to arrive and he's always striving for the future whereas the heiress to crap lives of the past. On the other hand, the proletariat lives in the present, because he doesn't care about his reputation. And he just lives and so are the two the bourgeois are the three the bourgeois is always the sucker. Because the poor poor you are is always cheated. Because well it's

going to cover some day you're going to get it even your money when you pull it out of your pockets, says promises to pay. Watch out for that. It's promises.

And for the bourgeoisie you see lives on promises. The whole of the whole economy of the United States being the great virtue our country is in a state of expectancy of feeling happy. Not on what you have but on what is going to come in. The aristocrat is happy of what has happened these great achievements of the past those nothing left to do except. A sort of glory of it. The proletarian wants it right now saying Amber very often gets it. But the poor board well. As my uncle once said, 'The poor have it given to them. The rich have it anyway, but the middle classes do without.' So, both the aristocrat and the sannyasan have resigned. Now the more interesting of the two types is of course the sannyasan who resigns from the world game.

Let me review for you the role of the sannyasan in Indian culture. You know there are four castes. The caste of priests or Brahmans, the caste of warriors and rulers are called kshatriyas, the caste of merchants call vaishyas are and the caste of workers call shudras. And to belong to a caste means that you are in the state called Grihastha, which is householder. That is to say, you are one who is involved in the world. You are engaged in what is called low cost something rough and Loca means the world Sundra means upholding. Upholding the going on of the great illusion. And so you are playing for money, for position, for status, for success. And hoping above all that you could win, you can beat the game. But it's opposed in the same culture that every man who retains the age of forty five or so, who has now a grown son to take over his work, will quit the game, will resign. And so when you become at that age you're supposed to move from the state of grihastha to house older to vanaprastha, which means forest dwellers. You give away all your possessions to your son. You change your name. You'll take off your clothes and go more or less naked. Because you have abandoned status. So the sannyasan has no status he is however respected in the culture for being an upper outcast whereas the aborigines of the Indian Peninsula. Are untouchables the lower outcasts. And the upper our caste always mimics the lower For example Buddha had his disciples were oka robes because oka robes were won by convicts. So in the same way, if today in San Quentin they all wear blue jeans was special kind of pants and a kind

of a blue denim jacket this could well become the uniform of. A new kind of sannyasan in the western world and to some extent this is happening.

So this guy says, the game is not worth the gamble. The richer I get, the more miserable I get. You know how this is you think that your problems maybe monetary. And you get more money. What do you do then when you've got enough money you start worrying about your health. And you can never never stop worrying about that. Or if you're not worried about your health, you worry about politics or somebody is going to take your money away from. You worry about taxes about who's cheating you. And so a person who goes through all that sees finally, I don't think the game's worth it. I'm going to resign. And so resignation, or renunciation, is different from repentance. It hasn't it hasn't got the same kind of passion and it developed. The repentant person feels he is wrong, has made mistakes has committed serious and wants to get better. But the renounced process isn't concerned with that kind of thing. He knows that better progress whether tomorrow on material is an illusion. And you have to understand this when you approach for example the study of Buddhism. I think one of the most withering remarks I ever heard from an Oriental, he was Japanese. He said once you must never. Get that whereas Jesus was the son of a carpenter, Buddha was the son of the King. You know wow, take that.

And it's true, see that is something always of that about it. That this is not that. There's a sense you see in which Christianity historically was the protest of the slave class against the Roman establishment. Buddhism was different. It was the abandonment of position by an aristocracy. Say we've done it we've seen it all, we've had it. And so now, we check out. And we will be there, we will resign from all games. And if you follow this attitude to an extreme. You're going to make because it all goes to the center of the same discovery. That is made by the personal followers repentance to an extreme. Just as the repentant person discovers that his contrition is phony. The person who tries to resign will discover that he can't. That there is no way of not playing a game. Let's go a little bit then into this game theory. There are a lot of games that we play. And it's not only the game of can I get one-up on the universe. Of pretending that I'm me. This is ego. With its name and its role in the mass. But also we have what I call Meta-games. For

example the game my games better in your game. I won't play with you because your game is vulgar still for it banal, inferior. And, or one of the most therefore effective caves in saying my game is better than your game is that I am not playing games at all. You are. Now, at the lowest level we find that in the form of you're not sincere. I am sincere. You were fooling me was I'm not fooling you I'm being honest with you now that's a great game. And this game of resignation is a form of it. As to say, you are children playing with toys. And you haven't ever really woke up with the important concerns of life. You haven't reached the dimension of ultimate sincerity. Or that is to say Ultimate Reality. And in order to reach if you have to resign from distractions. You'll hear a great deal in the literature about meditation. Of getting rid of distractions. Wondering thoughts. Well you might ask when you think about all that but. What are wandering socks What are wrong thoughts what should I be doing with my mind. Well they all say, actually every day you figure about this and then you think about that and your thoughts run on in an undisciplined way to one association to another. And you can't keep your mind fully on the job. Or whatever it is. So you see, you're supposed to renounce that. Because that's triviality, all those wondering thoughts they're not about the important thing. Now what's important? What should you keep your mind on? Well something, just so long as you keep your mind up. In an instruction of one of the Buddhist scriptures says about concentration one may concentrate on a yellow square on the ground on the burning tip of an incense stick. On your navel. On the tip of your nose on the center between the eyes or anything. And then a footnote the commentator adds but not on any wicked thing. Of the world over, that's commentators the world over it never having a human. With so. Anything will do just so long as you keep your mind up don't wonder. Stick to it.

So wandering is involvement in games. By this kind of definition. So then, you try to get out. Can you now get out? Can you stop competing with other human beings? In ancient Greek society, there was a place in the center of the community called the Agom. A G O M. And this was a place of contests. Where they had wrestling matches and other athletic events. Because all the men were constantly trying to show who was the better. And from this word the agonea, which means please the contest itself held in the are gone we get our world agony. The struggle and striving to be

superior. And a lot of people, that you meet among your you will recognize this among your friends all the time are not happy unless they are involved in a contest it doesn't matter what it is so long as they are trying to beat something, they're happy. And you may say Oh for heaven's sakes. You know can we just sit around and talk. Instead of having to play a game or bet or do something to prove lose the stronger. I was once married to a girl who was never happy unless she was engaged in some kind of condos. Well of course I had a game. The didn't look like one. And so it was a very superior game. Just because it didn't look like one. But it was a form of the game my game is better and yours.

So, you can't really not play. You may go through the motions of not playing if you still are and one of the most marvelous examples of this is the Buddhist Sangha. The Sangha means the order of what is monks of. Monks isn't quite the right word because. The basis of Buddhist monk is a little different from Christian, but I don't want to go into that technicality. There are these people living in save Burma, Salon, Thailand and so on who go around in yellow robes and have renounced the world. But of course they've become as a community very prosperous and powerful. And everybody you know makes a basis to monks and feeds them and they don't they don't feed just on the rice Grewal. Important monks get called into the houses of wealthy laity and get given a fine dinners because the layman feels he is acquiring merit by being so generous to the monks. And you should see the scene in Japan although today the monks have lost their power to a large extent you can see the traces of the power they once have. In the City of Kyoto, the Buddhist orders Zen. Tendai. And especially Shinju sect, have the best parts of town. If you speak day and night in a Zen monastery. As a guest. And go into one of the rooms that you are not in any hobble, you are in a palace. You live differently from the way we are accustomed to but you are liable to get shown into a room where the walls are entirely covered in gold leaf. And painted by the greatest masters of Japan. You'll say sitting down to sleep by a car no motor no blue screen. And the landscape around you, the garden, the view, are just beyond belief. This is the life of resignation. Now it's true. I know most about Zen monks rather than the other order. Zen monks live a pretty rough life. But it's extremely toney [sic]. It's healthy. It's absolutely non masochistic. They have started the art of enjoying poverty.

Now this is a terribly important thing in the understanding of Far Eastern culture. When a man in Japan. If you sort of inherits an old fashioned tradition makes a killing in business. He doesn't go around showing off how much he possesses, he goes around showing off how little he presented even though he may drive to his office in a Mercedes or a Rolls Royce, his house is relatively barren. And he chooses objects of art and paintings that look extremely simple. And he will as likely as not. Have a separate house from his main huge establishment. Where. It's like a hermit. I mean it's almost as absurd in its own way as Marie Antoinette playing shepherdess after reading Rousseau. And having a little cottage, rustic cottage in the grounds of Versailles. But it's not quite as absurd as that, because even the main house has an austerity about it. And they learn you see, to love that hostility. To them, it has the feeling of great comfort. Now you see what happened was there not long ago the best part of Kyoto, the hills that ring the north side and the east of the city being so beautiful were owned by a bunch of Britons. Who were later the noble Daimyos, or lords of Japan, the great feudal barons. And these people work as tough as all get out. They are always fighting. And so the Buddhist monks will live. And decided they would take this property away from Medina by out-competing them. By playing the game our game is more interesting than your game. So they said all those bridges so what. You've attained all these conquests you have your castles you love your greatest days but then what. It all falls apart you know especially when the brigand is getting a little elderly and has stomach troubles and. Dizziness and so on and this man comes along so. You know and furthermore the monk says you can't scare me. And the brigand so I am. And he pulls out his saw as a mark but now the point is you can't kill them up for that then and there because if he does that he will find out whether the monk was scared on.

And so the monk looks straight in the eyes. And nothing happens, he doesn't flinch. When the brigand has an hour and a contest thinks and he puts her saw quite right against his throat. Well the monk has it right there. But you see how in a way easier the game was. Because the monk knows. That he wins. His point. If he doesn't if the bring in kills it. Before the monk flinches. He's obviously cheated. Now since there is honor among thieves. That the chances are all those little sometimes be a BRIGER will feel put down by this contest of that four killed a month the chances are that

he won. But you know what the monk stands to gain. If he wins Brigand says Wow, would I like to have that courage. Because if I had that courage I would be that much better. So the monk says I'll teach you, and as a result of that the Monk does teach him. He teaches him the practice of Zen, zazen meditations and all this kind of thing and puts him through the to the works. And so he comes to understand what the monks didn't understand anyway which was that it really doesn't matter if you live or die because the thing goes on it's perfectly indestructible if you happen to die it just goes on in a new way because you are the works. So fine but the monk is playing a game. And so as a result, all the zen community has got given the old palaces. The Brigands all moved to Tokyo and set up their business and all around the great court. And the gorgeous temples and grounds went to the monks, where, although none of them owns anything personally, which is a great idea you know, because you don't have a new responsibility to the community you serve. And you don't have to pay added taxes and since you're a nonprofit organization if you're not taxable anyway if I'm. Our it's a great set up. And they they really did it beautifully but a part of what they did in effect was to carving those brigades out of the best land in Kyoto. By resignation, by playing a higher game. But you see, any one who goes through that, goes through the Buddhist process of resignation. Will come to a point, where he knows that he didn't resign at all. And this is what makes the difference between pedestrians Buddhist monks. Who think they've resigned. And have feel a little bit guilty because it's such a prosperous of. To resign because you live in the best places so on. And those ones who know will go right through the crowds to do the small. Residue great Buddhist masters who discovered that they can't resign at all. Let's consider an extreme example of resignation in. The life of a hermit. Far Eastern literature is full of the idealizations of the hermit's life. The wonderful idea of an old man somewhere in the mountains far. Off in the forest. Hakuin's book describe such an individual. Who can't be found nobody knows where he is he leaves no trace and they consider that is admirable. Poem you know it says I asked the boy beneath the pines he says: 'The master's gone alone, herb gathering on the Mount. Cloud-hidden, whereabouts unknown.' And that idea of the far off man way way. But what does a hundred at the start. If you try and get as lonely as you can get. You become aware that you can't get away from it because when you get very lonely and very quiet you become extremely sensitive. And

everything that goes on that's all not ordinarily unnoticed comes to your attention. First of all you will find as a community of insects. And they are tremendously interested in you are not necessarily hostile they may be sometimes but but alone in the forest when you get really quiet you will notice little creatures will come and inspect you look you all over. And they will go away and tell their friends and they'll come and look to see what it is. And you become aware of every single sound. And you realize that alone you're in the midst of the vast money crowd. [It] may not be human. But it's everything else.

So that the point of being a hermit, the discipline leads you to understand that you can't resign. The lonelier you are. The more you joined together with everything else because you get more sensitive. So then I find them I cannot give up playing your game look at it to from another point of view Supposing I say everybody is playing the game me first. Now I'm going to play the game you first. To use the phrase of Bon Huerter, who called Jesus the man for others. Now let's see if we can play that game instead of me first you first. After you please. Will you please. You know what a way this is putting everybody down. Say I'm the one you see was so generous I'm the one who's so loving so self-effacing and all you with inferior brats could go first if you could play me out play you. Are trying to convince you to play you-first. But the success of convincing you on that is relative this law and therefore the in-group will always be the people playing you first. And therefore they will get the honors. So, when you think that through, and you say I cannot stop playing me-first. There's no way of not doing it. Very well. And what does it mean when I'm in a trap that I can't get out of? The no way of getting out of this trap. Well what it means is that you and the trap of the same thing. You're not caught. Because when there's nobody in the trap there's no trap. So that long as you think you're in a trap then your traps got you but when you know you are the trap then what is the trap got. If you're trying to get out of the game, you're trapped with no way out, but when you will have found that you are in the game are the same. There's no game to get out of there's no one to get out of the game. And that's true resignation. And then you can take the point of view of the bodhisattva as to distinct from they arhat. The arhat in Buddhist terminology is the person who escapes from the wheel of birth and death. The samsara, gets out of the game, so he stands here. With both the stock

price is they are past his they are gone are to find out that you've got to get out again all the Bodhisattva's found over here. In other words, he goes back into the cycle of reincarnation and doesn't bother about escaping anymore.

So, in just the same way as to repent of leads to the understanding. That you're a phony even in repenting. Resignation leads to the understanding that even in resigning, you can't resign. It isn't as if someone were saying. You must play this game. And you felt yourself under some sort of compulsion. It's rather discovering that the game is what there is. And if you get out of it, you would be to be no where. You don't have to play. This is the point I'm going to repeat this because as is crucial it isn't that you have to play. Because that would make you feel a victim of some process beyond just self that has been telling you. It is that. The playing is you and nobody is shoving you around. Because you are in the universe which seems to constrain you are not to think. If you play the game that you are only here, then you will feel pushed around. But when, through trying to resign from either pushing around or being pushed around you discover that it can't be done. You then become very much aware there is no point getting away from anything. Where is away? And so it said a true zen monk has a mountain hermitage in any place that he stands on. So, let's have an intermission shall we?

Thus far, we have discussed two of the four attitudes of the human predicament. Characteristics of religions and methods of spiritual development. The attitudes of repentance and of resignation. Now let me repeat that the premise of this whole discussion the first premise is that existence is a game. In the in all senses of that word the best sense and the worst senses. That it's a pattern of dancing. The principle of which is now you see it now you don't. Or hide and seek or lost and found. And that we, as members of Western culture in the twentieth century, inherit a way of playing this game, where even we pretend. That we are each one of us an isolated individual. Who comes into the world as a stranger. We do not know in the ordinary course of events, that that is not true. And that each one of us is a way in which the whole fullness of ultimate reality pretends that gets lost. In an individual life situation and endures the adventures of pain and death. And endures all the critical efforts and decisions connected with practical and moral problems. The fact that this is the case is of course

the content of certain kinds of experience which are extraordinary. That means simply, not necessarily rare, but outside the usual order of things.

The types of experience we call cosmic Consciousness, mystical vision and so on. Where in sometimes as the result of following a yoga but sometimes simply as a consequence of a spontaneous change of gears you might almost call it, inside the brain. Or some anomaly of switching, we get let into the secret. And in such a moment a person feels that the scales had dropped from his eyes. And that he was awakened to the true state of affairs. That we do not know this to be the case in the ordinary way, is because we are...you could say in a certain sense of the word, hypnotized. In the sense of the word that is applicable to the technique of a stage magician. Almost all stage magic consists in misdirection of attention. So that the magician makes you watch something that will distract your attention from the trick he's going to pull on you. And we are almost all distracted in just such a way. Because we have so specialized in the powers and properties of conscious attention to things that we have identified our very selves with that faculty alone. We are therefore unaware of a much more inclusive and diffuse kind of awareness, which underlies the possibility of conscious attention. And which characterizes every single nerve end in our bodies. We screen out, that is to say, we pay no attention to, most of the information or to use electronic terms input that our organism receives. It is possible however, to, as I say, slip switches so that we become aware of the inputs. I won't say of the total in part because that would be shattering. But we've become aware of a great deal more than we ordinarily notice, and it is in those moments that the experiences of cosmic consciousness occur. Because it is in those moments that we become aware of the fact that what is inside your skin goes together with what is outside your skin in just the same way as your head goes together with your feet. Though the two..obviously, it's physically impossible for your inside of them to exist apart from the outside universe. And then you would just simply wouldn't have an air to breathe for one thing. The simplest possible case of it but it's far more complexly related than that. And the going together of these two worlds constitutes. A Unified Field of process of being. And we are not ordinarily aware of it because of the tricks of the game of pretending that we are the inside of the skin only.

So then, under the conditions of this game. And I'm not saying it's a bad game, that we shouldn't play this game. I'm only pointing out that it is a game. And that if sets up in other words all game sets up it sets up some formal rules. But these formal rules of the game should not be identified with the laws of nature or with the state of affairs of reality. There the rules of games are conventions. That is to say, agreements about how we are going to carry out a certain operation like the rules of dancing or waltz are game rules. So also are the rules of marriage, of political elections, of how we measure time and distance. And all sorts of things there are conventions. And convention is a word that translates exactly one of the meanings of the Sanskrit term Maya. Which is the all inclusive word that the Hindus and Buddhists use for the world illusion. It is therefore a convention to think of nature as divided into separate things and separate events. That is a convention that corresponds exactly to the mathematical operation of the calculus whereby a curve is measured by pretending that it is a discontinuous a series of points or of tiny tiny straight lines. It isn't so, the curve is continuous, but by pretending that it could be a series of point-instances we can count them, work out their positions in reference to some kind of a standard scale. And so we get a measurement of the curve. Just as one does that in mathematics so in everyday life, we count every human organism as a thing-unit. And we count all kinds of things as a thing unit but sometimes a child will surprise you by asking you for the name of something which you never thought I was a thing.

We don't for example have a word which specifies the inside of curved surfaces like the inside of a part. Of the inside of a pipe. Or the inside of a a tin can. We don't have a word that specifies dries space. Or a dry surface [sic]. Now, other languages have words for those because to those people for some reason or other this concept is important. Aztec language has one word which covers rain. Ice hail snow. Whereas the Eskimos have five words to differentiate different kinds of snow alone. So our child will often ask about something and say What is that? And the parent is not clear what that signifies. And it is because you see things and events are the units of experience. And they are those parts of experience that we notice. And when you've noticed something, you apply to it a notation. You notice by making notations and notations are words, numbers and such symbols as musical notes, or algebraic signs, or astronomical symbols. Or whatever. It

is a way of dividing up the world, so as to be able to discuss it with each other. And so to control our environment. But don't be deceived by noticing and notation. The world in which we live is not really divided. It's like taking a sieve and passing it through water. The wires of course cleave the water, but the water doesn't stay neatly sliced into the square lengths you see, as if it were something like being on the water close again and so in the same way although the intellect constantly slices the world into units the world. Well the slice that does not mean that the real state of the world is something like bean curve or junket. Completely formless. It means that the world is full of the just those various forms that we see. But it's real of a lot more forms than we see.

First of all, the waveband upon which our senses are responsive to, the electrical going around outside our skin, is quite narrow. And if we had a wider. Range of sensitivity let's imagine that we had some additional sense organs. That were as different from the five that we have, as sight is different from hearing. Then we should be aware of all kinds of connections and phenomena that we don't see in the ordinary way but even with the eye out without the addition of extra senses of that time it is possible to increase human awareness. So that we can see all kinds of things that we ordinarily ignore. The simplest example of this is that when we look at other people's faces, we see the human face in a formalized way. We see faces as painters and beauticians have taught us to see them. There are many characteristics of the human face that we block. Now supposing you are a so-called white caucasian. You are supposed to have you see a very very pinkish smooth skin. Well you don't have anything of the kind. You have a highly differentiated many colored blotchy skin. Only if you put on heavy makeup like a pancake makeup of course you reduce the color variations. But even then, your face moves constantly through an interplay of lights that are altering all the time. And we choose, unless you are a painter or a photographer who is trained to look at these details, you ordinarily ignore them altogether. Our faces have all kinds of hairs on them and pimples and little funny jiggles and it's all there. Only we don't consider that those details are significant. And so we screen them out of everyday consciousness.

So this Maya, this calculus of dividing up reality into units which are presumed to be disconnected, but somehow related to each other in more or less the same way as billiard balls, that interact by banging each other around, becomes the commonsensical view of the world. And is, just a convention and nothing more. Now in that circumstance, in the circumstance of the person, the human being feeling lonely. And feeling that he confronts an alien world, one of the possible tactics and the games that he can play is the highly aggressive game of dominating the environment by the power of His will. And this game is what I've indicated here by the word rebellion. Now, I'm using that word in a very loose and inclusive sense to cover not only formal rebellion, that is to say, the criminal way of life. But also, even official rebellion. That is to say, a US Marine sergeant might represent in some way an official rebel, since his attitude, his whole way of life, is based on guts. And the exile Taishan the gutsy attitude seems. Of the strong arm of muscle of brawn as against brain. And you can carry this attitude to such an extreme. That it can become a way of realisation just in the same way as these others repentance resignation and I which will see, reincarnation.

In a certain sense, Jean Genet is an example of the rebels. Are Big over such as put forward the view that Genet is a Holy Criminal. And this idea has had great popularity in modern times in France. And is part of the mystique of criminal young people in the United States. And it has to be understood, because otherwise, one doesn't really deal with it. To be, in other words, delivered wrong the egocentric predicament by carrying egocentricity to its extreme. Now, first of all. The idea that we are egos, although I have described it as a convention, and as something that is not fundamentally so. Nevertheless, the idea that we are egos does exist. There was a faith healer of deal who said although pain is not real when the point of the pin goes into my skin I dislike what I fancy I feel. But you see, the fancy is there. Little the same way the imagination. The illusion the Maya, that we are separate egos is something that does exist. And that fact, that our fancy is so is not a bad thing. It is a form of game. If you would imagine life. As a dump, a choreographic pattern. You might say that the imagination of being an ego is a very far out curlicue. You know how people do from design so you get. A front like this. And I want to hear. Another one here. And so. And then say Well now come on let's go. In the

smaller one, drawing the tendrils on the vine and then in the bidding temple come out of the other. Three and they make it more complicated and more interesting. And so, in that in that way. The development of the sensation of the ego is a very far out curlicue on the extremities of life.

So, the fact that you and I imagine we're egos, is the same sort of thing as you will observe in any complex pattern. Of crystals. Or surface tensions in foam, or anything like that. It is very very natural. And so, there is then a legitimate way of following this fancy through to its logical conclusion. The yoga of egocentricity. This is a very difficult yoga. For many people to follow. Because we've been brought up so as not to have the courage of our convictions about. To be a consistently egotist. Perhaps Nietzsche was a great example our philosophy. To be a consistent egotist requires a tremendous amount of nerve. Because everybody is trying to put you down. And say to you you should be unselfish. You should go. Operates with us and that requires doing things that you may not not like to do but it does for the common good that you should do these things. But the difficulty about all this is, that I'm talking about a quite superficial level of this descent. I'm talking about here. When people pretend to be unselfish and cooperative, they confuse others horribly. If you give somebody else the impression that you're going to be their loyal friend and you're going to really knock yourself out for them, and they rely on you to do that and then you let them down because that wasn't really what you meant to do you create a great deal of trouble.

So in marriage, if you have vowed to be faithful and constant to some girl in a moment of intense passion. And then after a while your affections cool off. And you lead her to believe that you will always be reliable and faithful, there's an awful crash coming. So it's terribly important to be emotionally honest. It's very difficult, because we don't always know what our emotions are. But to say to someone that I will love you forever and ever is a very very serious dishonesty and deception. So in the same way, to give the impression to all those around you in your society your community. That you will put the community before yourself can be relied upon to do this is a dangerous thing to do. You may have the fullest intention of carrying this out. But I find in practical relationships that I am much more comfortable with people who tell me frankly what their feelings are. In

other words if I'm not welcome, because they've got other business to do and they're all tied up with things it's much better that a person would say I'm sorry but I don't feel in time to see anybody right now I'm busy and so on. Then I can rely upon that person that when they tell me you are welcome that I really am. One of my best friends is a woman who is totally frank and if she is even if for purely irrational reasons she doesn't want to come along with something or do something she just says I don't feel like it. And so we understand each other perfectly everybody understands her. Because then they know when she says Please come, that she really means it.

So, a proper egocentricity. If you feel like an ego, you see, is essential in good human relations. And to be guided by your real wishes as far as you can make them out know what they are, is on the whole. A safer bet in human relations than to be guided by abstract principles. Now the abstract principles are all very well, and we should know what an ideal pattern of human behavior might be. One has to keep as it were one's eye on that. To see if you like it. You see, the game of existence is not isn't this not very simple. If I could say you know rely entirely on your feelings act on impulse never do anything except what you would really want to do. It isn't that that would be oversimplification. Because, among the things that most of us really want to do there is a certain concession we would like to make to an ideal pattern. So sometimes when a person does do something which is an act of self-sacrifice. Or described as such it really is something he wants to do somebody gives away some of his the money. [He] doesn't do it because this is a sacrifice and a masochistic spirit that the cars go to heaven I would really like to see what would happen when this guy gets the money. What fun to see this enterprise stuff even if I don't get anything back from an. Hour of the entertainment.

So, an ideal pattern of how human relations might be is always something to be worked out thought about and kept in mind. For we are all as always possible we might want to that way. But basically, to do what you really want to do is a more secure gamble than pretending all the time about a lot of oughts and shoulds. A friend of mine with a very brilliant mathematician once told a story that in the beginning of the ages. God was making up a dictionary of all the words that would be used in language. And one day he

visited the Archangel Gabriel, and they left the Dixie dictionary in the taxi. And while he was in with talking to Gabriel the devil got into the taxi and rode into the dictionary to work. Out and should.

Well, as a result then our pretenses. Of not being honest about what we want. Untold confusion arises. You know the proverb. Be very careful of what you desire. You may get it. But we live in a culture, where the almost the whole economy depends upon the creation of artificial desires. Upon giving you desires the two. Might never have had in the ordinary way. And therefore thinking that you want that simply aren't want to bore. A lot of people for example, when they feel miserable, depressed, simply go out shopping. Because somehow purchasing something, seems to be a lot of fulfillment of life. I mean I know of a lot of a wives whose husbands are engaged in business and leave them alone most of the day when there's nothing to do except they regularly go and go shopping. And they shop every day as if it was something I had to do every day like having breakfast. And of course, that keeps things buzzing and. Critics are only going to ask. If it means you're misinterpret your own feelings. And so there's always after a shopping spree a sense of letdown. Same thing happens every Christmas Day with children. You know that toys are increasingly phony. They are a method of propitiating children. I was saying yesterday about the educational system being a method of preventing children from growing up too fast so that they won't come on the labor market in one huge blotch.

So in the same way, children who are not allowed to participate in human activities such as cooking and hunting and so on have to be given so many activities. Toy cooking stoves dolls dolls houses, guns, anything, but the real thing so that they will be kept amused and kept out of the way. Because any real child you know, likes to play with pots and pans and all the things that the adults use and are doing. But toys prevent them from doing that. Now then, what happens is the children are given an immense artificial desire to tolerate. A toy shop seems paradox. When on Christmas Day, the suitable tree in all the fills all in all the stuff and package is wonderfully wrapped you know the wrappings are better than the content. More beautiful. They get all these things out and the room is to room with guns and buses and dolls and all that stuff by four o'clock in the afternoon they are screaming frantic. Because actually the whole thing was a terrible

letdown. And that happens again and again, but that happens to the other up to. The outside merely repeating for the children what they're doing they're acquiring all this kind of pretentious junk and thinking that's the answer and it's a let down. Because they didn't find out that they don't really want it and they don't find out what they do really. Because everybody has to pretend that it's good to work for what you don't want. So that's the initial difficulty, that is the mere Guardian dog at the gate on this part of the city. But so there I mean just simply an initial step here is to be honest with yourself. And to be unashamedly eager to. See I like people. Who are supposing they have a certain accomplishment don't be blushing Violet about it, but say I can do that. I know how to do that and I do it well and I can exact therefore a fair price for it. I feel happy with a person like that. Especially if he's someone say like a doctor. I show him the know that he is good at is job. And if he is confident about it like that and says as I know what to do then I have that essential faith in him which everybody has to have in their doctor in order to be able to be healed. And but we say the community says to a person who does that you are immodest. You are too big for your boots, you've got a swelled head. Now, a person has a swelled head, and when his opinion of his accomplishments is excessive. The when a person's accomplishments are good he ought to be proud of them. And be delighted that he can do it so well everybody says if you can dance well don't you love to do it. Are you a show-off? Yes, you are a show off you know but but build a show off please please like to see it but. This is part of the willies into why we all go around and grab colors. Nothing so off a meter can pick. You know kind of a clergy look to you. [laughing]

Because you see, people have thought in the past. If you'll show off, the enemy It will notice you. So a chameleon disappears into the background. And doesn't show off, so that the birds or whatever want to eat that chameleon won't notice it. But when you live in a reasonably protected community as we do, we are still carrying over from the past all kinds of camouflage habits, which really aren't necessary anymore you can't branch out a little. When it's extraordinary that our society doesn't really tolerate eccentricity. Even though it was based on what it thought was rugged individual. But you see, that's because we are half hearted about individuals. And if you are going to go the way of the ego you must go it's far away. That was true of all these ways. If you're going to chop off

somebody's head. And that really is the decision somehow or other it's necessary, you've got to do it with determination. For a half chopped off head is very bad. To use a blunt axe. This is the philosophy underline Bushido which is the Japanese philosophy of chivalry based on Zen, where they decided that if there are going to be soldiers and if there is going to be fighting at all then it must be done supremely well. And if you're going to fight supremely well, you've got to have a sword like a razor. You know a Japanese sword is a letter that literally every razor. And you've got to know how to go on to have what we call follow through. So the whole notion of Bushido swordsmanship is based unhesitating, going ahead, going ahead. It's called in Chinese Mo chir Chu. Are going straight ahead-ness. Which is an added field of never pausing if for example if you drive a car on a freeway here you have to have a little mo chi chu. You mustn't hesitate. It's true, even more true driving a car in the room. Where these Italian drivers fast but very subtle. And there are tremendously aware of each other much more so than here the worst drivers are in England but. In Rome this is very fast beat driving but that instantly responsive and you just have to go ahead and get into the traffic and. That's the only safety that is if you hesitate and fiddle around and so on you're done for. So this is absolutely the capitulation. With sudden swift speed. If the, what you're going to do is wrong do it well. As Luther put it check out a fortitude if you're going to sin make it a good one if you're going to make a mistake make it a good one. But don't nimble mountable them suffer them as they say and then. Walk or stand as you will but whatever you do don't wobble. Them. So that realization is about here. You know, we have the first one there we're about here now.

Now then, keep on going, when in the Divine Comedy, Dante accompanied by virtue of his guide explore how. They pass through a gate which says All Hope Abandon. You who enter here. You never never get out. That means you can't retrieve your step. There is a way out. If you have to go down to the bottom. And they. Finally come to the place where Satan himself is encased in ice, brooding over a new vast field of ice. And gnawing on Judas and Brutus and someone else Cassius the great traitors. And our very is utterly malignant, and every now and then his bat-like wings close together and open those together open. Now about those wings are the symbol of the active door. The active door in all mythologies in some way or other and it is. The gate through which. In passing you go through the critical moment

of initiation. And to get through the active draw. You've got to go without hesitation, because if you hesitate you're too late. It crushes you. Jason assailing the Argo has to go through the simplicity of the clashing rocks but this use has to get between skill and character. In the, one of the Arthurian legends ...is it Sir Gawain and the Green Knight? I forget. but there's somebody who has to charges cost. Across the drawbridge and into the park colors. And just as he gets in the park colors crashes down and takes up the rear end of his fall. He's got it. All sorts of stories like that so the wings of the devil think this is it they have to get quickly through those wings and they climb down the devil back on the great tuff but he has very heavy. Then suddenly they get a strange sensation. That they are no longer climbing down but climbing up. Because they passed the midpoint of the earth. And then they come where they hear a stream. By following the sound of the stream they find the secret passage which leads them out again to the vision of the stars. So what it means all hope of than when you enter here is you can't go back. You can only go on.

And so in this thing, this egocentric situation. Once you're in ego. Or think you are. There is no way out but on. Now you see what's happening here. People who repented of being ego. Were trying to go back. And by trying very hard to go back, to relent. They know now I should never have got into this, they found they couldn't go back. And that they were phoning. The people who said we resign from being the go down, they couldn't resign. And now we're getting a little bit warmer aren't we. We found it couldn't go back, and so you've got to play the ego game to the limit.

And, so comes a point, where the person plays this to an extreme and he may. Maybe in a very odd situation he may play it by being a real criminal. And end up in the penitentiary. But he's going to end up in a situation which is symbolized by three great myths. One is the myth of the tar baby. The other a giant sticky hair, and the other, the crucifixion. We found the crucifixion again didn't we, when we went along this way. But you know the tar baby is. You get stuck there are going to be a topic. And giant speaking here comes in the Jaffa tale about the photo in one of his previous incarnations attract a certain giant. Who would have a sticky and everything that hit him got stuck. Under a giant used to eat. The people of a certain village. And a prince came there one day and heard about it consider he

would go and clobber the giant. So he fled for the Giants and you struck him with his left arm half pound and it got stuck he struck him with his right hand and that got stuck he kicked him with his left foot that got stuck think there were this right foot and that got stuck his head banged it with his head and that got stuck in the giant's that Aha Now I'm going to eat you. And the prince said that that's all very well but you will find if you leave me that inside my belly is a thunderbolt. And if you swallow that it will blow to pieces. So the Giant really is the prince and promise not to eat the villagers any more.

So when you follow your ego to the limit, you'll get stuck., when you find suddenly powerless in your efforts to play again the world. But you realize that the reason for this is that, in fighting the world you're fighting yourself. You are like a person who picks up a dagger in each hand. And the left hand says to the right, I'll take you on. Let's fence. You ever try it? Fascinating. You know, be careful. But, you can have this strange thing and what happens is this: you meet a moment of total paralysis. Because each hand knows perfectly well what the other one is going to do. It just always. So, by following your ego to its most intense point you reach stalemate in the same way because suddenly the left hand discovers what the right hand is doing. And at that point the Oh ah oh oh oh oh. After all, I wasn't a separate ego. So let's have an intermission.

It's curious that in all the three approaches we have thus far discussed. The response of repentance, resignation, and rebellion, that there's an element of desperation in each one of them. Each one is an expression of conflict. A conflict between the human being sensing himself as a separate ego, and the life situation in which he finds himself. Now remember that I pointed out, that the situation of feeling yourself to be an ego is a kind of game. It is a pattern of life, a style of life. Just in exactly the same way that a robin or an ant or a marigold there's a style of life. It has a particular shape it goes this way or it goes that way or whatever it is we see. And so the human world in which we live out our egocentric adventures is a certain style of behavior, a certain kind of music. And so also are these three conflicting scenes. The fourth way though that we bring up now I call reincarnation. Simply because, for mnemonic reasons, I was giving four R's instead of the usual three R.'s. And I don't mean reincarnation quite in the sense that it's ordinarily understood. I mean getting with life, and if this should by any

chance involve reincarnation that is to say the willingness to be manifested in this world and all of the ventures, again and again and again and again, you can take it in that sense. But you know. This attitude in the religions of the world is extremely rare. And most religions are against life. Practically speaking. They turn back as it were to the law of God and say you know. You made a mistake. Either in creating the world, or in allowing the snake in the garden. And what we really have to do is get out of it. The way of repentance says God you didn't make the mistakes we did we're terribly sorry but we're trying to do better next time. And we know we've offended them most awfully against you. But I know you will still love us and we really will do our best if you will help. The way of resignation tends to say that they are not there wasn't some kind of original sin that man or an angel committed, but that the manifestation of the many out of the one, is itself some kind of mistake in some way. At this game, where for example all biological being used live by eating each other is a bad show and we resign. If possible we won't eat anything that screams too loud when it's killed. And I asked R.H. Blyth, or my wife I think I asked him. Why are you a vegetarian R.H. Blythe is a great British Zen man. And she said truth don't you realise that it also hurts the plants to tear them up and so on you said yes but they don't scream.

But in the end in the attitude of resignation you see there is still this conflict. Spirit against matter. The sense of the dualism. Of the soul incarcerated in the fleshly prison. In the attitude of rebellion, there is still even no known or very critical way express the sense of differentiation between the individual in the world. And our modern technological civilization dedicated to the so called Conquest of nature is a preeminent expression of that spirit. But as I pointed out to you if you push it far enough, if you rebel or oppose the universe was sufficient will and vigor. You will eventually reach an impasse which is just like a fencing with yourself. You have two knives crossed, see, and you are going. To date one of them I mean if you don't want to do it so dangerously you can do it with knitting pins always was chopsticks. And have a fencing match with yourself so that one hand tries to hit the other and the other that is to defend itself. Well you reach a stick point, because both hands know in advance what the other one's going to do. And I use that as comparable to the situation which arises when you have opposed whatever it is that you want

to opposed, sufficiently enough to discover that whatever you define as other turns out to be the same as you. Or to put it more exactly, I am not I. Turn out to be two poles of the same process. And it's the process rather than the Poles that really constitutes you. The last word in metaphysics is if you understand the subscript whole secret there is an inside for every outside and an outside for every inside. They go together, you see. When the inside moves, the outside moves. The movement of the inside is the same as the movement of the outside in the movement of the outside is the same as the movement of the other side. When a globule of some kind changes its shape, this is the same thing as a change in the shape of the space that surrounds it only, we are brought up to believe that space isn't there and is an unimportant factor. In the changes that go on among the solids in space. But this is why astronomers have such difficulty in communicating to the general public ideas of the come under the heading of properties of space. Why, because to the average person space doesn't have any properties space is just what isn't there.

But we know now that space isn't nothing. That it has properties only that they are not yet clearly understood. And when space may be said to be curved and by its curvature influence the way in which light is propagated. Or when, you can consider space as a magnetic field, you begin to realize that there's something you've been ignoring all the time. It was for example perfectly a matter of common sense to Dante and probably many of his contemporaries, to regard space and mind as the same thing. If you read a book called saving the appearances, by a British man whose name momentarily escapes me. Baron's field I think that's. The way our the N S S I E L D Barenfield Saving the Appearances. Anyway, that's the title.. He has the most marvelous discussion of changing. Common sense says, how different it would be to live in a world where everybody realizes that space is the mind. Rather than our present superstition. That the mind is something inside your head. When neurologists looked for the soul somewhere in the brain, they can't find it. Because they're looking in the wrong place. The brain is in the soul. And the soul is not some kind of gaseous spook. The soul is the total arrangement, and system of relationships constituting the universe, as picked up RAM transmitted by a brain. The brain in other words as some like a radio receiver. Found it expresses enough highly complicated way the total configuration of all

things that are. But in each brain it does it slightly different. So the cell, as you know, when astrologers drew a map of a person's soul. Past his horoscope. They drew as nearly as they knew it a picture of the universe. As focused upon the time and place of that individual's birth. Well that is a... astrology I think, is a highly unreliable science for practical affairs. But he did express in a kind of mythological image. Very beautifully. The truth that everyone is the cosmos center. In the place that you call here and now. But you see. When you don't know that, and you think that the external world is foreign to you. Instead of being as it were, your better half. I mean imagine that. It's so it's so. You do I know of one difficulty that people have assimilating this idea is that what happens to me when I'm unconscious. So I go to sleep at night and if I sleep soundly and don't have an injury. I wake up at the same moment I went to sleep. You know that just wasn't any interval only I feel different when I wake up revive a hangover or I feel refreshed. And, but the interim just wasn't there. And you think if it wasn't there then but that was I ever open to everybody else's inspection while I was lying in bed.

Now at the same sort of situation bothers people about death. Because if you come to an end and after death, there is unconsciousness. But you see unconsciousness doesn't last any time. It may from somebody else's point of view. But actually, there is no such thing as experiencing being unconscious. But in the same way that you are unconscious of the way your pituitary gland is functioning at this moment. And unconscious of the structure of small capillaries inside your body, and yet they're working even though you don't know anything about it consciously. So in just exactly that way, your extended body, namely the cosmos, goes on when you're dead in the same way that your organic body goes on when you're asleep. And as when you wake up your organic body restores its particular local consciousness, so after all of us die, the big organic body which is the cosmos wavers lives somewhere else. And they are us. By us I mean the real self the total cosmos appearing all over again and becoming conscious once more and when it happens, do you know what it will feel like? It will feel exactly like it felt when you were born. And whether you have instead of eyes long tentacles of some kind of whether you have an anti. Now on top of your head on nano head whether you have one hundred legs or two. You will see yourself as a human being. After all, mice and cats look human

to each other. They think we look very odd. We are some kind of monster, because we are a different piece of the all species look human to each other because with what the word human really means is the center place. Where ever anything looks out from is from its point of view of the human place. And you must also be very respectful to creatures because although you may think that they're not very cultured. They have a culture which is from their standpoint as refined as ours. They know, cats for example, know that there are more and less refined cats. I've just been sitting on and are denizens of patio listening to a Mockingbird. And that thing has a tremendous culture. The things it can do with its voice. And there's no apparent reason for all that is just sitting there on the T.V. antenna, enjoying the afternoon. It doesn't seem to be a mating call no mate comes around. It doesn't seem to be threatening anybody. It's just happy, and it's up there doing its stuff and making this gorgeously complex music and it's much more complex than we can hear. There are things in the qualities of the voice, subtle tiny changes, that are perfectly fascinating. This creature is unencumbered with codes. To, in other words we judge people's culture to such a large extent by their shopping I was talking about that was money you know why they go around and acquire things and have them all around and that's the human way of showing off. But other creatures do it in a different way they would from their point of view criticize us as being messy. As having all these things we have to dangle on ourselves and put on jewels and things and whatnot and they would say well that's not. For humans they have to do that because they have such ugly bodies. They look like potatoes. Underneath their skins. We have all these lovely fellows and the fish have such beautiful colors on them and they live in the water.

One of the most intelligent creatures on earth is the Dolphin. And the dolphin many many thousands of years ago it was a land animal. But when it saw what human beings were doing and the direction the high intelligence was taking on land they all decided to go back into the water because in the water others plenty of food. You don't have to hunt too energetically you are never right liable to run into a famine, and you don't have to be encumbered with houses and clothes and so you don't have to work. So dolphins spend most of their time playing they like for example, to pick up with a human ship. And then the the ship makes a wake, and so they set that tail at that exact angle Apprentice It's not have to graze or something and

the ship pushes them along. Where they can actually swim faster than the ship goes but they don't want to work. And they they laugh they play they break circles around the ship they do all sorts of things because that. It's their way of life and that very very sensible people. I've absolutely renounced eating dolphin meat because I feel that cannibalism. The Dolphin, in other words knows how to get with it. And you see, this is the thing that these three religious approaches only find at the end of the line. Now is it possible that there could be a new kind of religious approach in which Heaven says to earth. I really do love you with no its and buts. They say in Christianity God so loved the world. But there's always a but after it. But the world is falling away from God and He loves it of the sense of a kindly but stern father who says, this is going to hurt me more than it's going to hurt you. As a sort of I don't know. The whole attitude you see, is one of Cism, schism, schizophrenia. Division between the spirit and the material. Would it not be possible for there to be a real reconciliation, in which the spiritual in the material make friends? And can say to each other genuinely I love you with all my heart. And you see this possibility emerges in the fourth way and this fourth way historically, is largely characteristic of Mahayana Buddhism. Because whereas in Theravada Buddhism, resignation is carried to its full limit. In Mahayana...what happens really, is that when a resignation has been carried to its extreme and you'll find you can't resign from the game. Because you are the game there's no you to get out of it then you see this tends to happen automatically. So that the kind of personality called the bodhisattva emerges, that is to say, the one who doesn't go off into nirvana but who comes back into the turmoil of everyday life out of compassion for all other beings and helps them to be liberated. But when they get liberated you see, they in turn become Bodhisattvas. Because there's always someone to liberate. Because, while, with one hand reality is realising what it is with the other it's forgetting. See. It's like this and three for a penny three for a pound lover makes the world around that's that's what happens. So this is constantly going on, just like you're eating and yet excreting in breathing out, breathing coming and going everybody is a whirlpool into which a great stream of milk comes. Out of the stakes are all sorts of things are flowing and they swell around like this and shoot out the other end and that's that's like a whirlpool in water you see. So everything is like that because existence is constituted by in and out. Air in alone doesn't make any do out alone doesn't make any do

but in and out together they make a do. And so, much ado about nothing is a Buddhist conception of the cosmos. And that's marvelous, you see, because Much Ado will be better than nothing. Nothing all by itself to see you can have nothing all by itself. You have to have something to have nothing and as soon as you get nothing about something they go together in the same way.

So, in this point of view of then, we are at peace. In the middle of conflict. This is really the point, from which I started in saying. That from my point of view. There are no. Right religions and wrong religions. All of them are simply different like different flowers. And one has certain preferences and tastes one has one's favorite frog flowers and the flowers one personally doesn't like but the variety of them is necessary for every individual species they all go together. Well so in the same way from this standpoint, you get this odd view of the world as fulfilled and completed, not sometime in the future but now here today. With all its...with all those with all the things in it that appear from various points of view to be faults sicknesses, peculiarities and horrors. And now I quoted the Smalling a child a kid in a college. Who said the thing I can't stand about college is that it's always preparing you for something to come you never teaches you how to live now. You know that the poem. Called the Rubaiyat of Omar Khayyam. Which is not really only off but FITZGERALD It's an extremely free translation. But it. Carries the seam that we call carpe diem. Seize the day. Drink eat and be merry, for tomorrow we die.

And so, especially drink get roaring drunk because the future has nothing in it for you. Actually this poem is really mistranslated you should read the translation by Winfield, which is quite a different matter. Omar Khayyam was a sufi, that is to say an Islamic mystic. And the sufi is have to keep quiet about their doctrine. The central doctrine of Sufi as I'm is and I have. And that means I am he. The realisation I am God. And so they say, just as there is no deity about he. So there is no here to save us he. Well many Sufis were tortured and slain, because of the proclamation of the UN our heart so they used hidden language to propagate their ideas and in sufi symbology wine is the divinity. And to be drunk is to be enlightened, is to transcend oneself. And of course this imagery is likewise in Christianity that's one of the meanings of Holy Communion blood of Christ anybody. Is

one of the sayings in the I think the divine praises. And. So the whole meaning of the Rubaiyat is get drunk today because there is no tomorrow. Why is there no tomorrow it is not because life is transient. Not because we fall apart we keep on falling apart. So you once you fall apart you fall apart again everything is falling apart, it always has been. I mean life is a process of everything falling apart that makes multiplicity of many things. But the reason to get drunk today, because tomorrow we die is that. There is no such thing as tomorrow. There is only now, and if you don't do it now you will never do that. Because now is the only time it can be done.

So anybody who makes preparation for spiritual development and says. Well this is a tough and difficult road and after many lives I shall finally attain you know what you're doing you're playing games you're postponing it. Because you don't really want to wake up it's better to stay in the adventure in the dream in playing the role that you aren't. You know who. Now you see how in this way I've mentioned in talking about repentance how you could play with guilt. And I raised the question What is the awful thing you've really done. And I showed you how the confessor. If he's a really smart confessor will reject all the ordinary sense. All the murders and adulteries and all those things and say just small cheese, just a piddling menial sins. But there is something awful really awful. Everybody done what do you suppose it will be. Was it something I did in childhood in a forgotten. Something you're doing now but I forgot it Now, nobody can admit this. Because if you admit having done it you're immediately classified as insane. It's to say, Uh-oh, I see what happened. I am the supreme Self playing it doesn't. And the reason for having a guilt feelings is to keep the game going. There is this prohibition. You mustn't step beyond this mark. Don't do that that's the deepest taboo we have.

Worldly Religions

I see many faces here tonight that are rather new to me, and I'm happy about this, because I believe in turnover. I don't like the idea of a philosopher who has a kind of constant clique-ish following of disciples. Because I believe that the kind of philosophy I'm talking about is more like a medicine than a diet. And you don't want to get hooked on a medicine. It has a specific job to do, and then send you away and of course if you want

to come back for kicks that's a free country and you always can. But basically, my idea, in giving lectures and any kind of political discourse is to set people free from me. It's like a good doctor is always trying to get rid of his patients because he knows that there are always an enormous amount of indefinite supply of people are going to be sick and if he gets rid of patients the patients he gets rid of will recommend those new ones to come and he'll get rid of them to me and that's my attitude to all this and that's why I'm giving a seminar this weekend on the worldly religions which means being free from religion. So that your everyday life and your everyday profession and honor in your everyday work becomes your religion instead of being something that you feel bound to belong to and the that you use as a crutch and as a support. Of course, I'm not against the idea of religious celebrations, of rituals and so on, so long as you don't get hung up on them. As a matter of fact, if you do get hung up on a ritual like many Catholics get hung up on the necessity of having to go to Mass every Sunday, because it's their duty they learn to hate it. And it in comes out in their children because the parents hated going to Mass but felt they had to the children hate it even more and don't do it and thereby they deprive themselves of a celebration that would under other circumstances be a great delight.

So, we are going to move into an age now, when our formal religious exercises anything that can be branded as religion in quotes will only survive it's of if it's a great deal of fun. It will not survive if people do it as a solemn duty. On the other hand, the real religion is not so much in these symptomatic celebrations and I'll call them symptomatic just in the same way as would say if a person is blushing, it's symptomatic of a certain psychological state so in the same way if people are performing rituals in the right way it's symptomatic of a certain interior joy and peace, which comes about because they don't need a religion anymore. They've been cured of religion by religion. Buddha gave the example of his doctrine the dollar model of the method of but as I'm he likened it to a raft for crossing a stream years thereafter get on it and you cross the stream you get to the other side where you certainly don't pick up the raft and carry it. But there are a lot of people who are kind of rafting, they they love the raft they stay on it and they get to the other shore they go back and pick up a new load and then bring it over again and there you find all kinds of philosophers and

clergy types, and monks and people of that kind who are shall we say. Addicted to religion.

But I want to talk to you now about and the non-addictive sort of thing where the Superior, the finest product of religion, is something that doesn't look like religion at all. But is simply the practice of one's life. My bit old friend Frederick Spiegel Berg of Stanford University called this the religion of no religion. You might say it's like. When you get a great artist performing it looks so easy he doesn't seem to have any props. When a building is finished, the scaffolding disappears. And so in this way, there are certain people whose religion was like a vanished scaffolding. Where they become, well really in a certain way, indistinguishable from ordinary people and yet the something about them that you can't quite put your finger on. You know there's a difference but you can't say what it is. And so, in Buddhist philosophy the superbly in life and person is likened to the say, let's say this verse from the Chinese poetry. Entering the forest he does not disturb a blade of grass entering the water, he does not make a ripple. In other words his spiritual power his religion if you want it does not stand out like a sore thumb. It is a kind of anonymity that. I remember once a great Japanese artist to done a piece of calligraphy for me. And he'd...And it was amazing he had just written on a hanging scroll a kakemono the numbers in Chinese characters one, two, three, but he done it very skillfully. And I was very pleased with it and I hung it up in the. My office in the place where there was a kind of a token on my alcove. And just in the next few days the great Zen scholar. Professor Suzuki [was] going to pay a visit to us and I said well I'm going to hang it up and it's going to be there when professors if he comes and the artist said I hope he won't notice it. In other words that it should be something so compatible and so congenial with the whole environment but it doesn't stand out like a sore thumb.

So in that way, a person's religion can be something that becomes, as distinct from something that they have a hang up on. To be hung up on religion, is just terrible. Because they are always talking about it you're always trying to convert other people to your point of view you're interminably discussing your opinions and saying you know it's just like you found a great doctor who has got the latest medicines you to get hooked on. And you go around and you try and dissuade all your friends to join up

with you because that gives you a kind of feeling of confidence that more people agree with you have a stronger you feel in your opinion. And all missionary was based on this fallacy.

So please understand from the start, when I'm talking to you, I'm not trying to convert you. I'm not trying to do you any good. I'm just doing my own stuff. I talk this way like birds sing. It amuses me. I'm enjoy it because I'm interested I'm full of wonder about this universe. Full of all sorts of thoughts about it and I like to share these with people not in order to interfere with your personal lives or make you dependent on me Heaven forbid. If I had enough people depended on me I would have no sleep at nights at all it would be on the phone that be hanging around as I go away. But simply that. I think that with and with our exchange of ideas and rubbing ourselves against each other we may find something of mutual interest. And let's not make any more ambitious claim for it than that. Because anything beyond that would be getting us into the world of power games. Trying to influence people, trying to control people and I'm not interested in that. So let me start by putting my cards on the table and saying more or less as simply as I cabin what my basic approach is to the whole question of religion. Namely, my feeling for, idea about the nature of. This thing we call life the universe and so on here's. A. Very difficult. To put it in the form of a belief or a set of propositions, because what it begins from isn't ideas at all but experience. I don't mean quite experience in the sense that a person says to an applicant for a job how much experience do you have? I mean experience more in the sense of the word sensation. When you experience that water is cold by drinking it, you can't say now I've experienced twenty two times that water is cold and therefore I'm qualified about it. You see you don't go about it that way you just experience the actual sensation of drinking water.

But what I call religion is based on that sort of state. [It's] based on a kind or modality of consciousness, as to what all this is that's going on. Now we are mostly brought up, in all different kinds of cultures. Not only Western, but Africa and Latin American Eastern and so on the individual human being is by and large brought up to feel in some way, that he's a puppet. But of various ways of describing man as a puppet. That he is... you see, it begins with childhood. When the child is made to feel a subordinate

member of the family. Because when children come into the world we play all kinds of funny tricks on them. We are not at all honest with them. The first thing you notice is that when people start talking baby language. That's not being fair with a child. You get these I've been watching some educational television and of these sort of funny school teachers type girls who are very well meaning but they always rolled our eyes and lift their eyebrows when they talk and tell kind of a simple direct baby language of this kind dear children we are all what a nice boy I will do this, that, and the other you know, this isn't direct speaking at all it's not as where you would speak to each other. Creating children is a separate class. From the child if you don't treat a child in the same way as you would treat any other person a child is instantly bewildered. Why do you come on to me in a different way you come on to somebody else? Because when we don't welcome children frankly into this world saying how do you do? You're another one of us, and we're going to explain to you what's going on we're playing the following games, and these are the rules of the games and if you will please understand these rules you will later on maybe be able to think up better ones.

But what we do is we mystify children. And we put them all through all kinds of complicated grades of initiation. And most of us therefore, grow up as still children. We grow up always thinking that there is a parent above us. And if our parents are long ago dead and now I am a grandfather I have five grandchildren. And therefore I am able to I suppose assume in their eyes as much authority and as much dignity as my own grandfather did but I know I'm just as stupid as he was. So because you see in our most impressionable years, we get the idea constantly that there is someone out there and behind who knows the answers. And to a certain extent they do because they're more experienced they've practiced skills they're more developed in certain ways but we never are really able to get people to grow up to come into the state of adulthood without still taking the infantile attitude. There is something and someone who knows the answers better than we do. And therefore we always have through this kind of childhood indoctrination an attitude towards the universe and towards the ultimate reality behind it I was as if we were on probation. As if somehow we were interceding we were saying constantly to the lot of God please forgive me for having the disgusting effrontery to exist. And that goes back you see, to archaic

notions of the world. As if it were a political state, modeled after the political states of the ancient Near East, where great tyrant Kings were the fathers and rulers of the people. I'm constantly puzzled as to how the citizens of a republic such as the United States, [who are] supposed to believe that a republic is the best form of government. Can believe that the universe as a monarchy. It is a completely inconsistent idea. If the universe is a monarchy, then the monarchy is the best form of government, and you ought to have one.

No, I rather feel. If I can put this into words at all the sort of experience. That we are not strangers in this universe. Although we've all been somehow slightly with our own connivance been hoodwinked into thinking that we are. And we say I came into this world. I feel myself put upon by fate. By chance by my environmental whatever. And we take the attitude that we are in some way are other, victims of the scheme of things and therefore most of what we experience is defined as what happens to us and only a very small part of what we experience is defined as that which we ourselves do and wish and decide upon. So we feel experience as a conflict on the one hand, between our efforts and willing and wishing, and on the other hand what simply happens. And therefore, we feel sort of tossed about like ships on an enormous swell in relation to the rest of the world. But when you really consider your own existence, you can't account for it as something introduced into this world from outside. What you are as a total being..that is not only what you think and are aware of but also all that you don't think about and aren't aware of...the whole structure of your organism. That you are this is a symptom and expression. Of the whole thing that's going on. In a certain sense, you are just as much a part of an essential expression of the universe as the sun is. Or a galaxy is. Only, we tend to think of ourselves as discontinuous with the whole thing. In this way, when you look...;let's say at a photograph in a newspaper. You look at it with a magnifying glass the picture disappears. And you see only an area of dots. But when you stand away from it and drop the magnifying glass the dots merge into a face. So when you look at anything close up. You don't see it's related and as to everything else. Look at the dots under the magnifying glass and you don't see the connection with the face. So our view of our own personal lives, our own work, and our own personal circumstances is a very close-up view. And we don't see how it fits in with

some larger design we're too close to it. And we can argue it doesn't fit in. We feel we really are separate we're not connected with this whole thing our life my life as an individual is just a flash. Between two darkneses. Well there are all sorts of other flashes going on before we were born and after we die flash flash flash flash flash. Between all these different flashes which are likely dots in the newspaper photograph there are for those who want to see connections. After all you think of your body as a connected unified reality, but if you look at your body from a certain point of view you are composed of molecules that are vastly separate in space. But because those molecules are so tiny, and the separations between them so tiny as to escape your notice, you don't see that you are nothing as they stretch out your apparently solid on this is just did it did it did it did it that it did it all the way down thing. Is that some bird. So. It's all right that don't don't don't don't interrupt him because he's going to make a very amusing comments at some point.

But you see this that. When you take the small in view, you don't see the connectedness. And therefore you would say now is this the solidity of the continuities of this is that real. And the person who always thinks in terms of the microscopic would say no it's not real it's only an illusion the reality is all those separate knowledge kills. Then the physicist comes along to him and says That's a lot of nonsense those molecules aren't there at all they're only minute electrons and other subnuclear particles. But actually you see every part is point of view is correct it is correct that there are these widely separated little particles, but it is also correct that there is a unity through the whole thing. So in just the same way, we looking myopically at our own lives and seeing ourselves all the separate bodies and feeling that each one of us has a separate time beginning with birth and ending with death we are blind to the way in which each one of us is really absolutely integrated with everything else that's going on. With so long we see as we are all brought up to feel. That we are here on sufferance. Then we are to that extent emotionally prejudiced against seeing. That each one of us is really a particular way of looking at all that there is. And a picture peculiar way of being responsible for all that there is. You, in other words yes you did it, and are to be praised or blamed on neither for everything that's happening. When we say well that wasn't my fault, it was those scapegoats, whether they be if Jews, Communists, Turks, infidels, heretics, Chinese, Vietnamese

and Africans any, any Catholics butchers, New leftists anybody you can think of you don't like. You can always say well they started their cattle trouble. But the real secret is that you're responsible for everything that's going on. And there is in you, everything that is angelic about human beings and everything that's done by. The question is how do you play those two together. So putting it in this way then I would say simply. That life is the play. And I underline the word play of a single energy. And you are that energy. That energy like all energy is a pulsation. And therefore we have the appearance and disappearance of its pulses. You could say I defined as a certain human body called Alan Watts I am a pulse of this energy. And therefore I have my my presence is inseparable from my absence. As is the case with all waves and pulses. A wave must have an upside and the downside, or shall we say a crest and a trough where it is and where it isn't and so every powerless of the Universal Energy has an on and off we call that life and death. Or it may be waking and sleeping, or now you see it, now you don't. And this thing is just what we all are. From the highest point of view, it never makes mistakes. When you watch the clouds Did you ever accuse a cloud of being aesthetically malformed? Did you ever think that mountains were to be criticised for their outline? Did you ever think that the stars were badly arranged although the patterns in foam had something to be desired? No. But of course, we feel that about ourselves just because of our close point of view to ourselves. If we took If we look at ourselves. Sub specie aeternitatis, from the standpoint of eternity, we should see that our lives in every detail and in every respect where as harmonious and as exquisite as the patterns on seashells. And we should find that everything that was a mistake that was done wrong. Was actually an integral part of a harmonious relationship. Only we couldn't see it that way from my limited point of view. So one could say that at the highest level, this universe is an incomparable jewel of harmonious dancing, patterning energy. Very intelligent, in the sense of what do we mean by intelligence. A complex harmonious design. Included in this harmonious design, is of course the fact that we feel it not to be so. Our objections to what we wrongly think of as the disharmony of the universe did any fact that those objections occur are an integral part of the harmony. So that if I feel furious with somebody like Hitler because he kills ever so many people like that massacre of the Jews, I would not say that it was wrong for me to feel furious but simply that that too. If, if his slaying of the

Jews is after all part of this harmonious thing so is my theory about it. At that and from the highest point of view the most inclusive point of view, it all goes together. And if you understand that if you actually feel in your bones if you sense that there's a vivid sensation. You live very curious thing happens and. You are able to function in your everyday life without hang ups. It's like this. Everybody is really using an enormous amount of energy protecting themselves. And a lot of the energy we're using is only thinking about how we would protect ourselves if we were challenged to do so. We waste an incredible amount of psych psychic energy in this state it inner cramped tension, of anxiety about what will happen if. Supposing.

Now put yourselves in the position of realizing that you are walking and dancing around in a space like a trapeze artist. But there's no concrete below you to fall on. You can do anything you want, any crazy act. Flip any way you wish. And although you may go through the illusion of a crash there is never a real crash. You have nothing to lose because you are in fact the whole works. Only, the whole works has a most interesting device in it, which is pretending that it's in danger. That it could come to a final end. This is the familiar phenomenon of goosing yourself. Giving yourself a scare. As if the universe were a system that crept up behind itself and said move so to jumps you think and each jump is like the new spring of the grasshopper going along. Every time it gets as a book and it jumped as the book jumps like that. Because, you have to understand this, this is terribly important. A lot of people think you see that the goal of life the thing that you really should get hold of his power. To be in control. And you can take all kinds of lessons on master your life, be in control of this be in control of that. Now let me let you into a secret life the real meaning of all these things is. That when you study the the whole philosophy and psychology of power. And you really go to the end of it you'll find that that's not what you want to. Imagine that you're found as you go make us. The master magician. You can read everybody's mind you know the future completely and clearly. You need not be subject to the ordinary conditions of nature. Supposing for example, you could renew your body all the time and never need to die. Supposing you could be anywhere you wanted to be in the universe at the slight quiver of a whim. Go through this. Think this through. Everybody thinks they want power but if you really think through what you what situation you would be in if you had absolute power. You would say.

Man who needs it. You wouldn't want it. Because you would be completely bored. So power is not the thing we really want. There is nothing more instructive in the world than to think out systematically and thoroughly what it is that you do want. And curiously enough, the best you will come to is that you don't know. Because you want to surprise. Now you can surprise yourself, you see. If you're in control and you plan a surprise it's obviously not a surprise. But you see once you could imagine God who came to the conclusion in eternity that he knew it all. He had to create something and said to it surprise me. That was man. Of course it was God. Because God had a system in him self whereby he could let. Is Left happen to not know what his right hand was doing. Like when you play chess for yourself and you take each side in the game quite honestly and try to make it when one of the most interesting exercise take a couple of knitting needles all those cocktail pics that look like Saud's and have a fencing match between your left hand and your right hand and really try to get digs in but let the other hand be equally defensive against the digs so interesting that's a good exercise in yoga to do that. Find out a lot about yourself that way. Let not your left hand know what your right hand doeth. But that's the sort of system we're in. That's like this universe. Because if you understand that you don't want power not really you know you always want to be getting a little more power but you don't want the final part. Because then nothing would happen. Just like when you're playing a game. Maybe bridge, maybe chess, or whatever it is and at the moment that the outcome of the game becomes certain you cancel the game and begin again as a no fun and then a game with a certain outcome might just as well not play it as any future that is certain is already past in the sense that you've had it.

So I look then upon what we're doing. In this well that every one of us, is a particular expression at a particular time and a particular place of the whole thing. Basically you are, the which then which there is no which or you are the god. And you don't have to think of that in terms of an old gentleman with a beard. You are basically the Godhead. But this energy, intelligent energy, is capable of expressing itself in myriad forms. Each one with a different point of view like your eyes look out of your head each one with a different point of view all your nerve endings are there in your skin almost like the on down a little snail all feeling around everyone is you looking from a different point of view towards the world. So in turn, because I can

see all human beings I is as many many of pawns on a cosmic snail. All looking up from a single cent. All of us. Appearing and disappearing, coming and going, we pop out at me, pop in and we're born and we die. We thrown out and withdrawn. And as you watch this you see from a larger point of view you see a throbbing rhythm each time coming out with a different variation one day we could call it John Doe The next time. Jimmy Smith the next time it's you know it if it throbs it has little subtle variations in it each time each one worthy of being given a different name but it's all the same energy doing this.

Now obviously, if you aren't aware of that, and you think seriously. That you're just poor little me who got thrown into this well by some irresponsible parents. And a saddled suddenly with all these problems. And that all it's going to be is that you've got a struggle along as long as you can man. And maybe raise some children to struggle along in the same idiotic way you do. And then give up. And you generally feel frustrated and cheated by the whole scheme of things because you do not acknowledge that you are responsible for. What you got yourself into this situation. That you were the evil gleam in your father's eye when he pursued your mother. You were your father. Because he feels in just the same situation you did. You feels he's an 'I' to cast into this world. And he may have been brought up just like you to feel that he had nothing to do with anything else that he was somehow disconnected from the whole scheme of things and merely experiencing it passively or something that happens to you that is thrown upon you. So, so long as you choose to feel about things in that way. You complain when you are frustrated and you're fighting bitching about the whole thing, which is of course all right because that's what you want to do. Only, that you could see there's a certain joke in that indicates that it could be different but, that you don't need to be in that state of mind in regard to it. That you could wake up from this illusion of separateness and understand. That you aren't just a little an amalgam, crawling around on the surface of a globular rock that revolves around an insignificant star on the outer edge of one of the mind of galaxies. But that you are a special case of the center, what there is and of all that there is. You know, it's interesting that in a view of the universe which sees space as curved. Imagine for a moment this is not quite correct but that all objects in space are on the surface of a sphere. Then you will see at once that every point on the

surface of a sphere can be regarded as the center of the surface. Where is the central point of the surface of the sphere? Anywhere! So in this way, we can legitimately regard every point in this universe as being the center of the whole thing. And it's in this multi centered sense that every eye, which looks around and sees the world as something that been around you in your the axis you're quite correct it does. But you know how it is when you hold in your hand a gyroscope. And that it always feels alive doesn't it, because it surprises you it wants to move in a direction which you didn't predict. And that movement of the gyroscope that you hold that seems to be against you is the movement in life we call us us. All what happens to us. When we feel on the other hand that I am moving the gyroscope in the direction I wanted to go that's what we call self that's what we call voluntary. And you can't possibly know the one without the other. You don't know what you mean by self unless you know what you mean by other. And you don't know what you mean by the voluntary, what I want to happen, except in contrast and play against the involuntary what happens to me just as in the gyroscope the voluntary and the involuntary of the self on the other two poles of the same experience.

So, when you understand this, it is as if you had become one with all had a grasp of the axis of the gyroscope. And you know, that when the north side is going the way I want it. The south side is going in the opposite way. And it's really all one. Only it has to polarize itself in this way, so that there shall be something happening. That's the condition of the game. So then, we can say then that there are two poles in another way. We'll call one pole involution on the other pole evolution. Involution is all that aspect of life in which we get involved. In the schemes, in the games and the conflict, in the quarrels. So involved that we lose sight of the forest for the trees. And there comes a point as in every movie. Where that is so extreme that it has to swing up again in another direction. Where we see the forest over and above the trees and that is evolution. Where we for example, in our present day culture have gone through a historical. Sort of psychological historical development which is emphasised our consciousness of ourselves as individuals to an extraordinary degree. Never, never before in the history of man have people in the sun themselves so much with the plight of the individual. Never before have there been such social services. That would take every person and it consideration or at least go through the motions of

doing so. Never before was it thought important that every individual should have the chance of being given hospital treatment. And sickness all the sort of thing. But in doing this, we've raised a new kind of problem. The individual, having been brought to so great a realisation of his individuality because of the importance which society places upon, isn't quite sure that's what he wanted to be. Be careful of what you desire, you may get it. The individual, so critically emphasized, therefore turns towards. Going beyond individuality. Now you can do that in two ways. You can go beyond individuality by submerging himself. That is to say, by mindless and thoughtless adoption of a fanaticism. All by joining some mass movement some fanatical religion, some form of screwy politics. And by working for this cause be equally delivered from individuality as if you became a stone drunk. It's the same thing, there's nothing much to choose between the two. Or, by going right through the extreme of individuality. Instead of trying to forget one's loneliness self ego feeling go right into it. And through becoming an individual as intensely as you can become one now becoming as separate as you can get, you'll discover in a very natural way. at you are the eternal self behind the whole thing. There's that wonderful passage that is quoted in memoirs of the poet Tennyson, where he describes the way in which as a young boy he often used to be alone and used to repeat his own name to himself. Saying Alfred. Alfred. And you know he got that this thing called Alfred, this particular I is kind of spooky. You look at yourself in the mirror Don't look away you know other people feel awkward when they look at themselves in their. They don't quite want to look at themselves sometimes we feel your own power you see that thing going for our problems I do you figure start it's and want to rub it off like that. You're own inner processes, your own gut is something clear. But if you don't turn away from that you keep looking right in into your own eyes in the mirror. And first you say you rascal you Rod you down. You go on looking and you go deeper and deeper and deeper looking into your own. And then Tennyson goes on to say after he had said this name Alfred himself several times of this extraordinary feeling coming. In which he knew with total certainty, that beyond this little thing called Alfred, there was this absolutely eternal life that was forever and ever was the root and ground of everything. And if you've ever had the experience of going back in your own mind to childhood. Feeling that there's an immeasurably ancient you behind your childhood. A very knowing, Ancient of Days. That's what happens is when

you go through the experience of individuality to an extreme point. It very naturally explodes into the universe. Whereas if you withdraw from individuality, you're liable never to come across that. You just get caught up in the fashions and fads and customary escapes. Which other solace but most people. That's you see, the reason for being a hermit. Hermits are people who pursue individuality to an extreme they go off into complete solitude. And the most interesting thing you'll find in the state of complete solitude, when you get really alone. You find that you're connected with everything. Because what happens in complete solitude is that your ears become sensitized. And you hear all the sounds you want accustomed to hearing. You hear your own heartbeat, you hear the singing in your own ears, you hear the buzz of innumerable tiny insects you never paid attention to before. You hear the sound of the wind and every leaf responding to it you suddenly realise that the leaves are rippling through the wind and your eardrums rippling glitter all one process. That you indeed, are like a whirlpool in a stream. The pattern is constant but the water is always changing. You are a shimmering manifestation like the flame of a candle, which is really a stream of gas that never for two minutes the same you are dancing vibration and on either end of you is the whole the energy of the universe flowing through what is called you and wiggling in the recognizable form and then going on, you see. You are a wave waving of this energy. And we are all that is it's doing that hermit finds this out. Because by going into complete isolation he discovers there is no isolation. We become so sensitive to every tiny vibration. And when he discovers that then the good of him it comes back into the world. And even though he is involved in the business and turmoil of everyday life, he still sees this. So what is important for us to learn we're all most of us involved in some kind of frantic business. And what I want to suggest to you is that this frantic business. Can be your yoga. Your way of liberation. [That] you don't have to get out of it, you don't necessarily have to drop out. Although that's important for some people. It depends whether you have the vocation to drop out or whether you have a vocation to stay in. But you, I would not only say it is would help. To make your everyday life into a yoga but that you won't really be able to stand it if you don't. It's not as some people say can we Westerners practice Oriental disciplines. The question is if you can't you're not going to survive. You won't be able to take it.

So let's get to the point of view where we can see certain types of activity which are normally associated with extreme anxiety. Such as various forms of business where we always worry whether we're going to make the payments whether we're going to make the profit or whether we're going to do this that and the other and day to day, there's this constant anxiety going on. Now, there is a point of view from which those activities can be conducted as complete play and dancing, when you realize that you don't give a damn how it comes out. And it's only when you get to the point that you don't give a damn that you can be deployed to do the sort of things that all. If you do give a damn you can't get affordable afford to get involved in that kind of business that it has wreck your nerves and gives you ulcers. So it's terribly important not to give a damn. We are generally think that people who don't give a damn will collapse on the job will have no motivation. It's because they're not striving for power anymore. They realize that the striving for power is futile. So if you realize that striving for power is futile, what else would you do? What what other what other zest will there be? Other people think that if you deprive people of the urge for power they will have no motivation to do anything. What would be the motivation shall we call it if you are not interested in. Why would you do anything why would you make any effort, if it isn't that you want to control things. But you put in the place of the striving for power. Fun yeah, or to be surprised. Yeah. Right you. Are. Right. Yes but you will realize now once that there are several alternatives there isn't only. The fun which is one of them but say all that is also compassion. Where you see a lot of human beings are really suffering. And you can feel now but it's just not necessary you don't have to do it that way. And this may supply a great deal of energy you see, but the moment your energy is released from the power game, from the self-protection game it's free to do all kinds of other things you get a command as access now wait a minute let's let's have an intermission now and then we can bring up questions after about five minutes intermission OK. Well now, in pursuing the subject further, of yoga as everyday activity. I presume it is understood just what the word yoga, used in a very general sense, involves. The Indians use two words what I'm talking about one is yoga. And the other is sub par not. Meaning. Essentially a method a way. The objective of which is for the individual to rediscover, to realize, his true identity. That is, to say not who he may be defined as as a particular expression of life. By discovers his identity as deeply and essentially one

with the whole eternal process of life. With what I'll call for want of a better word the timeless energy that expresses itself as this world or all worlds all possible worlds. That's you know very deep and real sense you. The most real basic sense in which you can say the word I had all. But since this is not often never really realized because we are myopic. That is to say by looking at life close up and in narrow areas we become fascinated. With the contests with the problems with the games that are going on. Just for example if you examine your own blood stream under a microscope you would see a tremendous battles going on between all kinds of microorganisms and if you watched it long enough you would start taking sides. Yes taught to be wired. About which one was going to win and you would feel this crunching of the bodies of microbes as it were in your own bones. And you would therefore forget that you are a healthy human being just because that fight is going on in your bloodstream. The fight at one level, the conflict at one level is peace at a higher level. And life is all the way like that all the way up so that you can imagine what a whopping big piece there is at the top level. When you think of our conflicts as human beings as the conflicts of microbes. Redound into the health of a higher order of systems and then if you go into mythology and think of the conflicts between Deva's and Asuras. The angelic principles. Wowie you know what effect that is. And yet that is at a higher level of peace.

So when we are myopic, that is to say when we are working and living with a narrow view of what is going on. Then we are anxious and depressed or fearful or whatever it may be. Because. Yes we have lost contact. With awful selves and now of course we get into this way of looking at things. Because, for many many centuries, human beings have specialized. In one certain aspect of their total mind activity that's called it that. We've concentrated on our faculty for conscious attention. And this is in a way, what might be called The Fall of Man. We have you see this ingenious and valuable faculty of narrowing our gaze upon selected areas. If we take the visual field first of all, you are actually receiving everything that is in this great oval. The visual field. But you're not noticing everything. In order to notice, you have to focus your attention on some particular face or shoe or bag or pattern, or whatever it may be. And then your model to be able to recall in memory those little grasps of attention then you would any random detail in the whole thing if somebody says to me just by chance what was so

and so wearing at this gathering although I've seen it several times I won't remember if I didn't pay particular attention to it. Now hand in hand with this kind of raid up a separate in of the world that we scan. The environment and pick on things which we think are significant. And we select things that are significant with the aid of having words and therefore markers or tags which we can put onto these particular grasps off perception. And so, we come to be completely fascinated, in this way of looking at things. It is therefore at the root of reason of conscious calculation of all kinds it's at the root of science.

But, it is in fact although it has extraordinary advantages it is a very limited way of responding to the world. Because it's clumsy. And it is not the only way in which we respond and fit in with the world because all the time going on underneath our conscious attention is an interaction. Between our own organisms and the total physical environment, of immense complexity and which for the most part escapes our attention. We are doing our bodies. But we haven't the faintest idea in terms of language how we're doing it. You don't know how you managed to get born, not really. You know a few skimpy details but you don't know. How to Grow a fetus in the womb. How to arrange the marvelous balances which keep that fetus warm and fed. You don't know how to shape your bones, but you do it. But this is nothing to do with your conscious attention. And therefore we may be constantly astounded at the miracles performed by say a nervous system upon which our power of consuls conscious attention is based but which conscious attention itself does not comprehend. The nervous system is still too complicated for our most advanced neurologist to understand in any but a very partial way. And therefore, all great skill in any kind of work of art or craft or any human activity, depends upon your being able to do it in the same way that you grow your hair and shape your bones. To be able to go beyond performing whatever you do by mere power of conscious attention. Because that is a really very superficial faculty. It's like radar on a boat, and the function of the radar on the boat is merely to watch out for rocks and any novel thing that occurs in the environment. Consciousness is directed towards novelty, and those things which stimulate the nervous system all the time disappear from consciousness. They are beneath notice, because they're constant. That's the difficulty of say monogamy. When you have the same girl stimulating you all the time, you tend not to notice her, and

likewise husband. That's the problem with all constant features of life. They begin to slip from attention. But that's a pity, because then we become unaware of the incredible harmoniousness of all the features in our environment which are constant. The absolute beauty of this interchange, transaction, between our organisms and the total environment, which if we became aware of it, we would be in a state of total bliss. About it because our conscious attention is geared to looking out for differences and for things that are new and novel and because we've become over fascinated with it, we are mostly blind. To the miracle on the joyous performance of life which is going on all the time.

So then one of the major aspects of any doing a work, whether it be washing dishes or managing a bank. Or flying planes or whatever it is. You can learn to do that work effortlessly. In the same way as you effortlessly make your physical organism function. And. Only when you arrive at that point is the work that you're doing really good. And everybody knows this to some extent in whatever work it is that you do. If you are at all an expert in anything at all. I don't care what it is it may be simply that you're expert at riding a bicycle or swimming or talking. Or maybe cooking or something like that. If you really achieve any degree of mastery in the art. You do it. By the very fact that you don't do it, you in the ordinary sense. That you as a total living organism which is in turn a function of the whole universe when that is doing it it's always incredibly competent. And what we would like to know, is the difference between doing it that way. Doing it the hard way, that is to say by conscious effort and a third possibility the purely sloppy way, where it appears that the person is doing something effortlessly or they're really doing it very badly. It's just a mess. This culture today is confused between spontaneous behavior and messy behavior. Of course that is because we are primarily educated to do everything consciously. An enormous amount of say of sociological studies and psychological studies when you read them through their conclusions to which they arrive are just common sense. Everybody knew that already they got a Ph D. by proving it. That is to say, by analyzing how things happen naturally so that you can put them down in formulae of words, or formulae of numbers. And then we say now we know, because we've translated it into these terms. Not all academic knowledge is the minute measurement of what goes on in the world, in the hope that if we measure it this minute we should be able to

predict what it will do next and in this way control it. And up to a point, that's very successful. But there comes a point when it's not so successful. Because in ordinary affairs of life, we do not have time nor the expensive instruments to make these minute examinations of our problems and what we're supposed to do. We have to make decisions long before any kind of rational process could have worked out the right thing to do. Life comes out of that quickly and we really have to make ever so many decisions at once. And therefore, you cannot rely on your ordinary conscious calculation to make these decisions. And if you are not trained and accustomed to trusting your I'm conscious brain to make the decisions for you, you are at a great disadvantage. And therefore, basic to all this kind of thing, is learning to trust your own apparatus. You have far inside your head the best computer. That exists at all anywhere. And it's there to be used. It's there for you to give it problems and instead of your trying by muscular efforts to work out those problems to let your own computer do it for you. And you will always be confused when you first try this. Firstly, because you can hardly believe anything can be worked out that way. And secondly because you will accept answers from it before it's ready. Or after it's ready, because you didn't accept the first thing you thought of as the answer. For example, when people are trained in aircraft identification they expose outlines of different types of aircraft on a screen where they're exposed for only one thousandth of a second. And then they that's the speed with which you need to be able to recognise different kinds of aircraft. Or then they put on the same screen eight figure numbers, and the art of recognition is always to go for the first thing you thought of. If you got an eight figure number, don't stop to think just write down the first eight figure number you can think of and in a short time you find you are recording what came on the screen quite accurately. Because you're trusting your real first thought. But you see, this is a thing so contrary to the way we ordinarily brought up that we have a good deal of trepidation about doing it. And this, for this reason most people find it convenient and safe to do this kind of experimentation if at first in things that are not important. That's why you might for example take up the art of painting or pottery or archery or something that is simply a recreation and not not your main business in life and learn first of all to do this on important things in this way. So that you get enough confidence to be able to apply it to those aspects of your life which you feel to be important. And so that's why I say in Japan, many people take up an art outside their

ordinary business they'll take up tea ceremony or flower arrangement, or judo, or kendo, which is fencing. All even Zen practice, because this is something aside from the normal business of life in which they will get the training off how to have complete faith in your own organism. In what there's a master Bunkei, who taught in the seventeenth century called your unborn mind. That is to say the mind. He explained it this way, that when you hear a bird call, you instantly recognize a bird calling. When you hear a bell you instantly know it's a bell. That is to say your unconscious. This is what the really the word unborn means on. A manifest your on a manifest mind as this tremendous. And one learns to bring it out in exemplary ways. And so you gain the faith to live that way all the time. Now, let me say in doing this it is of help to understand that in a certain way you do live that way all the time because you can't help it. You are actually interfering with the normal functioning of your life by making all sorts of anxieties and stratagems and inner plans, and thinking about what to do if this happens and what to do if that happens. And most of this is not helping you at all it's just getting in the way of your ordinary functioning. Only you feel that you must do it in exactly the same way as a person afflicted by superstition walks down the sidewalk and must not tread on any lines. The feeling that I ought to... it's fun to do that of course but if you take it too seriously and feel that you must not avoid those lives you're completely interfering with your walk. And we're doing that all the time.

So, if you realize the extent to which you are ordinarily quite leading there are quite a civilised life. But that you are doing it. From, in the sense of by conscious will and effort. It's your innate sense, your innate intelligence that's taking care of it all. Furthermore, it helps too to realize, that you are not safe. However well-protected you may be. I notice that when people solve their so-called physical problems when for example you didn't have enough money and then you get enough money. Then you start worrying about your health. And then of course, you can take reasonable precautions about your health you can get the right shots and immunizations and so on but there's absolutely no way whatsoever of foolproof avoidance of accidents. Despite the best predictions of physicians you can always get heart trouble suddenly or kidney trouble or something and there is no safety. And therefore, going along with realizing that you quite ordinarily do transact the affairs of life in this through your unconscious intelligence, you

also realize there is really no way of protecting yourself. And an enormous amount of energy you used to protect yourself is completely wasted. Now the words you may be, you may discover through becoming aware of your own body that you're in a constant state of tension. As if ready to jump ready to defend yourself. Or even your trying to hold your body together. Charlotte Silva finds that when she but it gets people to lie on the floor and relax, they can't do it because they are in fact trying to hold their bodies together in the fear that if they didn't they would disappear into a kind of jello and slop all over the floor. And all that you see, all that constant sense of I should control what's going on is completely wasted energy. For the simple reason that conscious attention is not really the effective controlling force in your life it's merely the lookout. It's merely an information sauce which warns the organism as a whole of unusual features of the environment unusual changes that's why conscious attention tends to notice things that move rather than things that are relatively still, why it tends to notice figures rather than backgrounds. Because it is the radar of the organism, it is the troubleshooter. And if you identify yourself with your troubleshooter, well then you become one-sided and you'll become a perpetually anxious person. Whereas on the other hand if you see that you are identified principally not with that troubleshooter but with the whole organism. Then you become identified rather with that aspect of your being which is in a constantly harmonious relationship to its environment. We can of course explore at another moment in the seminar, those peculiar times of relationship to the environment. When the organism is being burnt up in a forest fire, or something of that kind. And how it responds to all those changes of circumstance that are as we say from the relative point of view, destructive to the organism. But actually, the organism and the environment are not two things. The environment is not the enemy of the organism. Nor is the organism the enemy of the environment that behavior goes together. In a constant and rhythmic expression of the greater organism of which they are both aspects. And the more your vision is widened and the more you live from that point of view, the more you see the total lack of necessity of being on the defensive all the time all.

Furthermore, as soon as you are not on the defensive and not trying to hold on to your control of life, by reason of the greater energy available to you. And by reason of your, I would say basically friendly and cooperative and

open attitude to other people you are by this non defending attitude much better protected, than you would otherwise be, because it's people who got a chip on their shoulders and are on the defensive who are always troublemakers. Whereas people who are generally speaking friend lead to whomever they relate, they don't get into difficulty very easily. They don't create difficulty. It's the same thing as cats when cats for cats are relaxed and therefore don't get hurt. And so my father once when he was a young man was suddenly slipped on a staircase. A very steep one, and fell down and it happened so quickly he didn't have time to resist. And therefore he wasn't hurt at all. This is the principle of falling in Judo. You learn to fall in a certain kind of cat-like heavy-loose, way. And so when you get thrown you don't get. And experts can fall on concrete and still not be heard. You know not just on padded mats and things like that. So all this comes about, not so much through a system of effort. But it comes about through a clear understanding of what your situation actually is. Face the facts. We talk you know of facing facts of something difficult preachers and politicians are always talking about hard facts and down to earth realities, as if they were something very unpleasant that we have to wake up to. I would rather say that the facts of our sister situation of the world aren't so bad people that. If we did arrive at the facts we would find that many things that we call hard facts and difficult problems are simply that there is out of not facing the facts not seeing what our situation is not realizing that we are completely vulnerable. And there's no way of being otherwise, we are unprotected. And that however protecting ourselves is not the way of life that evolution has favored. You see, contrast the molluscs and the mammals. The mollusks have hard shells on the outside and the soft flesh inside the shells the mammals have the soft flesh on the outside and the hard bones in the middle of the flesh. Now this species is more viable biologically, because it is more sensitive. And so it's found that this is why it will be abandoned iron warfare. OK. It is so constricted motion and so reduced vision and Sensibility and speed of. Of movement. That if it was really didn't work out.

And so in the same way, you could think of the disastrous French experiment of trusting in a Maginot Line. What a flop that was. And all elaborate defense systems are illusions. They don't work. Because life is basically lived as an act of faith. It is an adventure into the unknown. So, to

the degree you see, that you come to your senses and see that's the way things are. Whether you like it or not. This is the, this realisation alone is the greatest help in actually attaining the attitude of let go and the understanding of let-go and all the new energy that comes with it. Don't therefore say. You see it doesn't really help what I call Think positive in the sense of repeating to yourself. All is peace, all is love. I am letting go, I'm trusting...God loves me and all that. It's easier to do it the other way. That there is no safety to see everything is falling apart I'm as good as dead already and therefore stop resisting it the same. In this way you see you are not fighting things you are taking the facts and allowing them to help.

So then, you will naturally therefore begin to find as you do this that you seem, for example, in doing everyday things to be getting happy hunches. And to be a center of interesting. And fortunate accidents. People for examples, have often found that when they stop worrying about where the money is going country going to come from it starts turning up. That you get good ideas suddenly come to you. Like a comedian on the stage, when he's making gags and he doesn't clam the situation and advance because he doesn't know what kind of a situation is going to arise but somehow something works for him so he's constantly witty and has these comebacks which make everybody laugh. I had a friend who was saved in a most desperate situation by this faculty he was. Attached to a unit in the second world war in Asia. Under the command of Melvin Douglas. And they were curious group because they were entertainers responsible for going to U.S. installations all over Asia. And they had no rank. They simply assumed whatever rank. They were going to be with. Well they especially sent my friend out to situations where there was trouble well for example of a bad relationships between the commander and the rank and file. And it was one such base inside China where there was an American cardinal who was just a beast and testy fellow and they gave him orders to go in and take the stuffing out of that guy. So his act was a ventriloquist, and he had a dummy called the sad-sack. And he got on the stage in this huge auditorium in a tent or something, was set up. And here was this colonel with a nurse sitting in the front row. And so he began a dialogue with his dummy in the sack and began making rude remarks about. The commander in this camp. Son of the colonel, said so don't get off the stage. And so, my friend said nothing but the sad sack came back with some crack at it. He said so I want

to get off the stage I.V. a court martial. And despite everything the Sacket said so far there wasn't a laugh from the audience they were frightened to come and see and suddenly the sack said Ah shut up property back in my jockstrap. My friend said he had no idea he had never premeditated such a remark that simple thing like that around the house broke up just right around the colonel just strode out of the room you must be deflated. My friend says to this day it was the sack that said it I did.

So, this is just extraordinary thing you see, that this could this thing can come to the rescue. When so often in situations of this kind we think much later of the funny thing we should have said. And at the time were completely tongue tied and you see you are tongue tied or action tied. To the degree that you are anxious about the situation and are concerned with it if you are not concerned. Somehow everything is released. When you see that's basically the whole process of training in Zen Buddhism. Which is rather unique in this respect. It is a situation where you are in an environment with a teacher who constantly challenges you with problems that you cannot solve by ordinary thinking and that you must come back with come back at, without going through the process of conscious decision. The whole idea of a koan you see, a Zen problem. Like what is the sound of one hand. All these things are thought-stoppers. Thought-blockers. Which therefore can only be. Barriers which you can only pass if you act without stopping to think. Now you see, again we think in our culture that a person who doesn't stop to think is thoughtless. And is therefore irresponsible and unreliable. But while that is to a certain degree true it is also true that a person who does stop to think is unreliable because he can't make decisions fast enough. So, we are getting to a point now, which is really rather good we are handing over all decisions which require stopping to think, to computers. Which will analyze, in a rational way these problems much faster than we can ever dream of doing. And therefore, since we will hand over these sort of responsible decisions to computers we will be left free the exercise our hunch, like in spontaneous thinking, in a much greater degree than before. Now actually, though this hunch type thinking will apply to all responsible decisions I suppose it's always a matter of responsibility when you add up a line of figures. I personally haven't got an adding machine and I don't bother with us anymore. But Buckminster Fuller was telling me the other day that he can read a line of figures like

you read a line of print. And he can glance down a line and know it's time to. In fact, he can do through lines at once. And he just says he doesn't even think about it he lets his mind do it. And he invariably comes out right. And this of course is the way in which they train people in fast reading. To simply assume that whatever you see you will remember. Don't try to push your memory and say gangbanger I'm going on remember that you see. Simply assume that your memory works. And as I say at first this will discourage us and not work because we are frightened of it. But if you. Do this in something that you are not frightened about because it is not very important, you will be able to see that it does work. And that you as an organism are fundamentally to be trusted. Because therefore in the culture where Zen has played such a dominant part. On the Japanese all sorts of stories about. How this works in relation to. The various skills I'm Crofts. The. One I like best is about Carpenter's. Carpentry in over Japan is very definitely a yoga. And a carpenter has always prided themselves in their freedom from any plan in designing a house they were they still to this day when you watch them they have the very rough sketch of what's supposed to be done. And they do incredibly complicated joinery you know those wooden Japanese puzzles you buying all sorts of skulls they are simply throw off all of the carpentry technique of joinery they're put together the beams at an angle. To the corner of a building in the most amazing locked into locked ways very beautiful. And for that they do the whole thing by feel and by I no measure. And they all get absolutely clean shit without measurements. You see, wood is a vegetable. It's not like steel. And it's got all sorts of given fluctuation of the temperature changes. And therefore they relate to it in an organic way instead of a mechanical way. I was once having a conversation with a Zen master through an interpreter, who was a priest. And the interpreter was saying the Japanese carpenter, in not using a plan for his building was very like the attitude of Zen in everyday life. So I posed a koan to those gentlemen what happens in the case of the person who makes a blueprint but doesn't make a plan for it. You always make plans to make plans and make plans to make plans to make plans. Of course you don't. And therefore what I'm talking about is a not an anti-intellectual approach to life thoughtless and that's. Because when a scholar does his work and a scientist does his work he can also do it in the same spirit. He can intellectualize spontaneously. He can be reasonable with his intuitive capacity of mind. But the Carpenters were always having the most

marvelous happy Accidents there's a great story of two rival unions of carpenters in one town. Had been contracting to build a temple. And the people who had not got the contract with very aggregate those who had and the day came for raising the roof beam, which is a great ceremony. And when the master carpenter arrived to raise the roof be Mollie one morning. He suddenly found that it had been tampered with overnight, and that they had gone and cut six feet off it. And all the people who were measuring came and said to him this is terrible what are we going to do it said don't worry it's perfectly all right. I'll fix it. And so he went up to the roof beam, and solemnly struck it because how much instead now raised the ropes and put it in position and zip it went up and fitted perfectly. So he had actually made it six feet too long, in the knowledge that some one to business would be played. So you know, the literature of what I would call applied Zen is just full of tales like that. You are perhaps some of you have seen the film of Miyamoto Musashi, [who] was a school Samurai. And he was a great master of this kind of thing because as he got older he had been a terrific swordsman nobody could defeat him but he realized that that that his last battle was one in which he was absolutely challenged and forced into killing an absolutely beautiful young man who was a wonderful swordsman and he just felt depressed about the whole thing. So he developed in his later life the no-sword school of never having to use the saw at all because he would outwit. Any opponent long before it got to the point of fighting.

So, he was one day travelling across at the lake big lake near Kyoto called Biwa. And on the ferry boat there was a very drunk and rambunctious Samurai. Who challenges Musashi and said. I see you're a saw what school do you belong to and he said I belong to the no sword school. He said are no-sword school. And sister who is sought and said let's see what you can do with your nose dogs on the side she said Now look there are many people on this boat and if we start fighting innocent bystanders might get hurt so why don't we go over to that island and we can fight it out there so he said to the ferryman take us over to the otter. And as they came along shore this drunk summer I was so eager for the fight that he leaped off the boat first under the island that was actually grab the boatman's on press the boat out of the water. He said There you see my no-sword school.

So, Hasagawa, who was a great Japanese artist and friend of mine called all that kind of thing the controlled accident. And you see in every art this is the marvelous thing well I pointed out last night in discussing my own sort of basic philosophy, that what we are always looking for in life is a surprise that we really don't want a life situation in which we have complete control over everything. And therefore all future happenings are known because if they were known they would already be past. Of such a future we could say in our own inimitable slang, you've had it. Now you see then, the accident that happens is the surprise. But pure accident is of no interest. Because you realize the accidental only in terms of there being also something controlled which contrasts with it just in the same way as you recognize a figure by its contrast to the background or light by its contrast with darkness. So the accidental is realized in relation to the controlled, or we could say the random is recognized in relation to order and vice versa. And therefore what is sort of optimal in life is exactly then the controlled accident where you can watch for example of the Japanese Potters doing designs on plates and they'll pick up plate after plate and they've got a brush with a glaze and that you're really like that and all sorts of drips of glaze fall at random but within a controlled swirl of the brush, and one after another they'll just go on the stack like that you rip your ear every one of them different because the chance falling of the drops was different each time and yet behind those falling drops there was a rhythm they played it dancing hand see that was the element of control. And you can show this to yourself by a very simple formula which I don't recommend that you put this on exit, but you can have a wonderful time if you proceed as follows You take a black heavy a black brush full of ink or a. Felt pen and you make on a piece of paper completely random squiggles. Then, in a very careful way, you fill in all those squiggles with planned and highly controlled coloring. And you will see that you've made a rather interesting design it may not be a great work of art yet, but it will certainly be something interesting because of that combination of the random element and the planned orderly element. But you have to allow the random to occur. And then, the very skilled artist of course finds that he does control things in a random way. As he gets to being able as he won't know how to steer a car or ride a bicycle or whatever it is or swim quite thoughtlessly, because the control is completely in the hands of the unconscious non attentive functioning of your mind or nervous system. So then, I'm saying that this way of functioning, not as an ego

fighting and wrestling with the world, but as your organism, working as an expression of the whole energy of this universe of God or whatever you want to call it, will work at anything that you do far more effectively that way, than your present ideas of forcing it to do its job. And one has to be willing to take the risk of being a complete fool, to make the transition from one way of working to the other. All right, let's have an intermission. I thought that in discussing the yogas of everyday life, I should get rather specific and speak in detail about one of the yogas of everyday life as an example of all of them. And I could have chosen something exotic like learning judo, or archery or something like that you've got a book Zen in the Art of Archery. Which does this for archery but I thought it would be much more interesting to talk about something nearer to home. And discuss Yoga in terms of cooking. Now. This is an art and a religion, which in the United States we know a little about. Especially in the last maybe twenty years. During which there's been an absolutely phenomenal sale of books on cooking. Cookbooks of all kinds. They are among the best selling books in this country. And...but for all that, what we might call our public standards of cooking have not very much improved. Although you can find in homes and in individual life a great many excellent and accomplished coax me still. There are very few cases where the art of cooking itself becomes something of a yoga. And that's because we believe that so much [a] practical and everyday an affair. Cannot be spiritual. I've sometimes said scratch an American and discover a Christian Scientist. Because there is a kind of universal feeling that the process of biology which involves. Absolutely fundamentally eating, and eating of other living organisms, is something we are rather ashamed of. To have to be in the situation where you depend for your continued existence upon the destruction of animal and vegetable forms. And that is a formidable situation to be. And it's one which we tend to gloss over. And not really meet the challenge which this predicament office to us. We would like to in a way meet the challenge and we foresee perhaps an age. When all food will be compounded synthetically in labs, and be assimilated in the form of pills. And all he will have to do will be to take so many pills a day of different colors as prescribed by offices from dietician. In Richmond accordance with your needs. And you will just take those particular small pills and that will be that you won't have to go through the crude material and vulgar process of eating. Now this would be very dangerous indeed, if we got to that point because it

would let allow us to imagine that we do not belong to the biological process. That we do not either have to eat other creatures, and what is still more important to be eaten by them. Human beings are trying, and have been trying for years to be top species. And top species means the one who eats but does not get eaten. And therefore, we are the only species of life on Earth that hoards its own dead. Isn't that a fascinating terrible thought we haud. Our own dead as if they were buried gold. And try, and have tried since the time of the ancient Egyptian so to mummified and preserved dead human bodies that they are not devoured by worms and do not become manure for the ongoing process of life. And I feel that that's an extraordinarily ridiculous feature of our existence, and is somehow connected with our failure, to know and to feel, that we are continuous with the rest of the universe. That we are one lifehood. But to the extent that we don't feel that, to the extent that we I have been brought up to consider ourselves as external observers. And controllers of the rest of nature, the heads of nature chieftains of nature to that extent we resist belonging to the mutual eating society in which biology is. And to the extent that we refuse to belong to it, we become the most predatory monster on the face of the earth, who is destroying itself and its own life in directing. More effectively and swiftly than even swarms of locusts. There are of course, from time to time in the biological world and nominate, the predatory animal insect or mouse or rat or whatever it is, simply eats itself out of existence. And we could very easily do just that.

We could become a species of life which conquers this planet. And which has no natural enemy that is to say no other form of life which leads on us. And the moment you're in the position where you have no natural enemy nothing that feeds on you and I think you would if you can offer your body, and say this is my body which is given to you do this and remember me. Once you're in that position you are in a fatal position. Because you want nothing will then stop you from devouring everything in sight. And a new start becoming a cannibal, eating up your own kind, in one way or another, and that's going to be the end of you. It is therefore not insignificant that in this particular culture where. Cooking is not really an honored art, except among really a rather small segment of elite. Dilettante, That there should be a popular. Way of Death. The way of the American mortician, which is aimed at preventing the human corpse from being assimilated into the life

cycle. They are all pickled in formaldehyde. And put in enormous bronze caskets and concrete. Graves so that the beneficence officers of the world. And the maggot shall be frustrated. Now you've spent all your lives absorbing into your system the products of the soil. And therefore it is your biological duty to return. To the soil what you got from it. Both in terms of sewage. And in terms of your own corpse when the time comes to die. For the most fertile field. I've been found in times past and the fields of battle. Many corpses lay dead and were absorbed into the soil and they grow magnificent wheat, [and] the cycle of life goes on.

But we are resisting this. And the resistance to giving our bodies back to the earth goes hand in hand with our general disregard of what we call ecology. Ecology is the science of the relationship between living organisms and their physical environment. And it's one of the most important branches of science that there is. If we do not pay attention to the science of ecology, we more and more tend to be beings who follow our own nests, and who create, what we would call spoiled environments. Would be tourists are always asking about various foreign countries is it spoiled yet. That means doesn't it, have enough of us it is it is the place to make it no longer worth visiting. Have we turned the Hawaiian Islands, the Caribbean. Japan. Burma, Silan. Anywhere you like. Have we turned it into a new tourist trap? A Place In other words where you can no longer find human beings in their natural state. But find them in a new state of the tech the what I would call the. Early technological state of being at war with nature. Of the continuing the Jewish and Christian superstition. That man. Is to be top dog. That man. Is as it were and not a feature of nature. But a stranger in the earth who has as it were come into this planet. As an embodied spirit. And whose nature as being spiritual is alien to the nature of the earth. It's curious, you see, that even since the nineteenth century since the rise of what we call scientific naturalism. Since the rise of a philosophy of life in which supernaturalism and the supernatural origin of man are repudiated and we look upon ourselves as products of an evolutionary process, rather than a supernatural process. We evolved, Yes, according to the doctrines indeed the dogmas of scientific naturalism we evolved from our lower animal friends. But the people who believe in the philosophy are even more than traditional Christians and Jews antagonistic to the processes of nature. The outcome of scientific naturalism is a technology which is dedicated to

the conquest of nature. Because it's based. On a doctrine which we deeply resent even though most of us believe it. And this doctrine is, that the natural universe is a mechanical process. Which because it is mechanical, and nothing other than mechanical that is to say because it can be described then accounted for in a strictly logical way. We curiously therefore feel that it is essentially stupid. All machines, even though we revere them and depend on them, are regarded as stupid. In the sense that they have no heart. In the sense that they are purely logical and therefore do not care about the things that human beings really care about. They have no love in them. And we believe you see, if you are brought up in the tradition of thought of nineteenth century science, that the universe is fundamentally lacking in love. It doesn't give a damn. It has no feeling. And it has no intelligence. The human being is an evolutionary fluke that has come into this world as a result of a chance permutation and combination of biological elements. And we therefore, this superstition about the nature of man goes hand in hand with some of the superstitions of science. Not that these superstitions are any longer held, by really understanding soundest but it is a fundamental true scientific superstition that if the human being can stand in the situation of an objective observer of any given situation. That you can as it were, be impartial and view what is going on with a cold calculating intellect that sees what is as distinct from what one might wish to be. And a person who is the victim of what I would call scientism, as distinct from science is very large boulders the pose. That we are afflicted by wishful thinking. And that if you are the kind of person who is reliable, objectively and clear you are one. Who must necessarily take a grim and dim view of the universe. Because that will advertise the fact that you are tough-minded. And to be tough-minded will be your particular andona, or point of honor. And so, you will look upon all those who regard the universe as being in some way vital are intelligent as woolly minded. Because you will give yourself a case of extreme intellectual porcupinism, of being critically I mean your attitude to all facts. Analytic. Hardboiled. Definite precise and a rigorous. And that will advertise the fact that you. After all someone has come to a sense of. Actually, you've lost your senses. And you've only found your mind. And it's very truly said that you have to go out of your mind to come to your senses. That is to say you, you have to be liberated from the confusion of the symbolic world with the real world, and I've talked a great deal about that thus far. But here is you see the great problem after twenty a century

man basing his way of life on one thousand century ideas which are today the common sense of most educated individuals. That there is an implacable resentment against our biological situation. We endeavor in myriads of different ways to conceal the fact that we are biological beings. Our clothes. Our social institutions in ever so many ways are trying to say, we are not mammals. And anything that emphasizes our mammalian qualities is really considered vulgar. Of course we can't resist the truth that we are mammals and that's why American men are absolutely fascinated by female mamma, by breasts. Because you know, truth will out.

So then, when it comes down to a very very fundamental biological science, art. The art of so rendering food that it becomes extremely well absorbable. We have our qualms. And we don't really go to it. And yet you see as I suggested in a previous talk, the human being is like a weld pool. In water. The human being is a pattern of life which is a particular form of activity in a stream but the human stream consists of water. Milk. Wheat. Cow. Vegetables. All foodstuffs whatsoever in the process of being processed by us. In your lifetime, you have processed innumerable tons of groceries, and therefore, you are what you eat. Every fiber and cell of your bodies is beef steak and potatoes, and so on in the course of being processed humanly. And therefore, all those people who stand at the entryway. Whereby the stream enters the human organism and becomes changed into our form is in a very responsible position. For as cook, standing at the kitchen range you are most veritably a priest at an altar. And if you do not realize the priestly and magical nature of your function as a cook you are doing the human race a great disservice. But the trouble is of course that the average person who cooks in our culture is a harassed housewife. Who has to do this every day to get meals ready for our children and adults. Who are fundamentally in a hurry to do something else other than eat. Breakfast in the morning is usually a madhouse. Because everybody has to get up to get the children off to school in time and get the husband of the family after work in time. And this is usually postponed to the last minute. Among other reasons because of course of going to bed the night before was flown to the last minute. Because there was some fun going on the night before. Over which because of which one had to hurry through dinner in order to get out to it whatever it was. When we do tend to regard meals as medicine rather than diet. We would take packages of all the new foodstuffs. And we will find on them in

small print the same sort of chemical analysis of what's in it as you get in a bottle of pills. Every package of food has to have its contents spelled out, you see, as if it were medicine. You buy say an ordinary envelope of gelatin and there's a chemical formula on it. Because, we are looking at this this food. For what good it will do for us. We are firmly of the opinion that awful that we eat in order to live rather than that we live in order to eat. Therefore the pleasures of the table the art of the kitchen is simply relegated to being a means to an end. It enables us to continue our biological existence in order to, in order to what? Make money. Or be cultured, and people who listen to music or go to plays all read books with the motivation of becoming cultured people never listen to the music, don't understand the play and don't really read books, because they always have one eye on what kind of person this activity is turning me into what status it gives me. Therefore one never really does it. So in order to be human, in order to be cultured and civilised in the highest sense of the word. It is that absolutely necessary to everyday life that we take the art of cooking. Sincerely. That we regard the process that goes on at the table, as one of fundamental spiritual and religious importance. And make it a yoga. Not only the what goes on in the kitchen. But also what goes on at the table itself must for us become an occasion where we regard ourselves as involved. In one of the most important worthwhile things that we do. Because you see if you only eat in order to live. You will not digest your food properly. You will both wolf it down just to stop the knowing. And so I misquote Henry Miller. Throw anything down the hatch to stop the gnawing feeling and swallow a dozen vitamins. If that doesn't work see a surgeon. If that doesn't work get a Hollywood funeral. They're the duckiest, the cutest funerals. Why? You can have your beloved propped up, reading something like the Bhagavad Gita, and smoking a cigarette forever, cigarette guaranteed not to rot away before the lips or the buttons. Oh Death, where is lies sting Oh grave where is the victory jolly what a.

But that's the problem you see, of using this food merely as a means to an end. I was in the airport. Trying to find something for lunch just before coming down here and there were three goals in their late teens sitting at a table next to us. And their lunch consisted of French fried potatoes, with ketchup and Coca-Cola. They were putting down. And this sort of thing goes on all over the place. Lucius Beebe, who was a great gourmand, once

said the south of the Mason-Dixon line everything is fried in rancid axle grease. And that's pretty much true. I remember, not so long ago that for my sins, I was lecturing in the state of Virginia. And I was, in colleges most of the time, you see, and I was condemned out for to eat the offerings of college cafeterias. And sorority and fraternity house cooking and it was so abominable, that I literally starved. You may say I'm fussy but I will not eat. Unless I am literally starving and have been starving for days and days when anything will taste good but a normal person should not be asked to eat the incredible messes of ruthlessly boiled vegetables. Meat that has suffered in electronic purgatories for hours. And is served to you in a gravy that was made of water, bouillion cubes, and library taste. This is simply not fit for human consumption, and the fact that the whole academic world without question faculty and students eat this notorious garbage is of course rotting their brain. And making them highly uncivilised. That it just unpardonable. There is no excuse for this at all ,and part of the reason is that college kitchens are supervised by dieticians as distinct from cooks. And these two classes of persons are really mutually exclusive. Because the dietician thinks saw food in terms of its chemical contents, in terms of its calories its vitamins its proteins, and so, thinks through a test tube well as an accomplished cook thinks with his tongue. And with his belly and with what fundamentally is good for his gut. And he comes an accomplished book comes from a long tradition be it of French Cooking Chinese cooking or of Indonesian cooking Indian cooking or whatever it is has a long long historical tradition behind him of excellence and the French cook, no one is more proud. No one is more delighted with his art and the dinner [that] goes with him is also equally important as a person in seeing that human beings remain civilized at the table and at the table is not simply treated in the same way as the boss from the bathroom is the output room. And is always sort of relegated to unconsciousness, because we don't like to admit that we do these. Things. And the so where when you are you you carry the bathroom attitude to the kitchen as I suggested already the kitchen begins to look like a bathroom because it is just the input room. And no real reverence is accorded to the art of cooking. Well I think that. If we want to have a true civilization we want to be people of great culture, great humanity, a lot of it begins in the kitchen. And goes on around the eating table. In Christianity, after all, we have the mass as a central right. The Holy Communion. The eating of bread and the drinking of wine because in

Mediterranean civilization the time when Jesus lived bread was the staple food and wine was the staple drink people didn't drink water, for God's sake. Because you could never trust water what was in it therefore if you had a sudden alcoholic content in the water of his drinkable. But beyond that of course the nurture of grapes and the production of very fine. Loved and matured wines was a way of bottling sunshine. And you will find to this day, that in any restaurant where wine is not in Western culture, they do not now understand food. Food and wine in the Western tradition are inseparable. And wine is not alcohol in the sense of vodka or whiskey or whatever is hard liquor. Wine is food, and when an Italian family is asked the question is to put die. What it spends on food. What it stands on drink they will always include the wine under the food expenditure they don't imagine that it's spent on drink. Yes they would say all right if we bought some whisky that would be drink as distinct from food but wine is food. And so, these things blend themselves together and when anybody who really understands wine opens a bottle of wine you will notice that they always do it with a certain ritualistic attitude. They will carefully draw the cork and they will sniff the cork to see that the flavor is all right then they will pour a little wine into a glass and allow it to roll around the glass and you should always use their rather for table-wines like carrots, burgundy is shabbily so to an all those wines you should use a rather large glass what the French call it by long a balloon glass so that it almost like brandy you can catch the past few more of the wine in the glass. And you roll the wine around and sniff it and you may take a tiny step to see that it's all right. Meanwhile, the wine pourer stands beside you to see if you approve it maybe yourself as host of the table and you put it down and then you serve the other guests but you don't for the glass fill this kind of glass to the top you fill it about one third of one half so that an area is left above the wine to catch the perfume. And then you gently savor it, you don't wolf it down in a gulp.

Now you see there's a ritualistic attitude to that wine is something precious and valued. And if you follow wine and are interested in it. If you can learn the art for example of being. Almost blindfold. I don't mean that literally it's the bottle it's blindfolded because you need your eyes as well as your nose and tongue to test why you need to look at it. How it clings or doesn't cling to the side of the glass and so on and experts of course can do that yes

rather accurately what wine they're drinking. Where it's from. It's not easy to fact it's probably a fairy tale that people can pin down the actual Vineyard. But just they can do so occasionally in a fluke way, if they happen for example to. Be the manufacturer of that wine itself the might pin down the actual in. But you see, wherever wine is revered the serving of wine is attended with a ritual now I'm pointing out what is good cooking also is attended with a ritual because you are as cook a priest at an altar and you are a vital moment in human life in the point where. Other biological existences be they animal or vegetable are being transformed so as to enter the human system and to become us. And so as Lin Yutang once beautifully put it, a fish who acts which has died for you and is not well cooked has died in vain. Here you see, we face in a serious ethical problem since we do depend on all these other creatures for our life what is a response. Billed towards them. You can't avoid this, you can't become a vegetarian if you're squeamish about it. But that's only a gesture you're still destroying living beings to eat. Apples tomatoes cabbages lettuce. All those things, cereals. You're still destroying other forms of life.

And so the only possible good ethical response to finding ourselves in this Situation, is not only of cross the obvious one of putting to good to use the energies which we derive from them but also the immediate respect shall I say the grace, the Thanksgiving of honoring what we eat. By cooking it to perfection. And perfect cooking. Will involve, therefore, ritual, because ritual is actually. Any activity whatsoever done. With full attention and care. When you watch a surgeon or even a lowly dentist at work and he is a good surgeon or a good dentist you want out just that he has a certain ritualistic attitude to the way he disposes his tools, and to the order in which he does things. There are certain dentists, who you recognize at once as having surgeons fingers. They are loving, quiet, peace-giving things. That work with a kind of quick but on a hurried expertness. And you can see, the same thing in a driver of a car. Or in any expert work at any craft whatsoever. And you will always see he goes about what he's doing with a certain. Way of behaving that is very much like the behavior of a priest at an altar.

Now, I don't know how many people know much about what priests do with all those. Even Catholics don't always know very much about this.

And they think ceremony ceremony ceremony, a lot of empty gesturing. But actually, the way in which a priest celebrates the mass. It isn't quite practical. All the ceremonies connected with it were originally functional activities. Why are the candles on an altar. We think candle is a way of lighting a candle beside something in the way of paying respect to it. Well yeah, but originally one needed some light to see what you were doing, to read any book you might have. And, why was incense offered at all when you think Protestants especially have what we call Protestant noses and find incense in church very repugnant. But that is all connected with our putting down of the sense of smell. This is one of the most interesting things in our culture is our repression of smell. It tells a great deal about us taste depends to an enormous degree on smell we can actually only identify four kinds of taste with a ton of four dimensions of taste, and the real savoring of food depends on its texture and be on its mouth that is when you get a very bad cold you notice that you don't taste of food. But yet, in the English language we have only three words to distinguish qualities of smell. Acrid, pungent, and fragrant. All other words which we used to denote smell are borrowed from other senses. We are noseless. Chesterton put it in the line of one of his poems and goodness goodness only knows is the noselessness of man. Dogs, cats, all creatures very conscious of smell and find their way by it. But we when we say it is like the person who is alleged to have got into a coach with Dr Johnson this fastidious lady. Being in the eighteenth century when people went very fastidious about washing she looked at him and said so use that old. He said On the contrary, madam, you smell. I stink.

You see we don't like smells. And particularly, we don't like the smell of the human organism. We would rather smell of disinfectant. Of laboris, or something chemical like that, then we would smell of people. And therefore, the clean good healthy Western civilized type of person, smells of chemicals. In fact he smells like a public toilet. Rather than smelling human. And the to be smelly you see, is to be stinky. Means the same thing. And therefore Curiously the sense of smell becomes the transmission sense of the unconscious. You becomes immensely important just because it's repressed. And we get all kinds of messages which, for reasons that we don't understand, influence our likes and dislikes of other people. We like the people who smell good to us and dislike the people who don't smell good to us although this never passes through conscious analysis. An

enormous amount of communication comes this way. Memories for example, are wonderfully evoked by smells. Up all sorts of situations in childhood when we weren't so unconscious of smell. Our evoked is why we like the smell of freshly cooking coffee so much which reminds us of the wonderful breakfasts, long ago, of home. Of mother, of the kitchen. The smells of freshly cooking bacon, you know, all that sort of thing goes with the smell of burning autumn leaves. And all these really a cherished smells. And immediately evoke memories, and that's why you see in Buddhist and Hindu and Catholic worship the incense is used. Because there are certain smells connected with the shall I say the religious consciousness which evokes that consciousness. And in a very very powerful way.

So then, this is the sort of mystery that goes on at all to those. Where people are doing things. That indicate basically a reverence for life. Albert Schweitzer. Reverence for life. This is the sacrificial bread, and the sacrificial wine upon which your life depends and therefore on it is done to that. The Christian idea of the Communion is really very very simple, because the meaning of the mass, which Jesus was trying to point out, was that the Christ's sacrifice was basically, the grinding up of wheat, and the crushing of grapes. The sacrifice of every living creature which maintains the human species. This is my body, which is given to you. Therefore the death of all creatures which give other creatures life, is the ongoing process of love, of self-offering, which constitutes the very nature of the biophysical world. And therefore, if you say grace before meals what you should really fact is the dead cow, the dead fish, or the crushed grain which you are about to eat and say to this thank you very much. For allowing your life to be transformed into mine. And so, the natural outcome of grace is eventually to allow your life to be transformed into the life of other beings still be they ever so humble, be they merely bacteria or worms. Because they in their turn are a sort of beast. From which life continues to go on.

So now, all those of you who are at any time in gauged in cooking must become aware of the high dignity of this art. And all the possibilities in it for yoga and self realisation. No more must you ever throw something together to stop the gnawing feeling. There is no point whatsoever, in cooking without giving yourself adequate time for it. Because you will find that time spent on other things. To such an extent that it affords no time for

cooking is a way of wasting your life. On abstract fripperies, instead of things of true material consequence. Anybody who cooks, should therefore set aside a sufficient time of the day to do it to perfection. There is no point in cooking at all, unless one cooks perfectly. Because to do anything less than that is a serious a reference to the fish to the dead animals, and to the crushed grains that we use. I don't want to sound moralistic as if naughty naughty to be irreverent to these creatures. I'm merely saying if you aren't reverent towards them ,you will not eat well. Because the process of transforming these valuable living elements into great dishes is really worth it. But the basic thing in being a good cork. Is that you must love the natural elements which grow into it. And other words when you get spread out on the chopping board. The various meats and vegetables, eggs, and so on. You must start by feeling of love for those things. Roll the vegetables in your hand. Look how exquisite they are when the slice say a Purple Onion look at the lines the patterns in what is then displayed look at a fish laid out in front of you the wonderful music of it scales. What a beautiful thing it is, the way the bones are formed. When you slice meaning to look at the marbling in it the quality of the color. Relish all that, sniff all that. And if you love those raw materials, you will be able to cook because cooking is a process of loving it is loving it. It is a transformation through love of these raw materials in assimilable and truly edible form. And a person therefore who is engaged in the ritual of corking will never make the mistake of hurrying. Now, there are moments in cooking where you have to have your wits about you because timing, is terribly important, as in boiling an egg, as in making a souffle. As in making certain sauces as in frying with butter where the batter has to be at a certain temperature and mustn't be allowed to burn. Cooking certain kinds of pastry requires perfect timing but perfect timing and hurrying are two completely different things hurrying in cooking is always a failure. Instant coffee is a punishment for people who are in too much of a hurry. There is only one way of cooking coffee that is perfect, which is jungle coffee where you put coffee into cold water. And you allow you but you see you've got to watch it. And the moment it comes to that begins to come to the boil you turn it off and it was never boil and then you stir it and you put the lid back on the pan to keep the heat in and you allow a little time for the grounds to settle. And then pour it off through a fine strainer in case any ground should be done through and you have got absolutely perfect coffee. But it takes it takes your presence of mind, it

takes watching to do it. Our store also does boiling eggs which is a very subtle art yield there is no formula for boiling an egg. Because there are too many variables enter into it where, what is the temperature of the egg? What is the quality of the egg? How hot your flame is how high you are above sea level? When you think water begins to boil. All sorts of questions like that going to the boiling of an egg. And no egg timer will by itself teach you to boil an egg. You have to get a feel for your own stove for your own kitchen for your own climate or the kind of eggs you buy from the market and then eventually you will know almost instinctively how to boil an egg. So, I would say then, the basic attitude is one of concentrating. Not by sort of forcing our attention on things that's not the way to concentrate. I think the attitude of concentration is very well shown if you watch the conduct of the Japanese tea ceremony. The whole idea of which is that the simple act of serving powdered green tea in hot water which is whisked can be so utterly delightful. And that the contemplation of the bowls, and the bamboo instruments that are used in this procedure can give such aesthetic relish, that it is worth dallying over. And spending two or three hours just doing that.

So in the same way, you will find that very good cooks have extremely interesting kitchens. That they will, for example, have the kind of kitchen where there is not one single utensil not one jar or sauce which is not an object to be using. Such people will go out of their way to collect Mexican bowls because they are so warm-feeling and lovely. To have the most beautiful jobs for example they will buy the wonderful jobs that are made for use and lamps. With. The ground glass stoppers fit very snugly beautiful functional shapes. They are much better than the ordinary kind of glassware for such purposes it is served in supermarkets. Go to a lab manufacture and buy all sorts of bottles and beautiful instruments. They are perfect for use in the kitchen. So you will find that a good cook always has an interesting and colorful kitchen. Because a good cook makes the kitchen the most attractive center in the house. A good cook will find that the company invited for dinner will tend to gravitate to the kitchen while dinner is being prepared. This may be an embarrassment to the cook if you're doing something extremely complicated which requires that you spread yourself over a quite an area and you have to move rather swiftly from part of out of the kitchen and don't want to be interrupted by conversation. But that is true only of

certain very complex dishes. Everyone who really enjoys cooking tends also to like showing off. And to like to cook under other people's eyes and they instinctively also like to watch it being done because it stimulates the appetite. Therefore, you ideally should have an arrangement in your home where if you don't actually live in the kitchen and have like a big farm kitchen it's always a good idea to have this the kitchen and living area separated by a bar where the actual stove is in the bar under a suction fan. So that people before dinner can come with their drinks and sit at the bar and watch you make things right under their noses and you can carry on conversation and not be separated from your guests. This is likewise the principle of cooking say ski aki, yakitori, tempura and all those various Oriental dishes which are served at the table or funded Borgen Yar or Swiss cheese fondue and all those things that are cooked right right there.

Now, as you are of course a tyro a beginner in the article thing. You will find that you depend on the recipe book. On instructions as to how to go about it and that's quite right and proper because the recipes have been worked out and tested over many hundreds of years and. Are things to learn from. But as you, the more you begin to understand and get a feel for cooking the less you will need recipes, and you will find yourself in the delightful situation being able to invent all sorts of different meals, where you are not following recipes but you're creating your own. Especially is this true in the art of dealing with leftovers. This is a real test of mastery in cooking. A good cook should not waste anything. Should find out how to convert all things that are left over from the kitchen into something exciting and that you see a real test of your inventive genius. And eventually, you come to know in your bones, in your nerve centers and the nose. What goes with what, how to treat certain things. And you've been comes therefore increasing increasingly difficult for you to explain to anyone else how it's done. The Chinese Taoist book written by Chuang-Tzu has a number of examples in it of the yoga of everyday life. And to the ones he mentions in particular the art of the wheelwright. And the art of the butcher. The wheelwright is an old gentleman seventy years old, who makes wheels with absolute perfection. That do not wobble on the axle and do not grip on the axle but revolve quite evenly but he because he doesn't know how he does it, he cannot explain to his son how to do it as well as he can therefore still is working all those seventy years old. Then there is the butcher, who uses

his knife so skillfully that it hasn't been had to be sharpened in seventeen years. Because it always goes exactly through the joints in the bone. And that which is infinitely thin can enter whether is no space this is drunk as chance of a way of putting it. But that knife that goes wish to see and never has to go crack is always in sharp form. So in this way, he says there is something incommunicable about all great arts. He says also following his mentor Lao Tzu, the five colors make the eyes blind the five tones make the ears deaf. That means if you think there are only five colors you are blind. If you think there are only five tones you are deaf. In other words. I'd say we have the Spectrum seven colors. The Chinese think of five. We think of so many twelve terms in the musical scale, but if you think that only twelve terms are deaf. And so, in taste, in all the parts of cooking. If you depend on the recipe you have no tongue. You could say then in Taoist fashion, recipes spoil the tongue. That's an exaggerated way of saying something it's a half truth it's a truth that is imperfect but it's there that way in that violent way as it were to attract attention. Recipes are very useful. But you will eventually come to the point where you will not be able to explain and therefore you get those awkward recipes where it says simply season to taste a pinch of this, a dollop of that, and you don't know how big a pinch or a dollop is well that's because you haven't yet developed the feel for the way in which certain ingredients will go with others. But you will find as you cook in that attitude, that you will become deeply aware of the miracle of the transformation of the world into humanity through your careful ministrations, and therefore will become more aware of your ecological going with all other forms of life and therefore be more fundamentally enlightened.

Well now, last night, I was being specific about one of the yogas of everyday life and applying it to the art of cooking. And as a concluding session, I want to discuss the way in which consciousness of your essential oneness with this whole universe and what we call every day consciousness, go together. You... if you read a great deal about mysticism, you will find descriptions of ecstasies developed through the practice of yoga meditation or whatever, that seem to be so completely absorbing installing ecstatic and rapturous that you cannot conceive that anybody could be in that state of consciousness and at the same time carry on every day life. And we hear our great Hindu mystics like Sri Ramakrishna Sriram on a Maharishi who spend hours and hours in Samadhi. They sit there with

their eyes closed in sheer rapture. Out of this world altogether. And if that is the ideal state to which man should attain, that kind of contemplation obviously it is inconsistent with everyday life.

But there is a strong tradition not only in India but also in the Far East that there is a higher state than Samadhi. And rapture. And this much higher state is called in India Sahaja. S A H A J A. And that means the natural state of these to the state in which the elimination is quite natural and fits in precisely with everything in the way of ordinary consciousness this is very much a strong feature also of the Zen Buddhist tradition. Where they have the saying your ordinary mind is Buddha or is the Tao, the way. And in Zen, the poet, has said, supernatural power and marvelous activity. I draw water I gather fuel. So that I saw Zen There is no no distinction whatsoever between what we would call the normal consciousness of the everyday world through our five senses and the Supremes state of consciousness of total awakening and life and. Indeed going back to the fundamental logic of the will punish ods the great texts upon which all Indian wisdom is based. They insist again and again that the Supremes state is without duality. And without duality means without exclusiveness. They would say for example, that to experience the highest state of consciousness is not merely to experience the oneness of things you would think you see if you experienced all things as one that somehow the differentiations which you perceive in the world outside you would disappear. And that you would experience, all around you, in every direction a uniform luminosity in which all differentiation was dissolved. And I can assure you that would be an extremely boring state of mind to get stuck indefinitely. That's not what to expect. Because the non-dual means the non-exclusive. That which does not have any opposite. And if the ultimate reality behind this universe, the fundamental energy or essence or whatever you want to call it has no opposite it is therefore not incompatible with all other states and manifestations of life.

So you could say the Supreme Consciousness is much like a mirror because a mirror is always clear and pure. And yet it will reflect anything in front of it there is no in compatibility between the silver purity of the mirror and reflecting the face of a lovely girl or a dirty old ashtray. it will take in both and still remain pure. So in a rather similar way, the enlightened state of

consciousness can contain any subordinate state of consciousness. So first of all, I must give some attempt to describe what the awakened state of consciousness is like. And this naturally is a very difficult thing to do. Because it is in a way like trying to describe color to someone who is congenitally blind. And you have to do that by analogy. You can tell a blind person that color is an experience of a certain kind of variations in the world that could be likened to the variations of temperature we speak about hot colors and cold colors we call red hot color and blue or cold color. And that there are vibrations in a sense, that he knows nothing about. These variations and their characteristic of all sorts of things but he must not confuse what we call color with what he experiences as hot and cold, it's only like it. It's a little bit like that you see it I have to describe a novel state of consciousness. And in a way, it's more difficult than that for the simple reason that. The consciousness of the total unity or non-duality of the universe. Is not really like having acquired an additional sense. Because it comes through all one senses. It is very much like a sensation. It's more like a sensation than it is like anything else. It's more like a sensation and it's like an idea. Because it's very concrete very understated All the moment you slip into it and I don't doubt that there are a number of people in this room who have at one time or another slipped into it. It happens quite commonly in adolescence. And again in the dangerous forties. People are liable to have spontaneous mystical experiences. And sometimes in childhood. Others of you may have come into this by a discipline or by L.S.D. or something of that kind and so you'll know what I'm talking about. Although you must not, if you experiment with these things, you must not confuse what I would call visionary states, with the state of enlightenment. They are quite different. Visionary states when you experience overwhelming light or a sea of great mandalas sort of have visions of the cosmos and total harmony they're not quite at the at that the state of what Buddhists call Satori. Because there's nothing about it which is so to say visionary it doesn't consist in seeing any particular forms. Or visions that you can specify. Satori, which is the Zen word in Japanese for awakening is just exactly like what you're feeling now. Except that as Suzuki once put it it's about two inches off the ground. That is to say. You feel that the same old well that you see outside you. Is not upside you but is you. In other words the trees waving across the swimming pool and the flowers blooming red, the sunlight playing on the water the people sitting in

the room and all that. You know that that's just as much you with your own body. And you don't therefore defend yourself against it, you don't resist it. It's all you. And you are therefore doing all those things out there only are not doing it as we say we do voluntary acts but we're doing it in the same way that we grow our hair. Or breathe, or beat our hearts. And so you feel all this as the functioning of your own your own self. Simply that the whole issue of experience is one single process unified process, and there is no differentiation between the experiences going on and the one who experiences them you are what you are experiencing that becomes absolutely clear. And this as I say, it reduces the resistance factor it ordinarily exists between the experience and the experience the feel and the feeling the thinker and the thought. That disappears. You are no longer standing back and looking at a panorama of events going on as if you were outside it. You know for example that what you see outside in front of you is actually located inside your head. The optic nerves are in the back of the head. And so all the colors and all the shapes that you are aware of with your eyes are in here. They're you, because you know the external world only by translating yourself into it. Or translating it into yourself there's no other way of knowing it it has to become you for you to know it. And when you follow that out you find out that of course the external world exists in relation to you and you exist in relation to it in the same sort of way that a back is related to a front. There are inseparable and without one you don't have the other. I don't care which one you take away take away the external world the individual vanishes take away the individual the external world vanishes. There must, in other words, be some individuals some living being around for there to be an external world at all. Just as if you slap a drum which has no skin it makes no noise because noise is the relationship between the hand and the drum skin. And the hand can hit as hard as hard can be and it will be no sound and if the drum skin doesn't have anything to hit it it still won't make a noise, you have to have both. And so all over this universe the universe is called into being by individuals in it. It does not exist except in relationship to perceiving individuals. Because everything that exists is relational. You can only establish movement that is energy if there is a relationship between a body in motion and a body at rest. And that's the, what the whole thing is that the whole thing is relationship. Relationship is existence, and relationship between the knower and the known, the still in the moving, is a polar relationship. Polarity means that

the opposites whether we call them to be and not to be or alive and dead are light and dark or North and South. Opposites, always imply a unity between them just as the magnet is the solid unity that lies between North and South Poles. Yes, just as the coin is the unity between heads and tails. Just as a sheet of paper is the unity between back and front.

So in the same way, there is a unity of the organism and the environment the now I am the known. And without this polarizing unity there is nothing happening, nothing doing. So this is what you become aware of, you see, absolutely visibly. That the differentiations that you notice between solids and spaces between different spectra of color, between form between figure and ground all these differentiations you are normally aware of you experience as not separating things but rather joining. The differences show the unity. And therefore, don't expect in the state of Satori, everything to dissolve into uniform light or something like that they stay just as they are. But, you hear and see everything in a state of go-with-ness. Where every inside goes with its outside. Where every I goes with every thou. Where you see that at this moment that everything that comes to you, is your own doing or as Hindus would say your own karma. Your own doing that doesn't mean your fate. To someone else was putting it over. You know it doesn't mean your reward or your punishment. It simply means your own doing, because you feel this different sense of you. What you are the only ordinary limited ego-sense, in which you feel that you're a separate part of the world accepting or rejecting things that are going on elsewhere. You are doing it all.

Only, be very careful at this point. That you don't get into the state which you call inflation it's very easy for a Westerner to get into an inflated state about this because of our conception of God, as the governor of the universe the political government of the universe the supreme monarch. And then as a result of that if an individual feels that he is really doing the whole thing and is therefore one with God he's apt to give himself airs and graces and to feel that he is really personally in charge of everything that's going on. And people who get that kind of sensation and interpret it in that way are rather unacceptable socially. And we usually regard them as crazy. Well that's because they make a god of the ego instead of an ego of their god. They identify the limited ego with the whole universe in such a way as

to say I could change it if I wanted to. I could, on the prompting of an egocentric whim, show off in some way or other by. Turning the water in the swimming pool into champagne. But when you have the Hindu idea of God, you simply, say naturally one doesn't turn the water into champagne. Because it is the will of God that it be water. And you feel that the center of yourself is no longer in this superficial wishing faculty that we call the will. Although it's still you you discover that you run a great deal deeper than your own will your conscious will. You have a cause an unconscious will we know that fundamentally from all that we've done in the West in psychotherapy people's we talk about people unconscious which is unconscious drives. And of course, all that exists and that is you at a deeper level than you normally know so what has happened in this process is that you have discovered. You have center just selfish your own deepest level. Instead of centering yourself as it were somewhere out on the circumference of a wheel you found your center at the hub. And you have therefore to find the hub of your own organism where do you take from? Well from the hub, but the hub is not ordinarily the conscious center from which you operate. But as you see you try the experiments I've been discussing as you try trusting your own brain. To decide what to do as you try trusting your own nature and following your own natural grain. Shall I call it that? You will very soon come to act from your data center. And you will at first get the impression that what goes on puts you in a passive position. You seem at first, to get the idea that you are relaxing to a current two way with life motion above and beyond yourself or deeper than yourself whichever analogy you want to use. Sometimes we say that prefer the great thoughts are lofty Sometimes we think they're profound. There's two opposite metaphors. But, whether you want to call it high or deep it doesn't matter the point is you feel at first that you are responding to something in you but other than you a beyond within. But later on you discover that this isn't other it's simply you at its deepest level. And you don't feel exactly passive about it that's what you feel at first. As if you were being carried by a great stream. As if you were responding to a current of like a leaf. But later on that duality between the sauce and the one who responds disappears and it all becomes a single activity. And the fascinating thing about it is that you realize there is no way of doing it any other way. You can be under the illusion that you are opposing this energy which will call you views. Say the Chinese name the Tao, the course of nature. And

you can be under the illusion that you're acting against it that you that by your egocentricity you somehow create waves in the thing that shouldn't be there but you can't. There is absolutely no way of going against the Taoist, you can imagine that you are against it, because the Tao is complex enough that within its possibilities it includes imagining that you're going against it. That's all part of the game. But actually, you can't. There is no state of mind you can get into. There is no kind of consciousness, no kind of emotion whatsoever that will actually go against it. Now that's the important thing to understand. As you come to the point of realizing that there's just no way out of this story. Then you understand it. Because you don't look upon it then as something you can get. That is to say in some particular state of mind, happy-mood, peaceful-mood as distinct from sad mood depressed mood or anything it isn't some particular state of mind that you can acquire. And make the object of an ambition. To the degree that you are ambitious to change your state of consciousness by any means whatsoever whether it's yoga whether it's drugs whether it's... I don't care what it is, prayers, anything. So long as you're ambitious for another state of consciousness than the one you have now you can't get this thing. Because you can't get it but as explained in the Diamond Sutra. Oh so beauty when I attain unsurpassed complete awakening, I attained nothing whatsoever. And there was no one to attain it. This is trying to say, what I'm trying to say and I may be fumbling in my words about this but you are when you understand that there is nothing to be attained. Just as I was explaining last night, there is no way of being secure of stopping the process of change and transformation which we call life and death there is no way of separating yourself from the whole field of universal process.

So as you understand that there is nothing to be attained, and that's the whole point of this thing. Then you see as a kind of your mind as a flip. And that flip is called Satori, you see that everything is it. And therefore, you can within that understanding live your everyday life. You are as it were set free to forget about religion. And concentrate on anything you want to concentrate on. But the curious thing is, that in the moment when you see there's nothing to get and nothing to attain and there's no special state of consciousness your mind ought to be and the moment you see that there is something in a way added to you. It is different. It's not the same as you were in before. And also it's not another. That's a hard thing to explain.

One can use analogies and say that it's like you became aware that the moon is three dimensional, instead of a flat plate in the sky. You see what you always saw but you suddenly understand that it's three dimensional so in the same way more or less the same way you see all that you ordinarily see but you see the new dimension in it you see that it's all you. And that nothing, not even the unconsciousness or death makes the slightest difference to that. In fact, death becomes an extremely important way of understanding this. Think about death. Imagine the end of consciousness. Imagine going to sleep and never, never waking up again. Consider that, you see, carefully. Well, you very soon after thinking about going to sleep and waking up never waking up it occurs to you that when you were born you woke up without ever having done sleep. And you realize then that the state after death and the state before birth of the same state. They are the off period that polarizes with the on. When you know something is happening when there is knowledge when there is a feeling when there is a vibration. Obviously. If there is going to be if we don't realize that there is something called it is we can only do so in contrast with the is not. And so let go of let go don't resist this thing you don't need to ensure that you will survive death. Just let it happen. Because life death, life death is the pulsing of the energy which you are. You really want to die that's why you die that's the truth in Freud's idea of a death wish. You like you want to go to sleep. You may try to resist it with this part of yourself. But basically you want to go to sleep. And you want in the most deep sense, of the sense of karma, you want everything that happens to because it's all your situation and you are seen.

So, in coming to understand this, you might say to me well, you've made a lot of statements. About this kind of consciousness. But I really don't see that they mean anything because it doesn't really make any difference. Anybody who analyzes this sort of thing logically. Anybody who takes a logical approach to mystics will come to the conclusion that the mystics are talking about a nonsense. Because what difference does it make? Now is perfectly true. That this is not exactly logical. If I say, all things all the manifestations of the single energy. They would say, all you're really doing is you're making a statement about all things and you can't make a statement about all things. Because any one thing that is true of all things will be meaningless. It's like adding a number the same number all the

same letter to both sides of an equation it makes no difference if. I say everything in the world is moving slightly up, you will ask up with respect to what. And since there isn't anything else but everything I can't locate that relative point in respect to which everything is moving up so they would say in the same way by say everything is divine or everything is a manifestation of the Tao, they would say, well it did it you said it about everything and therefore you said it about nothing. But I can't help it that may be true from a logical point of view but nevertheless, when you experience this to be so, it makes a great deal of difference. It's a shattering experience that absolutely. Sometimes it makes the sweat poured out of you it's a startling. And can make you jump for joy absolute total delight. And so I have difficulty in explaining that logically but that's what you see you see as we say in our weak words it's all one. It doesn't make any difference. And what this does, it has a very very marked psychological effect, because it immediately cuts down the resistances you put up all the time. And it frees your psychic energy to do all sorts of things that you don't normally have the energy for it all. Because you waste it in fighting your experience the thinker fighting his thoughts the thinker is the source who's going to fight it. Show me you. That's always the question of the Zen teacher you say you have problems you say you confront a world which is threatening to you show me you bring me out the separate you that has these experiences. And of course the more you look for the separate you you can find it. You go on around and around and around trance a who is myself Where did I...Where do I start all this? You can't find it. Because you can't there is no separate you. The quality you see, you say you look at something else. Someone else. But you see the color of the other person's face, the color of another person's eyes when you look at them. That is the same as you. There would be no such things as eyes and no such thing as color, except in terms of you. So, wherever you look you are looking at the real you there is no observer separate from the color of somebody else's eyes. You see that. All these that you are... You see, we come from a scientific point of view a desexed brains and say well there is this nervous system and there is that nervous system and there's the other nervous system when they get into contact with each other they reflect each other like mirrors you see. But the guy who is saying this. And analyzing it all out is in a certain relationship himself, with all these separate brains he's looking out and plotting out. And he can never unstick that relationship

that's scientists know today they talk about the myth of the independent observer there is no such thing because every time you make an observation. You interfere with what you're observing by making the observation. You can't unstick yourself, you can't disentangle yourself, from the total web that is this universe. And say, to stand aside from it and observe it as if you were an outsider is ridiculous. And the reason why is it's you all study of nature is simply self observation. Only it's you, in a much greater sense than we ordinarily give to this word we ordinarily give to the word I the sense of something that is an independent observer. But the I which is actually operative is in no way different from what it's looking at. The I-ness of you. See, if I look around at you and I want to find myself as you and in you well you have dark hair you have blond hair and in the blonde color and in the dark color that's me. In other words, we are in a situation where we are mutually vitalizing each other. It isn't that I'm in this body or the only one that's real. But we are all shall we say tits on one sow. We all raise from one center. And mutually calling each other into being like the back in the front and the new jewel aspects of the car in all the sheet of paper. And in this relationship of course, everyone is necessary. Everyone is an essential part of the whole goes on, even if you, if your bodily appearance is only very brief. That brief part of the appearance is an essential part of the eternal universe and the eternal universe could not exist without it. So just as a big weight can hang on a thin rope, so eternity, can hang on a tiny short time.

So, now, this is very important to understand in a time when an enormous number of people, are interested in the mystical experience. And are using every conceivable means to try to get there. Although I don't deny the value of all those and all specific ways of approach. Whether they be the meditation exercises in the old fashioned way, or whether they be the use of psychedelic chemicals. These all have their value but but but but, you finally have to understand that this state of consciousness is not something to be attained. Because you have it. You're always there. Only you need some sort of a jolt to see that. And so often it is limited Taishan exercise of the Opera we call these various means that means a stratagem a device a gimmick. And these various means to jolt us into understanding that we were there all the time. That it isn't anything special There's a phrase that's used in Zen of this kind of consciousness called in Chinese whoosh or when

Japanese buji. You can probably remember buji more easily. But it means nothing special. It also means no fuss. And mean no business sense of business. And a person who is shall we say perfectly religious is wusha, that means he doesn't look as if he's religious. He fits into the landscape. Not compulsively, I mean it's not like the kind of person who is a self-effacing out of timidity. When necessary, the person who is in the state of set or he can come on very strong, or suddenly vanish and leave no trace at all. It isn't that you feel a compulsion to be modest. It's rather that you feel the incredible richness of the world as you are experiencing it now. Because that's the point.

Let me try and put it in some other ways, because perhaps through talking about it from different points of view, I strike a bell of recognition and someone. It's often said that one of the great ways of yoga and this is particularly applicable to the every day yogas, the yoga of cooking, the yoga of accounting or whatever it may be. That you concentrate in the present. Some of you will read the writings of Gurdjieef and Ouspensky have read about the self-remembering exercise, where you are vividly aware of everything you do all the time. That it is happening now you live in present time. That's one of these exercises a very interesting exercise. Always be alert are you here or now or are you wandering or your thoughts off somewhere out sizzix Are you completely with what you're doing because naturally when one is engaged in something very important like a surgical operation you have to be completely with it. Now or do you do everything that way you eat your breakfast that way you make love that way the are you absolutely with it. And so this meditation exercise is practice in being completely with it. Now the funny thing is that the end of this exercise is the discovery that you can't be any other state of consciousness than that one. Because you are everything you're conscious of in any way is the present. The memory of the past is the present it's like an echo of something that happened a few seconds ago the echo goes on and the Echo is here and the Echo is the memory of the noise and that of your brain is full of Echoes, but they're all present there is no way of being anywhere else than the here and now. But that's what you find and discover through trying to get into it. You have to try to get into the eternal now to realize that there's nowhere else to be. And you do that you see by analyzing by carefully watching what you're doing, and you discover that

your memory is and your distractions your thoughts about the future, your thoughts about the past, they're all happening now I am thinking about the past. I'm anticipating the future. And that then for if I that that's what I'm doing then I really do it you see get with it get with thinking about the future get with thinking about the past and you'll find it's all present.

Now then, this is a marvelous feeling when you catch this you feeling that the present moment is like a great stream that's carrying you along. See, how can you get out of the present moment just try. Can you avoid it? Can you be somewhere else? No, well if you see the present moment as the same thing as Satori. You see what I mean this is the present moment this now that is somehow always still in the it, always moving that is the doll that's God that's a tunnel now eternal life you can't get away from it just try public institution against the child against it trying to such a self against it has no way of doing it. And therefore, I can use this image, the symbol of the present moment, as a way of illustrating what this kind of consciousness is like. Other people might use the symbol of space. That's often use the Chinese word for Sunyata, a good term for the great void which is the ultimate reality they use the word that originally meant sky or space. And just as you can't get out of the present moment, you realize you are, everywhere in all directions, you are contained by space. And space what is space and space is your own mind. Everything that you are aware of occurs in space. And let's first of all relate space to the eyes. Space are those areas of the retina not being stimulated by something, and therefore it constitutes the background for every visible form. Space is the groundwork of optics. Let's consider it from the standpoint let's consider space in the standpoint of hearing. It's the silence in your ears against which you hear sound and can distinguish. Let's consider space or in the sense of touch. It's where you move your hands in the dark and meet no obstruction. And you have a kinesthetic sense of space in that way that space is fundamentally the in globing background to all specific sensations so there's visual space auditory space tactile space probably there's all factory space but as I said that's a sense for which we don't have any many words. And smell-lessness, against which to distinguish particular smells. But that space is the way in which we experience the availability of our consciousness for particular sensations, it is the room in consciousness of this and for that.

So, everything that if you experience this space, this vast, vast outgoing space to the limits of the universe. That simply you let your mind. And, just as every point in the universe because it's a curved spacetime continuum may be regarded as the center of the universe so every living being may be regarded as the center of the universe the center of space which is as it were multi-centered It's easy to think about that mathematically, but difficult to think about it in sort of ordinary three dimensional terms. So then, you may from the impression that I'm saying. Just as I can't get out of the present moment. And I'm always moving with it that therefore. The dial. Is something to which I am related in a deterministic way. My ego then, becomes nothing more than a puppet, which is pushed around by the great energy of nature. And all I do is sort of dangle on the end of it right along again like the leaf on the wind so let me remind you that that image of the leaf on the wind or of the person floating in the stream, is only analogy that what I'm trying to say is that the leaf is the wind. There is no, nothing in this universe, which is being moved by something else called the cosmic energy or God. All these things that appear to be being moved by it are it. It's just like you have difficulty in understanding that a pattern can exist without being made of some substance. That the pattern is the same thing as the substance. When you for example, touch anything solid. You say well I feel that I am touching something substantial but what is happening what that feeling is a pattern. The sense that you call hard it is just say for the exact argument it's a dig dig dig dig dig in consciousness as distinct from dig dig dig dig dig which would be what we call soft. All sensation whatsoever is patterned. Different kinds of patterns. And therefore that there is no substance involved in this the pattern isn't made of something as we would think that a pattern of wire had to be made of metal because when we analyze metal and what we mean by metal it's a patent only it's on a smaller scale than what we call wire. There's nothing else but that now there's a certain difficulty to our common sense in seeing that we say you can have a pattern unless it's made of something. So it is but in the cigs actually the same way there is not the universal energy as something distinct from some stuff behind out of which mantle pieces and people and birds and trees are shaped. Like we make so many carvings out of wood, it isn't like that. It is that the shapes are the energy. There's no duality at all so you when you feel this, you will as I said a little while ago at first feel passive because you're not used to it, and the initial impression is one of

passivity. But the thing you actually get on to is there's no difference between the energy and you object when what happens and what makes it happen it's all one. Things are not forced to happen. Unless you insist on abstracting the thing away from the totality when you do that you say what makes the thing behave the way it does. Well you've answered your own question because you asked the wrong question in the beginning you started by falsely separating it from what goes on and then forget you've done that and then say well what makes it behave the way it does. You created the problem by making the separation. As soon as you divide the universe into a lot of separate things and think about them that way, then you have the problem. How do they fit together or it was you who took them apart. So the answer to How do things fit together is simply the counterquestion, how did you take them apart? Why did you I don't lies the universe into a lot of separate behaviors. Well it became convenient to do that in order to talk about. That's calculus. Calculus analyzes curves into point instant. Curves don't come that way if you think about them that way. You forget that that is the technique of thought, the methodology of sought then you create all kinds of false problems. How did you, what is the meaning of life? How did this universe come into existence etc etc etc. The answer is it didn't come into existence some time off in the past. It only came into existence now. This is the point when the universe comes into existence. And what we call the past is its wake its echo result duration like the wake of the ship the wake starts from the nose the bow the ship that's where the wake is created.

So in the same way, this whole cosmos is created from this by God here and now this is the part of the Big Bang. Everybody is looking backwards to try and find out when it started you don't look backwards to find out you look at here to find out see if you're starting it now. It's all slowing out from your consciousness. Only, because you don't know that and you've forgotten it if you're looking back behind you and saying you know when I got involved in all this maybe it was my father mother maybe their father and mother go back you pass the bucket of blame for everything all along down the line then ha-ha, you are looking in the wrong direction. Just start again now generating all of the past is just echoes of what you did before. Draw your way your father. Their fathers and mothers and so on all the way back. Same old you. Like you know when they, when you're over you my father still alive, he says his name's I, and he feels Central just the same

way I feel central. [He] sees all the world going on around him he'll just like just the way I feel when it's the same fellow, you see, only doubling up looking at everything from all sorts of different points of view. And so long as you feel that way you will, you are the here and now you are the point from which creation begins. Beautiful. Well, we're going to stop now and have an intermission.

The Arts

Bushido

I decided that I should talk to you about something with relevance to your careers. And those of you who are in a religion class have recently been studying Buddhism, and as a subdivision of that you have been studying Zen Buddhism. And you may well know that the practice of Zen Buddhism has a very special relationship to what the Japanese called Bushido, which is the way of the warrior. It may seem surprising to some people that Buddhism could have any concern whatsoever with the military arts. But let's face it. If we are going to have a military arts, and if we are going to have military people at all, they must be as effective as possible. It is a very bad thing to cut off a person's head half-heartedly. Leaving our enemy with a half-severed head is not gentle money at all. I never thought of asking the extreme swiftness of action. Are saying at lunch with our friends here that Germany lost two world wars because of the goose step. You should never hear a soldier coming.

Well now, this has unexpected consequences because of what I'm really doing is giving you a talk on Occult strategy. Because I think one of the difficulties that we are having in this country today in its foreign policies is a certain defective strategy. And this is strategy or the very modest. Because it's an idea that it's not which sentimental people tend to avoid. You have to realize that these things do exist in the world and have to be. And you cannot be a good strategist unless you are also a philosopher, and you cannot be a good philosopher unless you're also something of a mystic. I know that's a sort of dirty word in intellectual circles and I sometimes refer to mysticism as ecological awareness. Makes it a bit more respectable in the academic world.

Now, for those of you don't know what Zen is I would just say read it that it's the sino Japanese thought absolutism which evolved in the time dynasty which was shot after 700 A.D.. It had Indian inspiration. But it was largely

a mixture of Indian Buddhism and Chinese Daoism because of this last bit of nature and China it is best exemplified in our own culture by the art of sailing. Go to the wind. And if you need to go in a different direction from that in which the wind is going, tack. But it is a much more intelligent way of negotiating oneself than rowing. Rowing involves undo strain. And the absolute principle that is involved in dollars and and which enters into Zen, is that all fine effort never strains. Anybody completely accomplished in the use of force by which I mean energy. 'Cause force sometimes means strength. Knows that who achieve your best results by following gravity. Or by going with the grain of things. And you notice if you practiced surf-riding, you know this if you've ever flown a plane and you know this in every kind of athletic discipline. You must not strain. Use your weight properly. Its weight that counts, and intelligence. Weight plus intelligence, because weight is mass and mass is energy. So that the darkest point of view dollars in the originated in China probably between oh around four hundred B.C.. And is associated in particular with a lovely book called in Chinese, Tao Te Ching. The Book of the Way and its power. And you should all read it in Lin Yutang's translation in the modern library. Called the wisdom of Lao Tzu. It is a book written as a manual of instruction for rules. And it has a great deal in it to say about military tactics. And it shows you how to do more with less. It is of course like Zen, in common with Zen, the philosophy underlying Judo. Do is the Japanese way of pronouncing the Chinese word Tao, meaning as I said the course of nature and do their own means the gentle way. The way of defending oneself. Without losing all using strength Yes but you never force it. Like when you put a key in a lock, of those difficult into if you simply use brute muscle you will bend the key or break the lock. In good stead or you puts an oil and jiggle to get it and you find the easy way through.

So then, Zen being a combination of that philosophy of going with the stream, and Buddhist philosophy. Comes out of something like this. But is philosophy is concerned with awakening with waking up with being awake. And the word Buddha means simply an awakened man or the awakened man. Now what is it to be awake. We have to contrast this with what it is to be asleep. To be asleep in a way as to be hypnotized. To fail to actually be sufficiently aware of reality. Adequate in which all civilized people hypnotize themselves, and get into terrible trouble is through too much of a

good thing. That is to say, through being enchanted or spell bound by words, concepts, and measures, which constitute a system of description of nature which we confuse with nature. The map in other words is not the character. The word is not the event. Water is a undrinkable noise. And it's tremendously important to observe that distinction. This is the basis of course of Korzybski's philosophy called General Semantics. That we as a culture significantly fail to observe this distinction and that's why we are taught. For example, we confuse money with wealth. You can't eat money, no a lot of stock certificates and dollar bills of the slightest use to you on a desert. Their value as wealth simply disappears. But you can add figures to each other indefinitely. And pile it up, pile it up, pile it up, but you cannot eat five roast of beef with one me. Or driving three cars at once all into cars at once. There is a limit to the material one can consume. And the United States, which is regarded all over the world and by itself as a materialistic civilization is nothing of the kind. A materialist is a person who loves material. Do our cities look as if they were made by people who love the material. Is it materially smart to live in the middle of poison gas?

So military men, who [is] supposed to be realists above all things, should have their eyes on the tears. And rot. So that's what Zen is all about. But in order to be really aware of the real world, you have time time back to the sun. I don't mean that kind of sign you know there's been a. Some very important citizen and somebody gets up and says let's observe the minute of silence in his honor, and everybody frowns and thinks very grave thoughts. That's not silence. Silence as they practice it in Zen, it is called Zazen, and what it means sitting Zen, that is the temporary suspension of thinking. And by thinking I have been specifically, talking to oneself inside the skull. Using descriptive symbolisms to put them all whether they be in words or numbers or whatever in fact that are looking directly at what it is. I got it. Because, if I were to talk all the time. I would have nothing to talk about because I wouldn't hear what you have to say. Likewise, if I talk to myself all the time if I think all the time I have nothing to think about except thoughts.

And that is the great academic fallacy. I'm not against the intellectual life. I'm an intellectual. I make my living by writing books and giving lectures. By being a philosopher. But to see how many things were lost sides of

bought you must occasionally be silent. And I'm going to explain and why, in some detail. The desk says primary concern. Is the cultivation of inner silence. Now you might ask me then, what is reality? What am I talking about? Experience through silence. Some people say that the material of the real world is material. But that is really a philosophical concept. It's a sort of seventeenth, eighteenth century form of Western philosophy called materialism. But it's purely conceptual, the idea that all this is some sort of stuff. Composed of our time a billiard balls of matter, is pillar a minute not. That is the alternative idea that everything is meant as in subjective idealism, as in Christian Science. That it saw us as reality a spiritual mentor or psychic, that also is a conception.

Reality itself is [claps]. You could say that is a clap but it wasn't. A clap is a different noise. So wake up. To wake up, you have to be quiet. So zazen involves the discipline of stillness, mental stillness. I say discipline, I suppose that would shouldn't frighten you. It doesn't many people. I really prefer to call it a skill. Cause discipline so often indicates something where you are forced by superior authority to follow a certain course of action. That is not real discipline, because it itself has. It's mere submission. But real discipline is a delicious thing. It's-you can't have any pleasure without discipline, you can't even get roaring drunk without a discipline of the distillers art. There is no pleasure without discipline.

So but it should be, all disciplines that are followed are delightful. Often you know it is the facade form of that let it be like fall if you like writing about money. And you give it something it extremely interesting to do. And that's why you devote attention to it and develop the skill and so on. So this discipline of interior science is practiced by that gentle students and has been so since the twelve century.

Now what happens is that every curious thing, because this discipline differs from all others in one very odd respect. It has no purpose. Because if you do it for a result in the future, you are not doing it. Because he will discover in the state of mental silence that is called in Japanese Mushin meaning literally no mind. Or no moon or no thought. You will discover that in that state that is no future. And likewise no past there is only not. The now out is all there ever was and all that that of it will be. And until

you know that secret. Making plans is of no use to you whatsoever. Because when your plans mature you won't be there to enjoy them. You'll be making plans for somewhere else.

Plans are of use only to those who live totally now and realize of course that their memory is happening now, and that their expectations are like now, there is only now. And that insight comes as a result of clarifying one's mind as if it were unpolished— I mean it a completely clear mirror. Or an unruffled pool, reflecting the sky and showing balances what lies at the bottom and that top of mind is what is achieved in the practice are then meditation was awesome. It goes also along with learning how to breath. Because zazen doesn't involve a kind of forced elimination of sorts, is all or of any sensory input that one may be having. You begin by letting everything happen what is happening. Let your ears you know whatever they want to hear, let your eyes see whatever they want to see let your lungs breathe as they will. And let your nerve endings distributed all over your body and feel anything they happen to want to feel. Let go. Don't interfere. And then say as you listen, without naming, without describing the sounds, without a scribe write the songs that are going on all around you as you. Feel. Without trying to identify what these feelings are. As you let your mind think about whatever it likes, but you listen to your own thoughts as it were they were birds chattering outside.

Then you begin to discover reality. You don't get a concept of reality, you get reality itself. Now that's tremendously important, because all our concepts with reality, all our descriptions of it, whether that it was all a mathematical formulation are linear. Words are strung out in a line. Thoughts are strung out in a line. And I always say you can only think of one thing at a time. But to be affected in life it must be able to think of innumerable things at once, or at least deal with them, but you cannot do that with linear thinking, because nature is non-linear. Nature is everything happening a together everywhere it wants. To put it in scientific language nature it involves billions of variables. Whereas in thought, the average person cannot entertain more often fall that enables at once without using a pencil. We cannot comprehend the millions of variables as in physics by using statistical methods. But average human problems involve say one

hundred thousand variables. Maybe even twenty five hundred. How can you think about twenty five hundred variables at once.

But the point is, although you are thinking systems cannot do this, your brain can. Your brain takes care of the organization of your body. Every single process of the human organism involves the nervous system. How do you grow your hair? How do you color your eyes? How do you make your glands secrete what they should? How do you beat your heart? How do you breathe? Incidentally, how do you manage to be conscious? Nobody knows. Except a few neurologists and they admit they know very little about. That means the brain is smarter than the science of neurology. How do you open and close your hand? You say, I know how to open and close my hand but you can't tell how it's done in words. But you can do it. And therefore what is necessary. Is the greater facilitation of the use of the nervous system. And we may miss that by paying too much attention to description. It may be much more important for us to neglect mathematics and physics a little bit. You know, I don't think they should be thrown out of the window by any means. But they will get in our way, and we will make serious mistakes through technology if we do not study the spontaneous use of the brain. And learn how to act spontaneously without any thinking. Now this is where Zen comes in very strongly. Zen operates, aside from cultivated mental silence in a kind of interchange between teacher and student.

An example of such an interchange is the following story. A Zen teacher, or Roshi as he's called in the Japan was walking through the forest with a group of students. Suddenly, he picked up a branch and turned by his students and said 'What is it?' And the student hesitated, so the Roshi hit him with it. He turned to another students and one of the students said 'Give it me so I can see,' and he turned and hit the Roshi. 'Ah,' said the Roshi, 'You had me there.'

Another story that's like it is the teacher was entertaining four students to tea, three students giving them tea. He pulled his fan out and tossed it to the first student and said 'What is it?' he said it's a fan. You have it to the next to the opened it and found. Not bad. You tell it to the first of the first student only put a cookie on it, and handed it to the teacher. You see, he had no fixed idea of it is a fan. The word, or this use only, it could become a tray, it

was a magical object. He could transform it seems into many different things and all inventive and creative people. Wired to creativity because they're not hung up on fixed definitions of any form of life or reality may be. Filled in as a result of that kind of insight it became very valuable to the Japanese some right. To study it. First of all they wanted to overcome the fear of death. And they found they couldn't frighten Zen teachers. Now why not? Why are we afraid of death? Obviously because we're thinking about it all the time, because we've been taught to be afraid it. When we were babies we had no fear of death we didn't even know about. Yet when we got sick. Ah parents and people came running and we were having a gas enjoying some sort of trance or weird fever state, the parents come on 'Oh it's awful it's awful it's awful poor baby, awww...' And the baby learns from this that something horrible is happening. And the baby can't do anything about it, it's no good teaching it worry. And furthermore if you do know about disease and your surgeon you don't want to be something sound about your patient but your hand shakes when you're operating. So we've made a bow you are out there. I mean. How do you know you're alive unless you were once dead? How do you know you exist that existence is something there! Unless you once didn't.

So existence and nonexistence, life and death are only vibration, it's like the crest of wave and the trough of the wave and so on, you can't have a trough without a crest to correct, so you can't have existence without nonexistence. It just doesn't make any sense at all. You may be afraid of the way of dying. Be burned up or something. But that becomes a problem to you if you think about it in advance. Sufficient to the day is the trouble. But it's because we have this overemphasis on the talk talk talk talk talk talk program going on inside all the time that we we worry. And then we worry because we worry. And we know that's not doing us any good.

So that was the first thing the Samurai wanted to discover: how not to be afraid of death. And so the Zen teachers taught them. How to act without thinking. And this requires an enclosed discipline, because if you start you're always used to acting on the basics think. And you suddenly switch to the other method, you may make some very foolish mistakes. So it's always done with another kind of encouragement like this is an academy there is a special school is that everybody understands the rules and

outsiders are into fairly by the process of what's going on. They're not bugged by. Outsiders would be very easily bugged by people who acted spontaneously, without due consideration. That you see it's absolutely necessary for all the samurai to act without due consideration. Because when you're in a sword fight, there isn't time to think. But also you have to be intelligent. It isn't simply a matter of learning etc reactors. Those of you who started to do it you know very well that it isn't merely a matter of learning a routine at reactions, and they are all being able to bring them on for almost any kind of assault maybe made against you. You never completely know what kind of assault may be made against you.

So if you go out routinely prepare for different kinds of assault and something that you never ran into before you lost. It's like the I mean, the beginning psychologist, and he's read old textbooks and notice this kind of case and that kind of a case and then suddenly it gets out of practice and. Somebody has got something that was discussed. So he rings up his teachers and say now what do I do about a thing like that? So what is important, you see is not just starting it all different techniques of strategy, but having your consciousness made over, to where it understands situations without thinking about them. Just as you understand how to breathe, how to close your eyes. And so there is a wonderful essay by a zen master called Takuan on the art of swordmanship. And it is absolutely important in this art, an immovable intelligence. And in our language we would say the awakened intelligence brain unobstructed by any preconceived idea.

So he says when the hands are clapped, the sound is issued immediately without a moment's hesitation. The friend struck the spot on stop just now he says this doesn't mean that you are right because hurrying itself is a block. You know I want psychology we use the block. Where you hesitate as to how something could be done in proverb but says he who hesitates is lost. Even though another probably says 'Look before you leap.' You see is not necessarily pondering. It is just using your are at as the immediate sensor of the brain. So you can must not be involved in any considerations of either winning this fight, or losing. If you want to win, that's a mental block, if you're afraid of losing it's a mental block. You know how it is sometimes when you act in a crisis you're driving a car and the things skids.

You suddenly find something come over you, where you act without any premeditation. Often you do the right. You only get the shakes afterwards, when you think about it. So in that kind of a crisis what do. What the Zen Master Takuan refers to as immovable wisdom takes over.

So that is the primary thing that has to be learned, in those, there is athletic or military disciplines which Zen influenced. It would be Kendo, or swordfighting, Judo, karate, Aikido, which is the most esoteric of all of them. And that is the art of being unattackable. Everybody should study Aikido. Especially if you're a militant people. Because the great skill in the military art is not to be able to be attacked. And this does not necessarily mean granite and strong fortification.

We come to it in the end in the highest school of Japanese swordsmanship. And if any of you get an opportunity or can rent a three night film. Three two-hour strips called Samurai, done by Mifune, in color, it is the life story of Miyamoto Mushashi. You should show it here. It is an absolutely thrilling story done with the greatest artistry. Leading up to a final battle in which most very reluctant to engage, but he is asked to do so as a Pondona, or point of honor. Where he comes at his opponent, who has a huge longsword. On a wooden ore. And he defeats him, by timing. He walks in from the sea to the beach, to duel, and he's timed it just exactly so that at the critical moment sunrise you know it's easy for me it's art. See that's intelligence. So then, the highest school of swordsmanship is called a no-sword school.

A very kind of elementary illustration of it was that the Mushashi was once taking a ferryboat across the Lake Fiwo to Kyoto. The last minute a very drunk samurai got on the boat. He was one of these machismo types. Very aggressive, tough. You saw actually says you are aren't you was all that. Musashi says now wait, there are a lot of other people on this boat. I mean if we fight, we may hurt innocent bystanders. Ferryman, you go over that island. We'll get out on that island and fight. So the ferryman went over to the island. And this drunken fellow, all eager to fight, jumps out onto the island, Mushashi grabbed the oar from the ferryman, push the boat way let this man stranded on the island. That's the no-sword school.

But in a more profound way that no-sword school is, you must first understand the nature of power. And consider, the basic thing to know in all strategy, is what you want. Now do you really want power? Would you like to be able to control everything absolutely? You know, it would be like making love to a plastic woman. No surprises. Now be very careful about the idea of power. And this is something that you get into the culture of the West all too easily, because a lot of men aren't confident of their masculinity, and therefore make a show of masculinity. And they think it's male, always to play tough. And therefore, they ignore anything subtle. You see this is good that was an entrance test that if you knew if you could recognize divinely ourjato, you would be rejected. Probably. You see I was not afraid to who has all the strength and courage and sexual capacity of a man is not afraid of gracefulness. Of a certain sensitivity. Because if you don't have that, you can't make a good soldier Because you will be unalert. Stupid. Like people you know they just think that [makes noise] is the whole Art of War. The whole art of war is Judo.

Very very quiet, be very alert. that you don't you can't try to do you know you can't force alertness. Alright, I'm looking at the time. If that talk further away and it might. I won't make it any clearer. If I relax my eyes, imagine a velvet curtain in a dark room you know my eyes don't like Times. Now I guess that I would start. Sailing, treating the whole of life as navigation. This is about holy. You're not a man who wants some foundation. Trouble is so much of our every religion is based on analogies of the rock. We need firm ground to stand on! People get narrow minded. Because life is fluid. So the sailor understands better. The Way Things Are you don't want to. Even so even mall that you would. In a still. Think if you don't know which way is. If you don't talk about up, talk about out. Going out or coming in. There's no up. Everybody's up is different just depends where you stand on it. You find that you are in the spaceship already. It's called Earth. You don't need to go rushing to the moon and rockets. That sort-of phallic symbol. What you do, what you do, strategically, you see, is cultivate very sensitive radio astronomy. So that you get to the nearest star like in several lifetimes. You may establish a nice Space Station outside the earth, where you don't have atmosphere to bother with telescopes. That's OK. But the future of the knowledge of the universe must come to us.

So you know all those things you do which seem to require brute force. See the military. The story you know of Richard the second, Richard the first, the Lion-Hearted king, with the Sultan. Richard draws his enormous two-handed sword, and takes an iron bar, and breaks it. The Sultan draws his scimitar and floats a piece of silk in the air, and it drops on the scimitar. That made everybody very frightened. But that that's the principle that underlies Taoist doctrine of going with the stream, of not forcing it and the Zen doctrine getting to reality which is always now out and you can comprehend without always having to figure it out in words.

The Importance of Space

I want to talk to you tonight about the most important thing in Eastern philosophy and this that exists which is space. Space largely neglected by us as being nothing, even though our architects talk about uses of space, characters of space and qualities of space. And though our astronomers talk about curved space, expanding space, and therefore active space. There is a saying in the Sutra which is recited by all Buddhists practically in Japan and China, called the Makaharamita Shingo. Or the Heart Sutra, Shinjo. Which is a form precisely is emptiness. This character also means the sky and so Space This means both form and color it corresponds to the Sanskrit word Roopak. It isn't the same as our word matter which has come to have the meaning of stuff, substance in the sense of stuff out of which things are made. This refers rather more to shape because that is not in Buddhist philosophy the concept of stuff.

So what is shape? What is for all, what is outline, what is significant, aperceptible or audible form is the same thing as space. Now this is not quite what we mean by equal equal sign. When you get this kind of equation is in eastern thought, that is to say you will get a Japanese saying be oh those so called Shabbat Sioux Shabbat Sioux so called we all go soku means, what these two things mean, unity is differentiation, differentiation is unity. Now we know ordinarily that nothing could be more different than a different and the same. And people will argue themselves into a bloody fight, that by God not the same is different from the different. And the different is different from the same. And so when you argue it that way, difference seems to have an edge over sameness, doesn't that? Because

you're going to argue the same is different from the different the by God the different does different from the same more times the word different as used in this argument of the word same. And yet you realize that you don't know what the different is unless you know what the same is. And that these two experiences designate each other. And it's this business of designating each other which is meant by these two characters here which link form and space. And you could say they imply each other. That is a little better translation than are the same as.

So then, we are looking at a culture, here, which in its aesthetics shows an immense valuation of space. Also today, under the great pressures of the population explosion, space is the most expensive thing in Japan. More expensive than food, transportation or anything else: space. And it is a country which has learned how to make small spaces seem enormous. So great is the appreciation of space. So in contrast with our point of view for which space is nothing and for which space is also disturbing. Look at the ways in which we find space disturbing. Space free from suck or silence is a form of space and that is something which is to most modern people whether American or Japanese disturbing. Silence should be filled. And you know that in the Far East where people have radios, they believe that they're not getting their money's worth out of the radio unless they have a current turn down as high as possible. They should get the maximum noise out of it because that's what after all it brings you, so turn it up high. This intrusion therefore into all life, of constant noise to destroy silence. Silence bothers us. So in the same way, space bothers us, because there's nothing in it. And you remember the glorious Victorian rooms where those space whatsoever was allowed the walls had to be covered with patterns you couldn't have a blank page or say a blank area on the binding of a book but you had to fill the whole thing up with flowers, and curly-Qs, and all kinds of things and you couldn't have a surface of wood without in some way or other covering it all. All because of the feeling that space just is something that's not there. And what I want to do the see evening is to show you various ways in which space is as important as the things that are supposed to be in it. And that once you can grasp that point you have very many problems solved.

Now let me start by repeating something that I've already told you, but I want to do this for the purpose of making it fresh in your mind and also illustrating it vividly so that you can't forget it. This is a most elementary lesson in space. And it starts with a universe in which there is only one ball. There has to be of course and in this universe, space surrounding the ball. Because the ball is a solid. And the solid must go with the space. After all, if the ball is all that there is. Then it's no ball at all because nobody can see it's out, its limitations. And on the other hand if it was the space around it. It is all that there is nobody will notice the space because there won't be anything in it. So we have to start with the primordial world of ball or solid and space. These two. Poles or qualities because the human nervous system is so arranged that the neurons constituting it have two possible operations. To fire, or not to fire. To be, or not to be. And so all thought is founded on an elaborate combination of what you might call yang and yin, or zero and one, on which with these two symbols you can put all arithmetic on that and computers used nothing but these symbols, no and yes to do the most elaborate calculations.

So, our way of thinking is entirely based on is you is or is you ain't. And so we have a certain difficulty in realizing something in common between those two which is suggested you see by this phrase goes with. And about this come endless arguments but entered any rate here is this universe in which all that there is is one ball and space. In this world of course no motion is possible. Because that ball cannot be said to be moving up or down or to the left or to the right to the north south east or west above or below because there is nothing else in relation to which it can move. So we don't know even that it still. We don't know whether it moves, neither stillness nor motion can be attributed to it. It is only when we get a second ball. And now we're going to call them A and B.. That there can be any motion at all. And so we can watch balls A and B growing closer to each other off other away from each other. But we cannot say whether A is moving and B. is still, whether B. is moving a is still or whether both are moving. There is no way of deciding if they grow either closer together off that away from each other back and forth but we cannot decide which one of them is doing it. Furthermore I want you to notice this. That these two balls can only move in a straight line. In other words, any position

whatsoever in which they may be found will be along a straight line. And so they are confined to that dimension of motion.

And so now we introduce a third ball, C.. And we get a new problem. First of all, let us suppose the balls A and B.. stay together at the same relative distance from each other. And C moves off Now the question arises, who has moved? Have A and B. moved away from C. or has C moved away from A and B.. How is this to be decided you can decide it only on the rather fallacious basis of the majority being in the right. So that because A and B. constitute a majority, they can decide whether they moved away from C or C moved away from them. And so by constituting themselves the majority they can rule the situation unless. C. decides to stay with them at a constant distance. Then so long as they stay together and C stays the same distance from them they can't move. Because they can only move in relation to C the only thing they can do to demonstrate movement is to break it up. If C. decides to stay here at this constant distance from them both you see. The only way they can change the situation is to break up this and for B. to move out here. And notice this, that in this situation the three of them can only move within a within a plane, within a surface, because wherever there are three points they will always lie on a surface. Just as where there are only two points they will always lie on a straight line. So here in the first place we had a one dimensional world with two balls we now have a two dimensional world with three balls. You see that is the difficulty here. All right now look here, wherever you have three points in space supposing we're looking now on the flat surface of the black ball but in the volume here I have two fists here. And to add to this we will use the base of the vase. Now do you see that however I move my fists, I can always have the base of the vase, the bulb here and each fist in one flat plane. In other words, supposing now I use you see here they're in a plane there's a triangle a flat triangle which joins all these three points if I move this one I've simply turned the triangle. If I move it this way, I've turned the triangle again. They're always in a plane. Yes but that but even with that you see you can see the three.

Now these fellows say look at we can decide. Where we are. In relation to each other this really this majority thing doesn't give us the real truth it's only popular opinion. And furthermore since we're only thinking in so.

Offices our judgment is rather superficial. What we need and is thinking in-depth. Somebody profound, somebody who can stand aside from the situation and look at it objectively and tell us what we're really doing. So we now invent a fourth ball, D. D for depth. And immediately you'll find that D. can move into a third dimension. And stand underneath A, B. and C.. Because once I have the three points fixed I can take a fourth and move it out of the plane into a third dimension to see that and from this point of reference in the third dimension. See all these all these three on the surface but this lies underneath them and looks up at them. Each. And this is the object of observer who will now tell us how these three are moving. And so you've got now your third dimension. The dimension of depth. Thickness, which gives us substance. All this was hither to rather abstract.

But problems keep cropping up. Because three dimensions aren't enough. This fellow D. can tell us how these three are moving, A.B. and C., but it can't tell us when they're moving. Do you see? The rate of motion is going to be quite as important as the how or shall I say the where of their movement. When do they do it? And so we're going to get a fourth dimension into the picture which is not however a fourth a fifth ball but a scale in. A way of marking off any motion as from here to here, like this. You see? And if we've got this way of saying how much they move in such and such a time, we have a better way still of describing what they're doing than from this point here. Alone. But you see once you've done that, that you can take step after step after step after step, dimension after dimension after dimension after dimension, and there is no end to it. You will never really finally be able to pin down what all these people are doing in reference to each other. You can only do it going back to the three situation, where we haven't even got D. yet. We constitute a majority, and therefore what we say goes. But we always know that that is fallible.

Now let's look at it in this way. All of us here have two eyes, two ears, one nose, one mouth and approximately the same sense organs all round. And therefore because we have these organs the same we all more or less agree as to what sort of a world we're in. Because we are in the majority about this. But there are some people who perceive the world differently from us. And the great problem that we have to decide is do they have diseased sense organs or do they have extraordinary sense organs. Are their organs

worse than ours or are they on the way to an improvement. We don't like to have to face this question. Because wherever somebody perceives the world in a different way from us, we feel threatened. We may not be right. You remember in Kipling story in the second jungle book called *Cars Hunting* the monkeys tribe, the band a log used to get together and every now and then they would all shout in unison "We all say so, so it must be true."

And so every great majority which has formed a consensus a set of conventions commonly held about the nature of the universe feels terribly threatened by somebody who suggests that it might be different. Is this person a genius or a madman? And we try to find out ways of testing it and we say by the fruits of his acts we will know whether he is a genius or a madman. Because if his new way of perceiving things of seeing things destroys the kind of order which we agree is the right order, then he's a madman. But if his way of seeing things in the long run agrees with the kind of order which we think is order, then we'll say he's a genius. You can't win against this. But there is this to be said. The crazy man has perceptions of a world which he gets lost in, and he can't relate to the world of the majority of the ordinary people. He can't talk the language. He's got lost. Whereas the genius who has a new kind of contradictions can always keep in touch with ordinary everyday people and explain or try to explain very clearly his point of view in their language so he is as it were a bilingual person a crazy man is simply a monolingual person. He can only talk one language is own language and if that doesn't happen to be your language in my language, then he's crazy. But the person you see I think we can decide this goes beyond craziness into something quite else becomes bilingual. He can talk the language of convention of ordinary everyday society and the language of the world seen. Beyond that or transcending that.

So this is what bothers us when we are confronted with new concepts and with revolutionary ideas of the nature of the world. We wonder whether the whole structure of sanity is being threatened or not. Whether this is a crazy man uttering ideas, or whether it is some kind of a new evolution in the structure of thought. Even perhaps in the structure of the nervous system. So the crazy idea which I wish to commend to you, which I will try to put into conventional language, assuming that all of you understand

conventional language, is that of the reality of space. Let's go back to our problem here where we have three balls moving in relation to each other. And look at it again from still another point of view. Let's suppose they all seem to go outwards from each other in this direction. Uniformly. We can consider two arguments about this, the balls are all on their own or moving away from each other uniformly. Of course it must be that way. After all it's common sense the balls are the things that are solid there what's real and things between. Only things that exist as a solid can do anything. But then there's another school of thought altogether say those things can't move! They're just balls, they're just solid things they have no vitality. And furthermore there are three separate ones they have no common mind how could they possibly arrange to move away from each other a uniform speed the thing that moves is the space between them. After all we say the distance increases and that's using the verb increases transitively or rather I mean it's a verb that is being used to indicate an action and it's the distance that does the action apparently when you say the distance increases you use the the noun distance in the same way as you say the man walks. So the this school of thought says So you see what is really moving is the space.

So you get the idea in astronomy because all the nebula in the galaxies are apparently moving away from each other uniformly. This is put in the form of saying that it is space that is expanding. And these things float in space. Then it's terribly disconcerting because when expect people wanted to feel see that space was something. And so we had ideas about the ether. And light would have to be transmitted through an ether in the same way that sound waves are transmitted through air. You can't, according to common sense, have the transmission of something through emptiness. There must be something in the emptiness to support this transmission and so we invented ether but as you will all know the Michelson-Morley experiment showed that there is no ether. That you have to think about the propagation of light and about the properties of space. Not in analogy with some fluid or liquid or gas which lies between all these things. You see we keep wanting to invent ghosts. To invent a solid. We can't accept the idea of space. Now air is a solid, water is a solid, ether is a pseudo-solid. It's something we had to invent to fill in this gap and say, 'No, although these solids are real good material solids there must if they are to be related to each other be some kind of a tenuous filmy gaseous sun and the joins all these things together.'

We've got to have that thing we got to have the strings attached to see. We couldn't stand the idea that space. Just made there's nothing but space you know was important.

So then you've got these two theories then, that the solids are moving. Or that the space between them is moving. And both sides of got good arguments I've tried to present them. But what both sides overlook is that they are each one one sided. That what is moving is neither the solid nor the space, but the solid space. There's a Zen story. Two monks were arguing about a flag that was flapping in the wind. And one of them said the wind is moving the flag and the other said the flag is moving the wind. And the six patriarch Wei-Nung when he was asked about this and he said you're both wrong, the mind is moving. And so what you might say here is the point of a. This is when you get down to this question which one is moving the mind is moving, because what is meant here by the word mind, is the necessary into dependence of the concept space and the concept solid. That is, of the of the nature of mind. That you can't have the one without the other and so, the mind used as a word to signify the into dependence of these two poles one of which is solid and the other of which is space. This moves.

And so, mind in this sense, is the creator of the world. I'm not saying that you imagine the world, each one of you out of your own private whimsy, imagines the kind of world that there is. What I'm saying is this. That the construction of the nervous system selects a world. You see your senses are selected. There are certain vibrations which they receive, and others that they don't. Then on top of your senses comes your noticing what your senses tell, because you don't notice all of that again is another act of selection and then on top of that is how you interpret what you notice. What patterns of sense you fit it into, what patterns of reason, or patterns of thought you call good judgement. And that still another level of selection so constantly the world. That and we are aware of is a selection of our mind.

But the way we have in our culture selected has always left out space. And rejected that, rejected the interval between things as something relatively insignificant. But now, let me try and show you that it is the interval that matters immensely. Let us take another kind of space altogether. Not the space of distance between objects, nor even the space of distance in time

between events, but let's take musical space. The difference between in the major scale of C.. the notes C. and G.. forming the common chord of the scale of C. Now, you have intervals between these tones. The notes C. E. and G. are tones. But the intervals between them are something else. Da-da-da. And you can hear in that three intervals the basis of the melody. Are la la la la La lalalala. You see it begins to make a tune. But if you hear only the tones and you don't hear the intervals, you don't hear a melody. There are people who are what we call tone-deaf. And they only hear noise, they don't hear melody because they don't hear intervals.

So here's the fascinating thing, that when you hear a melody, and sound begins to make sense to you, what you are actually hearing to constitute melody is the space or interval between the tones. It's the same as this. You recognize that. The Big Dipper. All right the why do we recognize it. Because we recognize the relative spaces between these points. If it was just da da da da, we could arrange them this way. Whatever, you know. But it is how they are patterned. And there are no strings joining these points in the sky, in just the same way as there's no would join between, but nevertheless you hear that pattern. And that's what makes sense.

So, in the same way, if we increased enormously the magnification of a human hand, we would find a huge multitude or flock of molecules. And we look can look and look and look in an in an inn and we find there's enormous spaces with no strings joining. And yet when I did this suddenly all those molecules would move together. Why? See, what has moved is not only the molecules, but the space. There is like birds in flight moved together in the same way. They don't seem to need a leader, who gives a signal and says follow me and do as I show you. They seem to have one mind so that they all move together. All right. Now, let's translate this into another thing altogether a problem which is quite fundamental to far eastern culture. And that is the question of birth and death. In popular thought, in India, and to a slightly lesser extent but nonetheless powerful extent China and Japan, people tend somehow to believe that they have many lives. There is a prevalent philosophy of reincarnation, although it's interpreted in many many different ways. According to some theories there is in each one of us a soul, which is a permanent and enduring principle. And that incarnates itself in body after body after body, gradually progressing or

regressing and we hope eventually progressing to higher and higher levels of spiritual Evolution. But in Buddhist philosophy, the existence of any such soul is denied. There is no permanent ego or permanent self which moves from life to life, and yet, the funny thing is that most Buddhists for all that they don't believe in any transmigrating soul, they still believe in transmigration. And they talk about the karma. Which you have been working out from your many past lives and the column by which you are now creating for your lives to come.

And yet, how can they possibly say this, because they don't believe in any soul which moves from one life to another, any entity that is as it were, the bearer of this Karma. So, to see how there might be a philosophy of transmigration, you've got to realize the importance of space. The importance of links or relationships between points that don't have any strings tying them together. So let's imagine first of all a river. Here is one bank and here is the other bank. And in this river lie many rocks. See.

Now, I am looking at this river from above because I'm standing on a high cliff. But I see that down below a man, and he is wanting to cross the river, and he looks at it from the immediate point of view. And he does this and he does this, he DOES THIS, THIS THIS THIS THIS THIS THIS THIS. Let's trace out that course he did THIS THIS THIS THIS THIS THIS THIS. See. He found it all the quality the whether he could connect these pebble these rocks depended on how far his legs could stretch. He took that way over that was the way he saw. But I from my own vantage point can see that there were other ways he could have gone. He could have gone from here to here here here here here see so he could have had as an alternative this line. Three and you can pick out other possible ways which he could have gone. And so, when you look at the sky at night, you can think of the stars in certain groups of constellations. But that's not the only way you could figure them. You could figure the stars and other groups and they would be just a satisfactory, provided we all agreed about them and how to figure them.

Now that I want you to imagine that each one of these pebbles in the stream represents the biography of a human individual. This bank of the stream represents the year one thousand nine hundred sixty five. And that this bank

of the stream represents the year fourteen hundred sixty five. And that between these times there have been human lives lived between certain spans of years. You see what I mean? All those stones constitute biographies. And now we have a historian looking at those biographies line between these two points in time and saying By Jove. It really does seem doesn't it that where this life left off. This one seemed to begin. And there really does seem to be a logical connection between these lives. And there also seems to be a logical connection between these. Although when it gets to this point, to this one here, it seems equally logical that this one go that way and this one go that way. Or it seems really here that it could have gone that way just as well as it went that way. You see what we're doing here we're looking at human lives. And we're making the same kind of sense out of their continuity as we make in the patterns of the stars. By figuring out constellations. And that is the doctrine of reincarnation. Now you say, is that just projection? Is that just a way we have of figuring things out like when you look in a Rorschach blot, you make your own sense of it and because you project. Yourself into it that's what's so important to the psychologist who interprets what you are, because that was your projection and to this blot, and as it were the blood itself had nothing to do with it the.

But actually, the whole world is a Rorschach blot. Only we have forced each other to agree about how to interpret it. Because you see when some abstract figure is drawn. See, what is it? What have I drawn? What is it? What does that look like? Anybody, no-nobody wants to be forceful about this right if you're not going to be for it. You saw flames as I was going to say the same thing. Now I see you and I agree, and we're going to lead this group we're going to tell him it's all flames, they say and so they're going to say yeah I see that after all it's strange isn't it they are. So basically in this universe, where little brains and nerves and to kitty kitty kitty things come into being inside their little little pods called skulls. Some of them say I around here this is the way it is. And it doesn't make any difference you see whether they are a succeed or whether they don't as a result of saying this because if as a result of saying it flames, they survive longer. Then they say that was success because we survived longer. If on the other hand they didn't survive longer they survive shorter they would say that success because the important thing is to survive a short time sweetly rather than a long time not so sweetly where you would want to go off with a flash or

you want to draw your life out of the steady glow. See, it's any way you want to interpret it. So everything's a Rorschach blot. In everyday life, only we've all agreed about it and so it doesn't seem like a Rorschach inkblot. Because in strongly human beings people like Jesus Christ, Mohammed and the Buddha and the man who made up the laws of Manu, and Moses, and all these cats have throughout the centuries impressed other human beings that this is the way it is, and the Lord God says so. So if they can invoke that authority, then this is the way it is, here we are.

Now what we do in other words we convince ourselves who we are, that we are the same person sitting here now as came into this room fifteen minutes ago. All this is interpreting a Rorschach blot in exactly the same way as one sees a continuity between one set or other of these though in the river of these biographies lying between the centuries. And you can't say you see, that that is something merely imaginary or merely arbitrary which you project onto the external world and that it's your own imagination and nothing more than that because your own imagination is something in the external world. In other words, you couldn't have that kind of imagination, or the kind of nervous system that you had unless you lived in this particular kind of universe. Your being an imaginative being, projecting all sorts of ideas onto the external world is in its own turn something that is a function of the external world, something the external world is doing.

So patterning, finding connections between points, is the whole operation of life. You can call it, there are two principles that correspond to space and two solid. One is called continuity, and the other discontinuity. In one place we see a connection. In the other place, we don't see a connection. I get your point. I see the connection between one thing you said and another thing you said of between something I thought and something you thought. I don't see your point. I don't see any connection. So if I want you to see one I have to be very ingenious to get you to see it. And then you recognise it. In other words, I can get you to see these connections, but it's going to be difficult for me to persuade you about this connection here, simply because my fingers won't stretch that far.

Now in this you can see that in this theory of reincarnation, there could be for any one individual life several individual lives at the next step. For

example, you see, by stretching of the, of the fingers, this fellow here could go here, here, and here for the next time. So we could say he has this individual in his next life incarnates as three individuals. In the next step he can go here. This one can go here or here. This one can go here or here or here. This one could become three. Sometimes there are situations in which three of them could only become one. Because there's only one that is consistent in the pattern, by whatever rules you are making up the pattern of connection.

'Let me ask you a question. Are you suggesting or saying that this pattern is in the eye of the beholder. This pattern is in the eye of the beholder but also that the eye of the beholder is in the one. And the way the eye of the beholder seems has something to do with the structure of the world which knows itself through the eye of the beholder. The identity of it is in the identity of a pattern, which you can see as linking them. All right, let me put it exactly in this way. Let us consider the University of California. The University of California has endured for many years and will endure darkness in many many years to come. And in the course of its endurance the all the students and all the members of the faculty and staff and indeed all the buildings will change completely and yet the University of California will go on. What is it that goes on? A pattern. Which is identifiable as a university and in particular actually University of California. In that geographical spot that's one of the rules of identification. Actually the the University of California one hundred hour seven campuses, and its geographical location is somewhat vague. And as compared say with Harvard. Nevertheless the thing is recognizable, because the pattern. Well I'm talking in this case I mean that's posing. Yes In other words we're going to say. There is a pattern of personality and character behavior between this one and this one and this one and this one and this one all this one and this one which makes them look as if they were continuations of each other. Yes right of course of course in other words there is a pattern that links all of us, because we wouldn't be here unless there was. Our being here together indicates certain common mindedness of a certain degree a pattern. We are in a sense therefore sitting around here all reincarnations of each other. [And the same thing is true for all human beings' Yes, but you can see patterns in other words. When you look at the sparks in the sort against the back of a fire and they're all coming and going

coming and going coming and going and you can see all sorts of patterns in the sparks and all of them are right there all the legitimate. They depend of course on your vision but you in turn your brain your neurons is part of the same world in which those sparks a coming and going on the back of the fireplace.

So, the fundamental thing then, that one needs to see though, is that what I've been talking about as the links here. There are no links, except spatial relationships, just as between the stars in the Big Dipper and as between the tones in music, there is a spatial or interval relationship between them. And this is what makes the sense.

The Way of Tea

Every religion in the world has a drink appropriate to it. Christianity and Judaism are wine. Islam is coffee. Hinduism, milk or maybe pan. Buddhism is tea, appropriately enough, because Buddhism is the way of awakening. The word Buddha means the awakened one, and tea keeps you awake. Especially the kind of tea that is drunk and tea ceremony where you don't drink steeped tea, but powdered tea very finely powdered which is whipped in with the water so you drink the actual tea. And there's a kind of it called Koi cha, which is drunk very sick almost like spinach soup, and that really keeps you awake. I recommended instead of methedrine.

The legend is of course that Bodhidharma who is supposed to have brought the zen type of Buddhism from India to China, somewhere after four hundred fifty AD perhaps, if he would really was a historical character. That one night he was meditating, and fell asleep. And in a great fury when he woke he cut off his eyelids, and threw them to the ground and they sprang up as the first tea plant. Or as you know the leaf of the tea is rather shaped like an eyelid. And in the course of time it became customary for Zen monks to drink tea to keep themselves awake during long spells of meditation. And as the behavior in a Zen monastery is rather ritualistic and formal, the way they drank tea became in due course ceremonious. And then, much later, the drinking of tea in this way became a ceremony also for many people. And it was modeled in this way by the great Sen No Rikyu. And from him descend at least five different schools. Of the tea ceremony

through various branches of his family. Some of them very formal and very difficult such as the common best known case cool which is the dominant school in Japan today, and which is the kind of tea ceremony that you ordinarily see when somebody puts on a performance. I find it excessively affected, very uncomfortable, and is mostly practiced by young ladies as a sort of accomplishment which they learn to be a lady. But it's painful, it's very very stiff and formal. On the other end is the Kankuan school. Which is very it's very elegant but much less formal much easier but it's practiced with enormous skill. And then there is a kind of peace out of many still so by Zen monks and literary men who are just entertaining their friends artists and so on, which is very informal indeed. And that's the kind I should be showing. Now the interesting thing is that this ceremony has no obviously religious character. It is quite secular It is just drinking tea and having pleasant conversation in surroundings of peacefulness and simplicity. And this derives from an essential aspect of Zen and I want you to try and understand the blending of ritual with simplicity. First of all there was a... Huston Smith, you know who's a professor of philosophy at MIT was traveling in Japan and a Zen monk was showing him around and he noticed that every time they passed the image of a Buddha or Bodhisattva in the temple it was in mouth stopped involved it and Huston Smith said I can't understand why you go through this ritual of bowing to things I thought he was then people were above all rituals you know I just assumed spit at it. And the master said, 'You spit, I bows.'

So, there is this question, why ritual, and why does Zen have a peculiar partial. For expressing itself in a secular way. Now ritual to begin with and something that makes Americans uncomfortable. I remember as a minister at one time whenever I went out to dinner they asked me to say grace. And after saying grace through the ghastly silence. And I had to stop the conversation flowing easily again. Because the something I don't know I can't find a proper adjective for an attitude which Protestants have to ritual. They don't have much but they have some but when they do it they look down their noses and feel that somehow an element has entered into things of a Godhead who is wagging the finger at you and saying you should at this moment think seriously about whether you've been good or not. And so, everybody is then reminded on comfortably by some words addressed to the good lord, that they really are all too human after all and somehow got

makes everybody on comfortable that's why they're getting rid of the mounting the debt. Because that kind of God would never live even except in people's imaginations.

But this idea you see of being watched all the time by a loving but severely judging father you know how it is when you were children in school and you were writing a job desk and the teacher however much you respected the teacher wandered around and looked over your shoulder while you were working it puts you off completely. If you want to show the finished product and leave me alone while I get it together. As a saying never show anything unfinished to children or fools. So, in the same way this God makes everybody feel uncomfortable and therefore any ritual in which the lord is invoked it makes people feel uncomfortable and it passes on from that to many Americans are quite uncomfortable as a formal dinner. You dress up in black tie and tuxedo and everything is in order wine is properly handled and a lot sort of thing very beautiful. People feel that somehow it's affected and Americans like to give the impression of be folksy, sincere, down to earth, no nonsense. And so frivolous are regarded as an essential but we have thereby impoverished our life enormously. And also, we don't handle things skillfully as a result we a clumsy. Because actually, ritual is a mood that comes into any action performed with complete awareness. I don't mean that you step up what you're doing and concentrate on it with. A ritual to a thing helps you to do it in an orderly way. Just as a practical matter and also it is a way of turning every day action into meditation and Zen is particularly keen on this that meditation is not just sitting for so long and concentrating on a koan on nothing.

Zen is everyday life, and the enlightened Zen person doesn't make any distinction between the Nirvana world of final reality on the songs our world of everyday life. Therefore to understand this, you must first realize that it is a basic principle of them, that you are it. That this whatever it is to which nobody gives a name because well it's been called suchness, it's been called emptiness it's been called the Tao, the way of nature but its fundamental flaws then. That you do not think about it. That is to say you don't have any concept of it because that which we really are and which all things are, you might say the fundamental energy of the universe is so basic. That if you have an idea of it it must be wrong. Just in the same way

that you cannot bite your own teeth that you cannot look into your own eyes without using a mirror. That you cannot see the color of the inside of your head. So, that which is absolutely fundamental which is you, must not be conceptualized, and you don't need to get it. You don't need to hang on to it you don't need to cling to it Rock of Ages, cleft for me, or anything like that. Because it's what you are and it's what there is and all that there is and that's you and it is subject to all rather it appears as. Something and nothing. As solid in space, as light and darkness, as life and death. The Yang a positive force and the yin or negative force, are it's outward manifestation. And as you well know you can't have your own without you know you and without again. You can't have life without death or death about life or solid without space or space without solid. They are polarized, like the north and the south pole of a magnet.

And so, just because they go together, however different they may look nonetheless they are inseparable and this indicates that there is something mysterious between them a sort of conspiracy. But nobody can say what it is because all thinking is either black or white or grey which is that the muddle. What it is in common between black and white between inside and outside between up and down. That can never be stated. Because everything we can talk about we talk about it by putting it in a box. Called classification. We sort our experiences into pigeon holed animal, vegetable, mineral. You see. Is you is or is you ain't. And watch it is that cannot be sorted into any pigeonhole because it is what is in common between the inside of the box and the outside and. We have no way of conceiving, and therefore for this reason, Zen does not take any image any idea or any doctrine with essential seriousness. It has nothing to say. Only to show, and what it shows you is what you see all the time and you can't miss. Because there it is and here it is. I am it and you are it and he is it and she is it and it is and this is it and that is that. And that's the poem by James Brown.

Now, but you see, in the ordinary way people don't feel any confidence. Because we are beguiled by the multiplicity of things that we see around us by this is distinct from that by life as distinct from death by life as distinct from darkness, and we think that the universe is an energy and energy is a thing that that to get time to wear out run out like an electric battery runs out of the gas runs out of your car, and therefore we always feel that the

universe is very precarious and that the positive side may easily lose and fizzle out and only the negative side will remain and that blackness and nonbeing may swallow everything up. What are the Chinese at the perfect fantastic notion. Because the moment you get to the deepest dark, you generate the seed of the brightest light. That's why in the union the circle with the through the middle you see the black cop of the white. And in the boat of the circle like the eye of a fish that is a dot of the opposite color that is the seed the seed of being within nonbeing and the seed of nonbeing within being. Lao Tzu says to be and not to be arise mutually. It isn't that there is fast nothing and then something or it might come in that order but that's like thing that the the egg come before them and. In a way it does and you can say that the hand is one a way of becoming another egg.

But it doesn't make any difference where you begin it's always the same thing because life is a pulsating process the tiniest pulsations of the propagation of light. Through deep sounds where you can hear the policy. Too much longer policy actions day and night. And finally the coming and going if you. So, one has beguiled, because you see, what is common to everything that you see. Well of course, we say sight is common to everything that we see but we don't see the color of our eyes, I mean of the lens. Because we say that's transparent if your lens was rose colored everything would look rosy, until you got used to it. And then it would be just ordinary except that you wouldn't be able to differentiate reds very clearly. If our eye lens has a color we don't know what it is. But it's basic to everything what is the sound of the ear. It's and the. Same way with the color of your head it's empty doesn't black it isn't white just empty and so too when you hear music on the radio or talk on the radio, that is all a vibration of the diaphragm. Every kind of sound visit that the diaphragm vibrating. But the diaphragm's own sound isn't heard. And nobody announces that the sounds that you are hearing the vibrations of the dial.

So you see, what is basic absolutely basic to all experience to all our senses to everything. Cannot be named, cannot be classified, and therefore because of that you forget about it you lose it you think that the reality is all the multiplicity of things. But the substrata, called the Ground of Being which is these decontaminated word for God. Seems not to be there at all. And so we've forgotten that that is you. And the object of Zen is to rediscover that

about to rediscover it in such a way that you do not grasp it in terms of some formula in terms of some ideas or even in terms of some particular practice. Because this thing has no terms. And therefore, you have to find it by ceasing to grasp yourself or your life in any way. By totally letting go. And of course that takes a lot of nerve. And the discipline of Zen has various functions but one of them is to convince you by hard work that that is no way whatsoever of getting hold of this thing. I remember Krishnamurti saying the same thing when I was having a talk with him once he was sitting on a couch and he had a couple of cushions. And he took one question and put it over here and said Now this is the real meditation. This is Mom he said it comes in wave after wave after wave it is. Marvelous beyond belief. Now this he said this is a sort of preliminary meditation and this he said is to understand beyond any shadow of doubt that that is nothing nothing nothing nothing you can do about it. But you see, until you know you can't, you always have a sneaking suspicion that you can.

So then, when you have discovered through hard work, that nothing can be done. Then you let go. And you discover it. Only as the moment con and then textbook says you are like a dumb man who had a marvelous dream. Everybody who's had a marvelous dream wants to explain and. Tell the story but you're dumb. To say your mouth isn't big enough. It would have to be so big that your head would disappear when you open. So then when this is understood, two things happen. One, all the energy that here the two expended on holding onto yourself and being anxious becomes available to something else. And you feel the zoom, this huge influx of energy. And it's available, for just living. Second thing is there's a curious kind of interior quietness goes along with this energy. A sense that there is nowhere to go, where is your rush. It's here. In other words that this room in which you're sitting now, and this particular time of day in New York City in November one hundred sixty six, is what there is. Because this, the basic reality, is not in time, it always is now. You can't measure it with a clock. Any more than you can catch space and this is. It eludes all measurement. But it is just now, and here it is you see. So we are here. And the thing is actually this is no different from us I don't want you to imagine some sort of formalism gloop that underlies all particularity. The particularity is not different from this. Nor is it quite the same. Sameness and difference don't apply, to this which is beyond all categories but in a very real sense. This here, now, is it.

And so please. Here you are see there's nowhere else to go nothing else to attain. Or anything you have it, it's here. So enjoy it.

And then you see, when that happens to you although you have an enormous energy which is available for anything you want to do, nevertheless you just don't feel compelled to get up and fidget with it you can also just live. And then you discover, that your mind stops scheming. To seek in the ordinary way when we just let our faults run around as we ordinarily do we are constantly scheming. How to get this thing arranged, how to control that. That you shouldn't be sitting here now because of something more important to you to do at least be improving your mind by reading a good book. And so, this constant scheming goes on and because that is in the head every a long long chattering, you only see the world in a very limited way. Because when you think your thought is always selected. And it picks up this is the thing that is the thing to notice and the other thing is the thing to notice and this is something important to do and that is a more important event than other events of C. and as a result you only notice what you think about. And so you are hardly noticing at all. In fact, you are there's a certain noticing you see always mean selecting. Selecting something as being important to look at all think about. But when you stop doing that you discover that life is much richer than you thought it was. You see, we, when that when tailor went to see the pope. They often what is it like always it is about a size forty. Because he sees from the point of view of his interest and every one of us has a certain kind of interest in terms of we see and select what we think is important to look at. But the world as an infinity. There are innumerable ways of looking at it and then there is no way at all of them. And that is of course the maximum vision.

So when you let your thoughts go. You do this by allowing them to think of anything they like. And so when. Thought is not being pushed in a certain direction it eventually subsides. And you find yourself sensing as hearing, seeing, but you don't think about it you just see you let your eyes see look at whatever they want to look at you let your ears hear whatever they want to hear. And you let your sense of touch feel whatever it wants to feel you you let go of it all. And then in the quietude that follows from this you make some very surprising discoveries and these discoveries are the basis of the tea ceremony. Namely, that the most ordinary things are magical. The

great masters of the tea ceremony are kind of the taste setters in the whole of Japanese culture because it is at their bidding that architects design rooms in a certain way. That part of those make certain kinds of pottery that. Bamboo crops and make certain kinds of labels and do. That painters do certain kinds of painting and couldn't do that gardeners make just such a garden. And so on so they are conductors of an orchestra. But what it was all based upon the original was that they discovered the marvelous quality of the everyday utensils used by peasants. Some of the most valuable Tea bowls in the world which now would sell for thousands of dollars in Japan where originally nothing about the cheapest kind of rice bowls used by Korean peasants. But there is a tradition of Korean pottery, so that even the humblest article carries with it the genius of the great Korean artist, and this was originally derived from the Chinese Potters of the Sun Dynasty. And they saw in that simplest most ordinary rice bowl. Which was not to see anything like possibly. But definitely a ceramic, with a rough glaze. Because these things were just turned up by the thousands. But every so often in those thousands, one as it were, escaped the infected. Wasn't quite all of them. And it was a work of genius, but unintentional genius. Nobody had thought that he was making a marvelous bowl at the time. But the tea steps which sees eye was free from conception. Could suddenly see that boat.

So also they found that nothing in the world could be more pleasant than listening to boiling water. The sound of the rain on the roof. The thing I learnt when I went to Japan was still be buys and mouth them the most important thing I learned in Japan, was that the sound of the rain needs no translation. We were discussing translating Zen classics into English, and he said Don't bother, the sound of the rain needs no translation. So listening to that, listening to water boiling smelling charcoal being made. And finally, making a fire. Drinking tea. Very ordinary secular everyday pursuits. They discovered that all this was really marvelous. And therefore, they went against elaborate art. Very ornate lacquer well very on a cost and very ornate clothing. And they induced in that spirit into Japanese art which today we call Shibuy. And she buoy is Zen taste and it said that the taste of then and the taste of the same it's a pun in Chinese tea is cha, Zen is Chan.

So then it is from this basis of quietness that derives pleasure are not only in the most ordinary things. I mean you have this everybody loves the smell of coffee on. The smell of leaves burning on an autumn day and the hazy blue smoke that comes from. My father takes intense pleasure in untangling string, because he is a real contemplative. And things like that can become for a person who is awake as rich as anything you could buy with a million dollars. Although it is said that when you are awakened, and you are competent to spend ten thousand gold coins a day. Now, also, going back to ritual out of the state of appreciation of the most ordinary things the ritualistic attitude in using them comes. Why? Because in doing, anything you are not in a hurry. After all, it's all here, and the preparation of a feast should be as enjoyable as the Feast itself. And you can tell when you taste people's food whether they enjoyed preparing it or not. Most food in our world tastes as if it had been washed in detergents and boiled to be disinfected, and served out of a sense of duty because it's good for you. Because you see, we don't have any real relationship to the material world, to the present. We're always living for something else for some abstract good. When you say something is good for you what is this good. Well, you'll survive you're see, you'll go on living if you eat food that's good for you but there's no point in going on living just in order to eat more unpleasant food good for you. And you know, people have kitchens that look like bathrooms, because it's a place where you do something that sort of necessary but you don't want it out in front of me and do it and they have no color and. They're just places to do something utilitarian, and when we do something utilitarian, boy does it look at. You see the kitchen should be the center of the home. And no food tastes as good as food that has been prepared under your nose. Watch it sizzling thing.

So we have to return to a thorough appreciation of this, because otherwise we would just be eating for the future. So, the great cook always. Loves the raw materials. Like what could be more beautiful than an egg or a potato. Or a slab of beef, or a beautiful long silver fish. And you arrange these things on a broad in your kitchen and before cooking, you should always lay things out and enjoy that appearance sitting. And then, cooking is the art of loving a thing into super that edibility. And you have to hover over it you mustn't switch it on look at your watch and go away and read the newspaper and when it's done and you have to be there, and this therefore

induces the ritualistic element because it's important too to have all the things you're going to need laid out or hung in some orderly way so that you can get them exactly when you want it and enjoy picking the spoon up in the room or the knife the beautiful feel of slicing something and all that is a sort of a ritualistic thing and all that attitude is in every moment of the preparation of it is as important as the serving of it. And in serving of it, you're not just passing someone up top you know here I have this as if the cop were my own part and vessel in which the thing was good for you is that. It is that the very act of having a pessimistic as it is. We don't have to say it that would be too bad to say it or even think of it but this is the play of the cosmic energy. This thing's going wammo, and there it is right there.

So don't, it is saying don't fritter away the moment. Every moment. The present moment is sacred. And live it. There's nothing else to do it was a matter of fact. You can't escape that. About so many people vote their lives like voting food. And then they wonder where it's all gone. You can you know slow down time everybody feels in a rush of time time is a roaring Robinson Jeffer says time goes faster in California than anywhere else in America. Because that's everybody's been following the sun and then they got stopped by the Pacific Ocean. In the summer and down and are still going west as far as possible to lengthen the day, to lengthen life to hang on to this in the hope that somewhere along the line someday somehow that great good luck was good to you we're looking for is going to turn up. Never does. Because you can't seek it tomorrow. You can only find it now. So then, the ritualistic attitude is simply a delight in material things. In handling them, borne of inner serenity, which comes from knowing. Only. We can't say what it is that we know but just that you're it. And it's very funny people say they don't know but I can look into your eyes, and I can see the mother goddess of the universe looking right at me. People blinking their eyes and think what me? I don't know anything, but those eyes wowie, look down into those.

Now I was explaining for you this morning the basic connection between Zen Buddhism and the secular everyday world in which there is no obstruction, no barrier, between the sacred and the secular. The transcendent, and the everyday worldly. If you see, you relate to the transcendent. To God, or whatever as something that could be an object of knowledge, then you put God down among things. To relate to God as it

were to another person, is to ungod God. And make the absolute one thing among others. On the other hand, when you leave the transcendent transcendent, you can't think about it at all, and therefore you could say how could I relate to it. Often Christians complain that you can't love an undifferentiated aesthetic continuum. Or necessary being of that circle whose center is everywhere and whose circumference is no where.

But, when you look for the ultimate reality as an object of love, something to love, you must find it, not as one thing among many, but as all things. And of course that is the root of compassion as an absolutely cardinal energy of Buddhism. But the fact remains that Buddhists do not relate to the absolute as something apart from the ordinary finite world. Although there is no way of thinking about it, and no way of speaking of it as it is in itself nevertheless you mustn't forget. That it is you, the real you. You are not some people who came into this world from somewhere else altogether. And it's very silly when we identify ourselves with our particular small separate bodies or something inside them, and then say to our parents you got me into this mess. It was your fault that I was born. And always we are blaming our condition on someone or something else, but that's only because we have made a very arbitrary definition of who we are. You were actually the evil gleam in your father's eye when he went after your mother. That is just as much you as anything that sprung from it, because it's all a continuous flow of life. Like the leap of a wave true when it hits the rock it bursts into a thousand droplets. But every droplet is the wave bursting, and so every human being is the it, the cosmic energy playing, and in this sense, just as you do really, although we don't acknowledge it in our social conventions you do really beat your heart you don't know how you'll beat it. Nor do you know how you open and close your hand and yet you say I can I know how to open and close my hand and pick up something. But you don't really know these two don't know if you really know but you don't know in words how it's done you couldn't explain it in the coding read is a few words are a form of coding experience and we can't possibly put everything in words because there wouldn't be enough time. For a million years you couldn't put everything in words because you'd have to code it all it would be like trying to drink the Pacific Ocean with a fork.

But still you see, if you do beat your heart, and if you do indeed grow your hair. Then you will find out that if that is true it is also true that you are blowing the wind and shining the sun and twinkling the stars in just exactly the same sense that you are beating your heart. [Because] it's all you, it's all the action of that energy which is you. So we need to overcome the sense of irresponsibility of being in a world which isn't our place which isn't our home, and we're not responsible for it, and we had a bunch of ancestors who were fools and got us into this mess. When you were a grandfather. I'm a grandfather, I have five grandchildren, you begin to realize that you're just as stupid as your own grandfather. So but the thing is we do not need to find the highest reality, the ground of our being, as something we can feel or know, as if it were some sort of object, you just be content with the fact that it is like sight, the substratum of everything seen. Like hearing the substratum of everything heard. But deeper than that, it is the substratum of everything that is. But don't differentiate it from everything that is because that puts it in a category this and not that. It's outside all categories. It's both this and that. Here and there. But it's always now.

So, I went on to show you that if this is realized, there is possible a kind of quietness, in which very everyday things become marvelous. For example, such a bamboo ladle as this, very cheap. Costs maybe one hundred yen which is forty cents or less as the three hundred sixty end to a dollar. But this is one of the most beautiful objects ever made. Look at that. It was of course just an ordinary dipping ladle originally, for the kitchen, or for drinking water. Take it in one of those stone bowls that they put. They get a big stone and hollow out the top and then with a bamboo pipe it comes from a mountain spring, and water is always falling into this cut out bowl, slopping over the sides and then drifting out through a bit of gravel so it doesn't get muddy. And you can just have such labels as this and they're usually a little bigger but that's the same principle lying on the well and you scoop it up and take a drink of this gorgeous fresh spring water. But that's all, it's the simplest possible kitchen object. And yet I think, probably the most beautiful thing used in the whole Tea Ceremony. And then, bowls such as these, which are called Raku wear. And you see immediately this is nothing special. Actually looks as if it were made by a child. Was just starting to learn pottery. It's rough, look, even the top isn't smooth it's bumpy all along. It's been made by hand. You know this was made on a

wheel but sometimes they're not, they're just shaped. And the glaze is very, very rough and crude. But this goes back to a fundamental aesthetic principle of the Taoist philosophy which underlies this whole thing it underlies Zen. It written a thing from Lao Tzu and Chuang Tzu, and lived somewhere around four in three hundred B.C.. And very important in their thinking was something they call the uncarved block. And the uncarved block is of course wood in its original state. Before human beings have tried to shape it into anything. And just as today we have learned the beauty of pieces of driftwood which we put around our homes every piece of such driftwood is the uncarved block. And then there was something else that Lao Tzu talked about which was unbleached silk. You know how shun Tung silk is which got a little nobbles in it and it's rather rough. Well that sort of silk a natural color which hasn't been dyed or bleached at all that is sort of this effect you see of this curtain. The spirit of the uncarved block and the unbleached silk enters into a bowl of this kind. And it seems that for that such a bowl is more in accordance with the nature of clay. It really looks like it's made of clay. Than something that is white porcelain almost translucent.

Now, this is this way, because the artists feel that a bowl of this kind is more natural than something elaborate, and here we have to consider a very funny problem, because after all, no distinction is more artificial than that between the artificial in the natural. You might say the distinction between the artificial in the natural is a very artificial distinction. Because surely, a bird's nest is no more no less natural and the Empire State Building. What about a bee's nest, with all those little cells and things in it. And so truly, everything that human beings do is natural. Only we're looking at each other rather closely and critically. I was looking at yesterday, at a wonderful movie, of fish of carp which a friend of mine took in Japan. And when those fish swim they never make a mistake, they're always elegant. And in the same way when the foam breaks on the water it never makes an aesthetic mistake. Beautiful every time, never fails. And there's only been one person in history who ever complained about the arrangement of the stars. And that was a man living in the eighteenth century you know, when they arranged formal gardens and made all the tulips form fours, and they cut all the trees into symmetrical shapes, and they planted everything out with box hedges around the edge in geometrical patterns. And this

particular French scholar complained at the time that the Lord would have manifested His glory far more surely if he had arranged the stars in some sort of orderly fashion to declare in geometrical figures the inner workings of the Divine Mind. But he was some sort of a nut. Because nobody else ever said that there was anything wrong with the arrangement of the stars they're beyond criticism. And we think they're gorgeous, because of the way they are scattered. And it is strange isn't it, how very often scattering produces the most fascinating and beautiful arrangements the random beauty. But, there is some problem about this, because by scattering, you can sometimes also make messes. And a lot of people don't understand the difference between random beauty and mess. And therefore, the art that goes into the tea ceremony is partly accidental. That bowl is partly accidental. But it's also controlled. And so, the trick of this whole art form is to arrange for a controlled accident. And that's the whole thing. When you combine the quality in man which enables him to master things and control them and yet within the context of that discipline you can allow accidents. Then you have the best of both worlds, the world of order and the world of randomness, and skill in life is always in combining these. For example, in games. A game that was perfectly or orderly would be too predictable. And when we know the result of a game, we always cancel the game and start again. If it's clear in chess after a certain stage that one of the people is obviously going to win, then we stop the game and we say well you're the winner and we'll start again. But on the other hand, the game of pure chance is not so interesting, as one in which some skill can be introduced. So throwing dice or roulette, it actually has a certain skill, but the skill is connected with the way you gamble on it, rather than how you spin the wheel. So, we always want somehow, to make this extraordinary combination of control and uncontrol. That is to have a dragon by the tail. Nobody can really control a dragon. And yet, you can do something with it. And it's marvelous.

So, great sages in Chinese iconography are often depicted riding on dragons or more frequently on tigers and sometimes on water buffaloes. A water buffalo too can be a very obstreperous beast. Lao Tzu is frequently shown playing a flute and riding on a water buffalo, because his intensely calm spirit didn't bother the buffalo and when he sat on its back it hardly felt him. So then, this whole approach is based on a subtle combination of order

and randomness, which is exemplified in the Chinese term Li which means originally the markings in jade of the grain in wood, or the fiber in muscle. And we when we see these things, when we see say the markings in marble, or rather patterns of sand, or the outlines of clouds or the structure of mountains and rather warm rocks, we know at once the something marvelous and beautiful about them and our artists do them the honor of painting them. But we cannot pin it down, just what it is, this beauty. And that's the excitement of it. If you could explain, by some geometrical reasoning, the beauty of any painting or any natural object, it wouldn't be beautiful because you could explain it. If you could train in [an] art school, every student to become a genius. Then nobody would be surprised by it any more. Everybody would know just exactly how it was done and what was the right way to do it. And then as a result of that everybody would be bored, and they would look for some artist who could do something quite unexplainable. And it's true, the great artist really can't explain how he does what he does. When he becomes a teacher, he's often a very bad teacher. Because he himself doesn't know.

So there is a Zen poem which says, if you want to know the flowers where the flowers come from, even the god of spring doesn't know. So the great creator always surprises himself, and if this is true in art. How much more true must it be in Zen. If we could get an enlightenment, an awakening and I could tell you exactly how to get it. So I would have an infallible formula. It would become very ordinary. So don't please, think that there is any such way. Anybody who comes to you selling you an infallible system is a fraud. And of course there are crowds of them. You practice these exercises, you do just this what I tell you, so on so forth you will get it. If you could you wouldn't want it. Not that way. So then, in superb beauty, there is an element that cannot be defined in analogy with the fact that the root and ground of the world cannot be defined. If it could be, if I could put it in our own language, if God understood himself completely, totally, through and through was absolutely transparent to his own knowledge and absolutely subject to his own control he would say to himself man get lost. Because it's surprise, that's the essence of life, and that's why the fundamental game of the world is the game of hide and seek. Now you see it but now you don't. And it's that you see, it's the hide and seek that keeps the world

going round. And generates the yang and the yin. Positive and negative. Controlled and uncontrolled order and randomness light and darkness.

So that principle of order plus randomness equals beauty as distinct from mess is basic to all Far Eastern aesthetics. And connected with it there is another principle surrounding everything here which is called yugen. And this is made up of two characters one of which means mysterious and the other means profound, or obscure even. And what is yugen? Well the great playwright Iwanoano gives some definitions of you again but they're all images he doesn't really tell you what it is sometimes it's called a flower growing from the rock. But he says. Yugen is to watch the sun go down behind a hill covered in flowers. It is to rock ships far out in the ocean. Being sailing and concealed by far off islands. Yugen is to watch wild geese seen and lost in the clouds it is to wander on and on in a great forest without thought of return. What is the connection between these images? Well I think you can feel it. Even if you can't put your finger on it. Another poem with much yugen in it is Basho's haiku: This is all there is. The path comes to an end among the parsley.

Now do you remember as children, mysterious paths that you often wondered where they went. And you never explored. And do remember sometimes you got the feeling that when you a path took you to a fence from there appeared to be a dead end, that there was actually some sort of a secret door which you couldn't quite remember how to get through, but there must be something there. And I have seen a Japanese garden and temple all designed and put together so as to give the impression of gates going somewhere or other. Even if it only just went round the building, there was always the impression of the lead up to something beyond beyond beyond. I've seen in a suburb where there are houses for miles nevertheless because of the trees down the street you could look over the ridge of the houses opposite and use all those tree branches sticking up beyond them. And it suggested that beyond that row of house there must be forest and fields and the open. Don't you look out to see. Way way down to the south say there are great clouds floating and your mind is drawn out across horizons. To Heaven only knows what islands, what mysterious places. And it's that feeling of ooh, like that drawn out into the mysterious, you see that is yugen. We don't give it away, we don't take the journey. It

always remains there as a potentiality. As a bottomless mystery. And it's true you see, that that is always there one will never get to the end you will never finish psychoanalysis. You will never get to the bottom of the unconscious. Because always there is another place. And if you follow greedily and think I'm going to grab places and see where things, well, you become a world gobbler. Leave it alone. Some people cannot leave mysteries alone. They have to prove it all and find it all out. And see everything, and touch it. And then they spit on it and say well it wasn't anything after all. So it is very important for example if you have a friend. And you are very much in love with your friend, you must not probe to find out everything. You must always allow another person reservations and secrets, because the moment you think that you know another person through and through, they become a robot in your eyes. You know exactly how they're going to tick under any given circumstances or you think you do. So always leave something alone. Don't explore everything, don't ask all questions. I know I have had students. I had one once on a trip to Japan. And ask ask ask ask ask all the time is it this way, is it that way, is it just so is it like that is it like this. I remember once somebody talking like this to the great artists Sabro Hasegawa. And finally he got mad and he said well some matter with you can't you feel? Because they want to know say the exact method, to do this do that to do the other thing.

Now, naturally, description has its virtues, and saying... I mean there is a point to be able to give concise instructions as to how to put together a bicycle. Fine. But on the other hand, when it comes to these things for which we can't give instructions, because we ourselves don't know how it's done, then you have to get it by feeling. And so, yugen. Don't inquire too closely. Let that path disappear up into the mountains. Heaven only knows where it goes. Maybe to some fabulous Hermitage, maybe to a hidden waterfall. Or maybe, just over the hill and back to the suburbs. But always leave something untouched, something unfinished just like the painter in this, you see, he leaves a lot of it untouched, and he doesn't fill in all the details. So that your imagination can play with it but not the sort of imagination in which you actually in your mind's eye fill in the empty spaces and see something that. This is something more suggestive than that you are on the brink of filling it in but you don't do it. And therefore the quality of yugen prevails.

And then, very important for the atmosphere of tea, is a feeling that the Japanese call Sabi. Sometimes they put it together with the word wabi and say wabi sabi. Sabi is a feeling of solitariness, as distinct from loneliness. A person who is lonely, as I would use the word or as I am now using the word is unhappy about it and one's friends and feels unloved and left out. But of course when you get many many friends and it all becomes rather too exciting then you look for solitude. Solid odd. And so Sabi has the meaning of solitude. But you must understand that the solitude of a hermit and this is [that] one of the great ideals of both Chinese and Japanese poetry is the mountain hermit. You know that famous poem. Looking for the master, it's called. I asked the boy beneath the pines and he answered master's gone alone, herb-gathering somewhere on the Mount cloud hidden whereabouts unknown. And you see, you have this magical evocation in the poem, of the old wise man who has a secret knowledge of herbal medicines, and he's gone up into the mountains. Nobody knows where, above the clouds, following a trail with a long row of pine trees on either side, digging about in the bushes, and nobody knows where he is. And that altogether adds to his wisdom in some way it makes him a yugen quality, you see. But he's also sabi, solitary. You see ever so many Chinese paintings of sages. Alone with a bottle of wine drinking under the moon. Or wandering along a lonely mountain path. And in such a crowded country as Japan, all kinds of stratagems exist for giving the illusion of solitude. And all sorts of politeness is exist so that people living together like sardines in a can can get psychological if not physical space around themselves. And manners, politeness, are a form of creating a way of creating psychological space. So, sabi is sometimes represented in the painting of a solitary crow on a branch. And when you... sometimes in the late autumn, you're out in the fields in the evening and there's just one crow, you know, goes overhead. You think maybe he's going home maybe, maybe not. But that feeling of the one crow creates the sensation of sabi.

So for the tea ceremony, the whole setting in which it's given is intended to create the sense of sabi. Our solitariness, of being away from it all. Now, today among the Americans, and indeed the British and I suppose the French and the Germans, sabi is regarded as a sort of escapism. If you go off to get away from it all, that's a little bit ignoble. It's like getting drunk to forget one's miseries. And people are constantly lecturing each other on

how they ought to face facts all the time. And because if you're escaping, well an escape shows that you're weak. It shows that you have a defective sense of social responsibility. I think this is a lot of nonsense.

We need to get away from it all, just as we need to sleep. And don't please sleep because it's good for you. And this whole thing that I was explaining this morning in connection with food about doing things because they're good for you, is in fact not to do those things which are supposed to be good for you. If you get away from it all simply because you feel that you need a rest and this will help you to get back to work with greater vigor, you are not getting away from it all. If you play in order to do your work better, you are not playing. I had a friend who went to Japan with me last time, and she had a girl who worked with her in the same office. And she said, 'Well now what did you learn from this trip?' And she said well what difference did it make to your life? My friend said this made this difference that every morning at dawn I get up and I clap three times to the sun. That served her right, an answer like that. Because of this we have a terrible intensity of being useful, of being constructive. This dreadful word creativity is being kicked around, you see, or that you should be making the world a better place than when you came into it. Now that's one of the ways to make it a little worse than when you came into it. It is necessary for us to their innocence and to let up and stop being on a special crusade to improve ourselves in the world. We should escape from that very often and not have any sense of guilt about it. Because when we carry on like this, with this crusading attitude that we're always improving something always making it better and so on. It shows again our extraordinary lack of relationship to the physically existing universe right under our noses. We improve things before we even know what they are. And you know like you go to a foreign country and you take a superficial glance at it and say well they haven't got this they haven't got that them but the other thing and so immediately they have to have it. They don't want it necessarily. A lot of people don't want refrigerators don't want television don't want cars, because the moment they got all that they would be paying for it and they'd be in a rat race to make more money and then sell them faster ways of getting around still so that they could make more money to pay for those and so it all goes.

So please, for sabi, for solitude for a kind of delicious loneliness. Don't feel guilty for going into it. Then, simplicity comes as next in the order of aesthetic canons. This is sometimes equated with poverty. Only poverty in a very special sense of the term rather like Franciscan poverty. There is you see such a thing as grinding poverty. Where people are starving and there's nothing to eat. This is not that kind of poverty. It's a different kind. Do you ever sometimes wake up in the morning in a hotel room and look around you and see there is nothing in sight that you own? It's all rather a relief. Because you're not responsible for it. And there is a kind of poverty you see, that really is equivalent to freedom. I'm not tied down with all these possessions. A rolling stone gathers no moss. He who travels light, travels fast. The first sort of satori experience I ever had was connected with poverty. Because what happened was that I abandoned and gave up all beliefs and threw the whole lot out of the window. And then came this sudden sense of sea of being immensely relieved. And I felt exactly as if I was leaves being blown along in the wind. You know how happy leaves in the autumn go down the sidewalk like children let out of school. Well I felt like one of those. You know, they can they go cart wheeling down t-t-t-t-ch-ch-ch-ch-ch.

So this is the sense of being the leaf. Of the drifter. In Japanese eighteenth century early nineteenth century there was what is called the Iko Oay attitude to life. Iko means floating world. And A, painting and so the great color print artist like hokus I and he or she get all represented in the Japanese Bohemianism Hokusai was a sort of very very high class bum. And they never saved any money, they didn't have much, but what they had they spent, and they just went along to take each day as it came and not worrying. It's amazing how you can get by with that you know. Something will turn up sort of thing because worrying about it makes very little difference to actually getting anything or getting anything done. It in rather on the contradicts in the way. So this attitude of the simplicity of poverty is to be free-floating, uncluttered. Now, as a matter of fact it isn't always successful I've been in a tea master's house. Where in the main rooms everything was beautifully shibui and empty and lovely spaces but my wife Jane-O was snooping around, and across the garden she went into a small tea room and saw there was a sliding screen at the back and she pushed it open and peeked inside and there was a great big room furnished in Western

style, heaped with boxes and papers and mess all piled high. And the master was right by her, and he closed it, and he said oh no no no, you mustn't see that. You see, in almost every household there is a closet skeletons and a sort of unconscious or repressed property where things have to be stored in case they come in useful someday. I don't know if that can be avoided. It's like the bag carried around by Hote, the fat laughing bum, and he is like a child because he picks up everything that's at all interesting and puts it in the bag. But he gives it away to children. So he's a sort of Far Eastern Santa Claus. Poverty is called in Zen, filling a well with snow. That is to say, and laying no claim to the meritorious deeds that you do. In other words in Zen Buddhism, you are not like most Buddhists trying to pile up good karma for your next incarnation and therefore doing all sorts of meritorious deeds in the hope that you will be rewarded in the next life. So, when the emperor Wu of Liyang interviewed Bodhidharma. The Emperor said, 'We've endowed monasteries. And that ordered scriptures to be translated and done all this, and what merit?' And Bodhidharma said None whatever. And the emperor horrified because he thought the whole point of part of Buddhism is acquiring merit so he said then what is the first principle of the sacred doctrine? And Bodhidharma replied in vast emptiness that is nothing sacred.

So that vast emptiness you see, again implies the idea of spiritual poverty. Or again simplicity it's as if you see you suddenly became simple. You don't know your name. You don't really live anywhere. You don't claim anything, you're not that anybody special you have no particular virtues no really sensational vices. Because that's a way of recognition too. You just, you're just what they call in Zen an unsui, that means cloud-water and is the name given to his Zen monk because he drifts like a cloud and flows like water. This you see, is the life of insecurity. The life of not constantly defending oneself by possessions against inevitable mortality. Because the world in Buddhism is seen as a flow, and get with it. Because if you resist it, you will be a mess. So this leads me to another quality. It's called In Japanese furyu. It's very difficult to translate it means literally wind flow. Although who, wind, has the general meaning also of atmosphere. What is your household wind means in Zen What is the particular style of your school of teaching. And so who has the same atmosphere of style. Ryu means flowing.

Now *furyu* in the dictionary is translated as elegance. But this is misleading. *Furyu* is when, for example you see somebody fishing. Now of course, if he's a serious fisherman he's just fishing to catch fish. But there's something kind of unconscious about that, in this is so often true you see that peasants don't appreciate the countryside at all. I remember in England, the fields being filled by peasants who were wearing an old Sunday suit, black, with a striped shirt. With a collar button no collar and a derby hat, old derby hat and they looked about as incongruous, out in the countryside as you could imagine any good luck. You know no business while you were climbing the fields in the bowl of Derby.

So in this way, the peasant often doesn't recognize what he's got. And the fun of things, you see is to know it. So *furyu* is the fisherman for example, who is sitting there fishing in the evening, not seriously trying to catch fish, but just digging the seed. The quietness. That's a kind of *furyu*. But basically it means, flowing. The style of life in which you flow with the Tao. A follower of the Tao is called a *Taoyu*, do it in Japanese *Doyou* in Chinese value and that's a fun new for you in Chinese *Fung you*. But he who is flowing with the Tao, is the person who never forces an issue. This is very strange you find in life if you don't go around forcing issues all the time, a lot of people will accuse you of irresponsibility. They'll say, 'Well now, if you leave you you've got to make up your mind, you've got to make a decision and if you don't make a decision one way it will be made for you the other.' Never this isn't true. It's very important sometimes not to decide, and to say let's wait and see what happens don't rush in to decide. Because there are more factors in any situation than you ever counted up. And you don't know really which ones are going to be operative.

So, if you don't force keys in locks you see. You always jiggle till they go of their own if you force it you're liable to bend the key break the lock and goodness knows what else. So the *furyu* or *furyu* man, is a kind of high level drifter is very good. But you see it comes also to mean elegance which you see elegance is a word for highly conscious, almost affected beauty. The way we use elegant in saying of someone over he's most elegant. So that means he's too self-conscious. About so if we stop short at all of that meaning, even though a crude translation would tend to bring it to that,

when we get to is right we require uncontrived elegance natural elegance as of a tiger.

And then there is another mood peculiarly related to poems of autumn, when one naturally has his mind on the dying year. Surrounded by all the gorgeous leaves, and some bare branches. Well when you turn the clock back you know. And it gets dark early. You feel the sort of sadness of the fall coming on. Entering into winter and this is called in Japanese aware. And this word aware isn't quite nostalgia. It's a feeling of sadness. Not as something unpleasant or that ought to be avoided but very good sadness a sort of wistful sadness at the dying of the foliage the end of the year, the end of human life. When it's all going on. There is an English poem which mentions the strange atmosphere of a banquet hall deserted after the party, with all the plates strewn around and paper caps and blow whistles and everything's got of the over the place and it's forgotten and gone and everybody's gone. There it remains and that evokes aware. The sigh in things the Japanese saying [Japanese] which means to penetrate to understand the a lot of things. There's a Latin phrase *Lacrimae Rerum* the tears of things. When you see some object that belonged to someone you loved who is dead, and this evokes tears This is locked in my room. How pitiful some things are and even things that didn't belong to anybody things thrown away. A doll discarded in the gutter. A thing that not just like a beer can you know but something that is pathetic, a thing that has become pathetic has *Lacrimae rerum*, and that's aware. And aware is very much the mood as I indicated of autumn. And seventy ceremony one follows the seasons and has moods appropriate to the various seasons suggested by everything that you use. You arrange whenever you give an entertainment you think carefully about who's coming about what their tastes are so far as you know them and you arrange all sorts of symbolic things supposing a person is born in the year of the tiger. Well you might very well have a plate with a tiger on it. There are all sorts of little things that touches like that that enter into this with the object are both pleasing and surprising your guest and bringing out all these various kinds of feeling and aesthetic appreciation that I've been discussing.

Now, are there any questions? Sabi is solitariness, peaceful solitude. You must remember..somebody in the previous session raised the question about

the noises going on around here. Mr Rockefeller's cars that are broadcasting so-called information, and all that going on. Now, I'll give you an example of aware and sabi combined, which you can hear around here so often. You're very quiet in the afternoon, and you may be sitting here very still, and you can hear the sound of somebody practicing the piano in the distance. And the music echoes through the buildings, or somebody is straining to sing and sounds as if he was being strangled you know, every so often. This terrible attempt to sing a tenor voice... play it all these things are funny they're like cow bells in the mountains. And if there's little noises that bring up the quiet there's a Zen poem which says the wind has dropped but the flowers keep on falling the bird calls and the mountain becomes more mysterious. And it's all those little far off sounds. That the hermit really gets to understand. The hermit might go into the hills, but as things become quiet around him he hears all the beads and insects. And very far away, the noises of human life.

And the whole point of becoming a hermit is to discover that you are inseparable from everything. There is no way of getting away, really. But you have to try to get away to find that out all. You're in a complete continuum of life all the time. You cannot isolate one part of the universe from the rest. So as you live in your solitude, all these little things will gradually begin to come to you. Of course if you go a long long way away and so on it will be take longer for that murmur of human existence to reach you.

Buddhism

Net of Jewels

Now, this understand, please, is a continuation. The third in a series of for seven hours on Mahayana Buddhism. And I try it as far as possible, to make each seminar self-contained, so that if you miss the ones that went before you don't find what's being said completely unintelligible. But what we're going to take up this time, under the title the Net of Jewels, is the most, I would say, advanced and mature form Mahayana Buddhism. Which is known in Japan as Kegon. K E G O N. And in China as Hua-Yen. H-U-A, Y E N. And in Sanskrit as Avatamsaka, A-V-A-T-A-M-S-A-K-A. And these words all mean the doctrine of the garland. Of the garland, of the wreath of flowers. And this was an attempt to make it a synthesis of all Mahayana Buddhist doctrines, and including also the southern school the Hinayana, or Theravada, so as to show that all these points of view well consistent with each other although apparently conflicting. It was perfected by a Chinese gentleman by the name of Fa-Tsang. F-A, hyphen, T-S-A-N-G. who died in 712 A.D.. A man of absolutely extraordinary genius. It's curious that he's a contemporary of Huineng, the six patriarch of the Zen sect, who died in seven hundred thirteen and a year later. You might say in a way of course that the doctrine of Kegon is the intellectual content of then, because all Zen people, insofar as they don't have any intellectual interests in Buddhism, study the Kegon doctrine. And one of the patriarchs of the Calgon school known as Shimit so. Was the patriarch of both schools. He lived in the Tung Dynasty rather later than part some.

Now let me remind you of one thing that Mahayana Buddhists don't have the same attitude to historical events that Christians do. For both Jews and Christians, history is enormously important. And the fact that Jesus did in fact live at a certain time, and that he taught thus and so, is considered immensely important. And therefore, all Christians tend to want to find out what Jesus really did teach, and go back to the original sources. It will forever be impossible to find out what the Buddha really did teach. It is

hopelessly overlaid, and nobody could ever figure it out. Besides, the Hindus have absolutely no sense of history whatsoever. It's impossible to date the great manuscripts of Hindu tradition and scholars have the wildest why a wide variations in their guesses as say to the date of the Bhagavad Gita, or anything like that you got a generally attested assumption that the Buddha lived shortly after six hundred B.C. and that somewhere in the succeeding years. Let's say, well, by about two hundred B.C., the Pali texts call the Pitakas, the three baskets of the doctrine had been formulated probably, probably. But nobody really knows. But then you see we have a whole succession of sutras, which represent the various points of view of the Mahayana, which may have been written or we might say forged, anywhere from 100 hundred B.C.. To 580. Most many of them don't exist in the original Sanskrit we only have them in Chinese or Tibetan translations. And. Here is why everything is so vague. The Mahayana theory is, you see, that when the Buddha first attained his and his liberation. He preached the complete inner Mahayana doctrine, but nobody could understand it. So he had to come down a step and preach something to simple people.

Well, this sort of thing went on. He had a deep doctrine and a simple doctrine, but as time passed those monks who had treasured the original records of the deep doctrine released them. And so, the Avataksama Sutra which is a whopper of a thing. Very very subtle. Appears to be in circulation. Roughly. About four hundred fifty A.D. and goodness only knows where it came from. Nobody can possibly tell it was simply found it was revealed. And in the same way of course let's take the Book of Deuteronomy. The Book of Deuteronomy purports to be by Moses although it describes Moses on death. It was as a matter of fact in the year six hundred twenty one B.C. when as a matter of fact it was written. Because it reflects opinions and attitudes of that time but naturally it had to be attributed to Moses and this was not because the author of Deuteronomy was a fraud intentionally, but because he was modest. If you expound the law, you must not do so in your own name that would be very very cocky. You must attribute it to Moses because Moses is the archetype of all law. So in exactly the same way, when you have very profound ideas of your own but nevertheless you feel that you got them from a depth of consciousness which was deeper than your ego you call that depth of consciousness, that

level, the Buddha. And so naturally, you attribute it to the Buddha. I must however explain. That there are many senses in which the word is used in Mahayana Buddhism, among Mahayana Buddhists. It is used as the title of the historic go to Mr Tata. Who we know as the Buddhist Shakyamuni, which means the sage of the Shakya clan.

But then in the Lotus Sutra which I was discussing last week. The Buddha explains that his appearance as Shakyamuni after six hundred B.C was a mere sort of illusion. It was an Upaya, that is to say skillful means, for helping sentient beings because the true actual Buddha, is eternal. And manifests itself again and again and again in myriad universes. And so you see these glorious Tibetan and Japanese Mandala paintings. Where you have a central Buddha surrounded with Buddhalets. You find for example, Kannon, the Temple of Sanjusangendo in Kyoto, where there are a hundred and one thousand and one figures of all in gold and each one of them has eleven hands. The main head that you see from the front and then one on each side looking this way one behind looking back and then a pile of little heads on top all the heads being different aspects of Buddha. The center figure has one thousand arms, literally. All carved wood, lacquered in gold. It's the most astonishing sight. You wonder what this is and you are reminded of Argus with his many eyes of some sort of cosmic centipede. Or sea urchin, or something of this kind with tentacles all over the place with. So this by then is that behind the historic Buddha, it is worked out there on. The eternal Buddha, but this eternal Buddha is diversified in many different ways. So the evolved doctrine of Marianna which is connected with this kind on doctrine is that there is at the center what is called Mahavairocana, which means the Great Sun Buddha Japanese die and it's in your eye. And this great somebody. Has some interesting historical origins. Because one suspects that it comes from Persia, and is some form of Ahura Mazda, the great Sun Buddha. The great light. Nobody knows. But there it is, Dainichi Nyorai, who is always shown wearing a crown unlike the ordinary Buddhas, which were a sort of round cap of snails. And it's in your eyes crowned, and has got great blazing Oriel of flames around him. And holds his hand thus. Well, it's pretty obvious, isn't it? You know, that's what's going on but in humans, it goes one way, in the cosmos it goes another way because the structure of a spiral nebula is this you know. Let's hold hands, you know, let's play.

Then around Dainichi Nyorai, there are either a four other Buddhas and these are all called Dhyani but as D H Y A N I. There is a Amitayus, who is the Buddha of boundless life. There is Amitabha, opposite to him, who is the Buddha of boundless light. Then there is Amoghasiddhi, which is the Buddha of power. Siddhi meaning in Sanskrit, psychic power or spiritual power. And there is Ratnasambhava. Who is, ratna means a jewel. And Pava is completely developed, and the they all are assigned different colors, different sounds, different meanings, and these five Dhyanis, but as I suppose, to constitute a symbolism of everybody's Buddha nature that is to say they are all in you, constituting your fundamental self.

But when there appears in the world someone who is highly in life and is always considered you see to be a manifestation of one of these five Yanni Buddhas. Or of all of them. So this is what the Buddha explains in the Lotus Sutra. That Buddha nature is the eternal principle and that furthermore, everybody has it. Trees and grass also have put in nature the very grains of dust have it. And so one of the sutras says, 'When every phase of our mind is in accord with the buddha mind there will not even be one grain of dust that does not become a Buddha.' So Buddhism does in fact, contrary to popular ideas, in this form of put is and which I'm talking about this weekend look forward to a consummation of the world in which everybody and everything becomes enlightened, and where the whole universe operates in total harmony. Now it's difficult to understand in what kind of time this is expected to happen. I don't mean in what length of time, I mean in what kind of time. It doesn't seem to be that it will in be in what we call the future. But you see the kind of time that we're living in is only one of many possibilities of time. You know, we think so especially I think some scientists are too apt to assume that what we call the physical universe as it is is really what there is and that there's nothing more than that. I find this an inconceivable assumption that this is all there is because we know already to say that there are all kinds of levels of existence outside our senses but within the reach of our instruments goodness knows what there is beyond the reach of the instruments and also in directions that we have never thought of. In spirit people develop. These things in science fiction they love to make up the idea of worlds corresponding to Riemann spaces. Because Riemann invented equations for the being of a so many different kinds of dimensions and spaces and you can theoretically conceive this.

And so the, the Hindus and the Buddhists feel you see, that there are infinitely many times and kinds of time, kinds of space kinds of world. That they may from the point of view of our space, be coincidental with each other that is to say all in the same place but there's no need for them to be all in the same place at all. You just have to let your imagination run a little bit and there's no harm doing that provided you know what you're doing. Because if you're letting your imagination run even if you know it's fantasy will often turn up with extremely interesting results. ALL of mathematics for example is simply playfulness. People who do high mathematics. Are not in the least bit interested as to whether they're going to attain any practical results. They're just doing things like very very involved crossword puzzles and seeing how to manipulate them. Well this is simply really a use of disciplined imagination.

And so in the same way, many of these Buddhist fantasies, disciplined imagination going to work on the world. Well so in some state which they would consider the goal of things. But you may also understand the goal. Not as being in future time. But as being in what you might call basic time. Time behind time, time beyond time. There is the state of total fulfillment. Now I want to read to you a description of this state which is rather curious it's the work of a very famous Buddhist scholar John Blowfield. Who was adventurous enough to take some mescaline. And suddenly got a real shock. Because he found out, practically everything it all was known in theory. And this is a very interesting experience. Because I'm not going to read all of it. He says after some time, that he tried to visualize the Tibetan mandala of the peaceful deities. That you find in the Tibetan Book of the Dead what I was describing to you and Mandela My viral Khana in the center and the Dhyani Buddhas arranged around it, you see them sitting inside a circle Well there are all sorts of these Mandalas it that you see in Tibet in art and we'll go into this a good bit next weekend but. The model of the peaceful deities is used as a support for meditation exercise, so he tries to visualize that. But succeeded only in countering up some rather metallic looking demons. Although they were far from frightening, and not even very lifelike or realistic being something of a cross between metal statues and living beings. But they did convey to me as though mockingly that to expect a profound religious experience as a result of taking mescaline was too presumptuous. Soon after that, the sensation of a rapidly fragmenting

personality returned to me with frightening force. I grew alarmed for my sanity and should have hastened to take an antidote for the mescaline had one been available. Then my friend persuaded me to eat some lunch I was in no condition to enjoy it by then things seen and presented themselves as independent independent visual and aural experiences with no see and hear or to link them into one of those single compositions which at any given moment form the content of normal consciousness the food went down my throat as usual but it seemed to be disappearing into a receptacles connected with me only to the extent that it was too near to be visible. The mental stress grew agonizing. My fear of permanent madness increased, and I suffered especially from the feeling of having no inner self or center of consciousness into which to retreat from the tension and take rest. An additional discomfort was the sensation of bright lights shining now and then from behind me that there's someone was standing there flicking a flashlight off and on. The movements of my man servant came in several times with dishes of food sweets and coffee occasioned great uneasiness whenever he was out of sight I felt he might be standing behind me with some vaguely sinister purpose, and since he knew nothing of the experiment I was afraid he would suppose that I was mad. Doubtless anyone else's in uninvited presence would have made me equally distrustful an uneasy that I was not bothered at all by the company of my friend because he was in the know and I felt the need of a nurse or guard. No words can describe the appalling mental torment that continued for well over an hour. All my organs and sensory experiences seem to be separate units. There was nothing left of me at all except a sort of dissin body and suffer a conscious of being mad, and racked by unprecedented tension there seemed no hope of being able to escape this torture. Certainly for many hours perhaps forever, hell itself could hardly be more terrifying. About one pm I drag myself to my bedroom shut myself away from everyone like a sick animal and fell on my bed. In my extremities I suddenly made a total surrender. And called upon my Idam. Now, in the, one of the schools of Mahayana Buddhism it is taught that all deities and therefore a man's own indwelling deity are products of his own consciousness. And that when consciousness is unimpeded. By karma. It is clearly seen not to be the property of the individual becoming to all beings to be the sole reality in all the universe. And he makes various notes on that sort of anyway this is the meaning of the ego it means your fundamental identity. Beyond all personal

differentiations. So the madness or death or anything whatever I would accept it without reservation if only I could be freed from the tension. While the first time in my life I ceased to cling to self loved ones sanity madness life or death. My renunciation of myself and its components was so complete as to constitute an act of annoyed trust in my Idam. Within a flash my state was utterly transformed from a hellish torment I was plunged into ecstasy and next an ecstasy infinitely exceeding anything describable or anything I had imagined from what the world's accomplished mystics of struggle to describe. Suddenly that dawned full awareness of three great truths which I had long accepted intellectually but never until that moment experienced as being fully self evident. Now they had best upon me not just as intellectual convictions but as experiences no less vivid intangible than I heat and light to a man closely surrounded by forest fire.

One. There was awareness of them differentiated unity embrace in the perfect identity of subject and object of singleness and plurality of the one of the many Thus I found myself if indeed the words I and myself have any meaning in such a context at once the audience the actors in the play logically the one can give birth to the many in the many can merge into the one all be fundamentally but not apparently identical with it they cannot be in all respects one and many simultaneously not logically but now logic was transcended. I they held and myself was it was a mass of brilliant colors and forms which being several colors and several forms but different from one another and yet all together the same at the very moment of being different. I doubted the statement can be made to see meaningful at the ordinary level of consciousness no wonder the mystics of all faiths teach that understanding comes only when logic and intellect are transcended. In any case, this truth even if at an ordinary level of consciousness it cannot be understood, can in a higher state of consciousness be directly experienced as self-evident. Logic also boggles at trying to explain how I could at once to see even yet be those colors in those forms how the see-er, the seeing and the seen the feel of the feeling in the felt would all be one but to me all this was so clearly self-evident as to suggest the words childishly simple.

Two: Simultaneously, there was awareness of unutterable bliss, coupled with the conviction that this was the only real and eternal state of being. All others, including our entire experience in the day to day world being no

more than passing dreams. This bliss, I'm convinced awaits all beings when the last vestiges of their self would have been destroyed or as in this case temporarily discarded it was so intense as to make it seem likely that body and mind would be burnt up in a flash yet though the state of bliss continued who what I later knew to be three or four hours I am urged from it unscathed.

Three: at the same time came awareness of all that is implied by the British doctrine of dominance. Namely that all things were the objects of mental or of sensory perception, are alike devoid of own being. That is the word svadhada existence as independent realities and whether they're divided that they are transitory combinations of an infinite number of impulses this was us fully apparent as are the individual bricks to someone staring at a non-plastic wall I actually experience the momentary rising of each impulse and the thrill of combination which it to me with which it immediately ceased to be. I shall now attempt to describe the entire experience in terms of sensory perception. Though not without fear that this will cloud rather than illuminate what has been said for the content of my experience being super-sensory and super-intellectual can hardly be made understandable in terms of originally coined to describe the mental and physical content of ordinary perception. Of reality it seems to me in retrospect can be viewed as a plasma, of no intrinsic color or form, that is nevertheless the substance of all colors and all forms highly charged with vivid consciousness energy in bliss, it is in gauged in eternal play. Or it can be viewed not as a plasma, but as an endless succession of myriads of simultaneous impulses each of which arises like a wave mounts and dissolves in bliss within an instant. The whirling colors and shapes which result, produce certain effects that recall flashes of red deities seen in pictures, dreams, or in the world of normal everyday consciousness. It can be deduced that the latter are in fact reflections of this eternal beauty I remember recognizing a well loved smile well remembered gesture of uncommon beauty. There I perceive no lips to smile, no arm to move, it was as though I beheld and recognize the everlasting abstract quality. To which such transience miles investors had owed their charm. Again, reality can be viewed as a god. dancing with marvelous vigor, playfully, his every movement producing waves of bliss from time to time he makes stabbing movements with a knife. At every stroke, the base becomes intense. I remember the plunging knife made me

cry aloud That's it that's right yes yes yes. Or else reality can be viewed as a whirling mass of light. Brilliant color, movement and get it coupled with an operable bliss those who experience it cannot refrain from laughing cries of yes yes yes ha ha that's how it is of course, of course. I felt as though after many years of anxious search for the answer to some momentous problem I was suddenly confronted with a solution so holy satisfying and so entirely simple, that I had to bust out laughing. I was conscious of the immense joy and of incredulous amazement at my own stupidity, in having taken so long to discover the simple truth. Within this play of the universe, there is endless giving and receiving that will giver, gift and receiver are of course the same. It is as though today it is while yet one are locked in ecstatic embrace, giving and receiving with the abandon of adoration the Tibetan Yabyung representation of deities into this the artists who paint them must be forgiven for that inability to indicate that give and receive or are not only one but formless there are indeed some artists manage to suggest the Oneness by blending the figures so well that the yom is not seen unless the picture is given prolonged and careful scrutiny. During the experience, I was identical with the giver, the receiver, and the incredible bliss given and received there is nothing sexual about this union it is formless the bliss is all pervading he should use the word genital not sexual and giver and receiver, giving and receiving are not to but one. It is only in attempting to convey the experience that the imagery of sexual joy suggest itself as perhaps coming a little closer than other imagery to the idea of an ecstatic union in which two are one.

Some of the conclusions I drew from the whole experience are as follows
A) Fear and anxiety as to our ultimate destiny and needless self-inflicted torments. By energetically breaking down the karmic propensities which give rise to the illusion of an ego and of individual separateness, we shall hasten the time when reality is revealed and all hindrances to ecstatic bliss removed. Unless like the bodhisattvas, we compassionately prolong our wanderings and some sour so as to lead other beings to that goal. B) The world around us so often grey, is the product of our own distorted vision, of our ego consciousness and ego-clinging. By casting away ourselves together with all longings desires qualities and properties that pertain to them we can utterly destroy the illusory egos which alone bar us from the ecstatic bliss of universal consciousness. The key is total renunciation, but

this alas cannot often be achieved by a single effort of will, because each of us is hemmed in by a hard shell of karmic propensities, the fruit of many, many misspent lives. The three fires of desire, passion and ignorance are hard to quench. Yet they would be quenched in an instant, should we but make and sustain an act of total renunciation. Such an act cannot result from effort or longing because these would involve our egos and thus actually strengthen them. Thus in the ultimate stage, even effort and longing for nirvana must be abandoned, together with everything else this truth is hard to understand. C) the Buddha's experience indicates that when unlike him and that is full awareness of that blissful reality of his attributes include inconceivable wisdom compassion light Beauty Energy and Gati is obtained in this life it is possible to continue carrying out human responsibilities behaving as required responding to circumstances as they arise and yet be free from them all so it is with a talented actor who in the pot of Romeo, weeps real tears. When his grief for Juliet threatens to overwhelm him, he can withdraw inwardly from his row long after recollect the unreality of Juliet and of death. And yet, continue to give the same for months as befall. D) A single glimpse of what I saw should be enough to call forth unbounded affection for all living beings. For however obvious smelly autonomous and they may seem all that is real about them is that gloriously blissful signing consciousness which forms the center of my experience hatred dislike disdain aversion for any being sharing that consciousness i.e.. any being that all, must amount to blasphemy and one who has seen being itself.

And now, I think anybody influenced by the weltanschauung, the zeitgeist of the twentieth century, would find great difficulty in taking such a statement seriously. Because. We pride ourselves on being realistic. That is to say, on being people who do not indulge in wishful thinking. And while at the beginning of our century, there was a great deal of what is now referred to a shallow optimism about human progress, when the true world was came and went. We decided that. Human nature was pretty much of a match. And that. You will remember no doubt. That during the Second World War there was a feel logical movement. Generally called back to sin. That is to say, back to belief in the very very fundamental reality of evil that was the time when C.S. Lewis wrote The Screwtape Letters. That was the time when Reinhold Niebuhr wrote The Nature and Destiny of Man. And

this was saying, you Westerners got to seven lies and too sentimental you don't really admit and face the fact of how ghastly things can be.

Well now, therefore, for that reason, a description like this which says the way things really are. Is a ball without any exception whatsoever and it is real and you were just on vacation from it for a moment which when you get out of it will seem like nothing. This is not a statement or an attitude that is coming out of anything like a sentimental culture. Nothing could be more different than the climate of Indian and Tibetan and Chinese Buddhism and the climate of New Thought at the end of the nineteenth century. After all, new thought Christian Science, Unity, all those movements, were conceived in the great American prosperity of New England. Among very nice, successful people, and as you see today when you go around the circles in which these very, very optimistic religions flourish. They're all composed mainly rather well-to-do comfortable bourgeoisie. No aristocrats ever went for them and no proletarians and that is the reason for this. Which is that aristocrats always live on the past. Because they have arrived long ago. Oh and therefore they have no reason to strive a real aristocrat is a very unassuming person who doesn't lot about but knows that he is someone and there's no way of questioning it that's why they're so courteous to servants. On the other hand a proletarian has no past and no future, and so he lives for the present. The boy who was he has no past but he won't live in the present he always lives for the future and therefore he is the one constantly deluded. So, he is always you see the sucker. As my uncle used to say, the rich can afford it, the poor get it given to them, and the middle classes do without. Which is a sort of a bitter comment but that the thing is that prosperous bourgeoisie did invent. And go for the philosophy that everything really behind the scenes is all right.

Now, this point of view comes from a well that is so different from that. A world of extreme insecurity. Of War of disease, of all kinds of spooks and horrors. And you see this reflected in Buddhist art. It has a class of beings in it, which are, we would say devils. The most appalling creatures with. Many heads, many arms, full of claws necklaces of skulls writhing Suppan surround them and are described in the text to be making the most appalling noise. And there they are that's life. These are not demons. They're not in the Christian sense of the word devils at all. They are aspects or shall we

say ruffle aspects of the underlying reality. And the whole point is this. And this is described in the Tibetan Book of the Dead. That you have to face these things, in the conviction that they are simply illusions of your own mind. But you don't try to push them away by thinking of something else see, as if this is not to say well don't think thoughts like that that are negative when you get negative thinking this is the different principle you don't substitute something positive. What you do is, you go slam bang into the middle of the negative. As this man did you see in describing his vision when he got this awful state he just plunged you see let go and plunged right into it. And, yes, he was helped by Mescaline, but anybody in need an awful state. Say they're in pain all that dying all something dreadful is happening will be able to achieve the same consequence. By going with it completely.

I remember. This wonderful German who wrote. The book called You know on Zen meditation it's all about belly hot I mean the belly. Bonding. Time caught Friedlander time. And he said to me you know I'm having a very interesting time because working in Germany after the awful ravages of the war. Has brought me some very interesting contacts he said I've come a lot cross a lot of people. Who had this tremendous spiritual illumination. And sort of, when it passed off, believed that they had had some kind of lapse of mind or hallucination under extreme stress and when they tried to tell anybody else about it they were laughed off. And he said of the three kinds. There was the experience of the dot bomb. You heard it coming. And there was this frightful whistle. And then there was a thud, and nothing happened. But in the meantime you knew this was it and you gave up and surrendered completely, you just. Let go and suddenly it became apparent exactly as he says. That everything is completely gorgeous. Then he said there was a second instance. Person in a concentration camp, with no sentence, no law, no nothing, and absolutely convinced that he would never never get out never. And he accepted it. And the same thing happened. And he said there was a third class of catastrophe very common to people that was to be completely operated. To be a displaced person, with all your possessions, all your money, all your career, totally destroyed. And when some people just accepted this the same thing happened to them. And of the funny thing about it is you see that. It's so queer because it's so difficult to pin any kind of morality on this. You know you see at that moment. That the other

people who are suffering. And who are resisting it. And having an awful time, are not really having an awful time at all. They are actually, you catch yourself doing this occasionally, when you nurse a grievance, and you enjoy hating somebody you know this sort of mood when. You just revel in disliking something.

So in this way, the from the vision one can see life reveling in agony. It's a very weird way of looking at things and of course you can't carry that over into practical life and say Now I should talk to you because you're going to enjoy such as exquisite agony. You don't do that. But this is how it's it is seen from this particular point of view this particular shift in consciousness and the funny thing is as he indicates. It's so simple. There's no question about it. It's absolutely clear now this is in other words what we're talking about is what is the Buddhist vision of the consummation of mankind. And of of being what what it is all about. Hard to say when, where, from what point of view but some way out rather fundamental. So you can say well, is this a hallucination that people slip into every now and then, like getting drunk or crazy or having months of measles or something that just distorts your point of view and gives you what would be called euphoria. You know when you want to use a putdown word for happiness you call a person euphoric. So, you could argue that way, and it would be quite legitimate to argue that way within the zeitgeist of our times. Because we are reassured by what I would call a rush to beer can view of reality. You know it's all comes down to a rush to be a care in the moments of that that's real that's the that's the thought of thing you see lying on the street and that's every day it's folksy and terribly reassuring.

But on the other hand, I keep coming back to the funny feeling, that if existence itself is not basically gorgeous in this way, that it wouldn't be able to exist. That in other words the game wouldn't be worth the candle. That you would have a reality system which would have cancelled itself out long ago through some simple method of suicide. Now cos here again we can say well that's what it's doing. Only it's taking an unconscionable long time to do it from our point of view. You know this is part of the God is Dead bit that you could read into that that God just couldn't stand it. This this whole thing was a terrible mistake and dire and I'm left well hanging. On For there are few logins who seriously think that God did once exist and has

actually disappeared. And died. This is unbelievable but it's his sorrow is more or less as I understand it the position of all ties I'm.

But, I suppose this is a quick one of those things that. It's like nerve. A lot of people by having nerves get away with all sorts of things that they shouldn't get away with but succeeded in doing so and we call them the successful. You know they shouldn't have succeeded, because they really didn't have the proper qualifications or educational background or whatever it was but they did have nerve. Well, in the same way you know, when you hit a golf ball, you have to have this follow-through, you can really go drilling go like this you don't just hit at the ball. Well so in a similar way when a person has the feeling you see that this is the way the universe is. It gives him a certain quality of existence and you may say well he's not really a very realistic person. But damn it, he gets on well.

Now, what I was talking to you about with morning. Namely, the conception of the universe as a totally harmonious energy system, which may be realized as such, at some time or some kind of time. Not necessarily a future time, as we ordinarily understand it, but let's just say that it is a point of view from which the whole gamut of being may be considered as completely harmonious. This is called in the loss of feel we're discussing that is to say the philosophy of the other tongues of. The Dharmadhatu. The D-H-A-R-M-A-D-H-A-T-U. Literally, the realm or domain of the Dharma, the dharma the ng this complicated difficult indeed impossible to Sanskrit word. That is used usually translated. In law in English. But which can also mean method function. Rather like our word principle, as in the phrase to get the principle of the thing. It can also have some affinity. It with our word reason, and it can also have some affinity with our word what is right. So you got to conduct that is described as the tomorrow which is right and wrong, roughly. Dharmadatu therefore really means of the order of the universe. What it is fundamentally. And I was pointing out that fundamentally this order is a harmony. And there is a point of view from which this can be seen.

Now, this philosophy of the Avatamsaka sutra makes a further analysis of the Dharma Datu. Into what are called the four Dharma worlds. And this is one of these mnemonic tricks that Buddhists always use to help you keep things in mind. They group things into four, into five, into six, seven eight,

nine, ten, twelve and so on they always miss out eleven for some reason and. So that you can memorize it easily. And the four Dharma worlds or what you might call the four ways of looking at existence let's call it that, are called in Japanese... I'll use this language because it's easier to remember than Chinese and easier to pronounce. First of all the world that is called Ji. J I. Second, the world that is called Ri , R-I. The one that is called. Rijimuge. Ri, ji mnd you get the. And then fourth, the world that is called jijimuge. Well, I will go through these things in order.

First of all, the way of looking at the world as Ji. The character Ji, in Chinese, has a very complex set of meanings. It can mean ordinarily, a thing or an event. It can mean business. That is to say, something that matters it's important I can mean a fast. It can mean affectation. So that a person who might be described as boogy in Japanese No. Physically once wrote me an autograph. And he wrote that the three characters Bu Ji Nin which means a no-fuss man. And the Virgin and as a man, of whom the poem says that I quoted you last week. Entering the forest he does not disturb a blade of grass entering the water he does not cause a ripple. You know like those wonderful South Sea Island Power fishes who can dive cutting the water like a knife and oddly making any splash at all. This kind of harmonious relationship with circumstances in which one doesn't stand out like a sore thumb that is Noji.. So Ji, the fundamental meaning, is whatever it is that stands out. That is to say the distinct the particular The indeed. The shop. So in contrast with Ji, which is one point of view toward the world, is really, really is a Chinese character pronounced by the Chinese, Li. Which almost all of you will by now be familiar with because I've explained in previous seminars and this character means fundamentally the markings in Jade. All the grain in wood all the fiber and muscle. Now at the stage of Chinese history that we're talking about which is seven hundred twelve A.D. when this particular philosophy was really matured by Fox sung. The word but really our leader. Meant. What I've been referring to all along as for the. Undefinable substrata things. Like the mirror underneath all the various reflections in the mirror. Or the diaphragm of the radio underlying all the sounds which the loudspeaker produces. All of the eye is fundamental to sight the fundamental design.

So if you could put it this way then that what Ji downfall is the individual reflections in the mirror and what Reese downs for is the narra. Hot sun himself explained it to one of the Chinese emperors by the image of a golden lion when he wrote a long treatise on the Golden Lion which if you want the whole thing and want to study it carefully you will find in volume two of fungal lands history of Chinese philosophy. This is an incidental, [that] anyone seriously interested in these things should possess these two volumes, published by Princeton. And in the second volume he has a long long exposition Fotsam on a nice thing about fun you learn. If he's a very conscientious historian. Because most of his book is quotations. He simply weaves in the original sources with explanatory help out and. Just lets you have it. And I think he's extraordinarily good, but he does is not easy reading. But he has the whole of the Golden Lion its position which shots on used to make the lion of the garland doctrine comprehensible to a slightly stupid Emperor. I said likely. Though he has the idea of the Golden Lion. Because he use the form of the lion to represent G.-D. that is the individual individual izing principle and the goal, to represent Ri, which is the underlying. And you remember we discussed this last week because in another way and from another point of view. We were talking about the Western distinction between form and substance. And how we have grown up with our common sense geared to the idea that every shape is a shape of some stuff. But we consider the shape principle, the form principle, to be spiritual. And the stuff principle to be material. In other words, form is a high order of being than matter. Because we think of matter of stuff the form of the pot is a higher principle than the play out of which it is made that's the way we think but in this district and the Hindu way of thinking it's exactly the other way around. The Gold is used to represent the higher principle. And the form of the lion is used to represent the material. Because you see, there isn't a word in Sanskrit that corresponds to our word material. They use Roopa and Roopa means form. When they, when in other words a Sanskrit thinking person wants to indicate what we call the material world. He doesn't really say material he says formal. The world of form then when he wants to indicate higher worlds that are spiritual He calls them out Arupa which are formless. So in his way of thinking the gold underlying the form of the lion. Represents a a deeper more basic order of reality than the form of the lion. You have to get used to see to these funny flips in. Metaphor. As used between Chinese speaking peoples are Sanskrit

speaking peoples and English or German speaking or Greek speaking peoples.

So, the point now that he's made he's making he's established these two ways of looking at the World. You can look at it from the point of view of all the jazz that everything is doing and see. All the forms all the dances all the patterns. And those are. Then you can look at it from the point of view of what is it doing it all what is it all happening in? What is in other words the medium, or the basis, which is all this universe and that is called Ri. Although, via a funny flit at a time later than Fotsan's. That is to say, we'll have to go on in Chinese history to the neo-Confucian philosophy, which will take us to the fourteenth century. Where the word really comes to have the meaning of the organic pattern of the world. Where the full meaning of the idea of markings in Jade which it originally had is brought out again. For a period here in under the auspices of Buddhism, Ri, roughly corresponds to what we mean in western philosophy by the word noumenon as distinct from phenomenon. Roughly. You see noumenon is based on new switches mind phenomenon is based on final which means to show, to manifest. Manifestation of mind or in Information of the formless. Because you see, fundamental to the whole Hindu Buddhist complex is the notion of the world as being something like what happens when you develop a photographic film. You look at the film and first of all in the solution it is formless, there's nothing on it and then suddenly all over the area that you're watching a picture develops. It doesn't develop across and that oughta or down and that all of it all over at once it comes out. And they feel that nature works in rather the same way. There is whatever it is you see, the vast unnamable continuum and this manifests itself like the film developing. So every Ji is a thing or event. Ri is the Continuum in which things and events occur. But as a matter of fact the two are not really different from each other.

Now this gets us to the next principle in the next step. The fourth, the third so-called Dharma talk to or Donna world is called rijimuge. And that means that between ri and ji, there is no blockage. Inconsistency the word again literally means a blockage. But probably inconsistency or. Separation you could use that no separation. No separation between Ri and Ji. Now he goes with the idea of the gold line and he puts it this way. You can't ever find

gold that is not in some form. If it's not in the form of a lion it'll be in some tongue. But you can't find a lion without the go in other words the lion even if it's a living lion has to have some. Ri underneath it as it were. This is the Oriental meaning of the word substance as distinct from our meaning which is stuff. So the gold in the Lion are in a way inseparable. You can think of them separate you can form the abstractions of gold on the one hand and lion on the other. But actually. The form the G. and the Ri would always go together. So then, really, the Muji no separation. Of the rope our world has the world of form and the formless wild is when you see there is no in compatibility between what we could call the spiritual and material.

Now this is an idea very very simpatico to the Chinese. It's not it hasn't been a very popular idea in India it did originate in India. But the Indian mind is to a large extent in popular sense. Very very disillusioned with the formal World which is always falling apart and which is painful and which is a struggle and a mess and everything like that and they long for the formless world. And so when you listen to most Hindu teachers, they will encourage you to become a spiritual as possible and to renounce the material life of family. Delight in the senses, sex, all that sort of thing is kind of out. Of the Chinese could never could see that that was a sensible point of view. The Chinese social order is essentially family oriented and they they don't they're celibacy makes no sense to them at all. So, although there have been Chinese ascetics by and large they don't dig that. So it appealed to them very much that there could be this philosophy of the view of the world in which Ri and Ji were perfectly compatible.

So then. What is being said here. Is that you get to go back to my image of the mirror and the images in the mirror. You will never see the mirror unless it's reflecting something that. There is no way of. There being a mirror which is not reflecting. So in other words, don't look for the principle called Ri, as something different from the Ji. In other words, when you wake up and understand that there is something behind existence, you are not to expect to find a big vast blank. A lot of people think that when they attain nirvana, all individual forms which they see before their eyes will slowly melt and become do it like the dissolution of the negative. Forms in the negative back into the formlessness behind as if that would happen. So that's not going to have that's not it's not going to be that way. What you're

going to find out is this. That all things as you see them, being quite distinct from each other, and all the shapes of them the differences of people and everything. That those which differences you see, what you are noticing in the world those things those events are not really separate from each other at all. They are the same thing as the Ji, I mean that the Ri, underlying it. It's important then to see that in nature. In the real physical world, there aren't any separate things. The idea of separate things is no more than an idea it is a way of talking about life. To get to this we have to go of cost of the fourth step in the series of what's called.

And this is the image of the net of jewels. And this is the central image of the whole Avatamsaka philosophy. There is a net like a spider's web covered with dew drops in the dawn. Only this web is multidimensional. In other words, it's not even three dimensional web it's more and more and more as many dimensions as you could possibly ever imagine. And I am this web every drop contains a reflection of all the other dewdrops. This is a way, an image, of saying that everything implies everything else. That take any detail any possible feature of the universe which you can in any way identify as a thing. And if you really go into it. You will have to see it as capable of existing only in the context of everything else. So, each thing implies everything, because it could not possibly have.... let's just take it this way where is anything you can only define a where of one thing in relation to the way out of all the others. You can only define the size of a thing in relation to other sizes. You can only define the length in time of a thing in relation to other lengths of time you see. So that, there is for example a point of view from which a very small thing, like this little clam shell here could seem to be enormous. And you can very easily get this point of view all you have to do is to hold this in your hand. And transfer your consciousness into a tiny creature wandering around inside this huge shell. Why it's colossal! Or else you can go the other way and you can think of all the galaxies as molecules in somebodies hair, in another world. You see it when it's really very little it's all depends on your scale. But the the point is this: that every....insofar as anything that you can possibly identify as a thing or as an event. Goes-with let's coin this word. The word goes-with. All other things whatsoever. And, I think in the seminar we mention this technique of making holograms whereby with less of these you can take any photographic negative and from any part of the negative

reconstruct the whole. Well it works the same way. That any Ji, is what it is only in relationship to in context with all other G. whatsoever and this can do is often. Also called the doctrine of mutual interpenetration. And this is the key to understanding what I was trying to describe this morning. As the experience of the universal harmony.

I remember once, a woman I met had an accident. And she was trapped in an elevator. But it caught her leg and leg was broken and she was trapped there for half an hour before anybody could rescue it. But she said I came in that time to realize, that in all this universe there was not one single speck of dust that was out of place. Because this again was, somebody accepting a situation about which nothing could be done. And that would of course include, accepting the fact that you can't accept it. That there it is. And then suddenly this extraordinary way of feeling comes to you. That everything goes with everything else. It isn't it's as if...it's curiously different from what we would call the fatalistic sense. The fatalistic sense means, I submit to a higher power. Something arranges everything and I don't have anything to do with it I have no responsibility and I just go because. I'm not I'm not an automaton I say. That is a of a rather different attitude and what I'm trying to describe, its more passive. This one is like this: My talking to you now. Is inseparable from the Gulf lying out there. Now you may say that's rather a far shot to call. This thing but as a matter of fact. Let's start putting it all together. We're living in a nice little town you know by the water. And by a combination of events, I make this place attractive so you come. And that if the world gulls around here it wouldn't be the ocean you know. Gulls and ocean go together. And so, this whole complex of things it isn't just that I'm in a vacuum, you see. But it all goes together and all goes with every single one of these houseboats and it goes with every kind of Crowley piece of falling off pain on rotting wood and off whole bit all interdepends. And if you get to see this one day, and you realize you know you felt terrible because you did this that and the other which you should have done. And suddenly you realize. Go back over your own life supposing your friends' parents and relations have never done anything wrong or what they thought was wrong. Think of the opportunities you would have missed. It fits. And there is this sense then that you get. That the whole Patten that you can feel out of your existence and one thing with another is completely logical. All goes together.

Now you see what this is, is a kind of fulfillment of what all scientists are trying to do. When we say, we ask if any behavior whatsoever in the world. Can we explain it? We are asking is there a reason for it? And what we are looking for is to be able to fit it into a consistent pattern. Now let's suppose for example that we say somebody has done something quite unreasonable. But then some psychologist comes along and says you know yes I agree from a certain point of view what he did was unreasonable but you haven't looked fully into this thing. You don't realize. All the complex of causes that were operating in the situation, and if you did understand that you would see and understand exactly why the person behaved in some unreasonable way the whole face of science is that the universe is explainable this way. That we can in other words make out a super pattern in terms of which all sub patterns make sense. If we're going to say, there are some things that will never make sense. There are some things which simply have no explanation whatsoever this is also a way of saying. Or, it amounts to saying that they don't exist. Because they're not connected. There is no rational explanation of their being there at all and so such things must be flukes. Not only flukes but complete cosmic madnesses. Now, when you call something a cosmic madness, something that is a total fluke for which you haven't got any explanation, all you're saying is My mind isn't big enough to get the point. And we have to admit there are many things going on which puzzle us profoundly, and our minds have not yet acquired a way but a way of explaining that. There are reasons for this. There are reasons that the patterns in terms of which we explain things that take for example the pattern of causality mechanical Newtonian causality is a rather limited pattern. And not everything will fit it. But as we think more and delve deeper we get concepts which are more generous. Concepts which accommodate the behavior of the world more subtly. The patterns we are using are more ingenious.

Now, there comes a point of course at which I see it all fits together, but I can't tell you quite why. Because the pattern, in terms of which it all fits together, is simultaneously too complex and too simple to talk about. Because you see we're getting back to this thing which is the the medium in which it all happens and which can't be defined. I guess that you see you get that feeling. Oh yes of course. It really does all go together but at that moment the philosopher would challenge me said Yes look here we thought

out things in terms of science we thought out orders we thought out equations We thought out patterns in which in terms of which events are predictable. And therefore we know they're fairly sure but you are telling us something which doesn't help us to predict anything. Because you're saying. That even the unpredictable is included in that. And so you're not telling us anything at all. And that is quite true. But. The most important of all things to tell, is nothing. Because that's. That's the basis that's. Why you don't pronounce the name of God. Why it's unspeakable.

So, there was a Zen monk who said I had the most marvelous teacher. I was very lucky. Because he never taught me anything. Neither was he never told me a word. All he did was sit around in a gruff kind of silence, while this poor student knocked himself out against him. And he got a point. Didn't have this is the problem that the. If there were a point you could get C. and say. Now I have really got this, I understand what the universe is what life is all about and I and now I know you see like that. We would have ended up part of it. You would say when I went a minute. Once outside of this, see, [you'll]be looking around the corner of one of the. Well what does this fit in say this thing I've got. Now for the sake of the tape recorder I have to say that I'm as it were holding a ball in my hands. And I've got to say but the something outside the ball. The really important thing which you need to get is what would never possibly be grasped. That is to say, the situation you're in, that is you. [There is] no way of getting that as an object focusing on it defining it pinning it down none whatever. And in that sense the whole situation is no-thing nothing. Can particularize it.

So, so much for that. But actually this thing that we call I don't want you to see to think of the no thing that something like Homogenized Jell-O.. You see, that that's not the point it doesn't like that it's like everything. With all of the tails and all you see this is why I must say in the matter of. People who try to communicate mystical vision. There are two schools of artists who communicate mystical visions, the precise school and the vague school. And the vague school which I don't really go for. I saw my son in law brought me over the other day a book of pictures of angels. But the trouble with them was they all looked wispy. They were all cloudihs forms, vague reflections in water, washy things now when I think of an angel I don't think of anything wishy. I think of something in which the detail is so

vivid. That you say who look at that in the same way as when you look at some marvelous flower. Or peacock feather for example. Look at a peacock feather and every kind of tiny little. Unit in it is all of that see now this is the point. That this world to be seen in its unity. Must at the same time be seen in maximum detail. It isn't a question of fuzzing the details that's what meant by jijimuge. Between thing and thing. Event and event, any detail any line you can draw there is no separation. Because you see what we call lines and draw them as clear and clean as you will. They join every line joins its two sides together it is a boundary in common between two areas they. Leave the black yang...I mean the the white Yang on the black yin are as different as can be but they go together and the boundary line S. curve between them in the thing joins them.

So this is why a great deal of high visionary art which it tempts to express deep mystical inside is fantastically detailed. And has tremendous precision. And is not wishy washy stuff at all. And so this will explain why... I will show you some examples they'll tomorrow of. The type of Buddhist painting that comes out of the school of thought and you will see what a minute rack of this world of wonder is in it, of extraordinary detail. Because this is the vision that you get. When you start exploring, you take a flower, you take a big magnifying glass. You go down into that flower, and you find out that the petals. Are composed of veins. And out of the veins come funny capillaries and suspended between the Capitol or is that the film ministers of Petal Amber stillness is a petal are made of tiny little dots that to ripple using everything like that to see then you know looking into the Lotus image, and you're seeing the details. But the point that you have to get is. That these details are not separate details. They all go together, so that every wiggle in the vein of the petal is part of the same thing that you are being they're looking at it. Just in other words as the flower may be considered as a unity with all those they knows and things moving out from the center. So in exactly the same way, least sitting here are doing something just like that. Only we're doing it with such a tremendous free float. In jazz to say we come from all over the place we've got to get a good to get a good ideas about this but we but just because we do it with that immense amount of free-floating jazz. We make the most extraordinary unity. When we sit around and talk, or whatever you do. Well it's have an intermission. Yesterday afternoon, I gave you the four views of the world which are

characteristic of the Kegon philosophy. And supply a sort of convenient summary of its general outlook. The world seen as simply things and events. That is from the point of view of multiplicity. That's the first view. And that's called Ji in Japanese. I'm giving the Japanese was because they're easier to remember. And the second view of the world is seeing things seen from the standpoint of unity. That is to say, just as the mirror provides a unity, a base, that is to say for all the separate images in it. So you might say that the mind or space, and there is a way in which the two of the same provides the unity for all the manifold things and events that exist in it. Now, there seems of course to be a conflict between these two points of view. The one and the many. And the most ancient philosophical problems revolve around this whole dichotomy, how do you get the one out of the many? How do you get the many out of the one? And it, it seems that one and many are mutually exclusive. In other words, in practical affairs we are many and we all have conflicting interests. What formula are we going to find so that we can agree and act together? This is always the most difficult task. And it requires great brains or great insight or great something or other to find the point on which we can all agree. And so work together.

So there is always an apparent fight going on between the principle of unity and the principle of diversity, because after all the diverse people don't want to be too united. You know, if we all had to wear exactly the same clothes and all had to do exactly the same sort of job that would be a revolution Say grr, stop interfering with my personality. Individual freedom is important in that and it certainly is. And what we've got to do you see them is to find a formula. Where there is the maximum of individual liberty. But all of it going on together harmoniously. And that's what we as a political historical community as have as our theoretical foundation is not fascination. To see we been trying to work out. This impossible problem, and incidentally, the theories of American politics, the basic ideas are founded on esoteric Christian mysticism. The whole idea of democracy, as we understand it, in the modern world, goes back to German mysticism in the fourteenth century. That is to say, it goes back to people like Mesiter Eckhart and Tala. Angelus Silesius, you see the brothers of the free spirit, the Anabaptists. The Anabaptists [were] people who said that all living beings are naturally children of God and therefore baptism is not necessary

to bring a person into salvation. Then there were people called the Levelers, and the Levelers...this movement migrated from Germany through the Dutch countries to England. And during the Great Puritan uprisings against Charles the First. All these groups began to flourish in England. And the British aristocracy simply couldn't stand them. Because they overthrew the whole order of hierarchy by saying everybody is equal and so they had to get out of England and come here.

Now you will see of course there is always the danger of a parity. That is to say, when everybody is equally a manifestation of the Godhead, which is the Quaker doctrine of the in a light that's what it really comes. And that's why the Quakers don't recognise any sacraments, because everything is a sacrament. While the Quakers don't have any ritual because sitting in together in silence This is a ritual. Anything is a ritual. The Quakers want to be make a complete fusion of everyday life and religion, so that you don't notice any religion around. You just have the good life. And so the Quakers won't remove their hats in court. They won't take an oath because they say, you've got to trust me because everything I say will be true. But so easy is that the Quaker idea is the direct continuation of the tradition of Christian mysticism as it flowered in Germany particularly in the late Middle Ages. The unfortunate parity of all that is that everybody is equally inferior. That's what you always have to watch out for. Everybody can be treated rudely by the police because you're all equal. And the police aren't going to say so. To somebody because he happens to be the mayor. The mayor but because you are an important figure in. Business or something you're all just Joe the city. And then that becomes everybody's equally superior. But if you could imagine where everybody is considered equal or superior This is the foundation of what we call courtesy. Good manners. Where you salute people. And you reverence their right to a certain privacy asserting it. Separateness missy. And you have to learn this art. In a state of affairs where. People start crowding in on each other.

Now you see, in a country like Japan, space is the most expensive thing there is. And it's becoming so here. Space used not to be expensive at all here there was just oodles of it. And everybody could afford to be equally rude. And now we can't. We're getting crowded into each other. And to create space, you have to create it by mountains. That is then respect to

everybody. Because for example, in a Japanese house, there is no privacy such as we understand that you can hear every bell or rumble. Because the walls are just paper and all the rooms are tiny and very close in on each other. And then they for example, they all take baths together. And they all always see each other naked, but they don't look. To begin with a so much steam that you can't really see much. But they have a way of being courteous. Nobody takes liberties in the bathtub, unless somebody wants liberties to be taken but in that in the ordinary way it complete strangers will meet together in the public bar of a hotel and male or female that there are two bathrooms one says men and the other says women men means men and women and women means women. But the family bath is always the one labeled men. And everybody goes in there and nobody is embarrassed. Because manners are preserved. The sense of...you can you sort of keep psychological hands off another person with the notion that they're to be respected you see that. You in Japanese culture everybody bows to everybody else and they have bowing contests they out by each other when you leave you know it goes on it interminably and as it where you're more polite if you bomb are often than the other parts of the other salt sort of funny from our point of view but it's still this point that.

There is a possibility in other words, of a bit of a cultural form, that will stress and get away with, the prospect and that...Not the prospect, the proposition that everybody is equal or divine as distinct from the proposition that everybody is equally inferior. And that feeling and the manners that go with it is essential. In any community where we start to crowd. And we get a population explosion. So this is one thing we have to do to solve this huge question of swarming population. Especially in the United States, which is not used to the idea of courtesy not really, that we've got to make a propaganda. For great respect to everybody. Otherwise we won't be able to to accommodate the crush at all. The funny thing about the Japanese incident is that. They've learned the manners of mutual respect, under certain circumstances. But new circumstances arise in which they haven't learned it. And one of these is the subway. It is total pandemonium. They they pack everybody into the subway like sardines, and they have special officials whose duty it is to push people in and to see that they're all jammed and they just shuffle the crowd then when they each official that the separate door has got it, he signals and the doors close.

Although in the situation the Japanese although they are shoving and pushing and so on when you are absolutely tied up against Japanese man or woman they're all right you know they're not going to pick your pocket or something like that. Then do it but they they do they fight and struggle and shove. To get place. After that, they relax. But they are not used to the situation and therefore haven't found out the proper amount of this for dealing with it.

So, this is then an example of solving a problem by seeing the one in the many. Namely that, treat every Many is the one that is to say accord respect. Then the many will be able to get along together. And that is that in some other words underlies our simplest ideas of every individual as equal rights in the eyes of the law. Only, don't invert it, meaning that every individual is equally nobody. This comes about of course, when we are in a hurry. When you're in a hurry, you can't be bothered to look at the details. And you simply wipe it out. So like naturally when you don't provide for sufficient schoolteachers every school teacher is dealing with a mass of children and there's an irony you can't be bothered with the details and you don't provide for enough judges. The courts are in a hurry and can't be bothered with the details. So always, be sure to keep your eyes open. That is to say, we have lots of teachers. And pay them properly. Lots of judges and pay them properly so that they want to accept bribe. And invest in those aspects of the community which are vital we're not doing that. In other words, the salary of a teacher. In any school is probably lower than that of the janitor. Which simply says. What it says. It just shows you what you value.

Well now, these for the use of the world, ended up of course with the fourth one which was called. The complete harmony of everything thing-event with every other thing-event. And I wanted to show you that this harmony exists anyhow. That, however wrong things may appear to go. There is a point of view from which you can see. A connection which is a harmonious rational connection. Just as if in your everyday life, you realize that, if you hadn't lost a certain job, you would never have been in the situation where you met someone you love dearly. You see, and you can in retrospect you can see all this kind of connectedness going along and one of the fascinating things in human relations is to figure out the network. You

know, there's a saying, that there are only five hundred people. This is a certain kind of joke. But it has to do with the fact that you have a network of friends. Who are, you know, the sort of people you think really are people. And they're all interlocked with each other in funny ways. It has been estimated that this should be a little larger figure, about fourteen thousand. That has something that that's a different joke and it has to do with the fact that communication has become easier than it used to be with the telephone rates and all that. And the jet aircraft. But there is this wonderful feeling of a network of people who know people and you'll get wonderful surprises because you meet someone and you find that they're the dearest friends of your old friends and so on and so forth. Now, from one point of view then, there is already existing between every single event and thing that happens in harmony. But this harmony is not manifest in terms of human conduct. It is there, even in the worst human conduct, but it's not manifest that is to say we do not have by any stretch of the imagination a really civilized society. And the Buddhists would say that you cannot have the really civilized society until you first realize that the harmony already exists. In other words, if you think you have to create the harmony socially. By some sort of moral violence. And impose it upon the world as it exists now you will only succeed in stirring up more trouble. That's why reformers that tend to be extremely destructive people. People with a fanatical mission. It is necessary first to see that absolutely nothing needs to be done to improve the world. Then it can indeed be improved. And this is another way of talking about what Blofeld referred to in his little essay as renunciation. Or complete giving up of self. Now you cannot give up yourself, let go of your own self interests and suddenly say well from today. I am no longer going to press my own advantage against everybody else. You can't do that by a voluntary decision. Because you will merely be using a new gimmick. To boost yourself. Look at me I am the most unselfish person how saintly I am. Only you may not say that to others that would be a little uncool you would say it to yourself though they look at me I'm I'm not really going to make this. There's no way they are for you see of. Being unselfish of renouncing clinging on purpose. It can be done only in the realization, when you actually come down to it you see that you cannot cling to anything at all. And there is nothing to cling to when there is no one to cling. And this is the realisation of what the Buddhists call voidness. The simplest manifestation of voidness is the fact that everything

is in a state of flux. Everything is falling apart. I mean there is it to me on this ferry boat because we are literally falling apart the hollows rusting underneath those dry rot in the wood. And it'll last a certain time and while it lasts we'll stay there but really it would be a fantastic project to preserve the whole thing and the money if such money were available or better be spent some other way but there is a sense when you live in the moving tides and watch all this junk out here growing and rotting and everything that there is and this is the Floating World. And that there's no nothing is permanent at all people create around themselves the illusions of permanence by building houses out of concrete and steel and granite and so on. And then when they get inside there they feel now that is put in order. But actually it's only a focus of your attention because the moment you solve a permanent ties a problem on one level say you make a lot of money and you build yourself a very solid house and you start worrying about your health. Because that's something you really can't control it's very fluid very volatile. Because it has to do with all your veins and intestines and and all these goofy things that don't stay put there you are about that is where you focus your attention but so if you become aware of what's happening in really in this world you see a basic proposition that everything is completely falling apart. And you think well then the obvious thing for a sensible person to do. Is to make an effort to secure it for as long as possible. And this is what we call the fitness Time Square practical attitude. This is the bush, well position you see. Make the best of the job. Do the work that's nearest though it's dull it whiles helping when you meet them name dogs over stiles. As the sort of thing you see on a plate, as a souvenir in someplace for tourists. Yeah, hold it together as long as you can. And there's something about that that we all laugh out. And why we did.

But that's not a very heroic attitude. It's not a very interesting attitude as the something else. That is the synthesis of despair and courage. In other words, that total courage arises out of seeing that there is really nothing can be done. Holding things together for as long as you can hold them together is a sort of illusion because you know time's going to run out and within one hundred years nothing will matter you'll be dead anyway. One reaction to that is of course why bother. But the other reaction is good lord if that's the truth but fun we can have now. You see if if the thing really is an illusion and it's simply falling to pieces and in every way there is nothing to grab is

the in any direction now get this now you see. No no don't say oh well I'll wait till tomorrow to face that. There is absolutely no possibility of anybody in this room being able. To stop dissolution. You can start all kinds of new evolution of dissolution by say having children or promoting a society which is going to go on beyond your death and whatever but. If you really get with the thing that there's nothing you can grab. That this is a total disintegration. And don't even try to hold on to something like God. Change and decay, all around I see, O thou will change it's not abide with me. Get rid of that, you see, because that that that doesn't allow the process to happen that I'm talking about when you don't hold even on to God There is nothing nothing whatsoever. It is just at that moment. That you acquire the curious vitality that we call Buddha nature. And that is essential energy, essential courage, and essential compassion. And remember, this can't fully be explained. You can say, that I see no logical connection. Between the act of renunciation. In other words, I've stopped thinking altogether not because I ought to, because I find out there's nothing else to do. Right now what's the logical connection between that. And the courage and compassion. It's not very easy to point that out because in order to find out you have to go through the experience. It's like there's and the parallel problem historically about the Calvinists. Calvinists believed in predestination. That there's absolutely nothing that the individual could do. To control whether he would be damned or saved for ever and ever because God had decided in the beginning of all time which individuals he would damn and which he would save. So you would naturally suppose that Calvinist who believed that would be rather dissolute and lazy people because they would say we're making a difference and nothing we can do about it but on the contrary Calvinist we're not Calvinist the very earnest people. Rather to learn is one my pillars of conventional probity, are prudence, morality and so on. Because they had to prove that they were predestined to be saved you see. So there is a difference between a theory and what you would think would be the application of that theory. The same theory in terms of experience and what will be the consequences of that experience. So here we are discussing because we are using words. A theory of the total ungraspability of the world. And that sounds as if it would lead to despair. Especially if there is no God to hang on to. Nothing at all to hang on to see. Then he would say, 'Oh well it's all nothing.' But actually, if you get on with that nothing, you discover what is

fundamentally worthwhile, what it's all about. And that's why they say Buddhists are atheists. Because when you really become one with God, Obviously you don't go around worshiping God. Or asking God for things and making prayers. There's no point in that anymore. Should God pray to himself?

So this then is a possibility here. When people see that, and are living let-go lives, that they could come into harmony with each other. In a social sense, political sense. And the question here now in practical politics is this. Is there any way of advocating a certain style of practical politics in everyday life, which persuades without preaching. See, one thing that is quite evident from the whole history of religion is that preaching doesn't work. I mean this is the great lesson of religion. When somebody says, you should do so and so because if you don't like what awful things are going to happen, nobody pays any attention. Because, they never really make the awful things that are going to happen convincing those else somewhere when you're dead or the consequences of not really amounting to being a nice person you know. What will everybody else think of you well who cares? You can always find a society a community where someone may think well of you. So you know if you are an outcast in one group in a civilization like ours you simply join another. Cause we're so diversified. And we make friends very quickly and nobody knows who you are what your background is, but they just take you in. In the old world, that's rather difficult. But in we have to find a way in other words of dealing with our great. Conflicts based on a kind of cold logic. Of seeing, of thinking a whole process through. Like that's take the Chinese. The Chinese are being stupid. The cause they've got the wrong propaganda man. They are squeaking. That they're calling out foul. And saying you record Western barbarians exploited us long enough. You're capitalists, you're imperialist, you're this that and the other had it. And we are going to. Overthrow you and we're going to overthrow our own landlords and so on and they're taking this line. Now that and that line is not going to work. It's just going to start hostility.

And exactly the same way in our own backyard here the negroes are taking the wrong line. Black Nationalism means we are just the kind of people the whites always said we were. Aggressive. Uncooperative, alienated. And if they take that line. Let's look at this is see as a matter of simply practical

politics if they take that line of black nationalism they are going to be wiped out mercilessly because who has the nap on. It is that is that. And looking at it from the other side, our white notion that Negroes are somehow inferior people doesn't pay off, because it just creates exactly that trouble. It creates that sort of saw in the body politic. It doesn't make any sense. Well suited sensate likewise to the China. Yes look. What you ought to do is instead of saying. With the put Chinese you say get up down your feet and say that so happens that we are the most ancient existing civilization on Earth, and we have cultivated reasonable as for centuries and you think Sweden is a reasonable country with a wonderful social democracy you just wait and see what we're going to do. We are going to be the most reasonable people you ever saw. And everybody will be astonished and will want to go to China and will there they'll walk over the whole of Asia. And the reason about all this that I'm trying to say... I'm not, I'll always try to emphasize the position that any doctrine of this kind is not preaching. It is not moralistic. It is simply pointing out the nature of the facts. That not that you ought to be unselfish and you ought not to cling to possessions to identity or to role to status the point is you can. And as you realize you can't you don't. Or so with other matters of practical politics when you realize what can't be done you won't do it. Or try to twist it. It's only so long as you are under illusions and think that certain things can be done which can't be done that then then these conflicts arise and. So, it is it seems to me along these lines, which I will call the lines of cosmologically. That there is perhaps some sort of possibility billeted, of brining about a practical realization of what the Buddhists call the Dharma Datu, or the state of affairs in which all individual things and events are in a harmonious relationship. Now let me though underline this point which is absolutely essential to grasp. That realization in social and ethical terms cannot possibly happen. Unless those involved in the project have understood that there is no necessity for it to happen. That, in other words, there is a point of view from which it has happened already. Because so long as it must happen, it won't. In other words when you say oh gee we've got to get this done this is urgent. Come on now everybody get in and pitch and so on with that we're going to make this happen it won't. That your life it won't. Cause people acting under the sense of necessity and constraint are not free. So this is why the. The Buddhist lays so much emphasis on the importance of what you might call the let-go personality. Person who it doesn't care. Doesn't give a damn to

use our own sort of colloquialisms. If I live OK, if I don't, so what? It doesn't matter. And that which looks from our standpoint that sound so negative. That the what they've discovered this is us that is the brightest most positive glowing gorgeous point of view.

Now, in the kind of culture and cosmology and view of the world out of which this philosophy arose historically, the general prevailing view is, that within a few thousand years, the world's going to blow up. You know Hindu cosmology works on the presupposition that in the course of time everything gets worse. And that only after it has got so bad that it dissolves. It's time renewed. And when the cycle starts again everything is as good as possible it's brand new. You know it's like a new house new car. New baby. And everything's great. And then as it gets older it deteriorates and finally falls apart. So there is, you see, about Asian politics. There's certain fundamental pessimism in that respect. That in the course of time, everything is going to get worse and there will come the destruction. Now, then what is the logic? What is the possible sense in talking about this case on philosophy? Well, they really seriously think that there might be the possibility of. In the harmonious world. The answer is this: That to get it you've got to get into a gift different kind of time. In the kind of time we are now living in everything is going to get worse. That's the nature of the time structure. But you don't have to live in this kind of time. You can live in another time structure all together. You realize this? You can. You can get out of this time. But only when you are disillusioned with it. When you see that it's not going anywhere. For example, you're all educated to believe that the future holds something for you. And you have a graded system of education where you've got step by step by step, always with a come on, saying now when you get this thing it's going to be great. And then when you get there are in your direction of the company. Chairman of the Department, senior surgeon in the hospital or whatever it is or you've married the guy. You suddenly realize that you don't have a future, because you've arrived. But then an insurance salesman comes around, and he tells you that if you buy this retirement policy there's going to be a great thing you had of you call retirement. And when you get that then you really got there you know then what they're going to do then is put you in a morgue as a senior citizen. Because you've got prostate trouble, bad teeth allows it ingestion has falling out and you haven't got the energy left to enjoy

yourself as you thought you would have but if you don't resist growing old and you understand how to grow old this is no problem. But the point is the constant illusion of that time will achieve what you are really after. If everybody brought up in this way is therefore living in of time. Now get out of that kind of time and see that by seeing that it doesn't lead anywhere. And I'm saying in another way the same thing as I was saying a moment ago that you can't stop things changing. And so there's nothing to hang onto. And there's no one to hang onto it either. This is like an illusory hand trying to hold firmly to apostle of smoke. So in these two ways seeing in and out of was that we're living in a false time and in this kind of time everything is going to get worse so forget it. It isn't profitable time. And you will be able to see that you can look at the the Everett what you would now call the everyday world see this is this this actual existence you can look at it in an entirely different perspective and live in a different kind of time. This other kind of time is vertical to ordinary clock time. It has a switch of emphasis in other words where the eternal now becomes what is supreme important. As the as we have time at the moment you see, there is no now. There's the past, and there's the future and there's a headline that which one becomes the other and on our watches you see I have a little funny watch that I open the hairlines are so fine that I have to put on my glasses to see them at all. And even then. They've really got them down to the most analytical little tiny lines would. You see what that means this is a symbol of having no present. Because the present has been abolished and made into the abstract hairline. The split second. There is no present in our kind of time. We are therefore presentless people. We have a past, we have a future that's all, but no present.

So then that's why it all of Huxley wrote a book called Time must have a stop. Now have to get rid of that time in the present is totally unimportant. What did you do it is important what will you do that is terribly important. That where are you who are you what are you now why are we not there. So then, it is only as people renounce the future and the past that they get a present. Now you the future hasn't come. Not here in the past is all together gone you can't get that. When you have no future and you have no past there is no nothing else you have but a person. And with this fundamental adjustment of human consciousness. You see the everyday world in an entirely different state, you are living in a new kind of time. And, you see

other people living in that kind of time which is of course going along this way. And you're sorry for them, because they are an illusion. But, it's a free country. And you can dig that illusion if you want to.

Now I want to finish up this seminar, by explaining, trying to explain, the way in which the Kegon the loss of faith, underlies the practice of zen. Because the earlier in the seminar I explained that it insofar as Zen Buddhism has an intellectual background. That is the Kegon philosophy. And in the first three sessions then I've tried to give you at least a partial view of what this fantastic metaphysical construct is. And if you want to incidentally explore it further. Alas, the literature is not too well available but there is an excellent account of it in the second volume of Fung Yu Lons history of Chinese philosophy. And I think that's the best place to go. There is a book that the little book that Suzuki wrote called the essence of Buddhism, published in London by the Buddhist society. And that also is an account of it but it's harder to find. So now how do we get from where we were to Zen? Well it goes like this. In the sutra of the six patriarch, the Ton Ching, which was the collected teachings of the sixth patriarch of the Zen school, who as I said was a contemporary of Fat Sung. And Sung died in seven hundred twelve A.D. and Wei-Nung died in seven hundred thirteen. In his discourse, he gives a lesson on the art of teaching. The art of being a guru. And this lesson is based on getting people to be capable of polar thinking. Polar thinking is simply, well it's not just thinking, it's a kind of feeling and a kind of sensing, wherein you see the going together notice of things that I have thought to be mutual thought to be mutually exclusive opposites. In other words, you wouldn't know you were right if unless somebody else was wrong. Normally, we think then the right and the wrong are mutually exclusive. But when you are capable of polar thinking you see that they go together a person who feels in a polar way sees figure and background going together. He doesn't see them as mutually exclusive. Now then you see when I was explaining the Jijimuge. The fall off Dharma world or the fourth way of looking at the universe which is the culmination of the school I was trying to show this point. That all events have a go-with-ness with each other in the same way as a figure in a background. So in order to get this point across when Wei-Nung explained that when a person asks you a question about something sacred. You give him an answer in terms of something secular. When he asks you about something eternal. You give him an answer in terms of the temporal. When he asked you about

something abstract you give him an answer in terms of the concrete. And so the whole way down the line. So, when you read your Zen stories which are always this apparently delightful nonsense somebody says What is the fundamental meaning of Buddhism and the answer is. A dried dung scraper. In the far East, [they] don't, they used not to use toilet paper they had a stick they used instead and this is the answer. You see here has switched completely from the domain of life that is considered philosophical and sacred to one that is considered completely profane and unmentionable. Then on other occasions. It goes the other way. A monk says to the master. And they're engaged in cooking. Potatoes I mean. This is possibly the knife. The master hands it to him blade first. And the monk says please give me the other end the must as what would you do with the other end. And this immediately has a kind of metaphysical flavor to it. So that he jumps you see from the practical question to the metaphysical, but if you ask him the metaphysical he will always answer in terms of the every day. And the whole genius of Zen is really this, that it has a way of religious life and a form of iconography. And the form of which is secular. And it has created a whole school of poetry, where the deep philosophical matters are never, never mentioned. Except sometimes by way of making a joke. Because what Zen tries to do ideally is to be completely cool. To create the religion of no-religion. So that you don't notice it's around unless you're in the know.

Now this is not actually true in practice. Many people are disturbed when they go to Japan. And they walk into Zen temples and find that they have rituals and services such as I've just been playing to you. That they have elaborate Buddha images and people are making bows to them as a matter of fact when Professor Huston Smith went to Japan. And was being shown around a Zen monastery. He noticed that his guide them you know the particular master of the monastery whenever he passed an image of the Buddha would stop and bow. And he said to him, I don't understand this he said because I thought you were present but it's wood burn up these images and as you one of your masters did in one of the stories. That I don't see why you bothered to might just as well spit at them. The Master said, you spits, I bows. But you see, the thing about all this is the about iconoclasm. There are very different spirits of iconoclasm. The Puritan iconoclasts who broke down all the images in the English Churches hated the images they

thought they were evil and wrong. And so they smash them ruthlessly. But when a chicken comes out of the egg shell. The egg shell is not something to be deployed it's certainly something to be broken. But had the shell not existed the chicken wouldn't have been protected. So in precisely the same way, images, religious ideas, religious symbols exist in order to be constructively and lovingly broken. Because they are like opening a package. If there's no package you know, you can hardly get the contents because it falls through your fingers. So something comes to you in a package. It's why packaging is so important and so interesting. Something comes to you in a package Well it's like on Christmas Day here all these gorgeous packages with colors and gold and everything and very often the package is a much better than what's in them but. You then all everybody proceeds to tell them apart and get what's inside.

So, from this point of view the Zen Buddhist Raghada all ideas. About Buddhism about philosophy about religion and so on as so much packaging. And in order to get at it you have to get rid of the packaging. So what happens then? When we get to the state I was talking about this morning, where you abandon completely, all belief. You abandon every sort of way of hanging on to life. You accept your complete impermanence, the prospect of your death, of vanishing into nothing whatsoever you see. And of not being able to control anything, of being at the mercy of what is completely other than you. And you let go to that you see in this means that you even get rid of any any god whatsoever to do this fully. You don't have a thing left to cling to. So this complete let go flips, and you discover having made it a new way of experiencing all together in which you don't need any god. Because you're it. But also, you don't cling to the idea that you're it. In other words, this is why Christian a mighty. Makes a certain kind of attack on people who are they down tests and who believe that the human self is ultimately the divine self he's as why do you believe in that. See, because if you believe in it, you are making it a thing to hang on to. And so in a way then you see all belief in God is lack of faith. That ever struck you. You're still clinging and so long as you're still clinging you don't have faith because faith is the state of total let go. So, when through some marvelous desperation, we get to the state of total let go, and then you see fantastically religion anything like religion simply disappears there's no need for it any longer. Like you've crossed the shore, [you] cross to the

other shore you don't need the raft. Get off. Leave the raft behind. Now the other shore is actually the same as this one. You know when you cross the river. When the mountain is in the distance see there's the other shore over there it's kind of different from here you can sit here and say. Be nice to live wouldn't. See a place up there I'd love to live because it looks so good from here. But then you go and you buy the house. And you sit there and it feels the same as this place feels because you are there. And how things feel. How you are near look back across here and say gee isn't that look lovely. There are mysterious trails going up Mt Tamalpais. That look as if they led to that place that we were talking about this morning the Secret Garden which every child remembers. And they'd disappear through trees and there's a kind of a mysterious little canyon and you can hear the sound of a waterfall and you know somewhere in there is that garden I know as a matter of fact where it is there is one. But, always, when you follow the road right through it leads back to San Rafael. And its suburbs, on the other side, you see. I have been years seeking the ideal place. And I've come to the conclusion that it the only way I can possibly find it is to be it. If you can find it in you, then anywhere you go is the ideal place to live. But it's so fascinating, projecting it outside and going on a look for it. I mean this is the whole of fun. Fun means.

So, when therefore, religion is abandoned, you are in a dangerous fix, because you can very easily slip into madness. We were talking this morning about a vision. Brought up this question about the vision of a fourth dimension or another dimension and anybody who looked at it went crazy. And this is a real danger. That people who have the mystical vision, whether through practicing yoga or Zen Buddhism or hesicaste Christian prayers or by taking L.S.D.. Become. A serious menace to society. And society gets really worried about them. Because they have, they they're not taking the world and its concerns seriously any longer. They know it's an illusion. And if you really know it's an illusion. If you really know I'm an illusion I don't know what you're going to do with me. I don't know whether I trust you I don't know whether you're going to keep the roots. I I just don't know about you you've seen through it and goodness only knows you may do anything and if you're not sure of yourself. And you suddenly see that all this is an illusion there's nothing you can cling to it's all relative, you may get bugged and you may go nuts. And that's the great danger in all

of this. And that is why a Zen monastery is at one and the same moment a place of total iconoclasm, of seeing through the whole thing, and yet at the same time it maintains a discipline as clean and strict as anywhere you can find. The combination of the two is simply marvelous.

Unfortunately modern Japan doesn't dig it. But what they've done is to, they've well recognized, that you cannot go into outer space and come back to this world without strict controls. It's exactly the same way when you're skin diving. You go below a certain number of fathoms and you experience weightlessness. Now a person who's not properly trained at that level will get happy. Now there's no reason why you shouldn't get happy. Provided you keep your wits about you. Nothing matters at all when your weight vanishes because after all you don't matter anymore you have no weight. Nothing is weighty, nothing is important. And a person may at this point take off his oxygen mask and offer it to a fish. In which case he'll drown, he'll never come back. And if he stays down too long he enjoys this too much his oxygen supply will run out. And he'll be lost. So he has a watch. And he knows according to discipline, that at a certain time on this instrument he's got to come. It's like when you had too much to drink and you're driving you got to watch a speedometer drive by instruments when you're in a difficult situation in an airplane and you lost your sense of gravity watch your instrument don't trust your senses. And see. This is very important.

In Buddhist imagery, there are guardians of the directions of the universe. And they are all in the figure of Chinese generals. With clubs and swords and very fierce expressions. And they are always put at gates. You know, Gates a north, south, east and west and here are the guards. They got the entrances but what they really God is the directions. Because it's absolutely important. That we can agree on our time scale. And on and off south east and west so that I can meet you. We can agree about that we all miss each other completely will never meet. And if we can't meet we can have dinner together. If we can have dinner together we can love each other. So in the middle of nothingness, which is all this space here, see, which is nothing whatever. There are nevertheless directions. And think what a beautiful thing that is easy to set up directions in the middle of nothing. So for this reason, in the religion where anything goes, and anything is allowed. No

holds barred. There is for that reason precise discipline and order, which is pretty strict. But the spirit of the strictness is different than the spirit of strictness in theistic religions. In Buddhism there's no boss. Ultimate reality is not conceived in the form of off parity. Because from their point of view that's childish. You're your own boss. And you're responsible if you want to believe it belong to a society. It's up to you if you want to conform in other words but one of the interesting things is you can always cease to be a monk without dishonor. In the Christian church, you can't. Because you make life vows to get in. You promise for ever to be obedient, chaste and poor. And this this is irrevocable like Christian marriage. But in the Buddhist Order, you can leave any time you want. And they say all right if you do you've got many other lives ahead of you in which you can be a monk all over again, and if you don't want to do it this round you don't have to. And we're not we're not mad at you. Just please, if you don't want to undergo this discipline go somewhere else. And there's no dishonorable. That at all. I have a friend in Los Angeles who runs a very fancy restaurant. He was a Buddhist monk for ten days. It was quite an experience but that's all right. OK you try it and if you want to stay here we're very happy to have you if you don't want to we just assume you one round because you're not deceiving us you know if you stay and you don't really want to but feel you auto you're a nuisance like a person who feels they ought to be unselfish and is therefore always making promises which they're never going to fulfill. It is much better to be frank and tell people what you honestly feel than pretend so. For this reason then, where there is no religion at all, because everybody's realized that the sky's the limit. There isn't any boss. There's nothing to kowtow to. Because you're it. It follows that you become therefore responsible for creating an order. Instead of there but, you see, instead of submitting to the order, you create it.

Next, you find that you can, having got rid of religion completely. Well now everything becomes religious. That is to say instead of having some kind of hang up on universals, on vast abstract huge area conceptions. You employ instead things that are very particular, very temporal. Because of jijimuge. You remember, the image that I used to illustrate G.G. more gave was the net of jewels. Where in every Crystal reflects all the other crystals every dewdrop on the spider's web reflects all the others OK So then. I just happened to pick up this because it happened to be handy. I don't want you

to think about found in Orient and what sort of thing. With this all Buddhism can be taught. All the universe, all sciences, all philosophy can be demonstrated with this. Because this is one of the jewels. Reflecting only others as when you pick up a link in a chain all the other links come up with it and so with us. And, if you ask me about what is the mystery of life what is God, and I show you this fan. People look at you in a strange way. And say. I wonder what he meant by that. Well truth of the matter is it didn't mean anything at all. Because this doesn't mean anything. Words mean something because they refer. To events and things that are other than the sounds of the words. But the things and events that words refer to don't refer to anything else. Of course that connected with everything else but they don't refer to everything else in the same way as a symbol dots.

So that's why Zen always answers in terms of the completely concrete. What is this? A fan. Must be a noise. Which This isn't. This is. What this? Or alternatively if you don't want to be hung up on it. It's this. Or this. New Thing. There's no fixed thing that this is. So, in just the same way. Let's consider the advance that Zen makes in the world. Of art. With all the world of painting. I showed you a Tibetan painting this morning which was extremely elaborate where every tiny space was filled. And where all of it was obviously religious It was quite clear that this painting was an icon. Now then people don't like that and then. I mean, it isn't that they have a real prejudice against it but they don't usually have it around. Instead, they prefer a style of painting in which there's an enormous amount of untouched paper. And where, a brush has various swiftly and deftly painted some bamboo sort of in one corner. Now, the way the bamboo is put on the paper lives all the rest of the paper, because it turns it into a lake. Without drawing a single line a master can put bamboo on a piece of paper and turn the rest of the paper into a lake. Everybody can see the lake there although nothing has happened empty space or it might be a whole mountain might be there but covered in mist. Because you see, he didn't use the paper as mere paper. You often see around especially motels they have, you know, the kind of Motel where you have flower prints over the bird. It is a bunch of flowers taken out of an old book of etchings or something put in a frame. Some interior decorator remember it was there in one two three four months in a row and always the bunch of flowers is put bang in the middle of the piece of paper now you know what that does that the vitalized is all the rest

of the paper because it means the background has become an important and this is always done by people who don't understand polar thinking who don't feel that figure and ground go together, but all Zen painting where you get this extraordinary relationship of figure to background is done by people who feel and think in a actually a sense in a polar way. They see the space and the solid simultaneously. And that's why the Chinese place things in space the way they do. Even, you can't all see it from where you're sitting. A piece of calligraphy contains in it, an extremely important relationship between the characters and the space. Now it would take me quite a while to go into all the details of that. But they have to be. Just the right size to accord with that space. There isn't only one way of doing it there are several ways of putting the characters in a piece of paper that size. But in each way that you use, you take account of the space. You don't use the paper as a mere neutral background. So when, for example, you will find so often with the Chinese painter takes his area, his rectangular area in which he is painting, and he will paint one corner. And for it say from the bottom left he will strike up a bamboo stalk, and flow leaves in the wind on it. And so leave the rest. This is a trick. You see which. Uses and as I said vitalize is the whole of the rest of the area. And you don't do that. Simply by putting the figure plump in the center.

So, the whole art which has been inspired by zen is based on the polar recognition of the identity of space and solid. Solid in space, see, one implies the other. But this is always so unexpected from the point of view of common sense people. In other words, think space is nothing. And it has no power. And so for this very reason, the architecture inspired by Zen is practically all of it playing with space. Then emphasizes the luxurious richness of poverty. Of rooms with practically nothing in. Furniture lessness. And if it has a luxury That's unbelievable. But the uncluttered life. Although I must say. That somewhere. I went to the house of a very great team out. Where everything was absolutely gorgeous live in order. It was the highest styles then taste Japan and. They call it the Motomusashi. And we went into a little tea room and Jane-O, in a kind of experimental fiddling way pushed aside a screen. And inside was a western style room. Come prickly cluttered with papers and old clothes and everything thrown in there was this thing because everybody needs an unconscious place you can somebody everybody everybody's house has a basement or a closet or

something where they throw everything away. That's just what I call the element of it or reducible rascality is always there. But nevertheless, on the outside, the place where you operate, you know, they have this sense of complete clearness. Which is the coincidence in one artistic expression of freedom and discipline. Anything goes because you've got complete space in which you can do anything and yet the space is disciplined beautifully. Then in the subject matter of painting. Then people of course as I said prefer the secular. Even when they paint St sages, Buddhas, and so on, they give them a secular form has to say they look like just ordinary people. They don't necessarily have hellos or special markings. They prefer that they shouldn't but they should look kind of rustic. And they prefer to put on the altar as it were the. Token Nama of a T.V. room. The alcove in other words, is not almost never adorned with a religious figure. But always with a naturalistic painting rocks. Water, vegetables. Trees, whatever. So in the same way, in poetry, where the haiku is a kind of masterpiece of this way of feeling the universe. The haiku always celebrates a particular finite. In ji type and no ji. as distinct from Ri...instant of life. In the dense mist, what is being shouted between hill and boat? And you from such a poem will remember you know some morning when you were at some goddess or of a story. And you couldn't see anything and of the conversation going on between going to calling down to someone in the boat on the Hill and you can't make out what it's all about anymore than you can make out what's on the other side of the river and yet you know it is God it is. Somehow the very fact that you can't see makes it all the better. This is all there is. The path comes to an end in the parsley. This is called in Japanese Yugen, Y-U-G-E-N.. We have no English word for you again whatsoever. But yugen... ends nowhere but with a certain implication. That is to say, as I was just trying to describe the place up in the mountain, where somehow the trail disappears. And there might be something beyond. But the whole point is that you don't investigate too closely. Because then you are the sort of person who when you get in there would spoil it. Like you say. When you make love to somebody do it delicately. Don't be too inquisitive. Don't be too probing, because that would injure what you love. But the real constant theme of the haiku is that it always incarnates the specific. Finite, temporal, immediate moment. And with this says more than you can say with any amount of abstract generalisations. Only, only, only, only, you always know but that behind this, the people who make up the haiku are not Bourgeois

philistines who say, well isn't the main thing simply to be practical and get on with their work. The point about the haiku is there's something in human life which is very difficult to pin down. But it's when somebody comes on at you. And says something but you know that there's another meaning behind it which doesn't have to be stated between you. And so you get a joke. So you get a tacit understanding about something. And. This looks like it's this but it does that. And I could does this in a very cunning way. It's the simplest possible utterance. Basho said to get haiku well written ask a three foot child to say, the robin's egg is blue. You light the fire. I'll show you something beautiful a great big ball of snow and this is a haiku. But something is conveyed by this, see, but we're not going to talk about to be bad form to begin with. Like gentlemen in England don't talk about religion. Or sex. Well, you don't mention these things it's not quite like that but it's nearly like that. There's something got over to you by this. Where the whole fun of the thing is that you don't mention it. But this is possible only when you know. The jijimuge thing. That every bit of experience takes in everything else so in exactly the same way we have a confraternity among us in our society today, of hipsters. And they can with a flick of an eyelash, make a whole crowd of people laugh or in the know. Because they have seen that one single moment motion of an eye is the whole universe in operation. And the joke is that the people outside don't know this. But when I move an eyelash at you and you're in the know about this, you laugh. It's the very funny game.

Problems in Meditation

As you know the subject of the seminars problems of meditation. But the word meditation in English is usually associated with thinking things over. And what I'm talking about is not that at all. But we use the word to translate Indian words such as tyana, which in Chinese is Chanon in Japanese Zen. And we use it to translate words like yoga. And sadhana which means more or less a spiritual discipline. But, the function of what we call meditation, in the East, is a process for changing consciousness. Changing the quality of consciousness changing the way in which you experience your own existence. And as you know, all over the world, with some exceptions among quite primitive people, we experience our existence in a rather odd way that is to say as being isolated individuals. Highly

disconnected from the external world. We feel that we are almost strangers in the earth, even though we are just as symptomatic of the earth as a tree or a cloud or the oceans or mountain. Only we move around rather more freely. And our behavior is extremely complicated. Also, we are more responsive to the movements of nature than say a mountain is. If you hit a bell, it will just say dong. But if you hit a human being, something much more complicated will happen. But it's quite clear that this way in which we experience our existence as a hallucination. It just doesn't fit the facts it doesn't fit the facts of science. Because when scientists describe the behavior of human beings or the behavior of any other living organism whatsoever. They find they can't do so unless they describe the behavior of the environment at the same time. That is to say, of the external world. And this forces one to the conclusion that what you are describing is not simply the behavior of an individual but the behavior of what we would call a physical field. And so in this sense then, the individual and the field the environment are the same process only it's a highly complex process and the difficulty we have in seeing it as a unity is simply that we suffer from a kind of myopia.

You see if you take... let's put it in a sort of an abstract way. There are a whole series of bodies points and they may be planets they might be cells in tissue or they might be a flock of birds. And as you watch them you see that they're all moving in the same way. Supposing you saw a vast chessboard with innumerable squares covered with Knights. And all the knights were moving through the knights move but in exactly the same pattern. You would then identify this whole performance as a thing. You would say it is one thing. It is a bevy of knights. Or a flock of birds. Or a Ganglion of cells. Now, the performance of this collective, might become a little bit more complicated as one sees a difference between a surface with an even pattern. With a uniform pattern and a surface with a complex pattern on it although with a surface with a complex pattern you might call a picture and a picture is a thing. So let us suppose that on our vast chess board, the Knights still kept the essential pattern of the knights move but certain groups of them did it towards the Far Side of the board, and others that it was the near side some did it towards the left and some did it towards the right then you would see a much more complicated process happening, but you would still call it a process. Well, let's make it a little more complicated

you see. And soon you will see the whole movement of the Knights will assume before your eyes what I would call a wiggly performance. It will look like a let's say a bucket of worms where they're all wiggling in different directions and the only reason you don't call it a thing anymore, is it's too complicated to figure out what is the pattern of the whole thing. There are as we say in it, too many variables. But it still essentially is the same sort of thing it was in the beginning except that it's just become more complicated.

And so, if you want to keep track of it, the only thing to do and that really isn't keeping track of it but it sort of keeping some sort of hold on it is to focus your attention on one of them. And you follow the path of one worm in the bucket. You watch that going around and watch it going around you see you know you get rather fond of it. You begin to take sides with it. And before you know where you are you've identified yourself with that particular worm. You're on its side. And if either one should clobber it you say don't do that because it loses my thread see my worm. I want to keep track of all this and if you Club of my why my I'm at a loss how to pick up another. And you see every individual is exactly in that situation. We have identified ourselves with a particular organism. And we're interested in it we would be very carefully brought up to take that point of view to take one's own side. And it's taken many, many millenia to produce that point of view in us, and therefore it isn't going to be easy to take another point of view altogether. We are myopically, in other words fixated on our what we call our own body.

And a little while ago I don't know if I've told you this story before but I was asked by the weapons research laboratory of the US Air Force to go there and consult with them about moral behavior, of all things. They were they got a panel of four philosophers. All there was at least one theologians and they wanted to know what was our basis for moral conduct. Well I said when it came my turn to tell them, You gentlemen here of course are all very realistic hard boiled people, and I'm not going to mess around with you and give you a lot of mawkish sentimentality. I tell you frankly in my bases for moral behavior is total self-interest. Cos I'm not crude about it I just don't go around and bang people on the head and tell them to give me what I want I do it much more subtly I'm in great shape I tell them I give

the impression that I very fond of them and going to be sociable and well behaved and so by this setting honey to catch flies I'll get what I want. And naturally, we must observe this basis for moral behavior not only on a personal level but also on a national level. And it's your job to conduct the strategy of the United States by such subtle methods as we get what we want and of course you other other hard hitting fellows and it's up more to the secretary of state to put on the counting. Now I said the problem about this is it raises two further questions. The first question it raises is what do I want? And the second question is who am I? And this it becomes an extraordinarily interesting and quite complicated when you really begin to think it through and it is your job as a high strategist to think these things through and not just take shots sighted goals because if you do you can get in tremendous trouble and what will you do with Vietnam when you get it? Any conqueror has a terrible time looking after his victory. Because just more responsibility and is that what you want you want all that responsibility. Do you want to be God? Do you want to rule the world? Well of course, nobody does. We don't in the first place want to rule our own bodies let alone the world and so we've got a marvelous contraption going insiders whereby most of the things that go on are inside our bodies don't even have to be thought about. And so it goes very well the only time we have to think about anything is when it goes wrong. We have this homeostatic process going on inside us which takes care of temperature and all that sort of stuff to digest our food for us without having to think about that. And that's just great and another word for that system is democracy. Because all we've delegated the authority. For regulating our bodies to all the organs and cells and so on and they they manage pretty well another name for it is an icky not in the sense of chaos but in the sense of anarchy as it was taught by Prince creep up in philosophical anarchy which is he would say for example that if you have a bunch of pebbles in a box and you shake it they will eventually arrange themselves in an order.

And, so in the same way he said you can only get human beings to behave themselves properly by trusting them. By letting them bite it was say in a big business you have to delegate authority or you go quite mad a person who tries to govern a large corporation or a political unit of some kind, must delegate off because if he doesn't he'll have to think of everything that's going on all the time and you'll never even get a moment to sleep

because he's the perpetual policeman of the Big Brother and there he'll be sitting in his super office with hundreds of television screens. Peeking at what people are doing because he'll probably have some subordinate peakers but he's got the peak of the beakers and see that they do their jobs and he just didn't In other words he he's tied up he's completely in a trap. So, then you know, we got into this kind of thing and what do you want. And they began to have their minds expanded. Because nobody really knows what he wants. It's perfectly fantastic to talk as I have for many years with young people when I've been in college situations. And the thing that one talks about most in the long run is what is generally called vocational guidance. What do you want to do? Well, some people say they just want to paint. Or write poetry. And others say they'd like to ride horses. Others say they want to make money. And they laugh at the people who want to paint and ride horses, because they say you never make any money that way. But I always said in this kind of counseling. Do what you really want to do and to hell with the money. Because you will find out that if you think that what you want is money that that's not what you want at all. Unless you are merely fascinated in the mathematics of making money, which of course has a certain interest to it, because it's like playing poker. But if you think you want money and that will make you happy it won't do anything of the kind because all the extraordinarily rich people I know, are for the most part miserable and have no idea how to enjoy themselves. They, they are either so absorbed in making and keeping the money and defending it against other people and against the government, that they worry about it their night or if they don't worry about it they worry instead about their health. Or their family relationships. There's always something to worry about it doesn't matter how secure you are how well off you are there's always something to keep you awake at night if you're the worrying type. And the people who think that what they want is money. They say Well I'd like to be rich. Well, I would say Be specific. What sort of wealth you want? You know you can't drive six cars at once You can't live in ten homes at once not eat twelve roast beef that one meal. So in concrete terms, please. Please make it as concrete as possible I say is material possible what do you want under Who do you want to marry? Be specific. Don't just say I want a beautiful and intelligent woman. Because there is no such thing in the abstract there is only this particular beautiful and intelligent woman or that one.

So you have to get very specific in thinking this question through. And soon you discover. And let's just take the question of marriage the sample This may seem to be a little bit off the subject but it really leads directly into a. Let's take the question of marriage. Now, you say yes, I want this I want that I want the other right let's go along now would you like. A woman. Who always does exactly what you wanted to do. And that she fulfilled your wishes even before you've expressed them. That she is completely responsive to [you]. You think that over for a while and some people would jump at it and say Yes, that's exactly what I want. But last said to think about it just a little bit more when you. And they go on thinking a while and they suddenly realize that what they would have would be a plastic doll. Very highly mechanized one, but very complicated one. But that's what it would be because if she would never be able to surprise you. And so when you it would be like where plastic covers when you push a plastic doll it yields and then when you take your figure away it goes back to its ordinary position. Well then you push that and it behaves that way you say that's not alive that's just a doll. But what you like about a real live woman is that if you push it a little bit you don't know what it what she's going to do next. And so she comes back at you, and you realize that she is a center of life, just like you are. See which is another one. And that's interesting now this more all in the in other words applicable to everything if you want to control everything all you will have will be a dull. But we want it to bounce back in an unpredictable way. Not too unpredictable. But there's something else we want to see and we want a relationship with it with that with. With a real living being and that means you've got to let things get out of control. So that you can be surprised. And I notice and we're going to come back to this notice notice notice that's the state of affairs we are in however much we may complain about. We are in this state of affairs where we're always being surprised, and where things are only very vaguely predictable. We can push technology and we can push science maybe in the coming centuries to extraordinary degrees, where we can predict all kinds of things, but I'm quite sure that as we approach that goal there will be an increasing anti-scientific revolution. We can see it already among the hippies that there is a tendency to want to abandon very, very high technology. Because it is as they say, and this is a sort of symbolic expression, covering the earth with concrete. Taking away the thing that we call ...and we really don't know what we mean, we call it nature. It's somehow against nature. And

when we say nature we mean the. Well of the earth we mean the wind in the trees we mean vegetation grass clouds water. All sorts of funky things. And there's something in us you see that yearns for that always. And yet we have a battle inside ourselves when it gets too funky we say it stinks and we want to clean it up. And we're always trying to straighten things out nature is always really all over the place but whenever you see anything straight like a house or a highway or factories you know people have been around because they always make things straight. They they're bothered by weekly things even though we're all very wiggly. So we're always straightening it out. And so yet at the same time when we get it too straight we don't like it. But what do we want? Well, you can always say we want something 'twixt in between. We want a certain amount of control Yes but we also want to certain amount of randomness. We like things to be tidy we like things to be simple we like things to be comprehensible and yet we don't really. Know what we want is a kind of. Orderly randomness and a random orderliness. That's what Buddha called the middle way. And the maintenance of the middle way is very difficult. It's like walking a tightrope. And when you walk a tightrope you're always swaying a little bit from side to side your counterbalancing itself. And so to keep the middle way is a matter of constant counterbalancing, and that's difficult. And so we say well, I know I did want the middle way but it's awfully difficult to keep it and that's rather bored do. It sir. If you really don't know what we want. And yet it away we want what we've got, because profoundly looking at it from the most profound point of view, we wouldn't have what we've got if we didn't want it. That's what the Buddhists and Hindus call karma. The doctrine that what comes to you is a return to you of what goes out of your. Karma, I, when you say it is your karma that this has happened it means very strictly it is your doing that it has happened but as the word karma means doing action. But of course, we, because we are constantly complaining, and say I didn't want this and I didn't want that and somebody else is to blame and you did it, or the universe did it, doesn't thing like that or God did it. We are constantly unaware. Of the fact that we get what we want. And we are unaware of what we want also because. We want a lot of things that we don't admit we want. And we don't admit it to ourselves you know that time and time again where somebody wishes their mother was dead but can't possibly admit that. And, finally they go to psychoanalysis and it comes out they really do wish their mother were out of the way and, you

know, that's a great revelation. So in the same way, you will find we have all kinds of concealed wishes that we won't admit. And if we really went into it I think we would find that we are on the whole living the way we want to live. And that would be embarrassing to find out from the very many reasons not only because we would discover all sorts of villainy within ourselves, but also because we would discover a great deal of power within ourselves. And that's dangerous because. You might begin to think you were God. Then, this is then raises the second problem the moment you get really get into it when you ask what do you want it raises the second problem who are you? What are you? And we haven't thought that over by a long shot.

Because, let's just consider a very simple problem in perception.

You cannot identify visually a figure without a background. You cannot identify a sound unless it can be heard against relative silence. Or in combination with a limited range of other sounds again against silence as in listening say two four part music. Now, if you can have the sound without the silence, if you can't have the figure without the background, doesn't it occur to you if you think about it, that the sound down the silence are all part of the same process. One of the most curious problems of human consciousness is what I will call ignorance or ignore and of space. Of background. Of the field in which any given event happens or in which any so-called thing exists space is ordinarily understood to be nothing. So we ignore space. There are all kinds of space. We can talk about intergalactic space, interstellar space, the space between people, space in a room. Space to stretch in. And only physicists and architects and painters. Really begin to be aware of space as something that they're. And so when astronomers talk about curved space. Or properties of space, the average person says they're talking total nonsense. You can't have curved nothing. You can't have properties of pure emptiness. And so they feel just the same way as people used to feel long ago when it suggested that the earth was spherical. Well they said you can't have a spherical earth, because the people on the opposite side would fall off. Because they thought of gravity. As one directional through space and they couldn't see it as some a force that was centripetal. So, when we say for example we should go on to higher things well who's higher? Because every one of us being, as it were, having our

feet pointing to the center of the Earth must have our heads which are up pointing to regions of space which are vastly differentiated. So which way is up. Your up or my up? That people have a great difficulty you see in getting new ideas of the skyline and this is the difference that is so often brought up by people who discuss oriental philosophy or mysticism. They say I understand. But you say in theory but I don't actually feel that I don't realize it.

So in the same way, somebody hundreds of years ago might have said to a geographer. Yes I understand your theory of the earth being that of all. But I don't feel I feel I'm living on a flat thing. I suppose a lot of people living today feel they're living on a flat thing but if you've done a great deal of travel by air certainly if you've been in orbit as an astronaut you jolly well know it isn't flat. You realized it. So in a similar way, I think that in the course of history we have realized colors. There's evidence to show that only quite recently have people really been able to differentiate blue from Green. In Chinese, there is one word meaning blue and green and it means the color of nature. You know how much there's a reference to the wine dark sea. And we wonder whether those early Greeks were aware of the differentiation of blue from the dark red of wine. See the dark red of wine is beginning to approach purple. You see, that the spectrum is...we always look at it in books when we study physics and in certain physical experiments we see the spectrum of as a band, as when we look at a rainbow we look at a section of the rainbow and we see a band with red at one side and purple at the other what we don't realize is that the spectrum should be drawn as a circle in which the different colors radiate from the center and we would see that when you have gone through red orange yellow etc around the purple you go again to red. Because after all what is purple except the mixture of red with blue.

So, everything goes around like that. Everything in the world, as a matter of fact, is a crisscrossing or interlocking of many Dimensions of spectra. You take the spectrum of sound. If anybody thought to do it they could make up a spectrum of smells. You can make a spectrum of emotions you can make a spectrum of tactile vibrations you could make a spectrum of textures. And when you put all these things together as you say. It is blue and hard. Or that's where you've crossed two spectra. We don't usually think of

something that is blue and noisy. But, it would really be quite easy to conceive something that was. We don't ordinarily hear colors but you can you can take L.S.D. and hear colors and or see the color of sounds and realize that your senses are fundamentally one sense differentiated, is very tender and sensitive in the eyes because it can by being so sensitive respond to the extremely subtle vibrations of light with the ears it's a little less stander but the ears respond to the subtle vibrations of sound. Vibrations in the air. And then the nerves on the epidermis, they are a little cruder. That they respond to the vibrations of the so-called hard objects. Or through vibrations on the same spectrum as light but we call it heat. And then when you begin to think about these spectra. You just begin to feel about them. You find there are some places in this interlocking measure of specter that you have rather be than others. You don't want to be where it's too hot. You don't want to be where the light's too bright. Or where there isn't any light. You don't want to be on the spectrum of touch with the sense of touch is excruciating, sharp, you're always try to move away from that. But you see there are so many spectra interlocking with each other the when you move away from one point that you don't like you're very liable to bump into another that you don't like on a different level. And so eventually you realize, that just as you can have the red and without the purple you can have the pleasure and of the tactile sensation, without there being also the pain end. Because if you weren't responsive to the pain and you couldn't respond to the pleasure end. You must have the whole spectrum to have any of it.

And the longer you go into that, the more you think it over, the more you realize that. You say something that Mystics often say, but which ordinary people just can't understand, when they say that everything is harmonious. It's absolutely absurd but everything. It is really harmonious in the end. And it's all of it is somehow just as it should be. And the ordinary person says Well that's absurd. Let's take the problem say that we're all faced with the atomic age. There's a real possibility we can blow up the planet. And we might do just that. When I mean, I'm involved in the situation if I were going to bet on it and they were somewhere to place my bet which there isn't. I would bet that human beings will blow up the planet. Taking a hard, realistic point of view as I think human beings are going to do the most stupid things they can do like I've never been anywhere anytime I've voted

in an election my candidate never won. So I tend not to vote. But I but I realize at the same time I'm involved in the scene. I can't get out of it. There's nowhere to place my bet therefore I have to do something to make things come out the way I think I want them to come out. But let's suppose they do blow up a planet. Well this is just a fantasy but supposing they turn it into a star. Maybe that's the way all stars started. Maybe there's a sort of a process which works like this that there is a star and it as it blows up it's got hoes all sorts of fragments out and these become planets. And then every so often and some star has a planet that starts generating life. And life gets more and more intelligent, and starts working around and fiddling and then it starts asking questions what is all this you know what is matter? They investigated for they prod it, and they electrify it and do this that and the other finally [explosion].

And so that you could say in this way in the evolution of the universe. All stars mean that there were once people around and. So in this way, then you could construct a vision of things where it was all perfectly all right that you have to have bad people as well as good people just as you have to have. The slugs in the garden and weeds and all sorts of things you don't approve of in order to have something that you can approve of. You see oil is the this is that this is what the mystic feels he suddenly gets it is say that it's all OK. And of course, the average person thinks that's a very dangerous thought and there are several reasons for thinking it's a very dangerous thought one is that. It seems to give justification for any kind of behavior and therefore to overrule all the ordinary reasons for being moral and cooperative. Although, it neglects the fact that the might you might then discover quite other reasons for being moral. And you might be so happy as a result of finding this out that you're happiness would become infectious After all if I'm suddenly going to be given a million dollars I'm not going to suddenly run out of doors and shoot everybody. I'm much more liable as a good Gareth on the road to invite people in for a party. And so, also, people would say if somebody realized that, well that's a that's subversive, that's awful, because that's bringing democracy into the kingdom of heaven, which is a point, which I won't go into right now but it's enormously interesting what that implies. Or other people would say, It's just the opposite of bringing democracy into the kingdom of heaven it's that you feel you're God. And that from your point of view everything's all

right. God's in his heavens, all's right with the world. Or else they say, well it's sentimental. A lot of people say this. I've run into this type, particularly in the academic world. They say the truth of life is fundamentally if you're a realist and if you're really sensitive and aware life is tragedy. And that is a noble set they feel that if they face the fact that the world is basically tragic. That human existence in particular is tragic because it's full of hope and love and joy and so on but it's doomed to come to a bad end that's tragic but to face tragedy and so on is to be very noble. I thought to disagree with this. I say you're just strutting on the stage. And saying how noble you are because that's the only result you've got. And wouldn't it I mean be better wouldn't you really enjoy your life much more if you could see that there was behind it all the possibility that it wasn't tragic and that it was a chronic tremendous celebration only, that on the way to realising that it is there are all kinds of things that go bang and rolls nasty shock from horrible surprises and difficult problems because you would be bored if there weren't. You have to wiggle yourself through all these mazes because that's what there is. That's the way we do it otherwise we get bored. But you know when the wiggling through the mazes of the shocks and the bangs and everything get too much. Some people say well isn't it time to wake up. Isn't it time to stop this myopia of imagining that there is a right place in the spectrum where you could be comfortable, and I'm talking about the multidimensional spectrum of all the different levels on the river. But can't we see that the whole thing is necessary and that as a matter of fact you are the whole thing. Only the whole thing as a very fascinating to pass city which is to be able to concentrate its attention in various places, and we call these places people. And therefore to surprise itself with another person. In the Upanishads, this one a bunch of which says that in the beginning was the self. And it said I am. And thus it is that when anyone is asked Who is there he says it is I and after that gives whatever particular name he may have. And when it realize that it was alone the self was afraid. But then it said of what have I be afraid where I am all that there is and fear can come only from another Keep that in mind then it said but I am alone and experience no joy delight as one who is alone has no delight. And therefore it split itself. And one half was male, and the other half female. So you can have delight without, now we've got another you've got the possibility of fear. And so that he-part copulated with the she part and produced all human beings. But she said how can he have intercourse with me since he is

originally me this is incest and so she turned herself into a cow. He immediately turned himself into a bull and from that population were produced all cattle. But then she turned herself into a mare but he immediately into a stallion and so they made all horses then she turned herself into a you and he became around. And so came all sheep and then all the various beasts down to the very ants and so the world was created as a sort of interesting backwards creation story in which the human beings come first and then all the other creatures. But that's that's the I mean, in a mythological way of talking that's the kind of game we're involved in. And so the process of meditation. Has as its objective. To enable us to have the vision of the mystic. To have what is called I think. Perhaps unfortunately a cosmic consciousness trouble with the word cosmic is that it's so associated with the daft old ladies who Wear Violet and read Madame Blavatsky or something. And always going around telling people that something's very cosmic. I remember I had a friend who became like that she was a very pretty girl when I first knew it and. When she she she always talked about body consciousness and I that said why do you use that word but it why don't you just say Buddhist it's an ordinary word in the dictionary and but it sounds spooky. But she went on talking about but it things and. Eventually. Dressed in pure white and had all things in her robe white and crystal balls on the tables of it you know there was nothing at the left about it she was much too pure.

Anyway, to to realise cosmic consciousness, to say that this universe that there state that what there is is all of a piece doesn't mean that it's like this lady's room all white or without any differentiations in it it sure is full of differentiation look at it but actually these differentiations are all the dancing of a single energy and you are that energy. And the thing that you don't realize in the ordinary way is that all energy goes on and off it's pulsing things so, now you see it, now you don't know. You're alive and now you're dead. See, and we because of our limited vision don't see that no that doesn't matter in the least. The conceit of thinking that when you're dead that will be the end of everything you know is just appalling. Naturally you will come back but you won't remember how it was when you were here before for the simple reason that if you did it would be a bore. You know just like you feel you're here now without remembering ever being here before you can feel you're here again without ever remembering you

were there before which is a definition of simply a definition of what we mean by somebody else. After you're dead you'll be somebody else, who thinks he's you. Because that's what he says he is. He says, I am I, That's your name. So I mean just don't worry about it the only thing is that it's some sense in looking toward the future so that when you come back again the world will be a reasonably decent place to appear in. Only as a matter of fact you simultaneously appear in all worlds. In whatever planets there may be with other people on them each one of them as it comes into the world is you. Those Because that's how you feel they all feel like that air from the point of view of Astrophysics. In a curved space-time continuum, every point in this universe can be regarded as its center. It's like you look out what is the central point on the surface of a sphere. Well any point can be the center. So in the same way, the fact that you feel that you are the center of the world is exactly the truth. You can see equal distantly around you in all ways you see and you feel as when you are out on a ship on the ocean, and that the horizon seems to be a circle Well that's just because you're in the middle. But everybody's in the middle. Wherever you are you're in the middle that's why St Bonaventure referred to God as that circle whose center is everywhere and whose circumference is nowhere.

So, modern man in the West in particular after he abandoned the Ptolemaic theory of the world and took on the Copernican. And then realized that the solar system is only on the edge of a galaxy has felt awfully put down. It's a terrible shock to find out that. Because he felt again he says if he wasn't in the center and wasn't really mean it didn't really belong. And that's why that having become our common sense we have such hatred of nature and have been fighting against it so hard. But the more you study astronomy the more you realize that that isn't that only a partial look at things I know a psychiatrist who uses astronomy for psychotherapy. He himself has an office where he practices but no home. Lives are not time of pies in a tent. And every night he enjoys the view. People perhaps don't realize that. You don't have to have a beautiful home like this to have a good view or you have to lie on your back. And you're looking straight out into the most incredible view. Goes on and on forever. And to begin to realize that your You're on a spaceship the big spaceship beautifully equipped. And you're going on a long long journey because it's not just the orbit of the earth around the Sun. The Sun's moving and carrying you along, and at a pretty

good clip. It isn't quite fast enough for anyone. And there are the beautiful thing about this existence is. That, in a certain sense, everything moves by falling. But there's nowhere for it to hit and when the something should collide in the COS but we're all in a completely relativistic space. And there's no up there's no down no right direction no wrong direction. Where we are behaving on this, in this galaxy, like a whole bunch of gulls you know when the wind blows the gulls like to get up high and they rock around in the wind and they plunge and they they they dance and this whole cosmos is going to live there in our little swimming around having a ball. Well it's all a lot of balls. Naturally it has a ball.

So, but, it needs an extension it needs an enlargement. Universalization of our consciousness in order to be able to feel it that way and know that that's what it is. And so therefore to do that, there must be some way of overcoming myopia, of overcoming shall I call it, fascinated identification with only a single part of the process. And so meditation, yana, yoga is the art of de-fascination, and that is why it is called. Liberation from Maya. From illusion. From being spellbound and charmed bewitch befuddled and bewildered. The Buddha. Means the one who is awake the wake, as in the man it was called Hara with the wake, in the early English history. So Guatama Wake, would be an excellent translation of go to my brother. Wake up. So meditation then is a process of clarifying your consciousness. Rather as one allows a pull to be clarified. When it's clear you can see what's on the bottom of it and you can see the sky reflected in it. You see both the heights and the depths in a clear pool. But in order for a pool to become clear. Either cleared of mud or cleared of waves, there's only one way to do it, which is to leave it alone. If you try to smooth the ways with your hand over the flat on your to start up more trouble if you try to push the mud down you would just make it all the worse. So you have to leave it alone. It's very difficult however to leave your mind alone without going to sleep. But doing that is the whole art of meditation.

And I say to someone, have you practice the piano today, and I say to another person do you practice medicine, it's obvious that the word practice has a different meaning in both senses. When you say do you practice the piano, it means do you prepare for a concert. Have you practiced as a preparation for your performance. But when you say do you practice medicine it means is medicine the regular thing you do is a way of life. And

so, when one talks about the practice of yoga or of meditation which senses it meant and. Most people take it in the first sense, practicing the piano. Because they tend to look upon meditation as a sort of mental gymnastic. Like doing physical exercises in the morning because it's good for your health. But if you understand the practice of meditation in that way, you're not meditating. Because it's quite erroneous to consider it as a preparatory exercise with an objective. And of course that that. That bugs people because then they say well why do it. I mean aren't you trying to do something for yourself and you're trying to improve aren't you trying to get in lightened. And. You say well no. Because fundamentally, meditation is not anything except a way of being. People of course usually sit when they practice yoga or zazen, they may also walk you can actually carry on meditation while you're doing almost anything except intellectual work. And even that can by someone competent in it be used to. But that's difficult.

Meditation is not really to be considered as something special apart from the rest of life. However, when Zen monks or yogis sit for a long time, they aren't doing anything else, except breathing. And, you might imagine that they were doing this for some purpose. They were trying to become Buddhas. Very far back in the early history of Zen, there was a master by the name of Basho. And he when he was a young man was practicing meditation. And when his teacher came along one day, or the man who became his teacher. The teacher said What are you doing? And he answered I'm sitting to become a Buddha. And the teacher picked up a brick and started to polish it. And Basho said What are you doing with the brick where he said I'm polishing it to make a mirror. And Basho said well however much you polish a brick it will never become a mirror. And the teacher said however much you meditate or sit you won't become a Buddha, because Buddha is in no special state. If you become attached to sitting, your Buddha will only be a static Buddha. Nevertheless, in spite of this, Zen monks still continue to meditate to do Zazen. Japanese simply means sitting sitting Zen as distinct from standing then lying Zen and walking Zen because in fact. There is in Buddhism what are called of the three dignities of man. And they are walking standing sitting and lying. Forces me for dignity as a man. And so that to to to sit in meditation is

simply really to sit the way a Buddha sits. And so they say in Zen, if you want to walk, walk, if you want to sit, sit, but don't wobble.

When Yakojo was asked what is what are all your monks doing in this monastery and he answered we eat when hungry we sleep when tired. The man said Well everybody does that what's special about Yakoojo they don't do anything of the kind. When they are hungry they don't just eat but they talk and think about all sorts of other things when they're tired they don't just sleep but they dream all sorts of dreams. And it's interesting you know that if your supreme profession people in then I. Suppose it's said that they don't have any dreams. The Taoist philosopher Chuang Tzu says that when a wise man sleeps he breathes deeply from his heels and is without dreams. So he sleeps thoroughly The Hindu's distinguish four states of consciousness waking state, the dreaming state, and dreamless sleep and then the fourth state which they don't call anything except the fourth. And they value very much. Long long periods of dreamless sleep in which you go to a very, very deep level. And it's so deep that you can't remember it when you wake up. And that's the non dream or the beyond dream state. However then, you might say that the whole principle therefore of meditation. Is along the lines of when you sit sit or as the Japanese Zen priest Dogen put it, sit just to sit. Not to become a Buddha, but because you are one. And so in the same way how koans song of starts out by saying from the beginning all beings are Buddhas it is like ice and water, apart from water no ice can exist. But ordinary people are like a man swimming in the middle of a lake crying out imploringly in thirst. So here is our initial apparent paradox. That if as we saw this morning, cosmic consciousness involves the recognition. That everything is right. Or harmonious the way it is. That the unit universe is a terrific play of energy. This energy is you. But part of the game is that this energy myopia-sizes itself, if I may invent a word. And it becomes identified with particular individual expressions of the pattern. Individual bits of the pattern. And once that has happened. There is it as it were a taking of sides. And you become identified with one particular wiggle and therefore concerned with that one particular wiggle and therefore eventually anxious about the destiny of that one particular wiggle. And that's the result of your not seeing the whole thing but that very entanglement, that very identification that taking sides is part of the whole system of wiggles in its own turn. I mean imagine the system of

wiggles. It's like a a great vine. And there's a central branch and then other branches come off and then other branches come off that and then other branches come off that and then on the end of those they begin to be twigs and right out on the end of the twigs you know how the vine clings to things that are little a little weakly legals.

Now, we could talk of a vine at various levels. The main trunk is level number one. When any trunk branching off the main trunk is at level two any trunk branching off the subsidiary trances at level three then each branching again we'll assign the numbers four five six until maybe. At about fifteen we get to those little curly things, you see. Now on every level you see, the thing is harmonious. But you might think you might mistake levels. You might think that something that was one of those little very complicated curly things was a level two phenomenon. You say, well that's not the way we should behave on that level. Because level two isn't supposed to be a spiral like that level two goes like this but you've mistaken levels. When you know how often we do this in ordinary human relationships. We mistake the level on which a message is given to us we take for example someone who's kidding as if they were speaking seriously that's a mistake the level. Or so in exactly the same way. When you get involved in the life game and you think you really are a separate ego that itself is part of the life game. That getting involved. But it's way out on the end you see it's very far out, to get so immersed in the illusion of separateness. And so as a result of getting immersed in the illusion of separateness, we play all our complex social games of one upmanship. But they're all in the scheme, they're very far out. So you never really you never get away from the vine. The whole thing is a play and it's perfectly from a fundamental view as say the mystic sees it, from his standpoint. All the people wandering around in ignorance are all perfectly divine. So then there's a basic difficulty arises about this. I can put it in two ways. If the mystic sees this. And says well I see that everyone is Buddha, everyone is God or whatever you want to say. Has he really said anything at all. And if you ask that was that master he would laugh and say no that nothing whatever. Because you see from the standpoint of strict logic, you can't say anything about everything. Because the only meaningful statements you can make are comparative statements which involve some sort of classification.

And there isn't a class of all classes. There isn't you can't classify everything.

And, so very naturally, a person who thinks logically I would say well this mystic is just talking out of the top of his of as talking through his hat. But nevertheless you cannot get away with the fact that the person who is saying this has had a very very moving and profound experience. And this is the way in which he tried to say what he meant. And that's why some of them just shrug their shoulders and give up and say it can't be put into words. You have to realize it, because you see whenever you put it into words you talk nonsense. But it is rather easy to see this. That. The lens of your eye is what we call transparent or colorless. If it were not so we were not be able to differentiate between all the colors we can see it is just possible that the lens of our eye has a color, only we are unaware of it because it's always the background to everything else. It is possible that the windows are colored. There might be some being with a different kind of iron from ours who would see our windows as colored and he would say Good heavens why do people always look at things through colored glass because it distorts your vision. If I have read glass you see, I will not be able to differentiate red in the outside view. So, would be some means then, you might say whereby I could discover the color of the lens of my eye. And if so, then it would be like putting on colored spectacles. And so, if I put on red spectacles I will see that everything is red. But I could only say that having remembered another situation where it wasn't. And I have by in my memory, I could compare the present situation with the former situation so I would know it was red. I can also have spectacles which simply turn everything upside down. And you see the world upside down. And if you wear them for some time, your brain will simply turn the image the right way out. And then you will be perfectly adjusted. Because you see consciousness eliminates all constant stimuli. Because the moment a stimulus is constant it is of no interest, no further interest to ordinary attentive consciousness. It isn't a warning sign it isn't something I have to look out for it's going to be the way it is we were talking about bad smells the only way to get Master a bad smell is to get used to it. If you live in a neighborhood where the tannery or a gas works or a slaughterhouse something you soon think that that's the nothing at all it vanishes. But you see, to talk about this though, it is not entirely to talk about meaningless

things. There is the transparency of the eye, through which everything seen is filtered. There is likewise the speaker in a radio. And on that speaker all the sounds that come from the radio vibrate on it. But you're not normally aware of that, because the speaker makes no difference to what is said on the radio or what music is played but they all go through it just the same. So then assuming that there is this unitary energy or whatever it is that is at the basis of the universe. There is no way of making it a thing that you can 'thing' about. Because if it wasn't there nothing else would be there. It's basic. It's what Paul Tillich called the Ground of Being his decontaminated name for God. So you say, well what difference does it make? If this ground is basic to everything what difference does it make Well it doesn't make any difference that's the whole point in let's you can say all differences that are made are in. It makes. Then again a logician is going to quarrel with that statement because you say all. But by analogy with the function of the speaker in the radio or the lens of the eye you can see that very well might be some completely indefinable continuum at the basis of the multiplicity we call life.

But how to get at it? It seems to be the same sort of problem as discussing color with a congenitally blind man. But apparently this is what the mystic has seen. Has become aware of in some way. And the difference that it makes is this. Having discovered that that's what there is and that's what you are. You then see that there is really no need to cling to life. That you are just what there is what there will be, what there always was. This energy this continuum that's at the basis of consciousness. And having seen that, you get an enormous access of psychic energy. Because in the ordinary way you waste a colossal amount of energy defending yourself worrying. Fighting this, and pushing that. When you don't when you see you don't need to do that anymore all that energy is available for something else. We could say, for creative work. For just wonderful life and goofing off and everything it's all there so it makes a difference in that sense. So then though, that's that's the first public part of the puzzle the second part of the puzzle is this. If it is true that everything that is happening is in accord. It is the expression of this energy down to the very wiggles and if even we can add to that confusing wiggles on one level with wheels on another. That's also in the game. Then wouldn't the best teaching be. To say to people. Why do you have any kind of religious therapeutic meditative practice at

all? Why not just be as you are? Eat when you're hungry, sleep when tired etc. Why is something special? After all we've never seen cats go to church with each other. I've never seen dogs practicing Zazen. They don't have the special thing they do. Why couldn't human beings be just natural like that? Why all this hocus pocus?

Furthermore we could go on to say. It may very well be that this hocus pocus gets in the way of realizing. The basic unity. That because if you are a Buddha, trying to become one is based on the presupposition that you aren't so already. And therefore it becomes like what the Taoists called beating a drum in search of a fugitive. Or as we would put it I'm driving to a police raid with the siren on because when they hear you coming get out of the way. So in this way Bankei describe it as trying to wash off blood with blood. Or we would say, trying to put out fire with fire. And there is an enormous amount of truth is. Because one would be astonished at the extent to which religious people are pretty mixed up. And you find this everywhere. One doesn't know whether they're religious because they're mixed up or mixed up, or because they're religious. And in Zen, this is called Zen stink. So then you see, it's like a very interesting meditation exercise you can employ is to take two knitting needles. And practice fencing with yourself. And really do it and see if you can stick one hand with the other and yet the other hand has got to defend itself. What happens? Well, nothing happens because one hand always for knows what the other one is going to do. There's no means of one hand surprising the other. So you got a stalemate. It's like those baseball games between two equally good sides. [[it's] absolutely boring perfect playing but nothing happens. So there has to be a surprise so then you ask the question how do you surprise yourself. When you can't arrange to do that. Satori, enlightenment is always a surprise. Pickups is a surprise is it difficult to plan things out. Or you know, the old Indian superstition that if you think of a monkey while you're taking medicine the medicine won't work so you must try not to think of the monkey while taking the medicine. See there's the whole hang up. Now, one answer to this is yes that's perfectly true. And therefore the only thing you can do is wait until it happens by itself. And say oh heavens, I might wait all my life for Satori, and it might never happen. It's like one of the kings of Spain went for twenty seven days without a bowel movement. And. Heaven you know what anxiety what

frightful purge it would take. But as George graphic the contemporary of Freud used to say just don't worry about it. There's a hold on at the end it's got to come out something.

So there are things you see it like going to sleep the children have a great day off and have a great deal of difficulty going to sleep because they're so excited. And their mothers tell them to try to go to sleep well that's a ridiculous thing to say you can try to go to sleep as merely a way of staying awake, because you develop anxiety about it. All when they are going back to the matters of the toiletry, children used to be. I don't know what they do today since the age and no spark whatever. But we used as children to be absolutely hounded. To have bowel movements every day regularly after breakfast. And if you didn't work. And they they first of all gave you a California syrup or figs. If that didn't work they gave you Senate Tea if that didn't work they gave you Cascara. If that didn't work they gave you a calomel pill and if that didn't work the final blast was caused their oil. And this developed in so many children a kind of chronic peristaltic anxiety. And they were just always in trouble. Because the mothers and nurses wouldn't let nature take its course they had to have it all on schedule. Well in just the same way, you can't schedule your own enlightened. You can't say you must be enlightened every day at six o'clock. Or when when I want it. You do have to wait. But now, there are two ways of waiting. One way is the way of expectancy. Oh when will it happen? Oh when will it happen? You know and you wait like that. Another way of waiting is to abandon enlightenment altogether. Give it up. When you say how can you do that because I am I can't help being fascinated with the prospect that there is another state of consciousness which is somehow more harmonious than the one I'm in. See, the grass on the other side of the fence is always green. And I want to get that other state of consciousness. Well now, then teachers you see have all kinds of clever gimmicks that they use to get in here. They say such as. You should realize that enlightenment is really the actual state of consciousness you're in now. There's nothing to be attained. And, or it was like one of the monks came to JoShu the other early Chinese and master and said What would you say to someone who comes to you with nothing? Joshu answered throw it away.

It's so...right. In ordinary consciousness. We are normally trying to get into another state of consciousness. We call it say the quest for pleasure or the quest for happiness I would like to be happy all the time. Therefore I I don't like the state of consciousness I'm in I want to get out of it. Now then, if I say somebody says no you can only change your consciousness by accepting it as it is. Then if I do something about that like trying to accept my state of mind as it is why am I doing that obviously that I want to change it so I didn't accept it at all. So then the teacher can say alright look, just leave everything alone. Because it's all there the way it is. See? Now, he may just if he's lucky get you to see something at that point. What he says in that way may surprise you, that what will you be doing then you see, you will be in fact in so far as you're not striving to change your state of consciousness. You're at last meditating. But it's that you see it's that little problem to get over. One thinks in other words, wouldn't it be nice to have cosmic consciousness. She Think of all the problems that would solve they have all the new energy I would get. Well what's wrong with this consciousness? What's wrong with being in this state can't you you know get rid of your troubles anyway. By seeing that you really can't going to think about them. Because you see if you do do anything about your problems in practical life. It's like what you're going to do if you win the war? Supposing you know you've got money troubles and you buy some shrewd business you get some more money you think you've solved your problem for a while. But then you start worrying about something else as I pointed out this morning. You got the same old trouble back only got another form. And we're always doing that we're always doing the same thing over and over again in all kinds of different ways pretending each time that into a new trick or a new situation or a new problem. That's what makes the world go round. It's like a squirrel cage see, this animal going to turn and turn turn turn turn, on the bottom of the cage you always stays in the same place but the Cage goes round and it looks as if it were getting somewhere. But he's not, Plus ça change, plus c'est la même chose, mentioned those more it changes the more of the same thing. And so it is likewise with all beings in this universe, whether they be as high as the gods or as low as the demons. They're all on the make. And they all think they have the same problems. You can see this to a certain extent in human life, that very poor people have their problems. Very rich people have their problems and from a subjective standpoint the two can feel equally bad. So

it is somehow isn't it a matter of coming to where you are. What's the difference then between coming to where you are. And going on just as you did before. Isn't there some little itty bitty difference? Well if I say no there isn't. There is none whatever, some people will simply dismiss the subject out of hand. Other people will be very deeply affected by it, because that understanding. Will lift away their anxiety. They'll become come inside they will not be struggling with their own state of consciousness as it is and that will be exactly like leaving the pool of water alone, so that the waves die down and the mud sinks to the bottom. Now when that starts to happen, and you've learned, somehow or other to leave your mind alone. You can begin to practice meditation. Which is that you make the discovery, that to sit quietly in this present state of consciousness. Letting whatever happens happen. In this way your mind pacifies itself and the activity becomes extraordinarily pleasant. So that those people are proficiency in meditation just plain like to meditate. They're not doing it for any Alterian reason but just that they like to be in that state. But the question is, you see, how get to that little jumping point between the two? And as you examine it and go back behind the motivation you see why do you want to jump from one to the other. Because I'd feel happier. How do you know you would if you haven't already been then. When all those mystics who come back with reports of it say they're happy that the little girl wrote to me the other day that Dear Mr. Watts, are you enlightened? I would be like to be enlightened too will you please tell me how I can be enlightened age fifteen. I have announced the letter yet. And. I think I'll send a hula hoop or something, I don't know but what would be a nice present for a fifteen year old girl... [audience murmurs] Oh that's right, yes, that's right. Kangaroo Balloon

So, this is then, let me try first of all and put it in this way. Generally speaking, the simplest way to learn to meditate is yes, by all means sit down. In Lotus posture or any posture that is reasonably comfortable. And let your mind alone. You could say to that your thoughts OK OK OK, go ahead. Think anything you want to. Say to your feelings all right feel. Your body yes by all means it. Fidget or whatever. As Li-Tzu put it, I let my mind think whatever it liked. I let my mouth say whatever it wanted I let my eyes see what ever they wanted to see and my ears whatever they wanted to hear. That is in a way you see in the direction of the democracy of the body others don't. Give free speech to your mouth. Free hearing to

your ears. And you can free vision your eyes then he said he let his legs go wherever they wanted to take him and then he discovered he was had the sensation of walking on the wind. And he says I didn't know whether I was riding on the wind of the wind was riding on me. In other words, he was describing the tremendous liberative effect of trusting your own organism to do its own thing. Of course, we feel that that's dangerous because we think that the human organism is really a kind of the naked ape. And that if left to itself and not in the ordinary sense of discipline that is to say not disciplined by violence, everybody will be like the monk of Siberia. Fasting grew weary and weary and the last of the yell he burst from the cell devour the fathers of period and that there's is what will happen well yes to some extent it would. With Westerners I think that if this became. A sort of popular religious attitude. All sorts of people would break loose. And do things they never would have dreamed of doing before this has happened to some extent in the hippie revolution. Because when people go and get a lot of mystical experiences from using L.S.D. or marijuana or something and they somehow get an insight into this thing. They are very liable through the karma or backlog of resentment they have for their off already figures teachers parents and so on they will do something calculated, to shock those parents completely. They will wear the kind of clothes that would be quite outrageous. See, responsible Americans always appear in a certain way. You can turn through the pages of photographs of important people. And by Jove, it's amazing how much alike they look, especially in dress. And short hair and so on. And so naturally, the hippie having realised this experience grows is how long. Whereas womanish be. And, generally it does all sorts of petty thievery and rights fall out of words all over the place and. You know the whole pitch. Well that's a swing you see that's one of the dangers that's the thing that's always liable to work. When you stop moving in one direction you tend to be shoved in the opposite even though your intention was to come to the middle way. Now but on the other hand if you persevered. Now that sounds like a practice word in the sense of practicing piano. Therefore persevere isn't quite the right word to use for meditation. Not persevered but. Simply go on doing it for no purpose at all. You know, when you've got the hot water faucet on and cold water is coming out and you leave it along. And it keeps coming cold water cold water you may have with your things on the tap be impatient and say oh, it's never going to come. Sometimes it comes quickly. But this is the idea of meditation is

putting your fingers under the cosmic hot water tap. And then you have to wait for it to happen. Now there's a difference between the experience in the state. If I say you wait for it to happen. And there is the thought Oh, I shouldn't be just lazy like that. Surely there's something I can do. Just some little bit of a thing I can do to hasten it along. But if the teacher says nothing. You see. What he's saying on one level and this again is a question of levels as I numerated them in the analogy of the vine will have a different sort of effect on another level. It's as if for example Calvinists who are fatalists, and believe in absolute predestination. How come that people who can believe that get so spiritually energetic. It's a paradox. But that's true for all the same. The person who sees In other words that any forced meditation can't solve anything, thereby leaves his mind alone. There's a Tibetan poem. For the verse [Tibetan phrase] which means don't. Think. Don't meditate don't concentrate. Don't. Practice contemplation but keep your mind in its natural state. From the precepts of Tilopa. Well you can't do it. There's no way of keeping your mind in its natural state. But. If I say to you, but you don't need to you always are. If, you, then and there. Get what I'm saying. So you just simply believe me. Then you will by doing that stop doing the things that are preventing you from being in the natural state. Only you mustn't say so. Otherwise it gives the show rights I've given the show away to you. So you can't do this anymore, 'cause you know about it. So what will you do next. Let me put it in another way. You can say. Whether you like it or not, you're a Buddha already. And nothing you can do will get rid of it. Not even trying to get it will get rid of it. So you have gone to another level now. I haven't said, by not trying you will get it. I have said you can't get away from it even if you do try. Now you see the psychological effect of that, you feel perfectly free to try i.e. to be as you are. And in this state then you are no longer wrestling with yourself. But the point is we always do wrestle with ourselves even people who we would consider, oh I don't know, spiritual bums and total failures and eve of positively vicious people they're wrestling with themselves like anything well let's take the people who was a special kind of cheating the income tax. And what you do is you go all over the country filing false returns. And then claiming something on them so the government will send you a check and you keep a place in ever so many different cities and you go around collecting the checks but you could earn far more money at an honest job. And this is one of the great fallacies of the criminal life that it becomes very

complicated. Because you have to tell lies to cover up lies you have to commit murders to cover up murders and you get so involved.

So in that sense you see it is more work, to be neurotic, to be a slob, than it is to actually meditate. That's in a way the easiest thing to do but the trouble is when you are used to a life of criminality. When you're used to anxiety. You can't give it up because you think it's good to be anxious. In all this talk by existentialist like Rollo May about authentic humanity. How a person who is not anxious. [laughter] Surprise The person is that anxious is not really human. And therefore it sort of becomes your duty to be anxious. Well a lot of people are like that. They think if I don't worry the thing I'm worried about is going to happen. That if we don't get excited about something see, well then we won't do anything to correct it because you want it but the point is if you do get excited about it if you do you know liar awake nights thinking about your sins and what specially your sins of omission. You [won't] wake up in the morning with any energy to do anything about it at all all your psychic energy will be will be dissipated in trying to steam up motivation. Now you don't need to do that. Because if you need to alter some situation in life and actually do something about anything you will do it not from worry. But from an overpass of psychic energy. It's like the industrial revolution everybody always worried about what to do with the poor people and the sick, but until the Industrial Revolution came along, there was no energy for it. And it's only as we harnessed electricity and steam and things like that that we could produce effectively to feed everybody in the world.

So in the same way when you have let go, then you've got all this energy to do things with. You don't ask where. We're going to get the energy from like asking where are we going to get the money from. Money doesn't come from anywhere. It's an invention and so where are you going to get the energy from where the answer is you are imaging you are nothing but and your whole being is a pattern consisting of nothing whatsoever except energy. There isn't any. Kind of lump of body that you are carrying around that's a koan and then who is it that carries this corpse around. Now, there is a very curious relationship between great energy and activity and stillness. These two like each other very much. Take a guy like Joe Louis the boxer. He would spend a great deal of time just lounging around. He was like a

great big cat. And it went and study cats. Because they're just like this cats will relax like this completely open. They'll curl up. They'll sit for a long time quite still but wide awake, watching. And then Zingo, the minute a cat needs to do anything it's all they're just full of energy. So in exactly the same way anybody who is. Has realized energy. He will very much enjoy being like a cat, and spending time just sitting. And that's meditation practice. And that's real meditation practice as distinct from something which is self-conscious, cultish, phony.. Well one of the most offensive things about. Certain people in Japan who go over there are studies and they're always bragging. About the difficult times they had how long they sat how much their needs ached. How difficult it all was, but by Jove have we suffered. You know this is the good old Protestant conscience suddenly coming along in a Buddhist rope.

This morning I'm going to talk about the various different methods of meditation. The yoga sutra Patanjali starts out with the phrase yoga citta naroga, which is a definition of yoga and roughly translated into English it means yoga is the cessation of mind waves. The word citta means roughly consciousness except that we don't have the same richness of words in English for aspects of the mind which they have in Sanskrit. They see that the word big neon which is also translated consciousness' chitter it's a different word which we just call consciousness and the manner. In which we translate mind, and so it goes. Now citta i analogous to the water in the pool that I was talking about the reflecting pool. And vriti is a word which means basically a turning that is to say a sort of a churning motion naroda means cessation, roughly. So the sensation of the turnings of the mind has quite an elaborate meaning. And different schools of thought interpreted in different ways. For example, when you get this pull completely still. It is another Sanskrit word is used for it which is NirviKalpa. Now, one school of thought will interpret this as the mind in such total stillness that nothing at all is registering it. In other words that there are not only no thoughts but also no feelings and no sensory input, quite blank. Perhaps not so extremely as to say quite blank. It is also held that this kind of blankness is also called satcitananda, which means reality consciousness bliss it is in a state of bliss of a kind of formless blissful luminosity. But if you look into the word nirvikalpa and see exactly what it means, the same word nir as in naroda, again means cessation about the caliper means concept. As distinct from percept. So, my own interpretation of the word because nearly Kalpa is the

mind operating without concepts. That is to say, thoughts are not being formulated and by thoughts I mean symbolic tools such as words such as numbers such as abstract symbols by which we represent the physical world. In other words, in a state of nirvikalpa, you would be perfectly aware of everything going on in this room. Only you wouldn't be talking to yourself about it, you wouldn't be naming things. And you would therefore be reflecting your sensory input. Very very clearly. Also you can say. Say that cittavriti, the mind waving or mind turning is a state like worrying. Where you're going around and around and around in a sort of vicious circle that's turning you can also interpret the same phrase to mean the mind attempting to turn back on itself like a dog chasing its tail. So there are at least four meanings of this phrase. But I simply take the one that means. The attainment of Nirvikalpa samadhi some of the meaning. Difficult word again to translate it referring to a state of consciousness the root of the word some is related to our word some. Which means therefore complete an idea of totality in integrity. Some of these sometimes translated trance but that isn't very good. Somebody is often understood to mean the disappearance of any distinction between subject and object, the knower and the known. And probably that does rather well because as I explained yesterday when after some time you have simply allowed. The art mind to think whatever it wants and to feel whatever it wants and to perceive whatever it wants. You will become aware of yourself not as a sort of separate observer, but simply as the flow of experience, so that there is no experience facing an experience or of vice versa but simply a process of experiencing which is unitary. Even though it is differentiated as we speak of sensory differentiations only you don't call it differentiated that's a concept. You can't point to the difference between somebodies fingers, because the difference between them is conceptual. The idea of difference is purely conceptual.

So, in this state then of Samadhi, it means it is a state of quietness because there is no further agitation going on between the process of experience the panorama of experience on the one hand and the experience of on the other who is either accepting or rejecting or commenting upon the constant flow of nature. Now, how then, or what are the various methods of getting to this state? We might begin with ananpranasmiti, which means watching over the breath. This is done it is basic to almost all techniques of meditation.

And it may take the form of simply allowing breath to go on, however it feels like going on, that say counting the breaths. There are two reasons for this. Number one, by watching breathing you concentrate your mind. On something which absorbs your attention but which isn't a concept. Also number two, breathing is a very curious faculty because you can experience it as happening either voluntarily or involuntarily. You can say I breathe. That's normal in our speech. Even though you don't say I circulate my blood. Because you don't experience that as a voluntary action. But so you can consciously control the rhythm of your breath but within limits if you stop thinking about it it goes on by itself and happens in voluntarily. And therefore through becoming aware of the breath in this way you see that the division between voluntary action and involuntary action is arbitrary. When you do something voluntarily, like opening and closing your hand, which is not something labile to go on automatically all the time or the are thinking about it or not then you say I do it and it does seem to be voluntarily voluntary it seems to be under your control and yet you don't know how you do it you are not in voluntary control of the processes which enable you to do something voluntarily. You don't know how you managed to be conscious. You don't know how you exert will. And so again the border line is quite arbitrary.

And so, as you simply become aware of breathing and sit for a while and do nothing but breathe. You begin to get into that state of mind. Where what you do and what happens to you become the same. And also the easy unrestricted flow of breath works on the rest of your consciousness like a pacifier. And everything becomes still and quiet. After a while the breathing the comes so gentle. That you could say, almost, that you have stopped breathing. You haven't of course actually stopped. Although some expert has a yogi can hold their breath for an unbelievably long time and will even roll back their tongues in a certain way and literally stop breathing and be buried underground for seven hours and then be brought out and immediately resuscitated. That's a sort of a musical trick. There's no point in it. But actually, what is called the cessation of breath. Simply means that it's become extremely quiet and very very smooth. On the other hand breathing exercises are practiced are quite a complex nature. Whereby for example you take your fingers and you breathe in at the left nostril and then out through the right nostril and then in through the right nostril, and out

through the left and in through the left and up through the right and then through the right and out through the left and through the left and out through the right and so on, and then as you do this, you imagine that the current that you're breathing in goes in when you breathe in through the left nostril so it goes down a passage in the spine which is called the sushumna. And it has two channels and one is called the ida on the left and the other is called the pingala on the right. So that when you breathe in through the left you imagine the current is going down through the ida. And it goes all the way down to the bottom of your spine and strikes on a center called a muladhara chakra. Chakra and of the word literally means a wheel. And there are sometimes equated with. Neural plaques or ganglia. Base the longest. Final column but I think one should take these in a more symbolic way and not really in a literal way. The muladhara chakra is always represented as being an inverted triangle that of course represents the feminine sex dog. Inside the triangle or dark chakra when it is drawn on yoga maps of the body there is an erect phallus, around which is entwined a serpent who is asleep and this gentleman is known as the kundalini. The crown chakra represents the divine essence. And it was said therefore that in ordinary people the divine essence is asleep. And needs to be awakened. And the process of yoga or what is strictly called Raja Yoga the royal yoga. Or many kinds of yoga Raja Yoga consists in awakening the kundalini and drawing it up the spinal cord up the sushumna and as it goes up it energizes all the different chakras on the way in there in all seven of them. I'm not going into the geography of all the chakras except to say that the top chakra is called the sahasra chakra, which means the thousand-petaled Lotus. And that is as it were, the cortex. Now all this has a very very deep symbolism in it. It is this. That the skull represents the vault of heaven. And in the top of the skull that is supposed to be an aperture out of which your life departs when you die but it's also represents the sun. Because the sun has been considered as a dog in the firmament of heaven through which you see into heaven. So the sun dog is at the top of the load of all that have. There is a great tree called the actual tree of the world and that is the spine. And the Sahasra chakra the thousand-petaled lotus as it were the great flowering top of the tree. And it goes down and it has roots and the muladhara chakra is the root place and the sleeping serpent at the bottom will find a complete parallel to this in Norse mythology where the world tree is called a Yggdrasil and at the bottom of it there is the world serpent who is always knowing the roots.

And about you see. Also you will see the medieval representation of the crucifixion. Where there is likewise a serpent at the base of the cross. Sometimes you will see crucifixes on which there is a serpent instead of the Body of Christ. And that is called in a hushed UN in Hebrew the serpent which Moses lifted up in the wilderness made of bronze so the two ever looked upon it was cured from the plague of snakes. Why is it also that doctors represent their profession staff with serpents intertwined around it why does Hermes carry such a staff it, a Caduceus, what is this business of serpents on rods. Well, to get the simplest answer to that question you look at the constellation of Pisces an astrological symbolism, where you will see that one fish is going up and the other fish is going down, or you take the in young symbol of the Taoists and you will see two fish like comers interlocked with each other, one black and one white. One is the Yang who is white one is the yin who is black. And each one has an eye of the opposite color. These are respectively going up and going down going in and going out going away and coming back they represent the fundamental vibration of nature. Or you could call it involution and evolution. So the when you take the the this breathing process that you see of the breast going down the eater up the pingala down the Beguiler and up the eater and getting the can do the can really need to wake up and come up again you are starting the process of evolution. So this relates to the Hindu idea that the universe is from on the Supreme of the star going to Brahman that is to say the. To be active aspect of Brahman. Playing hide and seek with itself. Now you see me, now you don't. Now I know who I am, now I get lost. And as Brahman imagines that it's all of us that is the serpent going down and hiding in the roots they also have the image of going down the tubes inside a Lotus stem. And you know when you eat Lotus roots they're for they they've got holes through them because the tubes through the stem and goes down and hides in the depth of the Lotus root under the surface of the water in the sea in the mud. And then when it comes up again why that's why you always see Buddha sitting on top of the Lotus he's come out so naturally he sits on the top of the Lotus. Thank you.

So, likewise also, Buddhas are born at midnight why at midnight because that's the time when the sun is right underneath you and that's the lotus on which you're sitting. All these images and figures from all over the world that fit together in a funny way. So then, as you go on practicing this

pranayama It's called, the breathing technique. And you energized the kundalini. And as it creeps up the spine and energizes each chakra you get all sorts of strange changes in your consciousness. You may start by hearing all sorts of bell like sounds, smelling the most beautiful perfumes. Seeing things that you just never saw before. And you must be very careful as you do this not to get sidetracked, because you may think oh these sounds are gas and I'm going to really absorb and explore all that you see but if you do that you're apt to get sidetracked because that's not the main issue. Then when it gets higher, you begin to get very strange experiences of reading other people's minds or of knowing. The past in strange ways and of foretelling the future and again you mustn't get sidetracked. These are not important. The thing is to go right on and get that going to Leni right up to the Sahara chakra. And then you are enlightened but you are what is called Mokhta which means liberated in the in life. As distinct from the day how Mokhta, which means liberated at death.

Now, and then of course the yogi as he's drawn on this map that I'm describing is shown sitting in the lotus basket and always above his head there is a flame. And that is the final liberation of the kundalini force escaping through the sundog at the top. And this is the death of the fundamental design of what is called in India a stupa. S.T. U.P.A. where you see a go to like structure with a dome and a spike on the to. Out of it so that dome on the stupa is the skull and the spike is the flame. That is modified in the far east as the pagoda it is also called the Dagobah you see the word pagoda is Dagobah it is also the fundamental design of the New England church spire. And the pattern, the architectural pattern of that though chutzpah is really the same as that of a stupor or The Globe. In Tibet it's called a chart and. So here is this wonderful sort of map of man's. In a lifeless psychic Constitution. And the process going on so finally see if you avoid all the traps if you avoid being beguiled by city which means supernormal powers. You are eventually liberated, because you see through the whole cosmic game. And naturally when people use pharmacological agents like L.S.D. and many of these chakras this is least what an Indian would say are touched off. And in life and as a result of that you hear all those sounds you see all the strange sights you smell the marvelous perfumes you become aware that the whole world is a throbbing electronic vibrating thing. [It's] is diaphanous and. But you will you see when when

people do this and they get fascinated with what I would call the by products of L.S.D.. They may get on a very wrong track and that's what leads people to take L.S.D. over and over again so that they can have a marvelous time. You know listening to Bach turned on and seeing the way they can the music evokes color, because you see as this process works you get to the point where you experience the unity of the senses. But you see to do that is in a way, to get lost in all the ramifications of the psychic world. So if you use things of this kind you must be very careful indeed because they are really nothing more than starters to get a person who is absolutely cannot understand what all this is about, to take a peek into paradise as it were. And see that there are more things in heaven and earth than I dreamed of in your philosophy. And it is of course often the occasion for a person who was really very boring. To become quite interested in life to see that there really is something going on in this world that is extremely exciting.

But, it, it's strongly to be advised, that once you have seen the point where. You understand quite clearly. That this whole world is in fact the play of a single energy. And that it has this harmonious property. Whatever may be said about things on another level conflicts, wars cruelties, diseases what have you. Then it's time for you to stop. Employing anything so powerful as L.S.D.. and to switch instead to meditation. Because at that point you had it you got the message. And no point going back and back about. Because when you come down out of a state of consciousness like that, there's a very critical moment as you come down which is seeing that the real insight doesn't consist in some exotic experience, it consists in the realisation that ordinary everyday consciousness is it. That in other words, if I may put it in the crudest possible terms, that you see quite plainly, that what is going on now is what God is doing. And you are that. And just this is so simple a matter of picking up the pipe and chewing it is a completely divine act. I don't even know why I use the word divine but I do it in order somehow to call attention to something that people don't ordinarily seem to see. So then, in yoga, when you've gone through all this. And all that jazz, was the way that kundalini was going up you get to a state which is beyond Nirvikalpa samadhi. And that is called Sahaja. S.A.H. A.J. A. And that means the natural state. And so a great master Great One might almost call him an avatar like Sri Ramana. Who lived in fear of animal law and in my dress died about oh I suppose twenty years ago. He spent a certain time sitting in

meditation but on the whole he sat back and read the new. Paper and. Write in his account in a compound. And hundreds of pilgrims would come from all over. And they would sit around in practice meditation they would occasionally ask him questions and he gave that what he was doing was called giving Darshan. Darshan meaning view he's on view and he's as and he's just as much an object of veneration as a put image. But he returned back on his couch and read the Hindustan Times and ate meals and carried on an everyday life because he was in the state so harder which means that he lives that can live the life of a perfectly ordinary person. And there so that in the same way many people who have undertaken Zen training. And gone through the whole thing they don't become Zen masters they just disappear. And they might be scientists or shoemakers or what have you in the formal way most of them being priests sons which is not to get an idea go go on to be priests take over their father's temples but many people who have completed Zen training just disappear. And indeed that's considered a very good thing to do, because you don't leave a track. The Buddha once in the dumb a part or likened the way of an enlightened person to the path of a bird through the sky it leaves no trace and as an poem says, entering the forest, he does not disturb the blade of grass entering the water he does not make a ripple. And there was one Zen Master very it was very much respected Bankei, who was a contemporary of Hakuin. Now, Hakuin dominates the Rinzai Zen to this day seventeenth century. His method. Bankei was a contemporary go in left eighty successors Bankei left none. And Bankei is that a little bit admired for this city he didn't as this and saying he didn't raise waves when no wind is blowing. So that kind of trace listeners. They would say you know it takes one to know one and if. The maybe a pope or someone who everybody else thinks is just ordinary like themselves but then man would perceive that he was was and like and. So, that roughly describes the cost. Of Raja Yoga meditation. And. It's not always easy to know just in what sense this is to be taken whether the thing is how far it's symbolic how far it's literal young always took it in history in a very symbolic sense of not referring to anything that had actually a connection with the spinal cord or the brain. I feel the truth is somewhere in between. And that this is a way of doing things. My own experiments especially with psychedelics that lead me to believe that there's really something in it. But that it's like all these things. When you study medieval European medicine., you find out all these there's a doctrine of signatures.

Say somebody has got as of a sour disposition wells and suddenly he needs sugar. Or because a sudden flower has that bloom or a leaf that corresponds to him by resemblance to certain parts of the human body then that's a medicine for those parts when they're affected one of the funniest things is that one of the very few really effective drugs we have is aspirin and the way aspirin was discovered. Was that. It was reason that in swampy land where people would contract that humors you would find the appropriate drugs for curing those that humor. Cause it was always said that next to the poison you found the healing. There's of course again the two supplements sitting on the could uses one of the poisonings up and one of the legs up. So they dug around in marshy land and of course willows grow in marshy land and from willows you get salicylic acid which is Aspen. And it was that was how it was found out and it was for reasons which today we would consider absurd.

So, the modern scientist looks at these old mumbo jumbo those, not entirely with disrespect. But chairs. There must be something in it. What in for example in some frightful stew that one is advised to make up with a rope from the gallows and boiled knew. What was the active ingredient what was essential and so I look at these things over these ancient methods of meditation and I asked whether they really doing. What is the essential ingredient? Because now we can we have that many many ways of looking at all this physiological neurological psychological pharmacological. And perhaps derive from all this, a yoga that is appropriate for Western man in the twentieth century. And perhaps very much more efficient this like a technology is a very efficient technology. So, what one sees then going on is a process of a person becoming aware of a world, which is far far richer. Than the world as he ordinarily knows it. Why is this? Because the world as ordinarily known is being screened. And the major screening activity. Results from the fact that throughout our lives we are taught what to experience. And we are not altogether too aware. That what is experience depends on certain social regulations. There are experiences which are taboo. There are experiences which really aren't allowed. And as we are brought up. In the same way that we are taught about gestures. There are certain gestures which are considered uncouth. Vulgar, hostile you don't do that see so in exactly the same way experiences is regulated. So, it's like the old joke about the psychiatrist saying to a person well do you ever have

strange thoughts. Do you ever have weird feelings. You know everybody had strange thoughts and weird feelings. Because, the input from exteroceptive and proprioceptive sense organs is colossal. And now we ordinarily say and people commonly put it like this. You can't deal with all that input because there's too much of it and it's too complicated. Now that's not true. It is only too much and too complicated when you try to analyze it and translate it into words. See, let's take a flower. How many things other in a flower? Well it depends how many you want to count. It depends how long you want to spend splitting it up. And analyzing it under a microscope and giving names to all the Wiggles. From another point of view, there aren't any things in a flower. It's all perfectly simple, but that doesn't mean it's not wiggly. Yes, it wiggles very much. But that doesn't make it complicated so when you try to understand it that is to say translated into words of figures then the flower becomes complicated the flower isn't complicated the process of translating it is complicated. So in the same way, how many things you are aware of when you're aware of this room? Well it depends on how you want to count the things now you play that game where you put a lot of objects spalls of thread of found in a bottle of medicine, saucer and a thimble on a plate and so on you expose it for a moment person looks at it then you cover it how many can they write down. That's not the same thing as awareness. That's simply a kind of intellectual dexterity. But this awareness is quite different from that it isn't counting things at all. But it comes up you see, when the mind is quiet and when the process of 'thing-king' which is the way we manufacture things is suspended. Then of course if you're not thinking about the world the difference between the no or in the known simply disappears because that's conceptual in the nirvikalpa our non-conceptual staid there is no difference also in a way there's no unity because unity is also a concept. That's what is meant by the Zen word mu. It doesn't mean nothing. It means. No thing. Neither one thing nor many things there's another call on saying when the many are reduced to the one to watch of the one be reduced. It's also called the state of things is called. In Sanskrit Tathata, which means proximately, vastness, that-ness or such ness. And that's something that comes out very powerfully in these states of consciousness. Now I have to explain it if I can. It's very easy to understand and very difficult to explain. When a baby is first born, the first sound it makes is 'ta'. And males and fathers and their vanity I think it's saying that it. That it is not saying that it's saying that.

Look at something. So the word tathata in Sanskrit is really that. Like we have the other in Western art I was some kind of feeling after this. Now what is such an it's. Well you can say it's just the way things are. But it's a little more than that and let me try and illustrate it. When you talk to someone, they understand the meaning of what you say. And it to change takes place. And I am going to ask the question. The process of talking. Making sounds that have a meaning conveys information to someone else. Or to yourself. The question is, what does it mean that we do that. Well it doesn't mean anything. Why should it? Words have a meaning but that doesn't that cause it that of the whole process including words but the process itself wasn't a word. It was a dance. So you look at nature! Why, you know, you hear all these trees reaching out and leaves absolving things and all the little creatures running around and breeding their family and then they eventually disappear just as a breath has to go out in order to come back in and so they disappear into the soil and then the new little generations of the same things which is the this is kind of a dozen. All over again it comes out and they wiggle around and they eat and they breed their families and so little of a little bit of it all is going on and when you look at it in that way you are seeing it from the standpoint of such ness that's just, it's the jazz. And you see everything is just like that. And. When you do anything happens you sort of stop panicking about it. And so you say well it it just does the whole thing doesn't have any meaning. In the West, that sounds like a put down because we say everything has that meaning you must do something meaningful. Why of course we say that because we're completely hypnotized with words. And so, if you do something that has no meaning people say you're crazy It means you're not acting in accordance with the order of concepts. But lots of people love it they get a little get away with doing things that are completely meaningless but they but they managed to give the impression that they're very important. Take music for example. Music from a practical point of view is a total waste of time. It doesn't do anyone it you know doesn't feed anyone unless you make money by playing music but music as such you see has. Absolutely that it you make the sum and it disappears it's not like a product that you can bring out and slap it on the counter and there it is you know. And that's the best music has no meaning. It doesn't represent anything it doesn't convey any particular message the medium is the message in music. And so were all these people blowing through to certain complicatedly lucky little patterns

of. Pulling strings and and hitting on drums and making blasts through trumpets. And why, everybody can say anybody who is anybody has to go to the symphony and contribute to its maintenance for all these weird people. Blowing through tubes. And this gentleman and greater power all gets up in front of them all you know and the conductor is a great orchestra leader and he comes out of a very ritualistic way and waves it that hung and sort of leads all these people and keeps them together and makes this fantastic blast. Of us all out of the. Well, it's culture. You could describe music as an addiction. To a very very hallucinatory state of consciousness called Cord-itis. And even worse what this is going to Logic's. And but you see that the whole world is like that. So then, there's another form of meditation I'm going to go into that's related to music and it's called mantra yoga. Actually you see, in India the principle yoga is the first Raja Yoga the royal yoga. Then this come on yoga, karma, action. Yoga being practiced through all the pursuit of one's professional vocation. Whether it's position housewife University professor shoemaker whatever. Next comes between you and I yoga which is a kind of intellectual yoga. It doesn't go through all those chakra things it's a very direct yoga. Represented by the Vedanta by the doctrines of Sankar. Then there's bakti yoga, which is usually a vice Navarra thing in others or the worshippers of Vishnu and they like to concentrate on devotion so back to means the yoga of devotion of love. Christianity is bakti yoga. The devotion to Christ. The beloved with the divine is always called the beloved and buck to yoga. Dennis Hopper yoga which is not so much a way of liberation as a very elaborate system of physical exercises passed years ago. All the complexities of breathing and so on then there is Mantra Yoga. Mantra yoga then is the use of sound as the method of. Arriving at the near a week out of thoughtlessness. And this is a for many people a very good way indeed. Because for some reason or other. Sound will concentrate you more than vision. It's much easier to give your whole attention into a hum. Than it is to stare at or to keep your eyes fixed on a certain point. Or even than to just watch your breath. Because sound has a little more activity in it it is a stronger vibration than just breath. And so, the the mantra means, a single syllable or a seek shot sequence of syllables, which are chanted in a certain way. Even out loud or subvocally in your imagination. Usually gurus of who you work with mantras will give each individual his own Mundra. Yes he does he says in mantra yogi. Are in the same way that as an teacher will give each person his own special can't

and you're not supposed to tell anyone else what your column is or what your mantra is. Now I vaguely suspect a little bit of hocus pocus that if I do know the point in the in the car on which is that. If the students start discussing their cars together well it lends to a little bit of cheating. But I don't see how that would be so with the mantra perhaps the idea is that when you've got a secret. You've got something sacred sacred secrets. And, that may be it. But anyway, you have to say the basic mantra is the word aum. And that is used because. Fully spelled in Sanskrit, it is A U M. And that starts you see are is right at the back of the throat the little comes up and is with the lips so you got the whole range of sound in that word and therefore it represents the universe the whole energy of the universe. And so if you hum own. It sets out of but beautiful thing is great to do it in a circle of people. By staggering it. It goes on all the time. You can get it on a tape and listen to it that way.

Now, the Buddhists extend that into the mantra. Um Mani Padme Hum. And that means very little. Um means everything, mani means jewel, padme means Lotus, om means it's sort of an explanation. And, they will hum this very very slowly. Taking a full breath on every syllable. And keep keep doing this. They'll often ring gongs and things along with it. And you can get well like that. Is just great. Then they have the Hindu is often used polish the last big amount try like that Howdy Krishna How do you Don but I'm a Christian I read on. Die die die. Die die die I'm. Howdy how he how do you how do you things like that and I and. This in the fella call Harry if it. Means one of the names of God. Now, he has to say the trouble for Americans is the pope's a man of the world you can't slap on the back and called Barry. But anyway, doing that is mantric. Now in exactly the same way, the Christians have used mantra look in the Eastern Orthodox Church there is a way of meditation which is called hesychasm. And is used by the say the monks of Mount Athos and of Russiam and it simply consists of what is called The Jesus prayer. And it is simply the endless repetition of the name of Jesus. And they describe all the cycle physical symptoms that will follow for this the change of temperature the warm feeling in the heart all sorts of things like that but that's what it is is the effect of going on and on and on and on and on and on like this then in the in the western church there are mantras to. Say why does a priest say as your penance say five Hail Mary's Well you know how I'll marry a set. Now that I guess about it I don't know

if I was of and I don't know if it was about that. And. If that is the slightest attention to the meaning of the words. In the same way with it with. For centuries and centuries the mass was always on my side in Latin which was a very good idea because nobody paid any attention to what it means. It's meaning that gets in the way. And this awful translation of the mass into English is ruining the whole Catholic Church. Because everybody discovers what it means and it's just terrible. So then they worked out the Gregorian chant which is a very powerfully monophonic chant. Even though unlike the eastern chant it has a much more melodic structure. Whereas, the eastern chant keeps up a pretty steady beat. All the syllables. Pretty much the same sound you know it but done. As an on the down be so. On and on. Be. Me that be. That I me be as out on. And so on. In the West you know your get. It moves along in a small little ting way but. You will see that as the difference between the traditional Western chant and say a mass by Bach or Beethoven's Missa Solemnis. Because there is no doubt when you hear the the mass in B. minor that it was written by Bach. The style is right there ,and Beethoven of course. Well now, mantrians say no, well that's not good. Because it's still much attached to a particular personal style. And the role of the of the chant is to depersonalize. It has likened to this that when you chant you become a flute. And the Holy Spirit blows through you. So it's the God of himself that's blown. When you sing the chant. And therefore an impersonal form is given to it. And so you will hear when monks chant the Psalms. They keep up an absolutely I'm very in its At first you think it's monotonous but it will go I mean in any in any in the the. Meaning you need any meaning the you need anything any meaning the I got here Part three and spirit is tall so you could add in principio sampled upper arm you know sake it was less Thank you a lot and you know just on and on and on like that I'm not very good singing this morning.

But, yeah you'll keep that up you go say to the the Holy Week service of Tenebrae in a monastic church. When they have a service that goes on for about three hours. And it slowly gets darker and darker as they put out all the lights but this rhythm is keeping up all the time until it gets completely black Well you ask Stoned by the end of that. Those monks are not thinking about what it all means. They're practicing contemplation if they know anything about it there. And they are slowly coming to what is the Christians call the divine darkness or, the Cloud of Unknowing. And that is

the same thing as need of a cult personality. It is the adoration of God without any concept or image of God in your mind. And really nobody has ever been able to explain it because the moment you open your mouth you bring in words and the state itself doesn't have any words. Now, because beyond that the mantra go get take me in an electronic age can be vastly souped up. You can get a continuous electrical note. And work on that. You can get a stroboscopic light. And work on that one. You can get revolving moray patterns. And look at those. You can get fascinated with an oscilloscope. There are endless things that can be done to facilitate meditation by technological means. A few warnings. Don't, don't push it too hard ever. Take it easy. Stop If you anything you do gives you a headache or seems to strain your eyes or if you start getting buzzing in the ears. Don't over do any breathing exercises never strain your breath. There is an exercise called kumbhaka. Kumbhaka is simply...retention of the breath. People do when it's moving part that practicing. But actually it don't ever keep up kumbhaka too long. You'll start reeling because you'll get sort of hyper oxygenation. And then people when they do breathing they tend to exit emphasize the out breath. And maybe that's a little bit better for us because when you relax you sort of give a sigh of relief. When you're frightened you suck your breath in and the breath the in breath is more tense of the outbreath more relaxing, and what they would say in Zen is do the out-breath and don't pay any attention to the in-breath, it will come back by itself. And so I would say in general don't overstrain anything in the meditation process now you see that the object of all these gimmicks. Is that they are like a clever teacher catching people's attention. In order to get them make it easy to understand the subject. So they are all of them crutches or spectacles or gadgets to help still the mind. There are those like Krishnamurti the won't have anything to do with them because he says if you make your mind still it is of if fake it's not natural stillness and he says natural stillness can come only by observing, being aware of all the job mind is doing without judgement without criticism without interference until in the course it will just give up and then it's naturalist ill. And of course there's a good deal to be said for that but I'm rather open minded about all these things and I say each man to his own way.

Thusness

Now, the title of the seminar is a very strange word translatable into English as thusness or suchness, in Sanskrit, tathata. This is based on the Sanskrit word tat which is Etymologically the root of our word that. And its supposed in India you see, that this is the first word that a baby says. We all know babies say da da da, and in our highly paternalistic culture it's assumed that the baby is addressing its father and so does our means father. But in India which is, where the cultures anciently were matriarchal, it didn't even mean mother but da which was the fundamental word of all words it is the baby pointing to it and saying that. Because when the baby wakes up and the... as I said last night and aperture through which the all looks at everything the great and proper exclamation is when it sees it is to say duck and so. Is that about. And it means just exactly that. In the same way as there was a dot a school of painting in the West because they wanted to go beyond words and names because they died I would argue when you call a dog a dog doesn't sound anything like a dog Psalms or shot in French sounds nothing like a dog but if you called a dog one that would be a proper name for a dog.

So, this is a fundamental word. And we have great difficulty in translating it because in a way it's a meaningless word. Now then, in order to understand the subject properly I must not take too much for granted. I have to give you some introduction to Buddhism because this is all part of Buddhist philosophy, and Buddhism finds its context in the philosophy of India. And we have to go first of all very thoroughly into what Buddhism is about. And the first thing I want you to understand about Buddhism that very few people do understand is that Buddhism does not have a doctrine in the same sense that Christianity has a doctrine. There could be no such thing as a Buddhist creed. The word dharma D H A R M A in Sanskrit, which describes what Buddhism is Buddhism is called the Buddha dharma. Dharma means method. Not doctrine, not law it's often translated law that won't do it all. Dharma sometimes means function. The function of somebody his svadharma, means roughly what we would call his vocation. The hallmark can also mean. In a peculiar way a thing, a basic portion of the world, a thing or event. But its primary meaning as used in the phrase Buddha dharma, is method. And so Buddhism is a method for something or other.

And so, for this reason, all Buddhism is a dialectic. A discussion, an interchange between a preceptor or guru or teacher. And his student between the Buddha and his disciples. Now what is it about first of all the word Buddha comes from a Sanskrit root budh, B U D H. And budh means to be awake. So it is a person who is awake. It is therefore a title, it's not a proper name. And it's not the name of a divinity. There are many many gods recognised angels we might rather call them in Buddhism. But they are regarded as being inferior to a Buddha the gods are not yet fully awakened. Buddhism divides the world into six divisions. And this is very important for understanding what's it about. You don't have to take these six divisions literally because they may equally well refer to states of human consciousness. But the six divisions are like this you see you draw the circle of the wheel of life. And in the top section of the circle you have the Deva world. And Deva from which we get our word devil, actually means the angels. In that the reason is this that when the the Iranians had battles with the Aryans, the Northern Indians, the Northern Indians called their gods Deva. So the Persians insulted them by using that word for devils. And then they had here Asura, who are in this division and these are spirits of wrath, and so opposite in passion are who are our mother is a lot of light. Because they were enemies but so here are the Devas on top and next to them on this side are the the powers of Divine. Wrath in the sense of energy vigor. And below opposite the devas are the NACA and those are the purgatory that's where everybody is as unhappy as they can possibly be. Here are animals in this section. Here are men and women. And here are things called pretas. Pretas are frustrated spirits with very large stomachs and very small mouths. Now this is the rat race of existence of all the Samsara, in Sanskrit, Samsara, the round of birth and death. And this is the nadir, I mean this is the zenith, and this is the nadir. This is as high as you can get that's as low as you can get and that's always going to happen to you while you work on the principle of a squirrel cage. That is to say so long as you are trying to make progress you will go up. But up always implies down. So while you are trying to get better and better and better that means that when you get to the best you can only go on to the worst. And so you go round and round and round ever chasing the illusion that there is something outside yourself, outside your here and now, to be attained that will make things better. And the thing is to recover from that illusion so a Buddha would mean somebody who has woken up and discovered that

running around this thing. Maybe fun and it may be good to run around but if you think you're going to get something out of it you're under illusion because you're forever the donkey with a carrot suspended from his own halter.

Now then, it goes on to say that there's only one place one point in this wheel, from which you can become a Buddha, and that's here. The devas are too happy to become Buddhas, or to worry about becoming a Buddha. The pretas are too miserable. The Asuras are too angry, the animals are too dumb and the predators too frustrated only in the middle position the position of man which is you could say the equal position the position of sufficient equanimity to begin to think about getting off this rat race only from there you see it can you become a Buddha. So the position of a Buddha may be represented either as not on the wheel at all or is right in the middle of it. It makes no difference. And so he is just as in a way the axle point, The Still Point of the turning world as to use T.S. Eliot's phrase is the unmoved center of the Unmoved Mover the primo mobile, the axletree of the world all thought the navel that's why yogis are said to contemplate their navel the navel isn't on their tummy it's this place. The navel of the world. So that's the scheme of cosmology. Of Ancient Indian cosmology in which Buddhism arises. So you see that for a Buddha is one who awakens from the illusion of some sorrow. That is, from the thought that there is something to get out of life. That tomorrow will bring it to you that in the course of time it will be all right. And therefore, one is set pursuing time, as if you were trying to quench your thirst by drinking salt water. Now I can exemplify this a little more strongly by relating Buddhism to the social system in which it arose. A Buddhist Monk is sometimes called a Sramana. This is closely allied to the word Shaman. And a shaman is the Holy Man in a culture that is still hunting it isn't settled it isn't agrarian. There is a very strong and important difference between a shaman and a priest. A priest receives his audience nation from his superiors. He receives something from a tradition which is handed down. A shaman doesn't. He receives his in lightened by going off into the forest by himself. To be completely alone. A shaman is a man in other words, who has undergone solitariness. He's gone away into the forest to find out who he really is, because it's very difficult to find that out while you're with other people. And the reason is that other people are busy all the time telling you who you are. In many

many ways, by the laws they impose on you by the behavior ruts they set on you, by the things they tell you by the fact that they always call you by your name and by the fact that when you live among people you have to be in a state of ceaseless chatter. But if you want to find out who you are before your father and mother conceived you, who you really are, you almost have to go off by yourself. And go into the forest and stop talking even stop thinking words. And be absolutely alone. And listen to the great silences. And then if you're lucky, you recover from the illusion that you're just a little me the so and so, and you attain the state of nirvana, which means the blown-out state. The relieved state the sigh of relief. Nirvana may be translated into English as phew. I've at last discovered that I don't have to survive. I can survive of course but I don't really have to. Because you discover you see that what you really are doesn't have to survive because it's what there is. The real you is it, or that, tat tvam asi, the Hindu say. So then. In the normal life of India. Which is not a hunting culture but a settled culture. There are priests. But there is something beyond the priest. That is to say when a man or woman has fulfilled his or her life in the world of society. It's the normal thing to do for a person to quit their status in society and become what's called a forest dweller. That is almost, you see, to go back to the hunting culture. Bait it would divide people into two classes agree hostile which means householder and Vanna Prosper which means forest dweller. And the older people will hand over their occupations. And positions to their children and into the state of Vannaprasta at their whim or become a trauma and go outside the stockade I'm speaking metaphorically they sometimes do actually they sometimes don't and become a nobody. They give up their name. That is to say, the label which designates who they are in terms of caste or class. They become unclassified people. That's why, strictly speaking, you see, Hinduism and Buddhism are not religions you can classify the religions you can say what's your denomination that does Methodist Catholic Presbyterian Episcopalian Quaker cetera et cetera et cetera you see. But strictly speaking a van a prostitute a shaman A has no label he is a labeled bottle.

So, in the time when the Buddha lived about six hundred B.C., the Hindu system had become somewhat decadent. It isn't altogether clear what had happened to it, but it was certain that it did seem in some way to be in need of reform. And so, there were many reasons for this. And the Buddha as a

young man, being basically troubled by the great problems that we are all troubled with. The problem of suffering. And the problem of what all this universe is about he endeavored to follow the methods that were then being used by people who were prominent as. Vanna prospers far as well as and at that time it's very apparent that the main method that these people were using was an ascetic discipline. Starvation, very arduous meditation practices. Probably self flagellation and things of that kind. And it said that for seven years he practiced these austerity is. But he found out that they didn't lead to liberation and all the people who were practicing them knew they didn't either but they felt that that was only because they weren't doing it hard enough. And so he propounded instead the middle way. The way that led to liberation from the rat race that I've drawn, neither through austerities, nor through pleasure seeking. So these are the two ways the two paths the people who say. The whole point of life is to enjoy it to get the most out. It you see and the other people who tried that and then they found it was sour grapes or something you know or they burned their fingers in the pursuit of pleasure. The girl that was so beautiful eventually fell apart [was] turned into a shrew and whatever it was. So they said instead let us torment ourselves. A lot of people enjoy this or get something special out of it I was in Mexico this summer and what I went there for was to study Mexican Catholicism, where they make a great cult of suffering. And I was very puzzled about this and wanted to understand it and everywhere you know they have these ghastly tormented Christs, all drooling with blood hanging on the crosses in very contorted positions. And I realized certain people who find that the sitting on the tip of a spike is the realest place in the world. Because when you're on the tip of a spike, you know you're there. There's no doubt about it and also you know that your expiating for everything this somehow by sitting on that's on the spike you are paying for your guilt and so long as you hurt you're all right. So these sramanas were doing something of the same kind. And the Buddha became enlightened, became a Buddha he woke up at the moment when he gave up that kind of quest the moment he gave up as we should say trying to take the kingdom of heaven by storm. Now what does this mean? It means, that in his time, the way of liberation had become competitive, which meant it was on the wrong track. There are a lot of people who we call it the holier than thou attitude but we find it today with some objectionable Westerners who go over to Japan to studies Zen Buddhism and then come home and brag about

the great disciplines they've undergone. And say I sat with my legs crossed in one position for ten hours as distinct from somebody else who only sat for five. And always, there's this tendency you know, to have a marathon and be in a competition with others or with oneself about these things. But the moment you do that you're back on the wheel. The best thing you can get by asceticism is to get up to the Deva world you can't get anywhere else by it. You may get down to the narakaworld by asceticism too. Read the story of Thais by Anatole France.

So he found you see that the real path. The middle way. The meaning of the middle way is that it's the path that can't be followed. Because to get you on to the middle way I have to get into a dialogue with you you see and you say to me because after all it's always the student that raises the problem not the teacher. You say, Well now what's the right thing to do. I say back to you why are you looking for the right thing to do. And then you have to consider your situation where you are. And you say, well I'm looking for the right thing to do because I feel that I'm in the wrong situation I don't have peace of mind. Why do you want peace of mind? Because my mind is disturbed. That in other words you as a disturbed mind are trying to find peace of mind your quest for peace of mind is the same thing as having a disturbed mind. Now, if you don't have a disturbed mind, you won't ask for peace of mind. Well, how can I quote my mind why are you asking to quiet your mind because it's disturbing you see where you are. So in this way by this dialogue the guru the teacher brings a person back to center. So then, this is the point all Buddhist teaching is a dialogue. Really and truly, the man who goes out and leaves society and becomes a monk is it a little bit too much. Buddhism involves this act as a preliminary gesture, but what it comes to in the end is the position of what's called a bodhisattva. A bodhisattva means somebody who went out of society. Or we should say gave up the world in some way took on the the robe took on the discipline. He found what he was looking for but his finding it was absolutely simultaneous with his coming back into society. And he's called a bodhisattva. As distinct from a Pratyeka Buddha, which means a private buddha, one who goes out and doesn't come back. And the Bodhisattva is considered as having is superior payment. Superior insight.

So the important thing to remember then is Buddhism is a dialogue. And its teaching is a method, and not a doctrine. Now the teaching of Buddhism is summed up in what are called the Four Noble Truths. The truth of suffering. The truth about the origin of suffering. The truth about the ceasing of suffering. And the truth about the way to the ceasing of suffering. DUKHA is in the Sanskrit word we translate suffering. Discord, frustration something like that that's always the problem you see and this because of suffering is the reason why human beings seek out teachers and saviors. I hurt, and I don't want to hurt. So that's the the universal problem you see that everybody brings. So then, the teacher replies to this problem. Programme that by saying my problem. You suffer because you crave things. T R I S H N A We from which we get our word first thrishna, craving or desire, is the cause of suffering that claim I'm going to die are you. Now the Buddhist analyze is this that. The world is Dukha that all of us ration and it's also characterized by in the prominence Anita. And by. I. Non-entity in this. That means that no thing exists independently. Everything is a thing only in relation to everything else therefore there are no separate things no real selves or souls or egos. And trying to cling to the world, which is necessarily changing, trying to have a separate self and to protect it. All these things are thrishna. They are the cause of dukha. So the teachers having said this then the student comes back and says Well how do I get rid of Trishna. If Trish not desire is the cause of suffering couldn't I get rid of desire so as not to suffer. And the teacher says well you try. And this then is the first part of the discipline to try and not to desire. To calm your mind. To practice centering to practice getting rid of all what they call Klesha K L E S A, disturbing thoughts distractions evil passions, immoderate appetites, and come to a picture or it can imitate of mind. And so the student practices that. And this is a very difficult an arduous discipline and all the time he sees the teacher watching him of the slightly sour expression on his face. And he knows of course, or thinks he knows that the teacher is fully aware of his inmost thoughts because you know it's the Indian way they go to meeting with the teacher and the teacher says. It's under a tree and smokes a cigarette or a pipe or something and all the students sit around a cross legged and they they meditate and sometimes the teacher meditates and they can see him occasionally looking at them like this you know. And they think uh-oh, the teacher knows what I'm thinking. Because he has the power of infinite vision you see and all seeing this and

this bugs them completely. Because you see you remember how it was in school when you were trying to do something the teacher walked around and looked over your shoulder. It puts you off completely. And so, the Hindu teacher, or the Buddhist teacher, deliberately puts his students off. And finally he raises in their minds an insoluble problem. That if you are trying to stop desire so that you will not suffer, aren't you still desiring to stop desire? All the students may very well find that out for themselves and they say to the teacher but how are we to stop desire when we're desiring to stop desire. So then the teacher can engage them in [an] extremely marvelous trap. Which is to say. He can he can play it in a number of different directions one direction is to say well, don't try to stop all desire. But try to stop as much desire as you can stop. You see where this is going to go. Then they're going to say well, I'm a little excessive about desiring to stop desire. Well, if you're naturally excessive about it he says try to be as us. Likely excessive as you can see. Now do you see what's leading here? If you follow that course, you are being brought to center. In the same way as I demonstrated before. You are being brought to yourself, to accept yourself as you are here and now totally. But you can't do that directly. Because if you try to accept yourself you will always find that in yourself there is a spirit of the non acceptance of things and you have to accept that. So the teacher would say, don't try to accept yourself more than you can accept yourself except yourself as much as you can accept yourself. Because then you see, you are also accepting the part of you that doesn't accept. Or, he may try on another tack he may say. All right now if you've seen that it's, that desiring not to desire is simply another form of desire. You're trying for example, to get rid of your sensuous appetites. You are going to give up booze and women and. Or whatever it may be. And you then think well now, yes this I must do. And eventually. You find that you are becoming proud of your success in mastering your appetites. And you're beginning to depend on that. So the teacher says, Do you see you're in the same trap as you always were. Formally you sought spiritual security in booze and women and so on now you are seeking it in holiness. Formerly, you bound yourself with chains of iron now you are bound with chains of gold. Formerly, you boasted to all the boys how many sins you committed. Now, your boasting before the lot of how many virtues you have same trap. Why do you do it. So, the student eventually finds there's no way at all. To not desire. Even desiring not to desire is desiring. Even

trying to accept oneself is a way of trying to escape from one's self because one hopes psychotherapeutic clear that by accepting yourself you will get rid of your nasty symptoms. So you're not accepting them you're not accepting them by the gimmick by the pretense of trying to accept them. So this is the way, in which the dialogue of Buddhism begins to work. And as it progresses step-by-step. Let me try and show you a little bit more how it works because I'm shortening it enormously, in order to give you an outline of the whole thing what is going on between the teacher and the student the Buddha and his disciples is not merely a dialogue. There is the verbal dialogue else that goes on but there are also it spread over a long period of time. And in the intervals the students are practicing meditations. They are making efforts to control their minds and emotions, and practicing those things which are the Buddhist equivalents of yoga.

So that, in parallel to the intellectual discussion that is going on, there is a total devotion of one's whole being to a quest. Morning, noon and night. And so you see this works up to a very considerable. Psychic alertness it makes the student put a very considerable psychic investment in the task. And as he goes on you see he becomes more and more frustrated. Because as the trap closes. And he finds that it's impossible to do the right thing because the right thing is always done for the wrong reason. When the wrong man uses the right means the right means work in the wrong way. You see. There is something you could do to attain liberation or as the Christian would say union with God. If you could do it. But the Christian would say by reason of original sin you can't because through Original Sin everybody is basically selfish and you can't be unselfish for a selfish reason but you have only selfish reasons. So to him that hath shall be given. But of course he doesn't need it. From him that hath not be taken away even that which you have. Poor fellow what is he to do. So you see in this way, the teacher closes a trap on the student where he finds himself completely impotent. Not only can he not do anything that will bring about his salvation, he is also unable not to do anything. One might say, you must do nothing. You must be completely passive, but you can't do that because the moment you try to be passive you are doing something. So you get into the state which they call in Zen Buddhism a mosquito biting and iron bull. Or as we would say, in our Western idiom the state when the irresistible force meets the immovable object. Where something must be done but simply

cannot be done. And in this state of maximum frustration. There is an opportunity. To understand the situation. To understand. That I. The meaning of the state I cannot do I cannot not do. The meaning of this state is that the separate I thought yourself to be is an illusion that's why it cannot do and why it cannot not do. You see, what is are I, our ego? Sometime in the development of man, maybe three four or five thousand years ago. We developed self consciousness in a peculiar way. We began to realize that by directed thought, we could control our environment. And then it was, you see, that we had a sense of responsibility let's just assume for the sake of argument that there was a time when nobody deliberated they did exactly what they felt like. When you were hungry, you ate. When you were thirsty, you drank. When you were angry, you hit something. When you were happy, you downs but you never stopped to think what was the right thing to do. You just trusted your intuition your instincts your unconscious or whatever it might be called. Well that was great because nobody wanted. Nobody had any problems when it was like that. See a baby is in the same situation today. Now maybe you were unsuccessful maybe the thing you did spontaneously was absolutely the wrong thing and the tiger ate you up well that was all right because it really doesn't matter if the tiger eats you up so long as you want spending a previous time worrying about it see everybody dies and if you die clunk like that that's that you don't spend all your life before you die worrying about death you don't spend all your time before you get sick worrying about getting sick. And when you see you move on that level of unpremeditated spontaneous behavior that's the golden age. And the reason people look back with nostalgia for the golden age is because that was the time of irresponsibility. That when people began to see that they could provide for the future, and that they could look after things and take care of and direct everything, immediately anxiety came into the world. So that was the fall of man.

Because then the moment you start doing that you begin to think now having thought this question through and decided that such and such is the right thing to do have I thought it over carefully enough. Now that's a real bugaboo of a question. You know you go out of the house and you wonder did I turn off the gas stove. I think counted but on the other hand I'm not quite sure that's go back and see so having gone about five blocks to work back yes you did turn it off so you go out again. And you wonder again,

now I wonder if I really looked, or whether I was so keen on finding out that I did turn it off that some sort of wishful thinking about it diverted my consciousness and whether I hadn't better check that I really did look properly or see well this way you never get away you're trapped. So this you see is the problem of all self-conscious beings. They are they feel responsibility and then they feel responsible for being responsible and responsible for being with sponsible for being responsible and there's no end to it. So when in this obscure way everybody wants to get back to the Golden Age. But they say, if I just acted as I felt and was completely spontaneous, goodness only knows what would happen. Jesus you see, said to do that. He did, and everybody reads it in the King James Bible where it means nothing. Take no thought for the morrow, watch you should eat, what you should drink and wherewithal you should be clothed. Consider the lives of the field how they grow toil not neither the days. But I say unto you that Solomon in all his glory was not a raid like one of these I have God so the grass of the field which today is and tomorrow is cast into the oven shall he not much more close you oh ye of little faith or I mean it sounds lovely read in church. But what it says. Her bosses know that's that's the summit on the mountain that's not practical nobody can do that maybe for a few saints but after all in our practical life was of practicing Christians in the modern world we can't do that kind of thing. Well. Isn't that funny. Why can't you do it I mean that's the real reason for saying it in the first place Jesus said many very strange things. For example, in the parable of the Pharisee in the publican, how the Pharisee goes up into the front row. And says how good he is and that he has fulfilled all his obligations and pay the ties and then there's this this publican who goes into the back and sits there and beats his breast and says God be merciful to me of sin and Jesus says now that man, was the Right man, he was justified, but the moment he's told that story everybody creeps into the back row and says God be merciful to me a sinner and they're all in the front row again but I'm nobody can do it, you see that's why the story is told in the same way he says Take no thought for the morrow, stop being anxious like going to a psychiatrist he said you don't want any stopping novus. Can you see nobody can. And also they find out to see that really in the end nobody can be God. Nobody can make life any better by being responsible about it. Because whatever you gain in that direction you lose at the same time. By being responsible, we've created civilization medicine care of the poor, everything, but what a headache the

thing is becoming. As we solve all our problems we make more problems every problem you solve gives you ten new problems I'm not saying don't do that but don't think you're going to get anywhere by doing that. That's one way of arranging it, that's one kind of dance you can have is to improve everything and have technology but it doesn't really solve anything. And it's only in the moment you see, when you fully understand that your situation as a human being is completely insoluble. [That] there is no answer. And that you give up looking for the answer that's, that's Nirvana and that's how Buddhism works.

In the first session last night, I was making two principle points about the nature of Buddhism. Number one, that it's a dharma, or method. And it's method is a dialogue or what is sometimes called dialectic. It is basically a conversation. A dialogue. The beginning of which is not necessarily at all the same thing as the end. The reason is that the discovery which constitutes the foundation of Buddhism the experience of awakening can't be stated. Or at least, if it can be stated it can't be stated in such a way that the mere statement will communicate the experience to somebody else. The experience itself is the culmination of an adventure. And one has to go through that adventure in order to come to it. I've sometimes tried to describe this adventure as a *reductio ad absurdum* of one's own false views, through a process wherein the teacher makes you act consistently upon your false views so that you come to find out experimentally that they are false. And indeed one might say, Buddhism has nothing to teach. Nothing whatever. All it has to do is to get rid of illusions. And then the content of the experience happens when the illusions are gone just like the sun comes out when the clouds go away. But if you try to manufacture the Sun before the clouds have gone away you see what I mean? And you paint the sun on the side of the clouds it's not the real fun so in this way the speculation as such ideation as such, does not lead to the awakening experience.

So then, that this is this was the first point then that it's a dialogue and from the statements about Buddhism that you can read in books. You will discover only the opening phases of the dialogue. One of the methods that's used in this respect... People say, now Buddhism teaches that all things are subject to change nothing is permanent. Now that isn't exactly what Buddhism teaches. A more subtle scholar will tell you that the Buddha taught that the world is impermanent. In order to counteract. The wrong

view that it's permanent. And Buddhist teachers always work in oppositions. If a person asks you a question about philosophical matters, you should reply in terms of everyday matters. What is the fundamental principle of Buddhism? I have just finished washing the saucepans. Or the other way around, if a person asks you a worldly question you answer with a philosophical one. Please will you pass me the knife. And so the teacher passes it blade first. Please I want the other end. And what would you do with the other end. You see here, the metaphysics comes in in answer to the practical question. And so if once when our RH Blythe was a great Zen student was asked by some students do you believe in God He replied If you do I don't if you don't I do. So. When anything then is taught it's taught in order to counteract something muesli the Buddha taught that there was no self. And scholars have debated eternally whether he meant there was no ego. In the sense of the superficial. I centered on consciousness alone. Or whether he taught that there is no self in the more classical Hindu sense of the Atman. That is to say, the ultimate self, the divine final reality which is in everybody, which is the root and ground of all consciousness everywhere. And some people who see of thought that he denied that well he may very well have done so. But with the idea you see of correcting something. If you see a person believes that his basic self is divine and eternal and beyond all vices to. He may be leaving that for the very he may be believing that the very wrong reason. He may be believing in it as something to cling to. To give him a sense of security but so long as you have a sense of security and you feel safe you haven't got the point because it means you are still relying on something. And a Buddha is a man who doesn't depend on anything not because he's so tough and he's so strong. When you get a tough guy who says I'm not afraid of anything you try him out and you'll soon find he has limits. Everybody has his price. If you try hard enough. It doesn't you see a question of being strong. In the sense of tough. It's a question of knowing very clearly that there isn't anything to depend on. So you don't depend on things anymore. The only thing to depend on is what you really are but that's not something you can hang onto you see you can't catch hold of that you don't need to. The sun doesn't need to shine a light on the sun. So, by the exploration of the dialectic, the teacher, by talking this way, and talking that way, completely undermines you. That is to say, he digs out all the dirt from underneath you. And you drop or think you do, because you're used to having your out there but

when you are in fully in empty space there's nowhere to drop. That's why people get such a marvelous feeling when they go skin-diving and they get down below thirty feet or so and start to lose all sense of weight. Or when astronauts go out and start to lose weight in the middle of the space bubbles. You know what's going to happen? All those boys are going to get out there and then I want to come back. This is just great that's what happens to skin divers You see they don't have automatic controls on those things they're not too certain of getting the man back because when people go down skin diving and they stay down too long so you have to have a watch with you and or someone with a string on your foot something to know exactly when you've got to make the trip back you may have oxygen to last you a long time but you're going to go out of your mind because you will suddenly realize that nothing matters that everything is OK. I mean so what, supposing I do die, and the people take off their oxygen masks and presented to a fish. They have a drag. And they're so happy.

So you know the famous story when Suzuki was asked what is it like to have Satori, he said well it's just like ordinary everyday experience except about two inches off the ground. So. There is this peculiar thing a sense of you might say weightlessness, but you mustn't interpret that too literally. Some people interpret it so literally that they believe great mystics levitate. I remember when I was a little boy there was a famous Dean in England his name was Ralph W. Inge ING I think it's pronounced. And he wrote many books on Plotinus and mysticism, and one day he came to kind of preconceived rule and was sitting in the choir stall and I was sitting right near him and I noticed that all the time he was doing this. Other stick you know. But people said it was because he was always Bach to live it. To keep you stuck down. So, that levitation you see, just as if something in mystical experience. Like a sense of luminosity. Or a sense of transparency. It's very common there are two visions of the world to see that painters have had in history is the vision of let's say in our own western history the vision of JATO of Jericho and the vision of Rembrandt, but you see Rembrandt is full of shadows. Whereas the other painters are full of luminosity. And then you can get some painters who are not only full of shadows. But their paintings look as if they were all. Drawn just outside of Foster's freeze you know what a Foster freeze is? I don't know if you have them on the East Coast but you probably have the equivalent of the places where they sell ice

cream custard. And they sell them from a from a glass box which is all it inside with fluorescent light it's absolutely blue and coat and the customers all stand outside the glass box and on a chilly night we have there you see them all under this ghastly blue light, eating ice cream cones, and the men serve it to them through little windows like a theater ticket box and how people can go that's the idea of one of the cold Hells. But they do, and so what are some paintings some visions of the world that look as if they're seen under that light so that there is no light within things. Now, when you see the other painter who sees light in everything. Even shadows are full of color you notice with you because those work how full of light it is. And that's because the vision of the world, of the mystic, is always full of light. Only it isn't quite literal light it isn't as if. Everything was blazing or you may say that everything is transparent and it doesn't mean that he can see through your body or to the wall of the other person behind. It means that things are transparent because they're clear it has become clear a problem has disappeared that I thought was a real problem and now it is clear I can't tell you how it's clear but it is and that's what we're going to get to in finding out what vastness is when things are seen in the state of vastness all such that they are clear there is no further problem about them they are what they are and they do what they do. And if you can really penetrate that as we should go into it you will see the mystery cleared up. The mystery clears up when you get to the point that you don't know what questions to ask him all. The questions of vanished the problem has vanished. Now aside from the fact that Buddhism is a method, is a dialogue. I explain to you that it's a transformation of one state of consciousness. That's what awakening means. That is to say, it is a transformation of the way you see things. Almost I could say, the way you sense them. And in this respect I've often thought that the process of Buddhism is much more like ophthalmology than it's like religion. An ophthalmologist as a person who corrects field. Vision so that you see clearly. And so in exactly the same way awakening is to see clearly. A transformation of consciousness. Be careful of the implications that that word may have. Because it doesn't mean necessarily an ecstatic state of affairs, and it doesn't mean an unnatural or even strange state of affairs. I mean, you could imagine that if you put on blue glasses, you would for a while see everything looking blue. It isn't something like that at all. Or it isn't as if you saw everything in a different way like you suddenly put on the eyes of a fly you see, and

suddenly everything became multiple .You saw all this room of the people in it hundreds of times all at once it isn't something like that.

It's just that everything is the way it always was except it has a completely different meaning. And there is a curious connection between the experience of this and the understanding of it. First of all, there are really three steps in this kind of understanding. You might say there is in the first place, an intellectual comprehension of the getting of an idea. And what sort of idea do I mean? Let's take for example, the idea of a third dimension. To be aware of depth. If you look at things with one eye only, you see, you don't see depth. But if you look with two eyes then the dimension of depth appears. And once you, though have understood depth though you can see depths for example I don't look at things with two eyes at once I look either with my left eye or with my right eye and I don't have binocular vision, but I still see depth, because I understand it to be there and as a result of understanding it to be that I see it. If I understand clearly. I couldn't understand the nature of depth if I was just told looking at things that they have two dimensions but if I make an exploration and I handle the thing, and I understand what the third dimension is then I understand it more thoroughly I'm quite clear about it, and then as a result of being clear about it I see it. Now in the same way, people did at one time actually see believe it or not the crystal spheres in which the planets were supported. We would say, How did they see it if it was transparent? Well they saw it they knew it was up there. And it was there for all to see because naturally you can always see through crystal clear. To see people really think like that. And they see things if they're hypnotized into seeing them. Now then if you take the suggestion away. Then they won't. Or conversely, if you have the idea of a number system which is only one two three many. Nobody can see four things. They will see something that other people call fall but they won't see far they want to see many and four will be as many as five. They might begin then to have a concept of a little many in a big many. And a middle many. That's three again. They won't be able to get a little many. Not so little many, rather large many, very big Many You see they won't be able to do that so long as their number system is one two three many. So then it can never be a fact for such a person that a room has four corners. It has many corners are all three. But once you've got the idea of four then you can see that it has four corners. When I see the sun rising I know that

the sun isn't moving but the earth is turning. One has traveled enough in airplanes to see that for oneself and the the question then now is this if someone believes that the sun is rising and the earth is still when he looks at the sunrise is he seeing the same thing I'm seeing. I don't think he is. Because my seeing, has an entirely different interpretation on it than his seeing.

So, what you understand also determines what you see. So that's what's meant by a yana in yoga in India method of awakening through intellectual mind, through intellectual understanding. People say you can't get it intellectually that's partly true but only partly true. That means first of all. Well for example, the old Hindu saying that you cannot get wisdom through books is as I explained because. It's a dialogue but also it's because the books that exist are only notes. In other words all the sacred books are nothing more than memoranda just like the notation of Hindu music or it is only a memorandum it's not something you follow it's a reminder of a certain rock graph or theme and then you play it and improvise on it. So in the same way, all the aphorisms in the yoga sutras or the verses of the of the gate and so on, they're notes. Little jottings, and then the teacher will explain them. So when the something is understood, very subtly by the thinking mind it will eventually become a sensation because you really understand it you see. So that, I'm saying all this as a basis for seeing. That when Buddhism in visage is the character and the consciousness of the highest form of man, which it calls Bodhisattva. It is not somebody who's out of this world. It's not somebody who is in a state of some weird ecstasy, or somebody who sees. Everything kind of full of angels as we might expect in the ordinary way or things like that. Real Angels, Gods and so on are very different from what you might suppose in the imagery. You can find out for example that the dust is full of gods. If you really look at dust. And that the paws of your skin contain many universes. And that's marvelous, you see. That's to see that things are full of gods but you're still not seeing anything different. From the ordinary things you see but you got a different understanding. So having a different understanding you was never the less the same world same everyday life same everything going on that everybody else has. The understanding in other words is not away from this everyday kind of experience we're having now so there's the bodhisattva. And this is an extraordinarily important vision for the whole of

Asia. Why? Because there was always a tendency in Asian spirituality to want to go away. That's very understandable, because when life is rough and there are terrible plagues and wars and hunger and diseases, a lot of people would think oh enough is enough is enough and if this is going to go on and on if we're going to be reincarnated back and back into this mess, isn't there some way of getting out? So in that way you can lose all interest in everyday life. For example, supposing you are a drunk. A really serious dedicated drunk and lots of people are they want out. And they couldn't care less whether they have no money whether they're going to die or whether they're dead just so long as they can stay out. Now you might say as we look at people like that well that's very sad. It's terrible. Well, look at them, they're wasting their lives but from their point of view they're not. They're living the real life, they want to live. Or a person may be an opium addict you see and he would be in his special paradise. And you say Well isn't that terrible. Or he wants out. And from his point of view as he looks at it it's perfectly all right because he thinks that people who are pursuing those ends which are considered virtuous. And practical he thinks they're out of their minds. Why do all that? Why do you have to go on struggling and struggling and struggling to keep alive? What do you think that that's going to give you to see so he feels it doesn't matter if it ends soon or if it ends later time is an illusion. In his state of consciousness he can make a tiny little bit of time into a long long time. He can experience one hundred years in an afternoon or longer. And some people think you see, that you might have immortality through the fact that in the moment of your death. Your sense of time gets longer and longer and longer and longer and longer and longer. So that although from the standpoint of an outside observer who is not in your state of consciousness, it looks as if you are having your head cut off in a hurry. From your standpoint that lasts forever. Because of the alteration of your time rhythm. See how slippery philosophy can be. And so people can think all these things and they can get lost and there was always a tendency in Oriental culture to do that and from our point of view, that's a bad thing.

Well from a say the Chinese point of view also, it was a bad thing the Chinese are very practical and like they believed in in the family and in having children and husbands and wives and in industriousness and in the building and in arts and in cultivating the soil by very ingenious methods.

And so, it was a special appeal to them in the idea of the bodhisattva. Bodhisattva you see it doesn't is not like the extremely contemplative. Private Buddha. You won't find a bodhisattva sitting all day under a tree in a state of rapt absorption. So that anybody who comes up and knocks on him won't get an answer. He'll be like everybody else or he will look like everybody else because he will see that this everyday world too is it. This no special, nothing special world. Misty rain on Mount Lu, waves surging on River Che. Waves, when you have not been there no rest from the pain of longing but you go there and come back it was nothing special misty rain on Mt Lu, surging waves Che-Chiang. This isn't meant to see to debunk it and say well after all. You know that it was a nasty baby any. Now, I don't know who died this but it is it isn't does it doesn't. It doesn't the kind of thing it was nothing like that. In the idea of nothing special or boogy. There is a way of saying. But look at ordinariness. Look, what you miss every moment. And you see that sort of attitude underlies tea ceremony well. Very. Great appreciation exists all of the very simplest kinds of utensils rooms architecture and so on. There was a very great sage who lived far off in the mountains behind Kyoto. And an American student had a great desire to see him. And he made all sorts of inquiries to find this man at last found the way to the Hermitage but then it was very difficult to get up. And but he did finally find the old man out and came and said How do you do? And they talked and the old man was delighted that the foreign student should have taken all that trouble and should show such [a] good understanding of these things, that he served him tea ceremony with nothing but hot water. No tea. And the American student was delighted he realized that this man had paid him a real compliment. So. That's buji you see that's nothing special. Now then. Generally speaking as we look at the whole field of Buddhism. The idea of the bodhisattva that is to say the idea of realising the enlightened state in terms of everyday life is characteristic of the Mahayana School of the North. North Asia. Whereas, the Theravada are sometimes when a young a school of South Asia still has its emphasis on the idea of getting away. Still very much concentrates on the ideal of the monkish life, which is celibate and away from every dayness all attachment, all kinds of worldly responsibility. And so those monks their yellow robes are very much a people apart. In the Marianna on the other hand. Although there are monks. They aren't monks quite in the sense of the Southern school I mean

it's like a Roman Catholic priest is not supposed to marry but in a piece of paper and priest may.

So in that sense the southern monks are like Roman Catholic monks and the Northern monks are like Anglican clergy or something like that except that they have a rule that if they do live in a monastery they mayn't take wives in there and likewise the nuns mayn't have husbands in their. But if they live apart into a temple a priest may have a wife. Because they see no fundamental inconsistency between the state of deeply illuminated consciousness and living in some kind of affectionate human community and society. So therefore, for that reason, through Mahayana through the idea of the bodhisattva Buddhism was able to exercise an enormous influence upon the everyday life of the Far East. To express itself through art forms that were by no means Styria typed. Not merely iconographic and stylized. Buddhism in the Far East expressed itself through naturalistic art forms. And so, it's an extraordinary thing but you see, the religious painting of China in so far as it is influenced by Zen Buddhism very rarely has a religious subject. When you would say, What is Christian art? Well, you wouldn't recognise that certain great schools and styles you would say you would associate Romanesque architecture with Christianity certainly Gothic architecture you would associate early Italian painting or a great deal of Russian painting with Christianity peculiar. But Christian art you see always seems to have for its subject matter. The the Christ the saints the angels the incidents in the lives of the saints that martyrdoms, and so on and so forth. But it's inconceivable, to get the idea isn't it, that a still life. Which might have been painted by a Christian is a form of Christian art. When all it is in it is a few apples on the table. That a case could be made for that idea but it hasn't been made it's never really occurred to someone to express Christianity through that sort of method Oh it's true that there has been a symbolism of the grapes and the wheat represent the sacrament the mass, that limb is represent something and so on and so forth but this is purely symbolic. It wouldn't occur for Christian art that. If the fine painting of a used ashtray, with a piece of tong paper beside it could possibly be Christian art. Unless it was propaganda against being dirty or something like that. But, for the Far East, a painting of an old rock with some grass growing beside it. Can most definitely be Buddhist art. Because that painting of the rock is concerned with such ness. And just as much so as

any painting of borders and their halos and golden. Duras and flowers and lotuses and all like kind of thing. So likewise, when this cool of painting paints Buddhas and bodhisattvas it makes them look like ordinary people. Even a little bit to get the point a little bit more than ordinary that is to say tramps, bums, clowns. You know, this fellow. This it Hotai, in Chinese and he is a fat slob. But he goes around with an enormous bag, patched and so on and he collects trash. He collects everything that nobody wants to see there are all new people are always up for precious things but put tires up for rubbish. And he collects all this rubbish and he gives it away to children who love it. Well this is the way you see this is true this man is sometimes called the Fat or laughing buddha and he has a fat Buddha. But, the only clue that he is a Buddha is a big ears. Because that means he can hear. Right through everything see. He can hear the ultimate sound in everybody's voice. Now that's a very important trick. If you listen to me talking, you may try to make sense of the words. But actually, in the sense of the words that I'm saying isn't the content of what I'm trying to explain. The content of what I'm trying to explain can be heard in the sound of my voice. And in order to listen to that properly you have to go beyond its meaning. For example, if you say the word yes, and then say it again yes yes yes yes yes, it becomes a very funny word. And you think why did we use that funny noise yes to mean yes. Or are you might see somebody sitting like this you know say I imagine this is on a movie. And the man just sitting there for a while and suddenly goes. He shrugs his shoulders. That's a normal enough gesture and I mean it was puzzled. But as he's going on saying that he does. And you want to know what's the matter to go to Dick. Suddenly you see the gesture begins to lose meaning you come upon something. Well, that's what you have to have big ears to get that you see. So it through that you know he he hears all sounds as being just songs. Of course, [he] can hear meaning in them too. When they have meaning but fundamentally underlying the meaning he hears just the sound. And this is something you get to if you go to a foreign country and you don't understand the language and you see all the people talking and you notice things that they don't notice about themselves because they get absorbed in the meaning of what they're saying. And so they don't notice. The fascinating aspect of the perfectly meaningless side of their behavior. But at any rate, the, a whole approach of the whole result of the bodhisattva doctrine in the art of the Far East is to create what the Spiegelberg has called the religion of non-

religion. Where the religion became so perfect that it left no trace. It's like when you build a house you erect scaffolding when you finish you take the scaffolding away. And you wonder if you had never seen a house being built how on earth the builders got up so high.

So in the same way, the ancient idea of Buddhism is that the Buddhism is a ferryboat. And it's designed to take you across the stream from this shore, which is Samsara, the Rat Race, to the other shore which is nirvana when you get on the other side you get off the ferry see a ferry boat goes back to bring the next party over. But if you stay on the ferry boat, that means you see you're in love with the ferry boat. And you're in danger of becoming a religious maniac. And, you people do that you see you know how it is you've probably had that experience people who join a church and then become fascinated with all the things that go with church they like Bibles not just for what's in them but the smell of a Bible, the appearance of the Bible has something something holy and numinous about it and they like crucifixes. Now, a crucifix is a pretty grisly object. A corpse nailed on beams, but they get jeweled crucifix it's beautiful works of art in natural gorgeous things and people with a great. Religious feeling love to think of those things easy and Buddhists to do that they like their rosaries and there. Are images and the smell of incense and they get a kind of church if occasion. The French have a wonderful word for those goods they call the bon years early. I know and it's a little difficult to translate. Literally, good God guttery. That lived long here you know everybody's on this sentimental because all of the born year though lady is always talking about the bond years and so people say you know people who've got church on the brain the born the year it's all these stores sell bronze years only.

Now while this you see is this just in its own way understandable. The whole point is that the in the Supremes state of understanding you get rid of volunteers or the altogether that's the religion of no religion see you don't even have any beliefs. The whole creed everything is utterly. Past surpassed that man's You left the ferryboat and you've gone on on the other shore you don't carry the ferryboat with you. And so, this religion of no religion, is very pure are very transparent it's called like the salt in water like the glue in color or in ink and you see it sticking that the Chinese make has glue in it to hold it together but you can't see the glue. It's all solid black all the way

through and the glue isn't observable. So the salt isn't observable in water. In this way you see religion is being used as a medicine and not as a diet the Dharma is, to use a Zen expression it's like picking up a brick to knock at somebody's door. And when the door opens, you don't carry the brick into the house. So a person who see who has much religion has what is called In Zen is instinct. And that's considered rather bad. Or rather special a bad smell and one of the Zen poem says to know your original mind your essential nature that is the great disease of our religion of our school see so people who have this thing who have zen and you can say well that fellow's a Buddhist. And he has this special thing he has you know it's like. Those of us who have the disadvantage of our eyes not being quite good we have to wear spectacles look new since we've got around with you all over the place gadgets you have to fix on you. Or people who belong like clergy to a religious order have to go around in funny clothes and at the rabbi who has a beautiful beard but he will wear a beastly black homburg at which is so unnatural. And, so, they have to separate us in a way that people with artificial legs crutches and so on so it isn't something that's worked it isn't working like a medicine because if the medicine works you get rid of it if a doctor successful, he gets rid of his patients.

And so in exactly this way, suchness is an attempt to say something which can't be said. It is trying to say. There is the world that just as it is you see that that's what we're trying to show you to look at we're not trying to drag in some fancy operators from about. Some special system which has got to be imposed on you some all kinds of gods and complicated people you've got to believe in. We're not going to fill your brains with a lot of new stuff. But instead come to the clarity of seeing things just the way they are. The trouble is, when when somebody said to a Zen master, the lines of the hills and the clouds are not all the is the body of Buddha he said yes but it's a pity to say so. And so even to have to say, look, that, see, it's just a little bit too much. Just a little bit too much. It would be more admirable if I didn't have to say anything didn't have to point out a thing, but after all, one does have to make some concessions to follow.

Psychedelics

Turning the Head or Turning On

I wonder how many of you have ever read a romantic Victorian novel called Zan Ngoni. It was written by Beau Willimon. And it's the story of an alchemist, an aristocratic, very good looking man called Zan Ngoni, who was several hundred years old, living in Naples shortly before the French Revolution. And he was several hundred years old because he had discovered the elixir of life. Which was, of course, supposed to be the quest of all alchemists all over the world, not simply something that would turn led into gold and give one indefinite riches about the secret of immortality. And this was the quest of alchemy both in the West and in the Far East. And many of the great emperors of China died because the Dow as priests gave them mysterious concoctions purporting to be the elixir of life. I only had an apprentice, and one day while the master was out, The Apprentice could not resist taking a very close look at some certain crystal bottles hidden in the depths of his cupboards. And this was the elixir. And he removed the stopper and took just a slight sniff.

And then suddenly there appeared before him an absolutely monstrous being.

And trembling, he put the stopper back into the bottle. And face this appalling apparition, which is called the dweller on the threshold. The something or other one has to come to terms with before crossing the border into immortality. Now, today, we are living in an age which is quite peculiar because in the world of science, there are no longer any secrets.

Because the method of science. Requires that all scientists be in communication with each other and therefore that every scientist, as soon as he has discovered something or got a good idea, he rushes into print.

And it's important for him to do so because some other scientists somewhere else in the world might be thinking about something on the

same lines and would be stimulated in his work by this man's speculations, even if not by discoverers.

And so the whole scientific world tries to remain in communication. And for this reason, it was an absolutely impossible to keep atomic energy a secret. In former ages, that might have been managed because there were many secrets once upon a time. And people were not admitted to these secrets unless they were in some way tested and found capable of handling them without running amuck. We live in such a dangerous age because all the secrets are out in the open and anybody can run amuck with them.

And that's just the situation we have to face and that is just the situation we have to handle. It is too late to stop it because that would be, as they say. Locking the door after the horse has bolted. And there is a certain reason why such a thing as a sudden chemical. Which is capable of opening people's minds in a certain way should be something extremely disturbing.

Because this particular chemical in common with a number of others that have been known for centuries. But I've been rather played cool through those centuries.

Is capable of doing something which simply cannot be tolerated.

That is to say, capable of letting properly prepared individuals or sometimes improperly prepared individuals in on a secret which is very closely guarded. And which is, as a matter of fact, the deepest and most fundamental of all our social taboos. I have just finished writing a book, which I've had with a sort of tongue in cheek attitude, had the temerity to call the book, and it is subtitled the book you see on the Taboo against knowing who you are. Because that is really the thing that cannot be let out. Sex is not really a serious taboo in our culture.

If you are initiating a young person into life and you realize that your son or daughter is going to college and that you ought therefore to have a serious talk with them, they'll laugh at you and say all this thing you're telling us about sex we knew years ago and we know more about it than you do. So that is not a subject for a serious initiation. Talk to a young person. So we have to think again and try and find out. Think deeply what is

fundamentally taboo in this culture and perhaps in other cultures as well. What would what information? In other words, would really let out let the cat out of the bag and give away the show?

Now quest around a bit.

Ask yourself this for what reason would a person be considered hopelessly insane? What sort of claims? Must a person simply not make it? Well, there is one, and that is if anybody claims that he is God. That simply isn't done. Certainly not in our culture, although it's very frequent in India, but in our culture, that is simply not allowed because we most of us from a Christian background and if not that from a Jewish background, and there's a great deal in common because both Christians and Jews are deeply concerned about somebody called Jesus Christ.

Both Christians and Jews are, in a way, followers of Jesus Christ in different ways. He is a problem to both because he was the man who came out and discovered he was God. And that simply is impermissible. The Jews handled it in one way. The Christians handled it quite as effectively. In another way, the Christians handled Jesus perfectly, even more tactfully than the Jews by putting him on a pedestal and saying this was the only man who ever was God, and nobody else was really so before.

And certainly nobody can be so afterwards. Stop right there. Put him on the altar, bow down to him, worship him so that everything he had to say will be null and void. And it worked beautifully, but you see, the trouble about deep secrets is they can't be repressed indefinitely.

As a certain president of the United States, one for once remarked, you can fool some of the people some of the time. But you cannot fool all of the people all of the time.

And we human beings have been systematically fooled by ourselves.

It isn't as if there were some deep, dark conspiracy with somebody else to blame for quite a number of centuries into the notion that we are strangers in the universe.

That the world that lies beyond the border of our skins is not ourselves and is some quite alien mechanical contraption into which we arrived. And from which we will disappear.

And we really have nothing very much to do with it. It's something about which we can take an objective point of view. We can look at it. We can measure it. We can calculate it. But it all turns out in the end to be some sort of stupid, stupid mechanism in which we are involved, because as bodies, we are part of it.

But it is. Common sense. For most individuals.

That they themselves. Aren't even their bodies. They are alienated spooks which have bodies like people have cars and in which they go around. And confront. The external world. As if it was something in which you were trapped. And children can say to their parents.

I didn't ask to be born. Just because of your funny love affairs and all that. I got mixed up in this world and you are responsible to.

And we don't even think that we had anything personally to do with the fact that our fathers once had an evil gleam in their eyes. But that evil gleam was you coming off.

Only U.S. by this idea of our own identity that we have, we are able to disclaim responsibility for all kinds of things. And say, no, it was my parents see if as a fellow taken in juvenile delinquency and he knows a little Freud, he can say, well, I couldn't help it because I was psycho analytically fouled up when I was a baby. Even before perhaps I was born. My mother had all sorts of complexes. And then if he gets away with that, the people in the press say for juvenile delinquents that the kids should not be punished. But the parents and the parents say, hey, wait a minute, we got fouled up by our parents. And we are we are pretty bad parents, we admit. But our parents before us brought us up in a certain way that we are hopelessly neurotic and we can't really raise children, but we have to. So every kid, everyone can pass the buck all the way down the line.

The woman that Dow gave us me. She tempted me and I did eat.

And then when God wagged his finger at the serpent. Subban didn't say anything because a serpent knew the answers.

He knew the thing which must not be admitted that the left hand goes with the right hand. That black goes with white and that you wouldn't know what white was unless you knew what black was.

And that, you know, wouldn't know what is was unless you knew what isn't is and you wouldn't know what here is unless you knew what that is. And you wouldn't know what you meant by self unless you knew what was meant by other.

And that is so simple.

But everybody contrived to ignore it.

Now, here's the problem, you see that there are certain processes, some of which are. What you might call spiritual exercises. Others are simply chemicals. Others are just horse sense. Whereby one comes to see very clearly indeed that black goes with white and self goes with other. And as this becomes clear to you, it's rather shaking. Because, look, if what you define as you. Is inseparable from everything, what you define as not you. Just as front is inseparable from back. Then you realize that deep down between self and other. There is some sort of conspiracy.

If these things always occur in combination. And look very different from each other and feel quite different. Nevertheless, the feeling of difference between them.

Allows each one to exist.

And so underneath the opposition or the polarity between self and other or between any other pair of opposites you can think of. There is something in common as there is, for example, between figure and background.

You can't see a figure without a background. You can't have an organism without an environment. Equally, you can't have a background without a figure or an environment without organisms in it or without things in it. You

can't have space which is unoccupied by any solid. You cannot cannot have solids not occupying some space. This is absolutely elementary. And yet we don't realize it. Because, for example, the average person thinks that space is nothing. But is this just sort of not fairness in which there are things?

And we are slightly afraid that not the fairness, that nothingness, that darkness, that the negative polls of all these oppositions will win.

That they will eventually swallow up every kind of being and every kind of Venice. But when you catch on to the game, you realize that that won't happen. Because what is called not existing is quite incapable of being there without the contrast of something called existing. It's like the crest and the trough of a wave. You can't have a wave that is all trough and no crest, just as you can't have a wave which is all crest and no trough. Such a thing has never been manifested in the physical universe.

They go together.

And that is the secret, there really is no other secret than that.

But it is thoroughly repressed.

And therefore, we are all educated to feel. That we've got to fight for the white. Because the black might with.

We've got to survive.

You must survive.

That's the great thing we're all working on now and pounding it out day after day and anxiety because this is a description of anxiety. Anxiety is the fear that one of a pair of opposites might cancel the other.

And if by any chance, by any means, you'll find out that that is not so.

You have an entirely new attitude to what human beings are doing.

Which may be very creative, but which also may be very dangerous. You see through the game. The game called White Must Win.

Because you know that neither black nor white are going to win because they belong to each other.

So one of the problems of the various chemicals which can change the human mind in certain ways so that it becomes apparent that inside and outside go together, is that they do rather give the show away. And people who take these chemicals and see through the human game.

Cannot be trusted.

They may decide to be good sports and go back into the game and play it as if it were for real. Or they may not. And if they don't know what's going to happen. If you wanted some sort of appropriate illustration for a Life magazine article on the effects of LSD, you would have one very simple solution.

You would publish the most gorgeous color reproductions of Persian miniatures. And of Moorish Arab Basques and of the illuminations of Celtic manuscripts that would give you the story. So far as changes in human sensation are concerned.

But there would be one thing very difficult to put across in pictures because the people who looked at them, if they didn't get the point of view, wouldn't see it. And that is what I will call the sensation, as well as the intellectual understanding of polarity. That is to say that the inside and the outside, the subjective and the objective, the self and the other go together.

In other words, what? There is a harmony, an unbreakable harmony. I'm when I'm using the word harmony, I don't necessarily mean something sweet. I mean, absolute Concorde relationship between what goes on inside your skin and what goes on outside your skin. It isn't that what goes on outside is so powerful that it pushes around and controls what goes on inside. Equally so it isn't that what goes on inside is so strong that it often succeeds in pushing around what goes on outside. It is very simply that the two processes, the two behaviors are one.

What you do is what the universe starts. And what the universe does is also what you do. Not EU in the sense of your superficial ego.

Which is a very small, little, tiny area of your conscious sensitivity, but you in the sense of your total psycho physical organism conscious as well as unconscious.

This is not something that arrived in the world from somewhere else altogether that confronts an alien reality. What you are.

Is the universe in that, in fact, the works? What there is and always has been and always will be forever and ever. Performing an act called John Doe.

And this is such a subversion of common sense. But is that fact, matter of fact something if you stop to think about it, that is completely obvious.

Only everything conspires to prevent you from seeing that obvious thing.

Because when you were babies, practically all your parents and your teachers and your aunts and uncles and your older brothers and sisters got together and they told you who you were. They defined you as Johnny.

Was just Johnny. No. And don't you come on too strong, Johnny. Because we've got elders and betters around here.

But you're responsible.

You're a free agent. You'd better be.

And so when you are told from childhood that you are expected and commanded to behave in a way that will be acceptable only if you do it voluntarily.

You remain permanently mixed up that if anything is permanent brain damage.

But that's the idea you see, because that's the game we're playing. You started it. I didn't say that's the game we're playing. We can make all kinds of complexities out of that and really in a way, have enormous fun. But once anybody sees through that.

Well, we are frightened.

Once you get this sense of polarity of your inside being the same process as your outside and your ego being one and the same process as the whole universe going on.

Then we are afraid that people may say. Well, good equals bad. And we can do anything we like and we didn't in any way be further subject to the ordinary rules of human conduct. And we can wear what clothes we like or no clothes at all. We can have what sexual life we like. We can do anything. And we are going to generally because the world is being rather oppressive towards us, challenged the whole thing and run amuck. And a lot of people are doing just exactly that.

So I want to introduce into this whole problem some ancient wisdom. I have really two things to talk about how cultures which always did know in some way or among whom a large number of people always did know this secret handled it. And then I want to make some observations about how we are trying to handle it and how it's not going to work.

Among the Hindus and among the Buddhists. This view of the real identity of a human being has always been known. At least by a very influential minority.

The central doctrine of the Hindu way of life. I call it that rather than a religion is in Sanskrit. Tad Devine Marcy, you're it. Put it in a kind of colloquial way, you're it and it is the which then which there is no which are which they call the Brahman or the Ottoman with a capital, a meaning the self. You are only just kidding that you're just poor little me. See the function of a guru. That is to say, a spiritual teacher in India is to look give you a funny look in the eye, because you come to him and say, Mr. Guru, I have problems.

I suffer. And it's the mess. And I can't control my mind. And I am miserable and depressed. So on. And he gives you a funny look.

And you feel a bit nervous about the way he looks at you. Because he you know, he is reading your thoughts.

And this man is a great magician. He can read everything that's in you. He knows right down into your unconscious and you know, all the dreadful things you thought and all that awful desires you have. And you are rather embarrassed that this man looks right through you and sees them all. That's not what he's looking at. He's giving you a funny look for quite another reason altogether, because he sees in you the drama, the Godhead, just claiming it's poor little me. And he's going to eventually buy all sorts of subtle techniques that are called in Sanskrit empire that in politics means chicanery and in spiritual education means skillful pedagogy. He is going to try and kid you back into realizing who you really are.

That's why he gives you a funny look. Why seems to see right through you. As if to say Shiva, oh, boy, don't kid me.

I know who you are, but you're coming on beautifully in this act. You're somebody else altogether. And I congratulate you.

You're doing a wonderful job playing this part, which you call the person. My person, you know, a person is a fake. It with the word means a mask. So if you read books on how to be a real person, you're reading books on how to be a genuine fake.

The word persona, as you know, means a mask worn in Greek or Roman drama.

So if you are this, come on to the guru and say, well, he asked you who you are, Sri Romana Maharishi, when anybody came to him and they said to him, as people do. Who was I and my last incarnation? Or will I be reincarnated again? He always replied. Who's asking the question? And everybody was irritated because he wouldn't give them answers about what they were in their former lives. But I said, Who are you?

And he looked at you if you looked at photographs of this man. I keep a photograph of him close by because of the humor in his eyes. They're looking at you with a dancing twinkle saying, come off it.

Now they're in these Asiatic traditions. It is well recognized. That people who get the knowledge that you're at.

May very well run amuck. And therefore, they always couple any method of gaining this, whether it is yoga, whether it is smoking something or drinking something or whatever, is the method, they always couple it with a discipline. Now, I know the word discipline isn't very popular these days. And I would like to have a new word for it, because most people who teach discipline don't teach them very well. They teach it with a kind of violence. As if a discipline was something that is going to be extremely unpleasant and you're going to have to put up with. But that's not the real secret of discipline. I would prefer to use the word skill.

Discipline is a way.

Expression. Say you want to express your feelings in stone now, stone doesn't give way very easily. It's tough stuff.

And so you have to learn the skill or the discipline of the sculptor in order to express yourself in stone. So in every other way, whatever you do, you require a skill. And it's enormously important, especially for American people to understand that there is absolutely no possibility of having any pleasure in life at all without skill.

Money doesn't buy pleasure.

Ever look if you want to get stoned drunk? And go out and get a bottle of bourbon and done it. You can't do that except for people who have practiced the distillers art. You can't even make love without art. Where I live in Sausalito, we have our harbor full of ever so many pleasure craft, motor cruisers, sailing boats, all kinds of things, and they never leave the dock.

All that happens with them is their owners have cocktail parties there on Saturdays and Sundays because they discovered having bought these things that the discipline of sailing is difficult to learn and takes a lot of time. And they didn't have time for it. So they just bought the thing is a status symbol. So in other words, you can't have pleasure in life without skill. But it isn't a unpleasant task to learn a skill. If the teacher in the first place gets you fascinated with it.

There is immense pleasure in learning how to do anything skillfully. To make carpentry things to cook to right. To calculate anything you want can be immensely pleasurable to learn the discipline. And it is completely indispensable. Because, look, you may be a very inspired musician.

I am not a musical technologist. You see. And I regret it, but I am a world work technologist. But I can hear in my head all kinds of symphonies and all kinds of marvelous compositions. But I do not have the technique to write them down on paper and share them with somebody else.

Too bad. Maybe next time around.

But you see, so far as words are concerned, I can express ideas because I have studied language and I work very hard, not that I didn't like it. I intensely enjoy the work of writing a book, although it is difficult, but it's fascinating to say what can never possibly be said.

So we do see what's happening, what you have to do. You have inspiration, but then you have to have technique to incarnate to express your inspiration.

That is to say, to bring heaven down to earth. And to express heaven in terms of earth. Of course, they are really one behind the scenes, but there's no way of pointing it out unless you do something skillful. You see, we are all at the moment absolutely in the midst of the beatific vision.

We are all one with the divine or some.

I don't like that sort of wishy washy language, but we are all there, but we are so much there that we like fish and water. They don't know they're in water like the birds don't know they're in the air because it's all around them. And in the same way, we don't know what the color of our eyes is. I don't mean whether you got blue or brown eyes, but the color of the lens of your eye. You call that transparent? No color.

See, because you can't see it. But it's basic to being able to see anything. So in order to find out where you are, there has to be some way of drawing attention to it and that involves skill who pay out in Sanskrit skillful means.

So it's all very well. Anybody can have ecstasy.

Anybody, as a matter of fact, can become aware that he is one with the eternal ground of the universe. But since that what's what you are?

Anyway, I am going to ask, so what, when a hero goes on an adventure and he leaves his people and is going to a strange land. He can go away and just hide himself around the corner in an obscure house and then appear a year later and say, I've been on a heroic journey until all sorts of tales. And they say, prove it.

Because they expect him to bring back something, something which nobody has seen before. Then they believe you've been on the journey. So in the same way. Exactly. Anybody who goes on a spiritual journey must bring something back. Because if you just say, oh, man, it was a gas.

Anyone can say that.

Now, this is why in the doctrines of Buddhism, there is a differentiation between two kinds of enlightened beings. They are both forms of Buddha. Which is to say the word Buddha means somebody who has awakened, who has discovered the secret behind all this. In other words, all this thing we call life with its frantic concerns is a big act.

Would you in your unconscious depths are deliberately setting up?

So you can do one of two things when you discover this. You can become what's called a practical Buddha.

That means a private Buddha who doesn't tell anything or you can become a Buddhist advert.

Protect a Buddha goes off into his ecstasy. And never seen again. Bodie Sava is come one who comes back and appears in the everyday world and plays the game of the everyday world by the rules of the everyday world. But he brings with him up higher. He brings with him some way of showing that he's been on the journey, that he's come back and he's going to let you in on the secret to.

If you if if if you will play it cool and also come back. To join in the everyday life of everyday people, because this is the rule.

If the world is dramatic. If the world, as the Hindu say, is a big act put on by the divine self. One of the rules of coming onstage is that you don't come on as yourself. You come on as the part that you're going to play.

It's very bad form if an actor always acts the same way.

That's what's called a star as distinct from an actor, a real actor can become anything.

And so but in private life. Well, he's just Mr. Jones.

And but he doesn't come on the stage that way. So in the same way, if you know that behind the scenes, in the depth, fundamentally, you are it, you don't come on that way. It always comes on as something else.

That's the rule of the stage. Because without that, there wouldn't be a play. It would only be reality, no illusion.

And the whole point of life is illusion. From the word Latin lottery to play.

Show biz, the show must go on. So don't give it away.

But the truth has a way of leaking. It gets out. But then the important thing is you see when the truth gets out.

Those who catch hold of it.

Must find a way of staying in contact with what society calls reality.

That is to say, if you have a radio, you don't only need an antenna. You also need a ground. So what happens in the world of mysticism, of psychedelic visions and so on needs to be grounded?

So then there are always two directions in which such a discipline works. One preparatory. In other words, those who taught disciplines for

awakening in the Orient were always careful to screen, first of all, to screen those who applied.

And then after screening them to make them sensible so that they knew how to handle the game and of ordinary human existence and play it by the ordinary human rules.

In other words, that they had strength of character and were not the sort of people who would be wiped out because they had no strength of character. By an overwhelming experience. Then they let them in. But there are certain disciplines such as Zen, where you get into the essential secret very early on in the discipline. And after that, they are concerned with much more training in showing you how to use it, how to use the power, to use the vision which you have acquired.

But when these people, you know, really feel threatened by this thing, they start sending around messages and public utterances, which sound exactly as if they had taken LSD, had had a bad trip with it and were coming on paranoid. And so they are spreading subtle rumors that this substance causes permanent brain damage and utter destruction of the super ego. There is a there are people in New York, likewise, who are spreading around the idea that you see once this thing has touched you, you as if you've had a prefrontal lobotomy.

You are somebody who ought to be put in a concentration camp because you've lost your conscience. You're out of order. Nothing more can be done about it. Now, do you see how alarming that could be in our day and age?

I think that your brother, your aunt has got permanent brain damage. You took some LSD.

You see what the situation is exactly. Power. You know, the thing that we learn from history is nobody ever learns from history. Consider just go back a few hundred years.

To the days of the Inquisition.

And realize that the theologians of the church were in those days accorded the same kind of respect that we now accord to the professor of pathology at the University of California Medical School.

Or to the professor of physics at Caltech.

We think those people are real authorities. They know it works. They've experiment. They have knowledge. They're the wisest people in our society. All right. Few hundred years ago, so were the theologians and they had the same sense of responsibility. It was the community that are great scientists and physicians have today. And they knew there was a thing called heresy going around.

That was not only capable once you caught heresy of making you damned to hell forever and ever and ever to the most unimaginable tortures that would go on without end, but that it was infectious.

And one heretic would soon make other heretics. So those are entirely humanitarian and merciful. Church fathers got together, said, what are we going to do to stop this? Well, are they new? There is an eternal life beyond the grave.

And so perhaps just in the same way as if you've got a cancer and that's something terrible because it might spread and destroy the whole body. Cut it out, even burn it out. If you have to add a little pain on the part of the patient in the several months on the end of tubes, won't be too bad for if you get rid of it. So they said we've got to torture these people because they might in the middle of this this extreme experience recount. And if they won't recount, we'll burn them because there's just the chance that in the agony of burning at the stake, they will say at the end, oh, God, forgive me for my sins and it'll be all right. Now realize the absolutely merciful intent behind the inquisitors. Perfectly responsible, acting on the best knowledge that they had in their day. Don't you see how that can happen again? Anytime.

So this scared talk is simply without foundation. But nevertheless, there are certain reasons to be cautious. And for those who understand the operation of these chemicals, to issue certain clear warnings.

And this I want to talk about quite seriously.

Now, this class of psychotropic chemicals, which includes LSD, mescaline and its original form, peyote, psilocybin, cannabis and so on, which is a very mild psychotropic.

These do not.

In moderation and proper use in any way harm the physical organism nor form such habits that you can't get rid of them without unpleasant withdrawal symptoms. But if you take them an absurdly large doses. You are in for trouble. I knew a Methodist minister who was a very violent totalitarian and became extremely sick from drinking too much milk. So after all, if you sit down and you buy a bottle of whiskey, which you can get at any store anywhere.

Perfectly legit and you consumed one quarter whiskey in one hour. You can expect trouble. So in the same way, if you've got LSD or something of that kind and you take a thousand micrograms because some friend of yours took 500 and you want to one up him, watch out. You're being just stupid. Furthermore, you're being rather stupid if you buy the kind of LSD that is currently being circulated in the black market.

Because for two reasons, you don't know what else is in it. You don't know how much is in it.

There are two sorts of producers of LSD on the black market. One is the enthusiastic graduate student in chemistry who wants to turn the whole world on.

And his product is apt to be pretty good but excessive in dosage, and what says 100 micrograms may well be 300?

There is another kind of producer who wants to make a good thing out of it. Oh, well, who wants to give you a big jazz, but you mix it with amphetamines. There's another more sinister kind of producer who'll either cut the amount or mix it with heroin. Are anything any other substance? Maybe. Again, amphetamines or whatever to get you hooked on it?

So you. There is no control of the quality of what is being circulated. None, whatever. And you just don't know what you're getting.

Now, this situation is the result of the fact that the United States never learns from history.

It is the same old story of prohibition to think the naive notion that you can control something that might turn into a social evil by handing it over to the police.

Now, after all, who pays the police, you?

And if you can't control yourself, if the police won't control you either, but in lieu of controlling you, they can suppress you.

Now, I all conscience the police have enough to do.

Not only to control the traffic, which is getting worse every day by virtue of Parkinson's law, but also all the possibilities of robbery, violence, murder and so on and so forth, which is a full time job. But to ask the police.

To go and look for people who have LSD or marijuana or heroin or opium or whatever, or who are living irregular sex lives or who have a gambling joint or a whorehouse.

This is to ask the police to act as officers of the state in service of the church. Uniformed ministers. And that's not their job. And when the police are asked to do that, they are put by lawmakers into a position which brings them into public disrespect, as it did in the days of prohibition. It is not fair to the police.

The only way to handle a thing of this kind is to bring it all out into the open. Nothing can be controlled when it's driven underground. It ought to be controlled. Just in the same way as we have learned how to control automobiles, we license people to drive them. So in the same way, we don't sell liquor to minors. We expect them to have some kind of education and grown up responsibility before they go boozing around. So in exactly the same way, society has got to face the fact that it's going to have to license

people for certain spiritual adventures or perhaps just plain pleasures, if that's what you want to call it. After all, you can't even join some churches without can't join the Catholic Church without taking a course of instruction that takes a few weeks and then they put you through an initiation and you may say when you get through that, well, what was all that preparation for?

I didn't feel anything.

But so in exactly the same way with this, it is completely urgent. In other words, that we.

Prevent the occurrence of a very serious, socially destructive criminal situation. Created by law. You've heard of the Trojan diseases. That means diseases caused by physicians. There are no majestic diseases or shall we say, no majestic crimes. Like somebody said, the only serious side effect of marijuana is that you may go to jail. This is a no majestic crime. In other words, it is a ritual crime in exactly the same way that when the early Christians refused to burn incense in front of the Roman gods in whom the Romans themselves didn't believe they were guilty of a crime.

It was a ritual crime and they refused. A reasonable man like the Emperor, Marcus Aurelius, said to the Christians, Now come off it. Really? Do you have to refuse to burn incense?

Said, yes, we're serious about it.

So there's a ritual crimes. And so in the same way various ritual crimes exist and are police poor devils are supposed to enforce it. And if they don't, they're going to get it from the politicians.

So I would say in general, to sum up. Substances like LSD, which give away a secret. About. The nature of the social game, the human game and what underlies it.

Are potentially dangerous.

Of course, like any good thing is electricity is dangerous. Fire is dangerous. Cars are dangerous. Planes are dangerous, but not so dangerous as driving on the freeway.

The only way to handle danger is to face it. If you start getting frightened of it.

Then you make it worse because you project onto it. All kinds of bogies and threats which don't exist in it at all.

The rule about all terrors going back to where I started from the dweller on the threshold. The rule for all terrors is head straight into them. When you are sailing in a storm, you do not let a wave hit your boat on the side, you go bow into the wave and ride it.

So in the same way old folklore says this is an old wives tale with a lot of truth in it.

Whenever you meet a ghost, don't run away because the ghost will capture the substance of your fear and materialize itself out of your own substance.

And will kill you eventually because it will take over all your own vitality. So then whenever confronted with a ghost, walk straight into it and it will disappear.

And so in the same way, when people stir up the depths of the unconscious and are confronted with their own monsters or with the terrors of discovering that they're in a relativistic world where black implies white and white implies black.

So who's in charge? You know, grandfather's dead, father's dead, too. This leaves me who's the authority?

See, when you get that that sense of terror, go right at it.

Don't run away. Explore, feel, fear as completely as you can feel it, head straight into it and just it so happens that these things give you the property and the opportunity. Let me put it that way.

The opportunity to go into some of your very, very most closely kept skeletons.

The Psychedelic Explosion

The psychedelic explosion is a subject on which we need a great deal more careful thought and a great deal less emotion because it's a very touchy subject. I'm going to talk this morning about the general background of this explosion so as to put it in some sort of perspective in time and space. And I have here a letter little card that I received. It says, Dear Mr. Watts, are you enlightened? If you are, would you please help me? I want to be enlightened also. Yours truly Miss So-and-so. Age 15. And as we know, the psychedelic explosion is something which is highly prevalent among young people and is a quest very largely on the part of young people for something which civilization as we know it in the West seems to have failed to supply. Now, what's the matter? The matter is fundamentally one of religion. It is that standard brand religion in the Western world is a very dreary affair. That in effect, what one gets from a church of whatever denomination, be it Catholic to the right or Southern Baptist to the left, is almost entirely preoccupied with moralizing. And when you study the subjects of sermons that are preached Sunday after Sunday, you read the newspapers and see what they're talking about.

You generally form the impression that what the churches in fact are are sexual and family regulation societies. That's what they're actually doing.

Because if you say someone is living in sin, it doesn't usually mean that he is following the profession of a bookie or that he is conducting a business which is profoundly dishonest and selling things that are just frauds. It means a person living in sin is living in an improper or unconventional sexual relationship. And when we speak of a morality, it really doesn't refer much to cheating. Your customers are being intensely cruel to someone or running a factory which is fouling the rivers. Immorality is generally taken to mean sexual irregularity.

I remember when I was a boy in school that every year we had a particular preacher who came to us to preach the same sermon every year, and the

subject was drink gambling and M.R. out and the immorality of gods meant sexual irregularity.

Well, in one way or another, with certain exceptions, the official churches of the West are saying to their congregations, Sunday after Sunday, Dear people, you ought to be good with a rather limited meaning.

What good is it? And I often wonder what my devout Episcopalian brethren mean when they say the general confession before the Holy Communion and say that we have sinned most grievously, and that the remembrance of these sins is grievous unto us and the burden of them is intolerable. I wonder what they think of. I used to be an Episcopalian priest. I suppose I still am. And as a result of that, I often used to hear confessions. And I know the sort of things people confessed and I know them very well what their idea of sin was.

And in all this history of not only Western Christianity, but to a very large extent, Judaism as well.

There has been an extraordinary and curious failure to emphasize the value of what we could call spiritual or religious experience. The Jewish people are very largely occupied with manners and morals out of the ritual of obeying the Mosaic Law. The Christians are preoccupied with other things besides, the Christians are very much preoccupied with what you believe in, whether, for example, you believe that Jesus Christ was in fact God. Whether you believe that Jesus Christ was the only unique incarnation of God. Whether you believe that the Godhead is a trinity.

Whether you believe that the sacrament of the altar, the bread and wine consecrated at the mass are in fact the body and blood of Christ are only represented. And they have fought with each other. They have cut each other's throats. They have waged crusades. The Thirty Years War, all these things were tremendous fights about doctrinal questions that the mayor have, course, have been some other motivations behind it. But at any rate, this was the subject matter that stirred people to fighting anger.

And in all this history, the Catholic Church in particular and other churches in lesser ways have ignored, excluded or actively persecuted people that we

call mystics. That is to say, those who have had a change of consciousness, which in effect induces the realization that you yourself are not a weird little creature that is a subject and nothing more than that of the heavenly king.

But the experience that you yourself are a direct manifestation of the ultimate reality, or what politics is called the ground of being, which was it is particular, I would say decontaminated praise for the word God, because the word God in our culture has all sorts of extremely unfortunate associations. When clergymen talk about our heavenly father, anybody under the age of 30 squirms. Have you made Jesus Christ your personal savior? All these questions you see have a kind of a creepy connotation to them. The churches endeavor to attract young people by all sorts of devices, by having dances and parties and any kind of goings on, even happenings in the more advanced churches today. But young people know very well that the object of these happenings or socials or whatever it is to attract young people is honey to catch flies. And that finally the minister is going to take you aside for a serious talk. And that serious talk is going to be about your morals and about what is your relationship to your heavenly father. You say your prayers. Do you read your Bible? You know, your prayers. And your Bible is a ghastly phrases.

So the thing that is signally missing and it doesn't matter whether it's Catholic or whether it's Protestant is the central function of religion in changing consciousness, because it's quite apparent to everyone that something is wrong with ordinary consciousness. And what is wrong with ordinary consciousness is reflected in ever so many casual phrases that we are accustomed to use, such as I like to forget myself. I want to get away from myself. I want to feel that my life has some meaning. And I find that meaning.

For example, in joining a movement, whether it be political, religious or whatever. Something then is apparently wrong with oneself as oneself is something that you need to forget. If you feel when you're alone, hopelessly anxious and bored, what's wrong with you?

Why is yourself so intolerable to.

You can't really well love your neighbor as yourself unless you have some love for yourself. If you don't have any love for yourself, you don't have any star or a fountain of love in you to give to your neighbors. And all this preaching of be good, be good, be good and love everybody. Everybody recognizes, yes, it would be wonderful if we could love our neighbors. Great. But how do you do it when you hate yourself? And the church is never explained, except, as I say, with some very rare ministers and special rather far out types of church.

So there is in the history of Christianity in particular, an exclusion and there has been from the very earliest times an exclusion of what is called God knows this.

And this has a complex history, which I'll go into a little because it's quite important to our whole subject. There were in the early history of Christianity, some subsets that were called Gnostics.

And they emphasized that the important thing was not belief, not so much even action, but knowledge. It had you. Could you attain to the actual knowledge of God, of the ultimate reality of the universe?

And many of the Gnostic sects offered this knowledge.

The problem with many of these sects was that they felt that the knowledge of God was contingent upon the renunciation of the world. That is to say, upon asceticism, upon celibacy, upon trying to separate one spirit from involvement in body and in matter, and therefore of agnostics classified three types of human being who were respectively called high like h y l I see from the Greek L.A., which means wood the wooden people.

Next there were the psychic people from the Greek sea, meaning the soul. And then finally there was a pneumatic people from the Greek plasma, meaning the spirit, the breath. And only pneumatic people could really expect to attain salvation because the lowest people were absorbed in their bodies.

The middle people were absorbed in their egos, the psyche and but the superior people were absorbed in the spirit, and they were aloof from all

material concerns. And there were two kinds of pneumatic people, according to the sect of Gnosticism, to which you belonged. On the one hand, there were, as I have said, the very, very spiritual people who tried to divorce their attention from all matters of the flesh. But there were the other people who said that the flesh is real and therefore what you do in the flesh. That simply doesn't matter. And they will. Libertines and the official church disapproved of both of them, and rightly in a way, because they said of the people who were the aesthetes that they had missed the central point of Christianity, which is the doctrine of the incarnation that in the person of Jesus Christ, God had become man, and the spirit had adopted the flesh, and therefore a reasonable, fleshly existence was quite proper. And that remains to this day, a tenet not only of Judaism, which holds it very strongly, but of Orthodox Catholicism, however much Catholicism may deny this in practice. It has to adhere to it in theory. And Jews especially believe that the material world is the positive creation of God and therefore is good and is to be enjoyed thoroughly.

And that is why Jewish food is, on the whole, very good in this country and better than Christian for a good Jewish delicatessen has a kind of lip smacking, robust attitude to eating. And, you know, is it kosher?

Jews will even go so far as to admit that God created the principle of evil because it says in the book of the Prophet Isaiah in the seventh verse, in the forty fifth chapter, I am the Lord, and there is none else.

I found the light and create the darkness. I make peace and create evil. Either Lord do all these things. And so Hebrews believe that God put into the heart of Adam something called the Yeti Sahara, which is the spirit of way witness, which I translate as the element of irreducible rascality that is involved in every human being. But it isn't. It's only a little bit. It's like a touch of salt in a stew. And you don't, of course, put salt through the holes, do you? Just put a pinch and God put a pinch of whey witness, of disobedience, of unpredictability and therefore evil in the heart of Adam. And that is the reason why Jews have a very subtle, itchy sense of humor is that they recognize this. Christianity, on the whole, with certain exceptions, is devoid of humor. A man like G.K. Chesterton is a humorous Christian.

But they're very rare. Whereas a Jew can talk to God with a certain kind of banter and you see that in a play like the Fiddler on the Roof.

Well, and you see it throughout the literature of. Which is full of very funny stories about spiritual things. And you can talk back to God in a kind of a friendly way. But a Christian finds that difficult. Christian is too impressed. And it's very strange how Jews have escaped from this since they are in a way responsible for the part of the trouble about religion in the West, which is that they they foisted upon themselves and upon all of us a model of God which is patterned after the great tyrant kings of the ancient Near East.

After David, after pharaoh, the Pharaohs of Egypt.

After the great law givers us like Hammurabi, of the ancient world of the Tigris Euphrates civilizations, and particularly even the second Isaiah, who wrote the book of the Prophet Isaiah from chapter forty onwards, he was very beholden to the then Cyrus of Persia, who invaded the Babylonian Empire and set the Jews free. And so this word, Cyrus, is the Greek kurios, which means the Lord, the King, as in the prayer curia it lays on. Lord Have Mercy Upon US. And the title of the. The Emperor of Persia. In those days was the King of Kings. And this title was adopted through Isaiah as the title of The God of the Hebrews.

The King of Kings and the Lord of Lords.

And so the model, the conception of God under which all these religions have operated is one that is essentially monarchical and political.

And so the human being is taught to view himself as the subject of this independent, extraterrestrial spiritual prince who is definitely authoritarian, definitely paternalistic. You were, therefore, according to both Jewish and Christian theology, brought into being by a fiat of the divine will out of pure nothingness.

And you'd better watch your step, because if you don't accord with the divine will, if you displease this ruler, you can be not only instantly annihilated, but the much more fearsome possibility. You can be condemned to the celestial dungeons forever and ever and ever. And so you

must cultivate spiritual obedience and humility by considering yourself a miserable worm, a nothing whose entire existence is contingent upon the divine pleasure.

And you must never, by any means, commit the final ultimate blasphemy of, say, I am God in Arabic and I'll hug.

The word of the Sufis, the Islamic mystics in Persia, which spread right through the Islamic world.

And they were always being persecuted and put to death and tortured because of unknown heart. I am Allah.

Jesus.

You see, while such a heretic from the standpoint of Judaism, when Jesus claimed as an end that he was one with God, I am the father are one before Abraham was, I am. I am the way, the truth and the life. I am the resurrection and the life. This was the reason why he was crucified. Really? He outraged Jewish piety. And you can see that Jesus is the case of an individual who had a very profound mystical experience and was hard put to it as to how to express that experience in the terms of contemporary Jewish theology. He more or less concentrated.

I mean, apparently if you examine that and study the gospels very closely, he admitted that he really was one was a father to a select circle of disciples. What he said in public was that he was the son of man. And this title meant the the supreme prophet. The expression son of in Hebrew means of the nature of when you call in modern slang, you call someone a son of a bitch. That means they behave like a bridge. And so in Hebrew or in Arabic, you have such expressions as a body called which means son of a dog. Anyhow, Hamar, being the son of a donkey means you are. You're a dog, you're a donkey. But son of means like. And so Jesus calling himself either the son of God or the son of man. Use both expressions means the one who is of divine nature.

Son of God and son of man means the essentially human the man. The second. Adam, the regenerate. Adam. But he had a terrible time. Is he

expressing these ideas? Because if you are brought up. In a culture where the prevailing cosmology is monarchical and you have the mystical experience, you are very liable to make claims as being divine that you imagine are peculiar to yourself.

You have had this experience, and because God is conceived as a commander and a ruler, you are apt to think that you in some sense yourself are now the commander and the ruler of people and of the whole domain of nature.

And you are not apt, as would be the case in India. You are not apt to see that everybody else is in the same situation, whether they know it or whether they don't.

So because then of the definitely imperialistic and royal and monarchical nature of the conception of God, which has come to us through Judaism and Christianity, mysticism has always been suspect for the simple reason that it sounds as if it was going to create democracy in the kingdom of heaven. And that, of course, is treachery, insubordination, subversion, democracy in the kingdom of heaven cannot be tolerated. And this presents for people living in the United States a very peculiar problem because this country is politically a republic.

And as a loyal American citizen, you have to curse and swear and say that you believe the republic to be the best form of government.

And yet an enormous number of Americans have believed and still do believe and half believe that the universe is a monarchy. And if the court of heaven is a monarchy, then obviously it's the best form of government.

And how can you then be a member of a republic without serious inner contradictions?

And this lies at the root of the reason why in the United States there is a very serious conflict between church and state.

Or rather, I would say not so much a conflict as a mix up so that we have our laws and our law enforcement officers enforcing commandments which

are essentially ecclesiastical. And herein lies one of the great roots of the psychedelic problem.

Consider some other laws which throw a great deal of light on this.

Let's take the situation of a conscientious objector now until not so long ago. It was a necessity to qualify as a conscientious objector. That you stated that you believed in a supreme being and therefore implied that you had received from the supreme being a commandment that you were not to fight in war or to kill. And this was taken as an absolute. You had to qualify as a conscientious objector to say that the commandment thou shalt not kill means you must not under any circumstances kill another person. And so they always ask you, what if a German soldier raped your mother and cut her throat saying, would you kill under those circumstances or wouldn't you? Now, the significance of this law. It's been altered recently, but the significance of it is this that you are saying that you have a conscience against killing or fighting in a war because you have received a you have received orders from a higher echelon of command than the president of the United States, namely from the Lord God.

And this was always the test until quite recently when because there have been a lot of Buddhists around and people like that who don't believe in a monarchical God and that do believe in conscientious objection, they could not say that they believed in a supreme being, although it's highly possible that the phrase that the intention of the law in implying the words supreme being was to be vague.

The people who wrote this law. They didn't know what to say. And so they just used the Vegas phrase they could think of instead of saying God or something like that. They said supreme being a supreme being.

There's a subtle difference between supreme being and a supreme being like between religion and a religion, God and a God. Is there a God? Is there God? These are two really fundamentally different questions, but that's the situation.

And therefore, because in the laws of the United States and England and many other Western countries and in the fundamental attitudes of Western

religion, there is this sense of God as the monarch. There has been going on for centuries and insidious and perpetual persecution of the rival religions, even though we say that everybody in this country has given religious liberty, that is not true. You do not really have religious liberty if you subscribe to the heretical doctrine that the universe is not a political state, but instead an organism, a living organism in which, just as are all the extremities and differentiated features of the physical body, are expressions of the whole body. A finger, you see, isn't just part of the body because it's not like an automotive part. If you lose a finger, kind of screw on a new one, although they're trying to do that, that they're trying to put in hearths and the grafting on this, that and the other, that's terribly difficult to do. Obviously, the the the the organism rejects alien parts. And so you have to give it drugs so that it won't reject those alien parts. But at the same time, those drugs make it unable to reject all sorts of bacteria that it normally would reject. Therefore, you have to keep a person with a heart graft in an absolutely sterile environment because he won't be able to resist infection. So but it is a fallacy to see that the human being has parts like a car, because a human being is not a mechanism. A human being is an organism. And an organism functions quite differently from a mechanism. An organism functions in such a way that every part is a complete expression of the whole.

And this, of course, is what Jesus was trying to say when he said to his disciples, I am the vine and you are the branches.

When he put forward the idea of that, you all belong to my body.

The image of the body and the image of the vine is an organic image. Distinct from a political image.

So our problem is that throughout the history of the West, all those who belong to the organic religion or who felt the organic religion have been persecuted.

You see, let's take the case of the mystical revolution that began with roughly Meister Eckhart in Germany. In that it began in the 13th century, but achieved its maximum force in the early 15th century and eventually became the philosophy of nature as exemplified, say, by gutter. But that are

started out in Germany, a movement that included people like Eckhart Taylor, Rice Brook, the brothers of the Free Spirit, Angeles's laziness. All these people writing from a mystical point of view, and they were very heavily persecuted. Some got by rise, broke up by tallow, barely got by. But Eckhart was condemned, and all for the reason that they experienced oneness or identity with God. Eckhart said The eye with which I see God is the same eye as with which God sees me. The love with which I love God is the love with which God loves me. And Angela Salacious went much further than that. He said If I were to die, God would no longer live, because my eye and God's eye are one eye. Just as the Sufis in Islam said, as there is no deity but Allah. So there is no pity but Allah.

That is to say, no selfishness. So all selfishness or anus is the anus of Allah. It's the same as the punish addict saying Touch them. I see you're at that thou art.

So this mystical movement in Germany flowered into various types of religiousness that spread to England and from England to the United States. Let's take George Fox and the Quakers.

The Quakers were regarded in their early days as the most dangerous subversives. They, for example, refused to remove their hats in church or in court. They refused to use titles.

And so in Quaker speech, I would always be just Alan Watts. No, Mr. No Doctor, no nothing. Just Alan Watts. And it's curious, incidentally, how this form of address has become prevalent today, that very many people write letters now. Not dear Mr. Watts, but dear Alan Watts and or whoever it may be. It's not just if you're a celebrity.

It's a very common form of address. Now, the Quakers also, of course, refused to take oaths because of Jesus saying do not swear by anything. Just let your communication be. Yes, yes or no? No. What is more than this comment of evil?

They wouldn't fight. They wouldn't try. And armies and they even felt that scripture was not as holy as the Bible is usually held out to be. As they said that there is something else that has a higher authority in scripture, which is

the inner light as the gospel of St. John describes it. The true light which enlightens every man that comes into the world.

And if you just put your mind back into the 17th century.

And consider that in those days, the theology of the Christian churches, whether Catholic or Protestant, had four people living in that time the same kind of authority and the same kind of respectability that is today enjoyed by great scientists.

Let's say you ask a question to the professor of pharmacology at the University of California, the professor of pathology. This is the last word. And on the advice of the professors of medicine, laws will be made preventing you from ingesting certain substances or from refusing to be cured in certain ways, from having certain operations or injection dates on the scientists today as priest and his vestments, instead of being the old fashioned chargeable around color. He wears a white coat and a stethoscope around his neck. Why is that a symbol of this? And so those people, those scientists do see we take very seriously. In exactly the same way people living in the 17th century took the theologians very seriously indeed, because the theologians knew what the answers were. They knew how the world was constructed and what was the proper way to behave.

And so when people like the Quakers and the other people who came out of German mysticism along with them, the Anna Baptists who were against baptism because they felt that salvation didn't depend on a silly ritual of pouring water on someone and muttering a mumbo jumbo. There were the levels all sorts of sects flourished in the 17th century and were regarded just as today. Hippies and freaks of that kind are regarded as extremely dangerous, subversive people upsetting the morals of society.

Now look what happened. Look what the Quakers have become.

Nothing is more respectable than the Pennsylvania Quaker, a veritable pillar of society that the laws in the United States about religious freedom were designed for just such people as Quakers.

They were individualists. They were far out.

And yet today, when you claim in court that you object conscientiously to war or that you have some peculiar religion with very odd sacraments, they say to you, what church do you belong to that authorizes this? How well established is it? How many members does it have? Can you prove that you were brought up by your parents in this way of life? Because these are the tests of whether your grounds for claiming that you are doing this thing as a matter of religious conscience. This is the test for whether you are valid and thus you are in a frightful double bind, because if you are accused in court of what is generally regarded to be a heinous felony, you know, your chances of getting a light sentence are much better.

If you take a guilty attitude, you plead guilty.

You say, I'm so sorry. It was a grievous mistake. I didn't mean to do it. Please forgive me. Dear God. You know, your chances are better, but if you say I insist that I did this as a religious act, it is in accord with my conscience and I am not guilty. The judge will say your attitude is truculent. And he won't like you and you're liable to get the most severe sentence. But this story is as old as the hills. It's been going on and on. And we never learn from history.

We do the same things over and over again. For example. We all have the horrors about the Spanish Inquisition and how they took Protestants and put them on the rack and with some screw and finally burn them at the stake. And we said, well, we don't do things like that anymore or we don't. I invite you to consider mental hospitals.

The new heresy is not of all religious opinions because nobody takes that seriously anymore. The new heresy is oddball states of consciousness.

And if you have an odd state of consciousness and you try to express it to your family, they start looking at you in a funny way and say, are you feeling all right?

And that's a terrible thing to say to anyone. You know, if you want to put I shouldn't really tell anyone this, but if you want us to really bug someone and put a hex on them, all you do is you look at them in a funny way and say, are you feeling well today?

And this is yes, I'm feeling fine. Now, I just thought you were a bit pale and so personable and feeling all kinds of squeamishness. And it's much worse when you question a person's state of mind because it's very easy to test.

But in this state, you can take a temperature pulse, have a urinalysis or something. And the doctor says there's nothing the matter with you. Sounds it does stethoscope on your lungs. Right.

But when it comes to your mind, everything is very vague.

You can get into the most weird Kafka esque situations, not whether you're sane on the moment you're challenged to prove that you're saying you're on your guard.

And immediately the psychiatrist says why you're so defensive. Psychiatry is completely diabolical. There's almost the more I see of it, the less I think there's any good to be said, for it is a way of bugging people if you arrive for your appointment early. You are defined as anxious. If you arrive late, you're defined as hostile. If you're happy, you're euphoric. If you're not happy, you're melancholic. If you're afraid of something, you're paranoid. Every conceivable way is devised of putting the patient down.

And when you are admitted to a mental hospital, you you may know all this, but you ought to know the law about these things, how it stands. You can be so easily put in a mental hospital, although the only salvation is that the mental hospitals in California today are so crowded and so understaffed that they're not wishing to admit anyone. And you really have to be in a state of the screaming meanies to get in, or somebody has to dislike you very much. But you are deprived of all civil rights. You are no longer considered as a person.

You are d personified in a negative sense.

See, there's a higher D personification when you attain the mystical realization and become one with the absolute and that there is, on the other hand, a lower de personification where you are simply an outcast. This has been true always in India. There were the higher outcasts called the sunny Athens, the holy man who renounced caste and lived a life of poverty and

freedom. But they were the untouchables on the other end. Who are the Aborigines? The like, the ETA in Japan.

And so if you go to a mental hospital, you become a lower outcast. You are no longer human. And you get frightened. You get scared out of your wits because you suddenly begin to realise that you cannot communicate with people because they look at you in a funny way about everything you say.

So I wondered what he meant by that and you get real scared.

And so you start to act in a funny way. Which is it? The whole thing. You know, the diagnosis of schizophrenia is a kind of self-fulfilling prophecy because anybody puts you in that position and makes you the patsy.

You can't help acting in an odd way. You say, now, look, everybody, you're putting a thing over on me.

I'm perfectly sane and say why you so were insisting on it. The thing that is protesting the death, it's a very difficult situation to be in. Never send anyone to an insane asylum to do anything with them anyway, because that's the trap.

They get it. And then, of course, because they're understaffed, you're ignored. They don't they really don't have time to get around to. I know what the problems are. And even very conscientious psychiatrists and insane asylums just can't get the work done.

So how do you get attention?

Well, you start at being difficult and in the expectation that this will draw attention to you and you'll get some therapy.

And that doesn't really work. I'll tell you how to get out of an insane asylum in a minute. But the.

The thing is that you try to get a. Tension until they they construe all the things you do to get attention as being further signs of insanity, of lack of cooperation. Finally, they throw you in a cell where there's nothing left to

you but take shit and throw it at the walls in order to get some kind of attention. And they see see how far gone.

Now, the way to get out of an insane asylum is very suddenly to flatter one other psychiatrist and cooperate with him to the utmost, not to quickly, but in a sort of gradual way, so as to give him the impression that his method of treatment is working.

In your case, as he wants to write a paper published in the psychiatric journal that showed a certain method, a certain technique is really good, and you will cooperate with that idea and you'll do everything he tells you. But just in the right with a sudden little subtle resistance to the don't don't you, he'll immediately spot you someone who is playing funny business. If you cooperate completely and don't do that, but just gently let it be understood that his therapy is working and they'll release.

Unless, of course you want to go to an insane asylum just so as to have no responsibility and just get out of the whole mess. I think there are some people who do that. But you see, what we've got here in this situation is that having a different state of consciousness or because you experience differently from other people.

That's heresy. And that makes everybody else terribly uncomfortable. And so in you go and then you say, now this is all they say. Well, this is pretty desperate guy. What are we going to do to help us person, you know, in all the kindness of their hearts? What are we going to do?

Well, you can see the inquisitors thinking this problem over to this heretic.

You realize that he is going to be tortured for ever and ever and ever because of his beliefs. And they're infectious. They spread. They go to other people who will be tortured in hell forever and ever and ever because of what they believe.

What are we going to do? We have reason with them and they don't respond to reason. Well, let's apply a thumb screw or something, you know, and see if that will just make the difference. Now is very stubborn. Patient.

Well.

It's a last resort, but we could burn them because they might. Under the torture of being burned, repent and therefore escape everlasting damnation.

And they did it with a kindness motivation, burned up the heretics.

So in the same way in a modern mental hospital, they say, well, we'll try shock treatment.

You know, nothing is more unbelievably clumsy. It works occasionally because the patient realizes that he had better get out at all costs. But by and large, it doesn't. And all it is, it is a form of torture.

And if that doesn't work well, as say, the only thing is to scrape out the front part of his brain.

And, you know, they put an ice pick through the lung, side the eyeball and get it into the front part of the brain and they stir it up. It's called a prefrontal lobotomy.

And then the person is a happy moron for the rest of his life.

But it's the same situation all over again. And we have, above all, to watch out in this country for this kind of psychiatric fascism.

Very, very dangerous. And the problem about the political problem today is that the right wing in this country is very mixed up.

They have that they are very opposed to official mental health, mental health programs and all that kind of thing.

And there have some good reasons for it. There are also some very bad reasons because they would send them to jail pronto. The right wing there also have a lot of opposition to taxation and centralized government, which is a kind of beginning of anarchism.

But they don't mean that.

They mean let's have centralized government against the people we don't like. Leave us alone. Tax everybody else, but not us. The wisdom of insecurity for others. So. And here is then a situation in which a for the reasons that I've outlined.

Western religion definitely ignores or positively excludes the mystical experience and be a religion plus law, persecute those who are uncool about having mystical experience.

So this double situation.

Has created, in the course of history, an alarming practical situation. Which is that Western man in charge of his tremendous technology. Is using it against life because he doesn't feel that he belongs in the universe by being identified as an ego, called into being out of nothing and feeling therefore that he comes into this world instead of flowering out of it. He is basically against the world, especially since the death of God in the 19th century, where the new doctrine that follows the authoritarian God, the father.

Is that the universe is a mindless mechanism, and therefore we have to fight it.

And therefore, in any war, the war against nature is naturally commander in chief. Chain of command drawn and the whole monarchical situation starts over again. So as a result of that, then we are using our technology. In an absolutely weird way, this goes, of course, into economic problems as well. You see, since the industrial revolution, it has been possible, increasingly possible with greater and greater rapidity to feed and clothe and adequately house every single person on earth. There is no technical obstacle to that whatsoever.

And but you've got to do it by automation to do enough of it. But when you automate things, you put people out of work. So if they're out of work, they don't have any money.

And so they can't buy what the machines produce. So you have huge surpluses begin to pile up. Well, you can't give them away. What would

happen, you say, if you said, well, let us pay the people for the work the machines do?

We said that would be going into debt. Where's the money going to come from?

Well, the money is originally based on gold.

And this is this is real hocus pocus, because supposing that gold is rather rare and you can't always find a new gold mine, but yet you are producing millions of tons of butter, milk, wheat, iron, wood, everything you could possibly need. We've got to wait to find a gold mine to get all this stuff into circulation. So the only thing they can do is this. People only go into debt in an emergency. So we increase the national debt and therefore circulate more and more purchasing power to keep the economy running by having was the perpetual state of emergency. We must the government has to go into debt because we are threatened by the communists, by the whatever Chinese veto means, anything, anybody. Just as long as we can say there is an emergency, therefore we can go into debt. But actually going into debt is gobbledygook semantically. All you're doing is you're issuing credit based on the actual productive wealth of the nation or whatever community is the unit.

But people don't understand that just as a several hundred years ago, they couldn't possibly understand that the earth was round and that if you lived in the antipodes you wouldn't fall off. And so there's the similar mumbo jumbo and hocus pocus about money. Money is it is a measure of wealth like inches or pounds or grams. And when you discover a load of iron ore, you don't have to go and borrow a thousand tons from someone before you can do anything with it. So.

In this way that.

The culture is so absorbed with verbiage, with doctrines and religion, with money in economics, with status in politics and with all kinds of manipulation of symbols, that we are not in contact in an aware way with the physical world. We are alienated from the physical world. We are fighting. We are fighting our own bodies. And so therefore, imaginative

young people become aware of this and see the disaster all around them. A terrifying depredations of nature. They see it growing and growing. They see the final achievement of great Western physics as the hydrogen bomb. And they say it's high time for us to get back to reality.

And therefore, naturally, they are accused of peddling hallucinations. But who is under a hallucination?

Look at recently, Congress passed very strict laws against burning the American flag and they did it with great further and all sorts of patriotic speeches and this, that and the other.

While they are by acts of commission or omission.

They are burning up the country for which the flag stands. Allowing continued pollution of the atmosphere, of the water ravaging of the forests. Destruction of wildlife on a fantastic scale.

Only if that doesn't matter.

You can tear the physical territory to pieces so long as you don't burn the flag.

And it's this. This is the hallucination. This is the divorce from reality.

And so I'm not reserving the question for the moment as to whether LSD and marijuana and mescaline and psilocybin and so on and so on. As to whether they are good things or bad things. We'll put that for the moment aside. But one thing seems to me to be in no doubt at all that something has to happen and happen fast.

If we are to again get people to be aware of physical reality, get in touch with the natural universe with their own bodies, and feel that they are one with all that, because if you feel obviously if you feel that you really belong, that Mark Hamill pies is as much part of you as your own hand, and that these waters around here, that everything is something in terms of which in and in the context to which you exist, then you can take a friendly attitude towards it and you'll want to use technology in a cooperative way

with all that and do on the mountain what the mountain would be like. Now you can look out of this window and you can see right across here.

Strawberry.

When I first came here in the summer of 1961. That was a reasonable, beautiful hill. But an idiot called Eichler went in with bulldozers and made it flat terraces. He took the top right off the hill and dumped it down in the bay so that could get extra land. And instead of cooperating with the hill, he treated it as one would treat a flat area so as to build houses on it when it's perfectly simple to build an adequate house on a hill without altering the hill at all.

Preserve the trees, preserve the topsoil, and you can build it. This is why this happened and that's happening all over because these people are quite mad. It's like San Francisco, which is a mass of hills on which they just dropped a grid on pattern and streets that would be suitable for Kansas City. Pay no attention to. They also get streaks that go like this and the cars get lost. They run runaway and cable cars and everything always troubles. You see this as a symbol of man's lack of relationship with nature. He doesn't know how to cook. He doesn't know how to clothe himself. He doesn't know how to make love. None, because it's all concepts. It's all ideas which are the true hallucinations, bugging our brains.

Those are the real bats in the belfry, not because ideas are not good things to have. The ones they shouldn't have concept shouldn't use words. But because one should realize that ideas and concepts and words are purely instrumental. There are things to use, but when you get used by them, then the machines have run away from you, and I suppose they will soon have computers that are breeding and making decisions about their own future.

And we'll say finally, let's get rid of human beings that are a nuisance. Having described a sort of historical and cultural background, the psychedelic explosion. I want to go on next to the subject of the actual relationship between the use of psychedelic chemicals and mystical experience.

And here we get again into an extremely tricky problem.

The problem raised by all those people who question whether anything in the way of profound understanding of life changing experience can simply come out of a bottle.

And this is not altogether an easy problem to deal with because one of the eternal questions about any kind of spiritual initiation, by one means or another, is simply that it seems from time to time there are so many cases in which it just doesn't take.

In the early history of Christianity, there was a long, long argument about people who were called Lapsley, that is to say those who had been baptized and had been initiated into the church but somehow fell away either in allegiance or in morals.

And it was a great puzzle how a person who could have undergone the sacrament of baptism, this great union with Christ conferred upon it, how how they could lapse and what to do about them. Supposing they wanted to come back.

And there were people who took a very rigorous line on this and said, no, once you've been baptized and you fell away, you were absolutely more than ever sold to the devil.

And there was no hope for you at all. But after all, because human beings are really creatures who muddle through life, a compromise was arranged and it was possible to follow them through some form of penance to come back in.

And I am amazed at the way in which the psychedelic movement shows so many parallels to the history of religious movements. At other times, it's simply fascinating.

First of all, let's take not so much the sacrament of baptism, but the sacrament of the Holy Communion, the conversion of bread and wine into the body and blood of Christ as a sort of parallel to this. Because here, after all, was a religion saying that you didn't really get the salvation unless you partook of a particular material substance, which had been formulas in a certain way.

See, the whole idea of transubstantiation was that the priest took the bread and wine and he had to say a certain formula over the. He kissed and in corpus mail. This is my body which is given for you.

And this is my blood of the New and Eternal Testament, which is shed for you and for many for the remission of sins. Actually, all he has to say is this is my body and this is my blood.

And if you are an ordained priest in the apostolic succession, it is how that just saying those words actually changes the bread and wine into a spiritual instrument, which will be equivalent to eating the body and blood of Christ.

And since on the principle that you are what you eat on the day you become what you eat, you are converted by the sacrament into a member of the body of Christ and therefore united with God.

Now just look at that.

For a moment and ask the question, how does that differ from a chemical operation?

C In chemistry there are involved the same sort of thing. There's the formula, the form of words through which one constitutes the chemical. There is the material bread and wine or wheat ergot. There is also the problem of authorization. And this is a very, very tricky question because the early Christians quarreled among themselves a great deal as to who had the true sacraments, just as psychoanalysts quarrel among themselves as to argue really in the line of Freud.

Well, you analyzed by someone who was analyzed by someone who was ultimately analyzed by Freud. And then in psychoanalysis, there is a huge apostolic succession.

So in the same way now with LSD. Take one example. There is a great deal of controversy going on as to whether Owsley is LSD is as pure as Sanders LSD. And certainly anybody with less genius than me put LSD on the market. That is just crowd and is stacked with amphetamines and heroin and belladonna and goodness only knows what.

Also that it shortchanged. Badly made. And so on. So the same controversies are taking place about the nature of the sacrament as took place in the early history of Christianity. Also, the good and bad trips correspond to the ancient Christian arguments about the state of grace in which you were when you received the sacrament. If you were in a good state of grace, then it redound to your salvation. But if you were in a state of mortal sin when you took the sacrament, it would be down to your damnation. Saint Paul mentions this in the New Testament.

And so one might say people who have good trips are in a good environment. I'll prepare properly. People are bad trips in a bad environment. Improperly prepare and serve the sacrament, redound to their damnation.

And in this case, damnation. Instead of being something of a postmodern nature that's up to date and modern.

As I pointed out, it is an unpleasant state of consciousness, a psychiatric condition.

And therefore you have to go not perhaps to the torture chambers of the devil, but to the dungeons of the insane asylum.

So that watch for these parallels. They're very instructive. History does indeed repeat itself, just as human beings are the same human beings. Generation after generation. And they're always doing the same sort of things in different ways.

So as in the history of Christianity. So in the history of this. Questions were raised by philosophers who said, why on earth should it be necessary to be baptized with water or to eat this particular bread and wine in order to attain salvation?

Because showing their true salvation has nothing to do with material agencies, we would say now to spiritual insight has nothing to do with artificial means. It's something you do yourself.

By your own will, by your own efforts, by, say, your own meditation exercises.

And so this isn't nearly as simple as it sounds because it raises the question of, well, what do you mean by yourself?

And as we examine that question, we have a whole host of sub questions yourself. Does this word yourself refer to your total organism? Does it refer to some sort of psychic entity which inhabits your organs?

And if the former then if you are your whole organism, you cannot neglect the principle that you are what you eat and that, for example, if you don't have the right kinds of vitamins and the right kinds of minerals, you're not gonna be healthy.

If, on the other hand, your spiritual sanity, let's call it that, really doesn't depend on the state of your body, because after all, we know many people with extremely sick bodies who are nevertheless absolutely marvelous as individuals.

Then it would suggest that the functioning of the psyche is fun, but is fundamentally different and independent from the functioning of the physical organs.

But on the other hand, we know all sorts of people who are quite plainly neurotic or even psychotic, but who are also geniuses and very creative.

So if you can function well with a sick body, if you can function well with a sick psyche, who are you?

What are you?

Now, I tend to the view of what I would call body and spirit as being aspects of the same process.

That, in other words, it is the sort of artificial to make a distinction between the human organism and the human mind.

For the reason that a sophisticated view of the physical world does not require this separation, because it does not require the idea that there is some sort of material stuff out of which bodies are made as tables are made of wood. To me, the human body is a pattern dancing in space, a pattern, you would say, of what? It doesn't have to be of anything. All you need is the pattern. Because when you try to describe the component materials of which bodies are composed, what you describe is always another pattern working on a smaller scale at a lower level of magnification. And nobody ever described anything except that.

So imagine them that we have a rope which is made of various materials at the beginning. The rope is made of hemp. Next stage it's made of cotton. Next date is made of silk and so on.

You can think of a nylon or all sorts of things.

The rope might be made of how you tie a knot in the rope. A simple ordinary knot and everybody can see the pattern of the knot. Now move the knot along the rope.

And as you move it, the it is first of all hamper.

Then it is linen and then it is cotton, then it's silk, then it's nylon.

But the pattern stays constant and it is so also see with the human body, the human body has every conceivable kind of materials flowing through it. We are a stream or we are a form in a stream like a whirlpool. And the stream consists of milk and beefsteak and water and beer and every conceivable sort of thing. Our cosmic rays and so on. And each one of us is a wiggle in this field of energy.

And we so long as we wiggle in approximately the same way, of course, we get older and as we get older, you haven't seen someone for ten years, but for some reason or other you still recognize them. Maybe after ten years of not seeing them because you recognize that it's still wiggly and more or less the same way has the same pattern. So you have a continuity in terms of pattern integrity.

And but there isn't any substance there in the sense of the kind of stuff which remains with you permanently. The only thing that continues as you go through life is the dance. You're doing the pattern.

Who does the dance?

That's a question that's really very silly because it's based on our commitment to speaking a language in which all verbs have to be accounted for by nouns. Call their subjects as if an action could only be initiated by a thing.

But when you begin to go into that and really think it through, you see that something that is different from a verb that is to say different from action could not possibly initiate action. Action comes from action. So as Buddhists and Hindus say, all this world is karma, and karma means doing actual motion energy.

So then your body is an energy pattern. Nobody is doing the pattern. The pattern is, shall we say, doing itself and what you are experiencing in every conceivable sense of the word experience, what you feel, what you sense, what you think, all that is you and it's merely a social convention that we think about some agent who does deeds, who feels feelings and thinks thoughts standing as a constant behind them.

What is the constant is not some kind of spook, but the constancy in the form of the pattern through which one recognizes a person even after ten years absence. It's like you would always recognize the, say, a certain Bach invention whenever it's played and say, Oh yes, that's Bach's invention number so-and-so on.

And so it's for just that reason that you recognize another human being. Now, of course, when we have that, when we talk about music, then we say, well, who's playing it?

There is an instrumentalist at the piano. True. But this is a pattern playing a pattern.

In other words, it is all really the same pattern. This pattern sometimes is in a whirl, which doesn't include a piano. But in other times, it's a well, which does include a piano. And the pattern called the being flows into the pattern called the piano. And as a result, there is music.

So if you think that way, when you eat something that's a pattern to.

And you, in relation to certain kinds of food, are in one state, in relation to other kinds of food. You are in another state. One man's meat is another man's poison. And so in the same way you in relation to certain chemicals feel one way, in relation to other chemicals, you feel another way. And there is no way of abolishing our ingestion of foods.

Or whatever. Because if we didn't, we just cease to exist.

But we know that there are certain things that may not be chemicals in the strict sense. They may be simply natural plants lying around like the peyote cactus, the mushrooms, psilocybin Mexicana, the plant, cannabis sativa, otherwise known as marijuana that's growing around local weed or Amanita muscaria. There's a mushroom. And if we eat those things, our consciousness changes. Now, some time ago, the American Medical Association and the American Bar Association formed a joint committee for legal purposes to try and find a definition of addiction.

And every time they thought they had addiction defined, they found that their definition was indistinguishable from a definition of dependence on food.

And they had the greatest difficulty in pinning down any distinction between a food and a drug like the Food and Drug Administration.

What is the difference between a food and a drug?

Obviously we can see there is a difference, but we can't pin it down. It's like when St. Augustine was asked what his time. He said, I know what it is, but when you ask me, I don't. And so in a similar sort of way, we can see a difference between the food and drug in that food is something that comes directly from nature. Whereas on the whole, a drug is something that

has to be prepared in a special way, is a sort of extract quintessence, a distillation, a concoction or something in a pill.

That's a very superficial distinction. That's all a matter of how you cook it.

And so it is argued by some people that the human organism needs psychic vitamins as well as Robert called bodily vitamins, and that your psyche cannot be in a healthy state unless you take your psychic vitamins like that cartoon in The New Yorker.

Well, two very hip parents are saying to their little girl, how can you expect to have hallucinations if you don't eat your mushrooms?

Now, there is a cost to a sense in which the possession of all the exercise of spiritual insight is analogous to saying being a good painter or a good musician, and you can't accomplish that without a great deal of practice so that you have it in your bones, how to do it.

And I don't for one minute deny that a Buddha, an enlightened one.

Has his enlightenment in him in very much the same way that a painter has his skill. And obviously, the capacity to exercise the skill all the time will not come because the painter took certain vitamins, it may be that he will not be able to exercise his skill if he doesn't take the vitamins.

But we can't attributed the insight that he has, the capacity has for dealing with it directly to anything that he eats.

On the other hand, various painters who have taken psychedelic chemicals.

Have been enormously encouraged in their work because they saw. Into the world more deeply than with the naked eye. And they came back to their painting and tried to bring across that vision. And many people have found that it was, in fact, very helpful.

They could remember what they saw under the psychedelic experience and with great ingenuity, translated by technique, by discipline into a remarkable painting.

So obviously, then the psychedelic chemicals are no substitute for skill, discipline and wisdom in the sphere of religious or mystical experience.

Nevertheless, they are an extraordinary boost to give a person a real understanding that there is something in the nature of deep inside of union with God or whatever you want to call it. They give him a taste of it, a taste which many people never, never have. And from that initial taste, there arises the enthusiasm to pursue the matter further. I do not see why this should not be so.

In view of an integral way of looking at soul and body, spirit and matter.

Really, the burden of proof as to why it should not be so rests upon those who claim that it shouldn't.

Why?

Must any genuine spiritual inside be independent of what you eat or what you drink? Since you yourself are really addicted to eating and drinking.

Let's take another parallel case, and it's very instructive. Which is an enormous number of people are apparently addicted to music. Now, music, when you look at it from a strictly practical survival point of view, music is a waste of time. You don't really need music, do you? I mean, you could go on and you could do your business without any music at all. Music's a luxury.

And yes, it is a major industry today producing music.

And I suppose you could say Ed Dalton made the suggestion that people who are addicted to music have a disease called colitis. And really, music should be stopped as a terrific waste of time. It achieves nothing constructive and is really therefore very bad for you because you become hung up on it. You can't do without music if you're a real music lover. And even if music isn't something you eat. It's just something you listen to. That boy, can you become addicted to it?

So she would get rid of it.

Dancing is something you do. It's also a total waste of time. And of course, Righteous Baptist and people like that have always condemned dancing. Say that's in no way of behaving. They think everybody should always be dignified and shouldn't jigger around. Well, Sir Wilhelm Reich was perfectly correct in saying that people like that, people who are afraid of orgasm, they're afraid of the lilt.

You know, in dancing, there's always this kind of motion if you really dance.

And that sort of goes all through you like a flip in the middle of you, like a whiplash, you know where it goes flip all the way through.

And if you can't do that, you see you've got a rigid body. But even that you see doesn't depend directly on any kind of food stimulus, drug stimulus. But still, dancing can be very addictive. You just plain get to like it. You have to do it. The strange thing is, of course, that the psychedelic chemicals are not addicting, except in the sense that you may belong to some in group, and all the members of this in group are constantly boasting to each other of how much of this sort of stuff they've taken. And so to be respected by the group, you have to keep on taking it. But none of it has the same kind of physical addictive properties as the opiates or alcohol or tobacco, where if you relinquish their use, you'll get remission symptoms, which are very uncomfortable. And this just doesn't occur. In other words, let's say. Well, take any of mescaline, LSD, psilocybin. So far as I'm concerned, for my own personal reasons. If they all vanished off the face of the earth tomorrow, I wouldn't be too unhappy. I would only be unhappy for other people so far as I'm concerned. I've seen what they have to tell me. I've got the message. I don't need it anymore.

Because I do feel that they are really more like medicines than diets.

And of course, one should not become addicted to medicine. And here we get a very curious and amusing difference between doctors and tell him. Doctors are always trying to get rid of their patients. They give the medicine and say, now I hope that will work and you won't have to come back. And they give them a limited amount of the medicine on prescription. But a clergyman hopes he will come back and he will become a member of

the church. And you will pay your dues every week and generally for life get hooked on the religion. Even though there is the Latin saying about the Cross of Christ Crooks, Medi, Jean and Wanda, the cross, the medicine of the world, you get added addicted. Now the Buddha, in referring to his own doctrine, is dynamite. His method likened it to a raft and said, Now, when you cross the river on a raft from the shore of samsara to the shore of Nirvana, when you get to the other shore, don't pick up the raft and carry it with you. Almost get there. Give it a shove and send it back to the other side. But a whole lot of people see are on this rock and they are absolutely fascinated with Iran. And they become monks and permanent religion people. And they go back and forth, back and forth. You know, they're all very man who can't let go of Buddhism and they're addicted. So you see every way. It's in the very funny sense, true, that religion is the opium of the people in so far as people become addicted to religion as a permanent situation. And so they're hung up on it. And this is one of the great parts of Zen training is to get you free from Zen. If you don't get free from Zen, you suffer from what's called Zen State.

So.

Religion, then, can be addictive.

For we'll say it doesn't have physical remission symptoms, but it causes psychological addiction. And so in the same way, we might say that taking psychedelics, whether they be LSD or marijuana or what will you can be psychologically addicting.

It's a separate question as to whether that does any serious damage.

Maybe it does. Maybe it doesn't.

But you could become dependent on these things in that way. But if they were used in as medicines as I believe they should be used. Then a few times it requires a little practice to use any of them properly and to get the full insights that they can afford. But once you've seen it, you've seen it. And there seems to be no point in going back and back and back and back to see it again. I will modify that statement in this way if I am making a special study of the changes in consciousness produced by one of these

substances, and I am therefore recording or an otherwise studying the changes that take place, and this is naturally a difficult task. I may need to go back many times in order to get my picture straight, to see how it does it under certain different circumstances to work out all the ramifications of it. And for me, my own reason for being interested in these things at all is that that as a writer, as a philosopher, it is my great life game to describe what is allegedly undescribable. And for example, there's a drug called Dinosaur Trip to mean the empty for shot and this is a 40 minute run where your consciousness is really screwed up. And I was told about this and I inquired of the doctors whether it was, you know, dangerous or harmful or would leave you with the heebie jeebies. And they said, no, it doesn't do anything like that. Just it says about 40 minutes of sheer insanity. And they said it renders people speechless. I said it won't. Random Bishop.

Oh, is that Nana? No. You you you come off it so or. I said, I'll bet you anything you like. Give me a tape recorder and give me this chemical.

And I will tell you just exactly how it feels in a coherent way.

Well, wow. They gave me the first shot, which was about one point three S.S. and although there was a kind of vaguely interesting change, nothing much happened. So then they gave me one point nine C C, I think, and then it came on. It was as if, say, your elbow as a point in my field of vision suddenly came at me. But in a spiral pattern against the background that was spiraling the other direction. So you've got this other thing going on, and then there's suddenly caught hold of my body, sucked it into the system, and twisted my body into the same spiral motion and that everything started seeming to go like this. And it was all converted into brilliantly illuminated plastic. So it became a cross between a toy shop and Times Square, vaguely menacing. And, you know, you hardly knew which way up you were. And so it was difficult. But patiently I talked into the tape recorder, every single thing that was going on. What it was like. Now, a lot of people would say, well, you shouldn't do that. That destroys the experience. When you talk about it, it doesn't. That's the funny thing about all these things that they are much more interesting when you do some work with them. The work seems to throw something into the experience and then it gives you another task back. And that all adds to the interest of the

thing. And I found out that in working with these things, there was no further conflict between the intellect and the intuition that the more you intellectualized, the more the intuitive insight sprung up to correspond to the intellectual. And so instead of therefore having a session in which you just curl up and go into your own little private room and let it take over and you come back and all you can say is, man, it was a gas. So what what's the point of going on a heroic journey and not bringing something back? The whole point in every myth, heroes who take strange journeys must bring back a feather of the fabulous bird, a claw of the dragon, or the beheaded head of the villain that they slew and say, See, here it is. So I always feel it's necessary in any of these adventures to bring something back. And so you get the great intense fun, really the most stimulating thing I'll say saying we're going to devote this session to the study of a particular problem. One of the best LSD sessions I was ever in on was conducted by a group of people who were all very competent in the world of painting and sculpture. They knew art history. They knew how to do it. Very well trained people. And we sat in front of the first cubist painting that was ever done, and the whole session practically was taken up by a discussion of this painting. And it was absolutely extraordinary and rewarding. And may be that what we came out with in the end was not the truth about the painting. It may have been our Rorschach blot that we projected something into it. I think that's very likely, but nevertheless, it drew us all out in the same way I say. There are certain people who have a marvelous capacity for drawing other people out, making them be at their best, making them talk at their best. And so the picture did that for us. And one person present was a very famous and very successful sculptor. And he said minds. That's what I call art criticism. But the whole conversation through this was completely sane. Even though it might have had some projective elements in it, like a project on a Rorschach glove and see your own individual scene in it. But because we were all talking together, we evolved a common scene. We evolved the idea that this particular artist living at the beginning of the century was a master of technique.

He knew all the European techniques and therefore that he had painted five superimposed paintings in five great classical European style and integrated them into the Cubist. We could see Flemish paintings. We could see French

impressionism. We could see primitive Italian, Flemish and so on. There is levels altogether.

Of course, we will never know his debt. Well, they had his intention or not. But it sure made sense at the time when I looked at the painting before the experience. I thought I knew what it was about. Now I look at it after the experience. I have no idea why I thought it was a painting in Cuba, style of a hillside with a village on it. But now I can't see that anymore. I just can't see it. But I can again catch glimpses of the different levels that we saw during this experience. So I think then that.

The the the these kind of chemicals.

Art tools and very strong tools like an automobile is a very strong tool. It's a death dealing engine. And you have to be very careful when you drive one. Now, of course, because what is good for America is good for General Motors, etc. The other way around to everybody sort of makes driving an automobile the test of whether you're competent.

So they say if you took LSD or marijuana, should you or shouldn't you drive an automobile automobile? This is the test, whether it's a good thing or not. Now I submit that you should not play a violin while driving an automobile. You should not make love while driving an automobile, nor should you read a book. All of these are very creative activities, but there are certain concentrated absorbing activities that are incompatible with piloting a death dealing engine along a freeway.

And that's because in a certain state of consciousness, you would be incapable of being in charge of an audit of an automobile. Doesn't mean it's bad unless you're a hopeless sucker for the policies of General Motors.

But these things you see, they are powerful, dangerous tools. Which puts you into a state of consciousness, which, if you don't know what's going on, can be quite terrifying. In other words, if you take a journey of this kind, you should have a map and you should know what you're liable to encounter. Let's take this now, for example.

I thought, you know, when I first investigated this, that it wasn't. Couldn't possibly bring anything about like a mystical experience. And the first time I tried it, it didn't. It had brought a most interesting aesthetic experience that I wouldn't have called it mystical. But later on when I said this and a lot of people realized that this was my opinion, another psychiatrist came in, he said, I just don't think that you have been on the right track with this, are you? Try it again. So I tried it again with him. And to my great embarrassment, it produced a mystical experience. And there was no could be no question about it. Now, how do I know it's a mystical experience? Well, I have had mystical experiences of a mild nature, the popular spontaneous, that we're not connected with any sort of drug.

And in some sense, I can compare it with those.

But these experiences went much deeper.

And the basic feature every time variable is what I call polar awareness. Now, what is polar awareness? Polar awareness is to see that what you do and what happens to you are aspects of the same process. Ordinarily, we pull them right apart. The voluntary and involuntary, the behavior of the organism, on the one hand, the behavior of the environment on the other. But it becomes utterly clear in the state of consciousness that what you do think initiate will and what you don't do. But what happens to you are one of the same process. When you are steering a car and you move the wheel, are you pushing or pulling the wheel? Now, push and pull a formerly opposed terms, but actually when you consider it on a steering wheel, you are simultaneously pushing and pulling.

I now then imagine that I put out my hand to pick up my pipe.

This is normally a push motion, isn't it?

And this pull motion.

Now, under the effect of one of these chemicals, it becomes apparent that this motion is also being pulled and that when I pull it towards me, I'm being pushed.

At the same time as in steering the car. In other words.

As I said before in the first session, I feel myself simultaneously to be the puppet of nature.

The cork on the stream and to be in charge of everything that's happened.

If I take either one of these interpretations by itself, I'll be wrong. But if I take them both together as two ways of looking at the same thing, the one modifying the other. Then I realize that these two ways of talking that I am a puppet, that I am in charge. I talk that way because I don't understand.

If I did understand, all I could say was that I see that my behavior or what has formerly been called my behavior and the all other behavior are not really separate. They are one single process.

And so what happens on the inside? The skin goes with what happens on the outside. It isn't that what happens on the outside controls on the inside or vice versa. Just like when a snake does, wiggling along which side moves first is left or right. Right now they move together. So in exactly the same way, you get the sensation that everything going on out there and everything going on in here is all absolutely connected, like the two different ends of any moving object.

They go this way or that way or this way or that way.

And you see with the most total clarity that this process that's working this way is in every way harmonious, that what is happening is what ought to happen. Including people's objections to what is happening now to happen to. You just see that everything in this universe is in accordance with the Buddhist doctrine called G.G. Gate. This means the mutual interdependence of all things and events that everything in the universe is vitally important. The whole universe hangs on every single event or thing that is in it.

And without it, the whole could not be.

It all is of a piece as its title had to shut the down, said the only true atom. That is the indivisible unit is the universe itself. Or if we take anything out

of the universe and separated, it is ravel at all its edges.

Because everything is interconnected. That's what you see.

And you see it with just complete clarity and you say, my God, what's the matter with me? Why didn't I see that before? It's so completely obvious. At a somewhat deeper level of this experience, it also becomes obvious that this is a little bit more difficult to describe. But you see absolutely clearly that you and the eternal energy of the world are the same thing.

But that energy is pulsing and it all energy is only known in terms of power station.

In other words, constant pressure applied without palace is not energy because that constant pressure applied is all one direction.

Energy is dit dit dit dit dit dit dit dit dit dit dit dit dit dit dit dit.

Very slow or very fast. So slow that you don't notice the pulse or so fast that you don't notice the pulse, but it's still pulse. So to be and not to be. Life and death appearing and disappearing are all forms of it. And therefore, you live. Let's go back to our vision of the world as energy patterns and imagine that we make a picture of these enemy energy patterns as ripples, you see. Go back to the image of the water ripples appearing and disappearing in water. You suddenly see that all this, the people around you, the houses, the mountains, the stars are ripples in a kind of energy water. And they come and they go. They come and they go. They come in. They go. But the water is always there.

And that's you.

That does this marvelous mirage going on.

But you are it, you're not just the ripple that comes and then disappears.

You're the whole process only. You don't always know it for the simple reason that part of the fun of the whole thing is to forget it.

And we imagine that you're all lost and alone. And while we want a thrill, that is and it does all these things and it does it and ever so many dimensions, as is not only this universe that we see now. There are probably infinitely many universes that could be visualized by different sense organs, different receivers, different wavelengths as on the radio.

Now, when you get into that state and you're not ready for it.

You may get scared absolutely out of your wits.

Because you suddenly feel the unaccustomed sensation of I'm doing the whole thing.

And you see everything that you do notice outside you is known to you as a transformation of your own nervous system. And insofar as that is you, then you are the behavior of the man working out there on the roof. And if you think that's the case, if we say, oh, heavens, I'm in charge of the whole universe on a sticky situation, that it's like the kid who turned himself into the Los Angeles police on a bad trip. Little piece of paper would said, Please help me sign Jehovah.

Or on the other hand, you may feel the opposite, that you are absolutely powerless and that everything you do is simply the determine effects of anything, and then you think, well, how can I rely on that?

How do I know that I'll be able to think in English the next minute? How will I remember who I am? Well, I know the way home.

How can I be sure I won't commit a murder or commit suicide or do something dreadful? You suddenly see you have no guarantee. Either way, you know, if your God, how can God rely on himself to be always sensible?

The real spooky.

So naturally, a lot of people feel completely insecure. No ground to put their foot on because there's no longer anything other. You see that, for example? Other is a different kind of ally. You see that self and other simply presuppose each other. You wouldn't know who you were. You wouldn't

know what you meant by me unless you felt something other than you. Well, that implies the two go together. They're inseparable. No one life. And then that that disturbs people. And so as a result of that, they start calling for help.

And as you panic, the panic is exaggerated because everything that you feel is exaggerated is more intense.

And people think up the most weird horrors, the paranoid, and project all sorts of ghastly schemes that are afoot to destroy. That's why the underground press is so full of paranoia of all these so many of these people are on LSD. They get very paranoid.

But if you understand the principles of this, if you understand what organism environment unity is, what reciprocity is, what the doctrine of G.G. Mulga is, instead of getting frightened, you say, well, well, well, look at that now. It was true, after all.

That's the way it works. And you just relax.

And you let it, you happen because there's nobody left apart from the whole experience to permit it to happen or not permitted to happen. You are simply what goes on and you're not either controlled by it because it's no you separate from it to be controlled by it and you don't control it because there's no you separate from it to control it.

It is just what gives. So it's neither voluntary stick on the one hand nor deterministic on the other.

Now that's a difficult idea to get through into people's common sense. But anybody who has had a deep experience, say the straight mystical all through one of these chemicals knows exactly what that means. Just as a person who is a mature student in physics understands Einsteins relativity theory almost without it having to be explained.

And for me, that is a great mystical experience.

And furthermore, it's very valuable for the reason that I mentioned in the first lecture that we have to realize our real our actual full energy relationship to the external world so that we can create a human civilization which cooperates with nature instead of opposing.

Yesterday afternoon, I was talking about the relationship between psychedelic experiences and mystical experiences and pointing out that there were really two major features in common. One of the sensation of polarity of you as a subject, a Noah, a center of action. Get this astonishing experience of being inseparable from everything that you had hitherto defined as other than yourself. Because you understand that the sensation of self cannot be experienced except in relation to the sensation of something other, and therefore that there is something in common between everything experienced as other and everything experienced the self. It's as if there was sort of a conspiracy like Tweedledum and Tweedledee agreeing to have a battle. And you see and you have the vivid sensation of the motions and behaviors going on inside you, which are voluntary, being simply it were the other face of all the motions and behaviors that go on, whether inside you or outside you that are involuntary, that they were two sides of the same coin dancing together. And this is a very fascinating feeling and a very good feeling.

If you have the there's something iffy about this, which I'll come back to a very good feeling on the whole, because you feel that the whole arrangement of life of the the world of the universe is fundamentally harmonious.

Even though you can understand that there are tragedies and agonies, nevertheless, for some peculiar reason, you see that those are. Shall I say bands on the spectrum of experience. The spectrum of experience is vast, is multidimensional, and that the energy of the world is playing on all parts of the spectrum.

So it ranges you see on the what we could call a pleasure pain scale from extremes of ecstasy to extremes of agony.

Now what we feel you see, we always feel that the extreme of agony is threatening because it can bring about death and we are up. We have been carefully trained to try to avoid experiences on the agony extreme of the

band. When you were a little baby and for example, you vomited. Your mother may have reacted dizzy and that taught you that vomiting was not a pleasant sensation, although in fact it is. And when people got sick, your parents got anxious and said, Oh, you are.

And you learn to imitate those reactions. When people died, they started crying and had a funeral and it was all very solemn. And so you learned that dying was a bad thing. But all these attributions of good and bad to the natural events of life are artificial. There are social conventions there, a game being played. And when we play games, we take various elements like, say, opposing your playing poker and you've got chips and you say red chips where so much blue chips were, so much white chips worth so much. And you put your valuation on the chips. So in exactly the same way life is going on and you put your valuations on it. Your parents put valuations out because they were playing games with life, competitive competitions.

Who wins, who loses, etc., etc. Easy. And so they put all these values on them. And consequently, these are so ingrained in everybody that they find it difficult to be liberated, to see everything in what Buddhists call it. Such as. Now, such news means this, and this is a very, very common feature of psychedelic experience that you see that everything is simply a dance of energy. It isn't good, it isn't bad, but it is beyond good and bad good with a capital g that it's just great. It's a fantastic achievement. Sea life.

And it's going do do, do, do, do, do, do, do, do, do, do.

There are all sorts of ways that it it it it is a goody goody goody goody goody goody, you know, doing all these dances and that's what it's all about.

And therefore, in a certain sense, anything goes. And yet in another sense, it isn't just anything goes because the fun of this whole thing is to make patterns.

To figure out games, to do something with it.

And it's doing this forever and ever and ever and it's going to surprise itself because you know what a shock death is. No, it just blows you right out.

But, you know, if you observe the world, you see that it keeps coming back. So for heaven's sakes, don't worry yourself with images of being annihilated forever. You know, of being, as it were, buried alive in the dark. And to be confined in darkness for always and always and always, which would be just unbearable.

Just forget it. That's his complete hallucination.

After you dead, you know where you'll be someone else, just as you are now, you know, you came into this world, came out of this world is more correct way of saying and experienced yourself altogether new. Well, everybody who comes out of this world has the same experience and it keeps happening. And when one of them is finished and feels itself disappear, then as we know, another one starts. And that's you all over again. That's a difficult thing to understand because most people are unaware of the reality of intervals.

Of spaces and there are spaces, intervals between all human lives and those spaces join the lives together, whether they are spaces is what the ordinary little space or whether their spaces of time, intervals of time. And you can understand this when you listen to music and realize that the melody that you hear is a result of hearing the intervals between the tones. If you don't hear the intervals, you just hear a succession of noises and you don't hear melody at all.

So in the same way that the intervals between lives that join the lives together, you don't have to imagine any strings attached. And his soul spook trance migrating from one life to another lives. The lives are joined simply by the interval between them. And to become aware of space in this way is the most important thing. Most people are completely unconscious of space and regard it as nothing.

Then so I said this then is a major feature of psychedelic experience, which is in common with mystical experience, is then we'll call it first the sense of polarity and of the games. The such list of things that life is simply what it is, that it has no absolute value, but you put your values on it like you put values on the chips in poker. But actually, let's suppose you let me give two

illustrations of such a.. Let's say we consider the word yes. And that we mean by something that it's affirmative. But say yes several times.

Yes, yes, yes. Yes, yes, yes. Yes, yes, yes. Yes, yes, yes. You begin to hear it as a nice. Yes. Is it funny that we make that noise? Yes. Yes.

And suddenly the meaning evaporates from it and you get just the noise. So in exactly that way, you begin to look at everything. I'll take another illustration when somebody doesn't know about. I mean, shrug of the shoulders. And you do it once and it has a meaning.

But imagine you're watching someone going, you know, and suddenly you see everything is like that.

It. It doesn't mean anything.

But it's fascinating because it is just a certain play of pattern. Like you're fascinated when you look at a crystal. You like to turn it around, look at all the angles. And the thing and all the patterns are a pick up a seashell, pick up a fantastic rock, admirer of fish, the sea. And this way of looking at it, that it just everything is a fantastic pattern, has no meaning, except it's just what it is, dancing like that. Did you ever see a lady go this way? Go that way? Mm hmm. That's what it is.

And that's such a..

And then the second aspect is that you can often come to a level of experience where you get in touch with the final basic energy that is operating in all these patterns, diagrams and games. And this is generally experienced as a sensation of intensely brilliant light.

As if you realized the current inside your nerves and saw it as this brilliant light.

Somebody hits you on the head hard. You see stars. See, because then you suddenly experience the current inside the nerves. And with psychedelics, you very often come to an experience of absolutely vivid light in accord with the physicist's realization that everything is really light, that this whole

world is light throbbing in different vibrations, so that wherever we encounter something dark or something solid, it isn't actually against light, but it is a form of light that is going so fast in its wavelength that it has effects us as the experience of density and impenetrable ability. If light is too bright, it smashes your eyes as quite as effectively as somebodies fist can smash your face. So what? Everything that we call density and impenetrable city is not. It is really in effect. Strength of light.

Now, these are the two features then of two principal features of psychedelic experiences which correspond with mystical experiences.

Now, I want to talk. Particularly today, about the aspect of danger in these things.

Because you will see in what I've been saying so far, come on me, that there's a departure from common sense.

For example, people say, oh, I want my life to be meaningful, I want it all to make sense. And therefore, when you propose the idea that life really doesn't make any sense at all. That is there some kind of jazz going on? This is threatening to people. They say, is it, after all, a tale told by an idiot full of sound and fury signifying nothing. But as our age, Blythe said once when commenting on this passage from Macbeth, it is said so well that it doesn't seem so bad after all. Maybe the whole thing is a tale told by an idiot full of sound and fury, but it's the sound and the fury that are important listening.

But that's an idea which we are not used to. We are taught to think that if your life doesn't have some purpose, you're a washout. You're just an idiot. But maybe it's a very good thing to be an idiot.

To be a complete fool.

And simply to sit and watch the wave, know how good a thing it is to sit on a beach and just watch waves breaking and dissolving, you can sit for hours completely fascinated. And children like to do this. I just sit by a pond and drop pebbles into it and see all the concentric circles coming out of the plop.

While you could say, well, it's much more important to go into business and achieve some substantial results and raise a family, why you're just making a bigger splash. That's all.

And you have children and the children go, bla bla good. The bird, the goody, goody, goody, goody, goody, goody.

Finally they give when they start in better living and how they make sense and they talk and so on. But it's all just the kind of jazz. I mean, raising families and businesses and getting food and eating and going on and going up this way and so on. It's like gun hair growing or trees coming out and everything should be all over the place.

That's scary. If you've been brought up to think that it's supposed to mean something when you see it doesn't. And that's just what's happening.

Like people get frightened and they think they're going insane. And they wonder whether they can remember the rules. Well, now, in getting into this predicament, the most important thing to understand.

Is the immense sanity giving power of letting go and not trying to hold on to any sort of security? This is a I think this is one of the most important things in life to realize how powerful and how great in conferring order and sanity and a feeling of comfort on any conceivable situation, it is to be able to let go. Now that there is a difference between this kind of relaxation and being merely limp in the sense of when you hang a cloth over a clothesline, it is limp, it simply drops. And there's a subtle difference between being completely relaxed and being merely limp. You see, when you are as a physical body or completely relaxed, you still have muscle tone as you have a sudden vibrancy going in you.

You are not just a bunch of jello or kind of grease that if you relax, you will form a nasty blob and eventually slip through the floor.

There is the varsity and strength. So in the same way, if you relax psychologically and completely let go of things. You will find that you have psychological terms, energy. And you cannot really do anything skillfully,

any art, you can't talk, you can't think you can't have sexual orgasms or anything like that unless you have learned fundamental relaxation.

So when in the midst of some sort of psychedelic experience, whether you are using LSD or whatever, or whether you have an experience that comes upon you spontaneously and you get scared that you're going to go out of your mind, you're going to lose control.

And I'm gonna be in charge anymore.

You do exactly what you do. If you find yourself in a typhoon and see when you find yourself in a typhoon, what they do is they turn off the engines because in a big steamship, if the propellers get swung out of the water and turn on their own, they shatter the ship by vibration. So they turn off the engines and drift cause they keep an eye on how near to land they are, but they try to get as far from land as possible and just drift in the same way. If you're in a sandstorm in the desert, there's absolutely nothing you can do. So the Arab League, he wears a wall by noose and he crouches down on the ground like a fetus in the womb and simply covers himself with his burns and doesn't move until the sandstorm is over.

And you know, Edgar Allan Poe story about the vortex, about the man who gets into the middle of the thing where it went well.

The calm center is. I had a friend in London years ago. He was a psychiatrist and a very wise one. And he wanted to see a royal procession celebrating the king's jubilee or something. But he wasn't going to walk out onto the street at four o'clock in the morning and wait so as to get a front seat. He came just a few minutes before the procession started. There was this milling crowd of people pushing and shoving and so on. He just leant on the back of the crowd, did nothing else but lean, and in all the jostling he learned. And then they leave. They found himself in the front row.

So when any kind of terror starts and you begin to feel uncomfortable and uneasy, you just let go. Now, why does it work?

It works for exactly the same reason that you got long. You had nothing to do with it from the conscious point of view. All this remarkable brain and

bones and everything came into being you or even your father and mother didn't understand really how it happened. They knew they had to do certain formalities to get the thing started. But really how it all works. Nobody understands, but it does it of itself. It's why the Chinese call nature a run, which means of itself. So spontaneity and this extraordinary organization of intelligence happen.

And we we we are afraid of it because it is scary from the point of view of individual consciousness, as the Simons says.

The Lord, I am fearfully and wonderfully made, and that means I am scary to myself.

And so we think that we know better and that we ought to make certain corrections to nature so that it will function more desirable. But that's quite doubtful, you know, whether we really ought to do that. It might have been better to leave it all alone as the great diarist sages of China had always advised his leave life alone.

They say the man who train first man who trained horses was called polo.

So you get the name of the game of polo from him and that he ruined the nature of horses by doing this, we could say to that by our technology, we really made an awful mess of things.

It perhaps you see what we call cost, where we are stuck with it. That's the nature of karma.

Once you once you've interfered, you're stuck with it. You've got to see it through.

But it could be argued quite persuasively that we never should have done anything like that. That we should have followed our feeling and just let live happen.

And then, of course, we wouldn't have any of the problems we have now in terms of atom bombs, population bombs or all these problems.

You see, it would not have occurred only from the standpoint of civilized people, we should say, of human beings in that state. Well, they're just barbarians. They do what they feel like.

And from our standpoint, that is not very pretty because we've got a special concept of what it is to be very pretty, which is all stuck about with Ding Dongs and clothes and bells and whatever, you know, houses.

But the fish, the cats, the birds live with their curious dignity and they make no. You know, you remember Jesus when he said, consider the lilies of the field, how they grow. And I've never yet heard a sermon on that passage where the preacher commanded it. They all say, well, that's a great life. But of course, for all practical purposes, it's impossible. The most subversive pathogen that's been out anxious for the morrow.

They take care of itself. Drift be like a leaf on the wind.

I remember when I had my very first mystical experience. I was 17 years old.

And. I was in a great state of tension trying to find out something and suddenly I abandoned the whole thing. And worked.

You know, you live, it flipped, you're inside. And I felt like I was a leaf on the wind that happened to be at the time of year. It was autumn and there were many dry leaves floating around and skittering about. You know, how leaves play like their little children let out of school, go particularly along the street with the wind.

And I felt exactly like that, as if I didn't own anything, didn't have any responsibilities. Didn't care whether it went this way or whether it meant that I was completely released.

And I felt completely one with a leaf being blown by a wind, and I was the wind and I was the leaf and this wind was the wind blowing where it listed that Jesus uses as an analogy of the spirit. You know what list of means it blows where it likes, not where you hear. It's nothing to do with. Listen to the old English list of means that blows where it wills.

In other words, at random and to let go in that sense.

And allow and and really consider the possibility that everything in life is completely out of control and at random, but go with it. This is fundamental to any kind of strength, any kind of real control. So that what happens in a psychedelic experience is that when it is valuable for the reason that it can be a very threatening experience, it can suddenly show you that you are not really in control, that anything might happen.

And this, I think, in a way is the center of the whole thing, why these sort of drugs are effective is that they throw you off your normal function and they're out.

You see that this is why there are a whole complex of drugs that are quite different, but act in the same general way. What they do is they throw you off. And as I said, I think earlier in the seminar, we gave you a sense of something clear change your state of consciousness so that by contrast with your habitual way of feeling things, you say, I feel odd. Now, it may be odd good and it may be odd bad, but you feel odd. It's as if everything the whole said, sorry, I'm your whole consciousness has had a change in it and you can't really figure out what it is because it's common to every particular sense impression, to seeing, to hearing, to to white, to blue to red. Everything has been subtly altered as if it were buzzing, as if it were at a strange angle, as if it had become luminous, as if it were suddenly transparent, as if it were squirming a bit. And because this is common to everything you say, this is clear.

So you suddenly are out of control. Things aren't ordinarily what they should be. And of course, the same thing can happen in sickness. Some people when they are dying, have the sense that everything is completely wrong. It's all out of order. It's weirdly out of order.

Now, these then are opportunities to let go. Give it up. Don't try to control anything.

And as soon as you are really persuaded by some kind of event to do that. Like the person caught in the typhoon or the sandstorm or people who are dying. Anybody in extremis will recognize that he just has to give up.

There's nothing else to do. And when you do that, you suddenly discover you have enormous reserves of strength.

Intelligence and power. If you let go.

But is the common sense militates against this. They say, well, if you let go, you just become a slob who will just become nothing at all and you will be sucked down the drain.

But it isn't true.

It's only by complete letting go that you have a source of strength.

Which bounces right back at you.

So then when people get the horrors and the terrors.

In using, say, LSD, you also act to panic and go running off to a doctor or turn themselves in at a hospital and say, please, please, please, I'm.

I'm lost in the corridors of my mind. I've been chased down some endless passage and I can't find my way back.

Help! Help! Help! I'm lost.

And then, of course.

Because if a psychiatrist doesn't know what to do and thinks this person is really in a very serious condition, he gets anxious.

And his anxiety instantly community Kate's itself to the patient who gets more anxious and they come around and they look official and they give medications and this, that and the other, and the person is completely spooked.

So a good psychiatrist can handle anything like this. Just.

Treats it as if it were the most normal everyday occurrence.

People think they're going to die.

People think they have are about to lose the power to breathe, that their hearts are going to stop, that their brains are going to dissolve into phantom drip and feel all those sort of sensations that all those sensations you see of being out of control are the sensation of the dissolution of the ego.

That's what's happening.

Their ego is a what you once called a cramp in consciousness and in Sanskrit, there's a word some culture, which means essentially contraction and the the give out man, the the the ego is a sum culture.

And do you often feel if you experience yourself organically, thoroughly, that you're contracted, can you feel a constant strain in yourself? It centers right between the eyes. Yeah. And triggered Barrow, made experiments with electro and settler graphs and things to see what was the difference between the state of a person who had a cramp here and the person who relaxed it. But it's not only here. You feel it all over you. If you become aware that through all the day long you are in a state of defensiveness. Europe tightening where you needn't tighten. And a lot of people experience it here. And as a result, generate ulcers.

There all sorts of places where we feel this this holding on.

It doesn't do any good.

Cos I can't tell anyone. You just simply you should relax because that's as a sort of double bind, because the moment you say should you inculcate a state of mind which is, um, relaxed.

Thou shalt love the Lord, our God. You better watch out if you don't. Well, you can't love on that basis. You can't love because you know that you ought to love in self-defense.

It's impossible.

Love is something. Not under any ego control at all. You have to let go to let love happen. Maybe it will, maybe it won't. But that's none of your business.

So it's very, very frequent in psychedelic experiences that people become vividly aware of how tense now defending themselves against everything all the time on the watch out.

But almost all the energy we expend in doing that kind of thing is waste.

So that if you stop doing it because you see that the only way to stop doing it is you can't will yourself to stop doing it. You can only realize that it's completely useless. That it doesn't achieve anything at all, it just wears you out. It's absolutely no good. It's like having a sense of guilt is an entirely destructive emotion that doesn't do anything for anyone.

There are a lot of existentialists today who say that unless you feel a anxious and be guilty, you are not living a genuine existence.

Imagine, you know, you're not authentic because if you're a real human being, you know that if you exist, you might not exist.

Therefore, you try to be or not to be. If you're a human being, you know that you're not really up to what you might be and therefore you feel guilty because you're a little defective.

And all this is posturing. It's a great pose. People say to be real. You've got to be a. Yeah, that's that's all play acting. It's just a joke. Yes, I am deeply sincere, you know. Yes, I am terribly sincere. I really mean this.

You know, do I really need to exist to be here as an organism? I mean, good lord, I am here, you know.

And, well, I can't help it.

It has nothing to do with my ego that I have feet and that I exist and that I'm here. Do I really mean it or don't I? Well, I guess I do. I mean, my my

physical existence here is perfectly sincere. It's about as real as anything can be.

But I didn't intend it. I don't have to say no. I mean, if somebody threatens me, then I may bounce back rather strongly. But I don't have to make a sort of cause out of it.

So are they.

The notion that I ought to feel anxious all the time, that I ought to feel guilty all the time is simply a way of people who really don't have a very good sense of existence. And they drum something up like lying on a bed of nails because that makes you feel more real.

It hurts. It's a kind of masochism.

Well, you can do that if you want to. There's really no reason why you shouldn't.

Except that I think it's a sort of a drag.

So the point being that people who who say, well, you should lie on a bed of nails and feel that makes you feel important, you've done something that most people don't do and you are you're a bit far out and therefore perhaps they're more real. I say, OK, but just please have a sense of humor about what you're doing.

Don't take it quite that seriously.

Try to convert everybody else to sleeping on a bed of nails. Because it's not to everybody's taste.

And but a lot of people you see who sleep on beds of nails just because they're very insecurity, because they feel that unless they suffer that something awful going to happen, they try to convert everybody else to doing the same thing. So that's one way of finding out that knowing that you are right is to get as many people as possible to agree with you. Like be bad to log the monkeys. And Kipling's story in The Jungle Book will keep

exclaiming. We all say so. So it must be true. And so to feel guilty and to feel anxious and then make a religion out of it and say this is the way any authentic human being feels. And if you don't, there's something wrong with you. You know, like a lot of people who are being psychoanalyzed feel that anybody who is not being psychoanalyzed is neurotic. Philip Brief puts it in his book on Freud, *The Mind of the Moralists*. He says, The characteristic institution of our era is not the parliament, but the hospital, that everybody is being undergoing therapy. Everybody must admit that they are in the costs of being cured, but is not cured. Nobody can claim anybody who got up and say, I am perfectly psychoanalyzed. I have no further problems would be regarded in this day and age as someone who would in a former age get up and say, I'm absolutely holy. I'm the perfect saint. That is immediately spiritual pride. You can't possibly claim that all saints are measured as saints by the degree to which they declare themselves to be sinners.

I am. My sins are worse than yours. I am more sorry for my sins than you.

You can see them from the point of view that these chemicals give you.

You become aware of all these intricate games that people are played. I remember once long ago, Dana and I had a wonderful psychedelic session in which we were listening to the radio on a Sunday evening and all these preachers were coming on with their messages. And the only one that rang true was a Negro revivalist. And he was stopping to make any sense at all.

He was saying that gift is about it. That is it. Now, our congregation was saying that I am an. You know, if you got that far, they shut him off and change the program.

That was all right. There's a poor little man who was talking in an echo chamber, so it sounded like a great, great cathedral.

And he played records of hymns and then he came on with this Bible message.

And he kept saying, if you want a copy of this message, be sure to send one dollar to the station.

Be showed us in those your dollar and we'll listen to that. Oh, yeah. Isn't that grubby? But then you listen down into this voice saying that. Be sure to send in your dollar. You realize this is a poor little creatures saying, well, I've got to make a living somehow, too. And in that voice, that awful corny voice saying be Sharon sending you down, you hear a crying child.

Oh, you hear a lost animal calling out, please help mama. I I want.

I want to help you listen down into that and you go further listening to the sound. And finally, the human voice becomes like breath going through a flute.

You. And do you think at first that's sad. And after a while you realize it isn't. It's just one of the ways things happen. It's the fundamental sound. It's the ohm. It's the voice of God playing a particular tune.

And you think marvel of marvels. You heard the divine sound through the throat of a Baptist preacher.

Incredible.

So, you know, that's that's one of the really great things about this kind of experience. You can tackle you can confront things that in the ordinary state of consciousness you think were downright awful.

And learn to understand why they're there.

You can take people that you thoroughly disapprove of and you can begin to understand why they are the way they are. For example, from my point of view, I've always been an argumentative person because I liked the discussions and talking about philosophy and religion and so on, and I won't argue about anybody's religion anymore.

I regard all the different opinions as so many different flowers and a garden. And they need each other. In other words, if somebody disagrees with me, then I know where I stand. If I said there wasn't somebody who disagreed with me, I wouldn't know where I stood. So I have to thank him for pointing out to me what I think and say. Keep it up. That's great.

We're all you see by our differentiations of point of view. Making up a great pattern, which you could call the intellectual life.

It depends on that.

But the basic point that I want to make in all this. What I am really talking about is how through the use of the psychedelic chemicals, you can be so shocked, you can be so disturbed that you will learn that you've got nothing else to do but completely relax your controller, your sensor, your ego, and that to the degree that you really let go and don't try to hold onto life anymore.

You just you become enormously strong and able actually to control things.

But all fundamental control depends on giving up control.

And this paradox, which scares the hell out of us is the is the main lesson of the whole thing.

Now, the final problem that comes up in this discussion is what we might call psychedelic control. The whole question of. Since there is a widespread circulation and knowledge of these substances among us. What are we going to do about it? I want to make the initial point that there is a very strong difference between controlling something and suppressing it. If you are controlled to go back to the great General Motors image of life. If you are controlled as a driver of a car that is quite different from a person who never drives, keeps the car locked up in the garage. If you are controlled as a writer, you are not a person who never picks up a pen. If you are controlled as a dancer, you are not a person who never dances.

But this has been utterly misunderstood throughout the whole history of the Christian West.

And.

In the United States, we just haven't learned from any of the historical lessons. I recently was discussing this problem with an Indian tribe. And a tribe which incorporates the Native American church where they use peyote

in a religious ceremonial. And the significant thing about this particular order. Is that the peyote Indians are exemplary in their tribes as stabilizers.

They are stable in their families, in their work, and they don't drink alcohol, which for some reason is extremely demoralizing to Indians. And they are very much against it.

They won't allow it on the reservation at all because they can't take it.

It may be a question whether we don't have the same predicament in reverse. Can we take peyote and stay sane? We're used to alcohol, but it doesn't help us to be particularly sane. That does something for us, I guess. But the peyote Indians are really exemplary. They are wonderful people. And the peyote ceremony is absolutely marvelous, although it's part of tested endurance. People who practice Zen talk about the session, you know, where you sit in zazen practice for a couple of hours maybe. But in the peyote ceremony, you sit all night from sunset to dawn and you hardly move except once at midnight when you get a drink of water, pass around and you can go up to the john if you want to.

They say.

Because they think that their religion is legal. There have been court tests of it.

And that they their view is that peyote being a natural plant is God given, and the government has no right whatsoever to interfere with it. They would say, for example, that if the growth and distribution of peyote were under government regulation and they would get what they were given the special privilege of being able to use it because they are a church, they would still protest and say this is not the business of any government whatsoever.

Because.

It grows and all things that grow and all things that are natural are essentially good. And in this, they concur with the Hebrew view of things. Because in the Book of Genesis, it is explained that God created all things whatsoever and only of all things, the tree of knowledge was forbidden.

Costs that's always a problem of why it was there at all. But every time it says every herb and every plant is given for the good of man and the Hebrew insists that, in other words, the material world, because it's the creation of God, is a good world and that evil can only arise through the misuse. Of natural things. So they very strongly. The Indians contest the interference of government in the use or possession. Of any natural plant or herb whatsoever, and so naturally then in this case, under this category, there come three of the major psychedelics and actually there are more. But the three that are best known are peyote. The cactus, the mushrooms, psilocybin Mexicana and the hemp plant from which we get marijuana.

I suppose you would also say tobacco. Incidentally, we don't smoke real tobacco. We smoke treated tobacco. The Indians smoke real tobacco and they mix it with willow bark. That's rather a different scene.

So.

When it comes, however, to LSD and to die methyl tripp to mean and synthesize drugs, there might be some cause for dispute about this.

Just as there would be if we completely freely circulated penicillin or barbiturates, opiates and strong acting drugs of that description, we might say, yes, there is some good cause for imposing rather strict controls on the actual possession or purchase of these substances. Just as there is an obvious reason for controlling the purchase of dynamite or TNT or licensing people to own guns, drive cars and and so on. But you'll notice there is no law prohibiting the growing or possession of Amanita Panther Arena. Amanita Panther Arena is a mushroom that looks very like edible mushrooms and is deadly poison. There is no really effective antidote to it, but it is not forbidden by law. There is no law against growing belladonna, deadly nightshade, so the whole nature of a law against especially the possession of something that grows naturally on God's green earth has a certain degree of insanity about it. Because they're at the root of many points of view from which this can be considered.

First of all.

Anyone can use a gun to kill a person or you can just use it for plinking and shooting tin cans. It is not the possession of a gun which is criminal. It is the misuse of a gun as it is also with the misuse of an automobile. And therefore the very nature of crime consists in a specific action which misuses some substance to the detriment of other people. When you make a law in which the possession of a given substance is a felony, you thereby invite endless corruption and problems. Let us consider, first of all, the problem of marijuana.

It's very easy indeed.

To prove that someone possesses marijuana, all you have to do is sprinkle a little dust of the substance on somebodys coat and then you can declare to the police that you have reason to believe that they possess marijuana and they can vacuum, clean your coat and find some small dust of marijuana there. And you can be put in jail for five years. In some states, you can even be put to death.

Although this hasn't happened in quite a while.

In other words, if you have a political rival and you want to get rid of him, you just plants and marijuana on his premises and and tip off the police. If you have a wife you want to get rid of. If you have an enemy, then a description.

This is what you do.

And in turn, if the government wants to get rid of you because they don't like your politics, they can just send the police around with a search warrant to your home and they will carry in their pockets a few roaches. You know, which are the butts of marijuana cigarets. And I just find it. And something that you have to see a law against possession is is completely insane because it invites all those sorts of possibilities. In the case, you know, like when Al Capone was giving trouble, they couldn't get at him directly for any of his crimes. So they found an error and his income tax. Well, it's so much easier to find someone guilty of possessing marijuana and the penalties for possessing it are worse and higher than those for fudging your income tax or for armed robbery, all sorts of quite desperate crimes are

punished less heavily than possessing and especially pushing or selling marijuana.

And so far as this particular herb, which is what it is, is concerned, the laws about it are based on pure superstition.

There is not one single reputable scientific study of any description whatsoever that can prove a link between the use of marijuana and crime and insanity. There is no proof whatsoever that it leads inevitably to the use of heavy stuff like heroin. It is all worked up by Mr. Slinger, who used to be head of the Federal Bureau of Narcotics. His history is rather interesting because before that time he was a great prohibition enforcer and the law put him out of a job and he had to find a new job. So he worked up the myth that marijuana was a very dangerous drug and got himself made head of the Federal Bureau of Narcotics. And he's got it. He's worked all over the world. He's got it written into international treaties. And an enormous amount of nonsense has sprung up around us.

Now.

And the British government back at the end of the last century realized that marijuana was an extensive use in India and they had to decide what to do about it, and they made a very, very extensive investigation and published its results in several volumes and concluded not to take any steps against it in India. The United States surgeon general investigated its use in Panama and they decided that there was no point taking any action from their standpoint. They found nothing particularly wrong with it. And when Mala Guardia was in charge of New York, he had the New York Academy of Medicine make a very thorough investigation of its use. And their report was that they saw no particular harm in it. And at most it could be called a social nuisance. So but for some reason, the ACMA, the American Medical Association, condemned the New York Academy of Medicine for premature judgment and unscientific investigation. But you know what lies behind that? They did. One of the difficulties of the whole situation is that the use of marijuana is a substitute for alcohol.

And alcohol is big business. So cigarets.

And there's a fear among producers of alcohol that if people got onto marijuana, they wouldn't drink so much and so they have a slush fund, quite considerable sum, which they spend, keeping up the notion that marijuana is very destructive. Also, it's very easy to grow. And although I don't think that if it were legal, many people would bother to grow it and prepare because it's quite a problem involved of cleaning it and getting out stocks and seeds and all that crowd. I don't think most people would bother so that the tobacco companies could very well switch crops, be quite easy and fact much cheaper than growing tobacco.

And they could supply marijuana cigarets in beautiful packages with all kinds of psychedelic colors on them and wonderful brand names and make a terrific business out of it as well as the get the excise tax that would naturally be imposed on it could finance a whole new war.

But one must face the fact that in the free use of marijuana, there are certain dangers.

But perhaps not such great dangers are as are involved in the free use of alcohol.

But I would want to say there a clear warning that there are varieties of marijuana which are extreme, extremely strong, especially in the form known as hashish, which is simply marijuana resin concentrated.

Which if it were commonly used, we should run into certain social problems. And I'm going to deal with this first and then later with LSD because the situations are rather different.

The social problems that we could run into are that people who are under a very strong marijuana influence.

We often don't know where they are.

Can easily get lost and confused. They are not liable to be violent unless there is some completely separate predisposing reason for them to be violent. It does not of itself make people violent. On the contrary, it makes them quiet Pacific and slow down. But you could get very confused. You

might also get paranoid over fearful. And you might also become, in a certain sense, irresponsible because one of the characteristics of marijuana is wonderfully described in a story I forget at the moment, its exact origin, but it's about a Negro and a young white boy who are close friends.

The Negro is a hand on the farm and by the boy's father. And one day the Negro explains marijuana to the boy.

And he says that it makes everything transparent. You see right through everything. Not in the literal sense that it becomes like glass.

That's a metaphorical sense that you understand what people are up to.

But again, it's. And you get to laughing.

That induces a certain kind of what I would call loving cynicism, where you see the schemes, the.

Ego inflating and promoting tricks that everybody's up to.

And you see the unimportant of a great deal of activity that human beings consider to be extremely important in the case of almost all psychedelics.

This is true because what happens is you suddenly slow down. And you realize that this moment is really worth living. And in fact, that's the important thing.

What's going on when you look around you and you see people going about their everyday business and they all look frantic. They're quite insane, rushing off in cars and driving and getting there and making it on time and delivering that stuff and so on and so forth. You think one of Earth's the matter with him? And in this respect, you get into a state of feeling which quite apart from anything to do with drugs, is the normal state of feeling for, say, an Indian. That's why in the United States we can't understand the Indians and never have gone on with them. And all our best efforts to do something good for them are always futile because, for example, we want them to have big factories, better pay and but go and live in Los Angeles because they don't want to live in Los Angeles. They say we're quite mad

because we work our men work for four days at some frantic job so they can take a little time off to go fishing or hunting. We'll say we're there already. We will run it. We fish, we hunt, and we're happy with that. Indians live in a kind of present which involves both the past and the future, but they don't have our idea of time as a clockwork thing. Tick, tick, tick, tick. What you keep up with Indians value time and a very special way.

For example, when they have a meeting on some important question for the tribe, they'll come in there for four hours or so, they'll sit and just talk. And at the end, for reasons that the white man can't understand.

They've come to a decision because they say time made the decision.

You know, you ask them, what do you think about so-and-so? What would you like to do? And they won't give you a direct answer because it's not the time for the answer. They believe that if you wait around and let it cook, time itself will deliver the decision. And we think that's terrible, that it's improvident, that it's if you don't make up your mind, make up your mind. Now see, decide. Now you can't. And I've always known this and have constantly run into trouble because I would put off decisions because I knew that the moment for it wasn't right, that when things developed in a certain way, I would know what to do. So under the influence of these substances, one does intend a little bit to become a sort of Indian. And as they say, the only good Indians are dead Indian.

It's that it's that whole attitude you see to nature and that absence of the competitive spirit which is in Indians that the white Protestants strongly disapprove of white Catholics do American Catholics and Protestants, crypto Protestants.

And so that wouldn't be the problem from the point of view of our culture that if the use of marijuana was widespread.

People would get a bit mañana in their attitudes to things and say, oh, let it wait. We're busy. What's the point? And they might be there for a lack of pep and push and ginger.

A little poem by HB Martin thought that troubled a businessman during a sleepless night. Supposing that St. Peter at the door finds pep and push and ginger. All aboard.

Well, now, in that sense, then, I think a widespread use of marijuana, especially if people started using it almost as frequently as they used tobacco, would result in a lot of extremely lazy people lounging around. Although I would say it would be stupid to use it as frequently as one uses tobacco.

Because he would lose the the the benefit of it. It would be something to be used. Well, I would say certainly not more than twice in a day because it has a certain sacramental quality to it.

In other words, why you can do a job and smoke a cigaret. You know, and forget that you've got a cigaret.

And you can to a certain extent. Drink and do something else, you know. But if you are smoking marijuana, you shouldn't do anything else at all. You should really like you would sit down to do justice to a marvelous dinner and you should eat and not try to smoke while you're eating or watch television. You should really do justice to the dinner. So in the same way, if you use marijuana, you should really do justice to it and be quiet. Yes, by all means, listen to music, et cetera, et cetera, but don't do anything that will distract from that state of consciousness. Like don't drive a car while you're playing the violin.

Now.

This leads me to think that there is a good reason why a substance of this kind should be rather difficult to get. The Japanese have an idea about views. A lovely view. You should not have a lovely view too easily visible.

You should make a little bit of effort to go to the place where the beautiful view is, because then you won't just take it for granted. You really devote yourself to it.

And so I don't know that if marijuana was what is the best way of controlling it as distinct from suppressing it and making it a little bit difficult to come by.

Either you make it expensive or you make it necessary to grow your own. And illegal to sell it or to market it. That could be a possibility. But you could perfectly free to grow your own and take care of it and cure it and do everything that has to be done.

But if it is as easily come by as a package of cigarets, I have a feeling that it might in some ways lose its effect. You see, if you go back into history, you will find all kinds of documentation, documentation for similar outcries and fears about tea, about coffee, about tomatoes and of course, about tobacco.

All sorts of tracts were written, say the tomatoes.

There they were very suspicious. And as for tea. Why? Tea was terribly expensive when it first came on the market in the West. And Dr. Samuel Johnson was a tea addict and a society hostesses were embarrassed when he came because he drank such moderate quantities of tea and it was very expensive. GUEST.

All these things have been looked on with immense suspicion.

And of course, they're all relatively harmless, especially tomatoes, and.

But to see this sort of superstition keeps going, keeps running. Now, I suppose that when tomatoes were suspect, that city people really sat down to eat a tomato.

Oh, gee, we've got this dangerous fruit. That's fantastic stuff. And so when they ate a tomato, they made it a big thing. And so the tomato tasted gorgeous simply because it was valued. Now, in exactly the same way when we say we've got some pot. No, this is great stuff, terribly illegal. So let's not trifle with this. Let's really sit down and enjoy this situation.

See? Well, that adds an enormous amount of value to the effect that it has. Now, I'm not saying that it's all psychological and there's nothing to do

with the chemistry, but it's always mixed.

We are psychosomatic beings and therefore the expectation, the setting in which one dad does anything like this is of great consequence.

It's just the same, say, with wine.

Then you get one of those gorgeous French wines and you've got this bottle and the special label and it's that year. People sit and drink.

Oh, that's.

But actually very few people can tell the difference if they're blindfolded between a cheap petri wine and a fine French one.

Yes. Naturally, the person who is an expert on wines with no blindfold what it had. But the game of guessing wines is tricky.

And most people can't tell.

But the build up, you see, if the thing has got the build up on it coming in the right looking bottle and so on, then you have a marvelous time.

So if the if marijuana does indeed have beneficial effects and then to a certain degree, it emphatically does mean it is the most perfect tranquilizer of all of them. You can forget Librium and things like that, Milton. They have nothing of the effect of marijuana. It will get people off alcoholism.

I know a doctor who is just he's a very respectable doctor and he is fighting mad because he can't prescribe marijuana to his patients and he is deluged with alcoholics. Doesn't know what to do about them.

And even though he is a he's a pillar of society, he's president of a county medical association and all that jazz.

So it is a it is unquestionably a healing herb, but it like everything good in the world, it has to be used judiciously.

And so there would be a danger with very cheap, enormous supplies of marijuana that people out of their minds would just smoke and smoke and smoke to be in the groove or something for some reason of that kind. And it could be troublesome.

But obviously, the solution to that particular problem is. Simply put, primarily to see the total unreason of any law prohibiting possession.

If anybody wants to have their own plants and grow it and use it, there is no conceivable legal reason why they shouldn't. Selling on Assad is another matter.

That should obviously be subject to some sort of regulation.

It might be a tax regulation that makes the price high or or whatever, but I'm not going to mean that. That's a question that shouldn't be decided until after a very careful discussion. But the idea that it's a killer drug or a sort of a demon thing is this is pure superstition and rather malicious superstition that you realize that this really perfectly harmless activity as compared with smoking, tobacco or drinking. There are fifteen hundred people in jail on fairly long terms in the state of California alone right now.

And God only knows how many throughout the country at your expense.

Now, when it comes to the problems of the more strong psychedelics like LSD, the problem becomes trickier.

Because LSD can be so disorient into many people and so terrifying that it is not wise to use it without the right sort of preparation and help. But of course, for that very reason, it's exciting.

When I was giving a lecture sometime ago on some subject not directly connected with these psychedelics at all. At a private high school, rather posh school, immediately the lecture was over.

I invited questions and all the questions were about LSD. So I said to these boys. I have given you a lecture on the Chinese philosophy of nature and you ask me about LSD. What's the reason for this? Well, a set of men into

our household with each other and that little talk went to huddle with each other and talk. And they said, well, we think that our parents and grandparents did a pretty good job exploring the external world and learning how to control it. We would like to explore the internal world. And furthermore, because it's forbidden, it's that much more interesting. So there is the challenge here. And young people are always out for adventures. You can't they wouldn't be young people if they weren't. And one reason why we have so much trouble with young people is that we coddle them.

We make too much safety.

Other people don't coddle their young like that in Japan, for example. Children have an enormous amount. Little children, especially an enormous amount of liberty in dimensions in which we don't have liberty. For example, I was going along the edge of a river or canal in Marseilles and about 20 feet above the canal.

There's a wall of water pipe crossing the canal on a few concrete supports, and a small boy was crawling across it, having a wonderful time.

Very dangerous. We would have a fit. We would build a fence all along thing. And we would have, you know, like at schools, wherever there's a school entrance, there are policemen with stop signs and the children are herded across so they won't be knocked down by cars. There are children are even escorted in groups to, to and from school in Japan.

You'll see a little thing, this high little yellow hat on and a knapsack on its back and danced down as a crowded street. Bicycle taxis, cars going every which way. Mad confusion. This little thing is going along all by itself.

I remember Felix Green once told me that he gave a lecture at a high school and it was a great banner over the auditorium of the proscenium arch in white letters on Red said safety first in all things.

You know, well, that's a way to die. Death is safe. You can't get into trouble if you're dead.

Also, if you go into solitary confinement, it will be rather difficult to get into trouble. So stay home and be safe, although there are more accidents in homes.

So we must realize in our attitude to children that while, yes, you advise your children about streets and cars and things like that, there is no such thing as safety. There never was in life. And there never will be. And unless you take that as your first premise in living that nothing will happen, you must be in secure.

There isn't so any security.

Nevertheless, you can't just say, all right. No. No restrictions, no controls on anything.

Because then people could obviously go out and buy tons of dynamite or private tanks and machine guns, mortars, howitzers and whatever.

You know, there are a lot of men who would love to end the Howitzer and have a terrific crash with a shell. Every morning you go out in the middle of the bay and just blow off.

So something has to be done.

I would say if and when it comes to LSD then, that we really got a dragon by the tail.

In this particular chemical, although I think that it's a primitive chemical, that is to say that it's very unpredictable in its results. And I'm quite sure that if research is pursued, we will be able to get something that is much more easy to handle than LSD, but as effective in a creative way. But you see, there isn't that research really being done except by illicit graduate chemistry students who are working out all sorts of things, alternatives to LSD so as to be the law against its possession. Now a law against the possession of LSD. Whatever. Its wisdom is completely unenforceable for the simple reason that you can disguise LSD as anything in the world. You can, for example, take get a solution of LSD and alcohol and you can put a piece of Kleenex into it and pull the Kleenex out and let it dry. Then you've

got a filthy old piece of Kleenex, you jam into your pocket that looks might be something you blow your nose on and all you have to do is take it out. Drop it again, an alcohol, soak it out. And there is the stuff you can disguise it as peanut butter, fingernail polish, just anything at all.

Cookies and chemically in a in a smallish quantity, say, of a few hundred micrograms. It's very, very difficult to detect. And you would really have to know. We would have to otherwise.

If you suspected that a given person wasn't wearing nothing but a suit, you would have to analyze everything on him to find out whether there was any LSD present.

It's simply unenforceable unless you are tipped off. Unless you know in advance that the person has it in such a place. But you could smuggle interstate through into the country vast quantities because the the basic dose that will, as I say, turn a person on is as low as 50 micrograms.

Micrograms and millionth of the ground.

So.

Therefore, the only solution in all these problems is the solution of facing facts, that is to say, of bringing everything out into the open.

You cannot abolish the problem.

In fact, as you try to do so, you will only intensify.

That's always been true because if you prohibit something like this. Well, of course, everybody will want it.

Forbidden fruit is sweet and therefore there is always an organization to take care of the supply of prohibited things, whether it's hors or possibilities for gambling. There is an organization of criminals. Who will undertake to do so? But the trouble is that whenever they deal in any business, they have no conscience about the quality of goods they deliver. So you remember the prohibition, the quality of the liquor you got from your bootlegger? The

illicit whores. Who is to say they don't have venereal disease? Illicit gambling? Well, obviously, the house always cheats. And the one armed bandits rob you and I'll give you a fair chance. Everything controlled by the mafia becomes crooked through and through. So when naturally then if the mafia were to move into psychedelics, heaven only knows what we should get. And a lot of the reason for the fact that there are these terrible stories about people who have complications with LSD. Is that what they took was not simply LSD. People will cut the supply. You know, you just sell you sodium by carbonate with a tiny bit of LSD. They do all sorts of things. Mix it with other drugs. So the solution, as I see it, is to bring the whole thing out right into the open to encourage research on it. And I suppose the at this present time, the maximum sort of control that ought to be imposed on it is to make it something prescribed by doctors. Now, this isn't the ideal form of control, but it's a practical one. And then in places like major university campuses have LSD research centers or psychedelic research centers where anybody who wanted this kind of experience could simply apply and there would be facilities for experiencing it in a helpful environment.

When young people get adventurous, what they need is not police and prohibition. They need help. They need the best information and the best guidance that's possibly available to do a dangerous thing. And once someone wants to go to learn to fly an airplane or he can apply and it needs a license, but he gets the best advice possible. I want to be an astronaut in this space. Well, you could go to school for it. And I visualize the possibility of psychedelic museums where you would have.

A gorgeous set of buildings in lovely grounds. Gardens or by the sea. And there would be. It would be equipped with a big library of art books with reproductions of all kinds of masterpieces from the whole world. There would be a collection of tapes and records with beautiful sound systems. There would be glass cases full of objects like seashells, crystals, ferns. There would be a conservatory with plants of all kinds. You know, growing and equipped in this way. Then if you wanted to take it, you would go in for a three day session. The first day would be forgetting a relaxed and for learning something about the properties of it, getting an idea of the map before you went into the territory. The second day would be to take the chemical and do anything work on any problem you wanted to because it is

peculiarly suitable for working on some particular problem. There's a book by Stafford and Golightly called LSD. The Problem Solving Drug. And there are ever so many case histories in that of engineers, architects, musicians and so on who had specific problems to solve and who use this for doing it. So that would be the second day. Then the third day would be for evaluation, because after you've been through, unless the experience, you need a good day's rest to get back into the swing of things. But to think it over how to write about it or to do something about it. Supposing you had seen a particular image that you wanted to preserve while on the third day you could paint it out or draw it out or write it out or whatever you wanted to do. And the existence of such places then would put the youth above board out in the open and not something that is simply done.

In an illegal situation, you see, one of the problems with most psychedelics is that they do tend.

To foster paranoia.

And if a situation is illegal, you can get all sorts of ridiculous paranoid fantasies as that your best friend, as a representative of the police, and you can see every reason why he really should be. Because the capacity of these chemicals is that you have an enormous power of projection.

You can see. You know, how in the ordinary way you might be looking at this sort of wall here, which is not irregular paint patterns on it. Well, you can sit here and just in a perfectly ordinary state of consciousness and see pictures and you can see trees and people and all sorts of things. Leonardo da Vinci used to make a regular practice of looking at a dirty old wall. And fine paintings in it. That's, of course, how many here we believe many of the cave. Great cave paintings were done. Is that those people looked in the marks on the rocks and saw buffaloes and deer and just follow the markings on the rocks. And for that reason, created images of animals that were a stunningly accurate and realistic, because if you use identity thinking, you'll do that.

I remember one night I was up here and I was walking by the window and there was a that I usually keep that table here.

And I looked in the window, to my astonishment, I saw a man sitting at the table on this side facing the window. I was looking at the reflection in the window, a rather scholarly looking gentleman with a little imperial beard resting his head on his hand like this and reading a book.

There he was right there, and I analyzed that for a while and I could see exactly what was going on. There were things in the fireplace paper and stuff that built themselves perfectly into this image.

So then you can see these things. People, for example, who hear voices. I've got a theory about this and I believe it's correct. Naturally, in any place, there are all sorts of noises going around on around you. Sound of water and pipes. The sound of a gas heater. Sound of people working in the distance. Sound of the wind. And you can project meaningful voices and sequences of ideas onto these sounds and actually hear voices.

So if you check with someone else and say, now, look, I hear a voice talking or I see a picture on the wall or I see a vision. Do you see it? And at first they say no. But if you then I actually understand that you are projecting. You can point out to them where you see it and they will say, oh, yes, I see how you see that.

But of course, it isn't there in the ordinary sense.

So with the psychedelic chemical, you have a tremendous power of projection. Your power projection is increased a hundredfold.

And in fact, you can play games with. You can take anything and turn it into practically anything else by looking carefully enough and you'll find out a reason for turning it that way.

I play this game quite deliberately. Now, in the ordinary state of consciousness, I play projections and see shapes. Just that anything. This is wonderful what you can do. And especially if you take something a bit chaotic, like a Rorschach blot or Dario a wall or whatever you want, you can have an infinite fun seeing images and.

But the problem then is if there is an unconscious reason for seeing certain images, if you're afraid, if you're mistrustful or anything like that, you can see in a human life situation.

Say your relationship to your family.

You can see a pattern of relationship which is absolutely misleading.

And you can see the best reasons why it is this sinister situation.

And then you're in trouble.

So when therefore, the use of LSD is totally illegal and people take it, they tend because they are scared of what they're doing to have the paranoid reaction altogether reinforced. And so naturally, the illegality, the reasons that the government puts forward for making it illegal are of the nature of a self-fulfilling prophecy.

By making it illegal, they make it harmful. Then they can say, look at all these harmful results. That's why it's illegal, but it's harmful because it's illegal.

Partly, it can also be harmful simply through ordinary misuse.

But I think our answer is to bring the whole question right out into the open and to deal with it as a fact that exists, that cannot be suppressed. It should not be suppressed and try to control it because you see, it said it's only one step, one link in a long, long, vast process of scientific work, which is. As I said earlier, once you started to interfere with the world, you can't stop.

And man, as many, many scientists now say is no longer passively undergoing an evolutionary process, is involved in it, and therefore we are reaching out to try and control ourselves. Our brains are nervous systems by surgery, by electrical stimulation, by chemicals, all sorts of things we're using to try and find out how we tick.

And I suppose we've got to go on and go on and go on doing that until we. For some reason can call a halt and see that we don't need to do it anymore.

But you see, LSD and psychedelics are just a part of this whole thing.

And it has to be faced. But one final word, it.

It is not something and none of these things are understandable, uncontrollable.

From what we might call it, purely scientific point of view. Because the mumbo jumbo of the purely scientific approach is in itself a kind of game.

Involved in many sciences is the myth that situations can be observed objectively.

And therefore, scientists make a special effort, as it were, to be very serious. And very analytic about certain situations, which is often quite right. But when you come into an LSD situation and you are investigating someone on its influence and you come in with your scientific pomposity, he immediately sees that you're a freak.

And quite asinine.

And so it gives a rather bad impression in the hospital, for example. Hospitals are a big game then the disciplines and the routines and the things that go on in hospitals, they do an enormous amount of things that are simply precautions against possible legal action in the future. And so now in any hospital, the doctors and the nurses have a great deal of difficulty doing their business because they keep filling out papers, hours and hours and hours of paperwork goes on. So that the record is straight. Soon they won't treat people at all. They'll just record all sorts of things and they're just make records. They don't have to do anything. It just records something that didn't happen at all. The songs, the records of straight.

And it's getting that bad. It's getting that bad in universities happens that way, too.

So in those environments.

The psychedelic experience can get very, very clear and frightening.

So the question is what sort of people are qualified to investigate LSD? And the answer is a present in a way no one. And in another way, I would say simply those who've had a great deal of experience with it.

You might say it, certainly psychiatrist, some qualified.

Least of all practically because psychiatrist tend to be very scared of any kind of irregular reality. They are guardians of what we call sanity of the way the world is on a bleep Monday morning.

They're frightening, very frightened of the unconscious, especially psychoanalysts.

They always speak about the unconscious with a hushed voice. And we mustn't go fishing in the unconscious. It's a very dangerous field. Only a qualified person should investigate the unconscious because the unconscious is the big mad sink. You know, of the primordial slime out of which life issues serpents and menacing dragons.

So perhaps a psychiatrist has some disciplines that might help with using psychedelics. But here, there there should be. Generally, it needs the wisdom of a psychologist, of a pharmacologist, of an anthropologist, of a specialist in the psychology of religion, of mythologies, of a poet, a painter. And you would have in other words, in my psychedelic museums, you would have to have a team of people with all sorts of knowledge to combine somehow the sort of skill that is necessary for understanding psychedelics.

As I said, are the best people are really those who are most familiar with the territory, like you may be a specialist in mining. You may know all about mining. But to get into a certain territory, what you need is an Indian guide.

He will show you where how to get in and how to get out.

Although he knows nothing about mining and it may be that in the investigation of the LSD to be a great deal of helped know, no, not a lot about neurology.

But the neurologist needs an Indian guide, the Indian guide as the person who's been in the place quite often and knows his way around. And if you have taken LSD many times, you begin to know your way around.

The landscape becomes familiar, you know, all the different states of consciousness. And so LSD, people begin to formulate their own lingo. They know a state called the plastic doll. They know a state called the Magic Theater.

They know a state called I call it the any winning.

They know a state called the Great White Light. They know a state of the wiggles where the walls seem to breathe. And if you look at a flower, it's all rippling as if it were under water. Say they know all these things. They know the state of paranoia of getting lost, wondering whether you can get back. And they have because they're familiar with them all, that nobody gets frightened.

And psychiatrist, if they are to be effective, their psychiatrist should be people who are familiar with all kinds of states of consciousness and they should work if somebody is way out of his head.

He should be able to consult a person who knows exactly where he is and can come in and be quite familiar with that state.

So that he can say, oh, yeah, I know where you are. I've been there myself. And it's like this, you know. But as it is, you see, psychiatry is not really exploring the mind.

It is trying to stand outside and understand psychiatric problems through looking at patients and writing down their symptoms without really knowing anything about it. And therefore, all the terms that are used in psychiatry to describe symptomatology are completely unscientific. They they they have no scientific spectrum of consciousness and it's all its possibilities at all. There is no such idea. You could write a textbook called The Spectrum of Consciousness and you could with the quotations from literature and photographs and so on, illustrate almost all the known states of consciousness of which man is capable.

But nobody has done such a project. And that would be basic reading for anybody who expected to be proficient in psychology or psychiatry. These things have to be done and.

Without fear. But with these these chemicals and other words are not something to be afraid of. They are simply something to be respected and handled with reasonable care.

Out in the open and not in know sort of a dingy pad or in the back of a car.

The Psychedelic Experience

Almost all the great religions of the world are in some way associated with a drink. Judaism and Christianity with wine, Islam with coffee, Hinduism with the milk of sacred cows, Buddhism with tea. And in one way or another, these sacred drinks are used for sacramental purposes. And the sacrament defined at least in the Anglican Church, as the outward and visible sign of an inward and spiritual grace is a very common feature of religion throughout the world, although one which is, I would say, highly disapproved of by many people living in the modern West under the influence of Protestantism and humanism. A sacrament. In other words, is a method of giving spiritual power or insight through corporeal means. As, for example, in the sacrament of baptism. Orthodox Christians believe that through the pouring of water, a physical substance, a person may be in some way united with the power or the grace of God, or that the right formula set by the right person over bread and wine may transform them verifiably into the body and blood of Christ, so that whoever partakes of them on the principle that you are what you eat, becomes transformed into Christ behind the more obvious drinks of sacramental liquids associated with the various religions. There are some religions which imply more potent substances, and so one associates Islam and the whole Arabian culture with the use of hashish. And no one can doubt who knows anything about the effects of the substance that the people who painted Persian miniatures and who designed the great Arab asks of Islamic civilization. No one can doubt that those people had had the sort of vision which comes through participation in hashish. Likewise, the earliest Vedic texts of India mentioned is something called Soma, and nobody really knows what Soma was.

But one may guess in view of modern practices in India that it was some derivative of the plant cannabis, which is today in India and has probably for centuries been used by certain types of yogi. For example, the Shiva worshipers use it very widely in the form that is called bum, which is a drink or ganja which is smoked in China.

There was for a long time in the dullest school of philosophy, a quest for the elixir of life.

And this was associated with Darwin's alchemy. And when you read alchemical texts, you must realise that they are always veiled. The dullest sages were apparently looking for an elixir of immortality that would convert a human being into any model.

And it was suppose that if you hit on the right elixir when you became an old man and your skin shriveled, it would eventually peel off and reveal a youth underneath as a snake changes its skin. And there are statues in certain parts of China, a venerable old sages with their skin falling off to reveal a young face below. Many sages and and indeed even emperors died from drinking concoctions that purported to be the elixir of life. One of the ingredients of the elixir was always tea. And of course, tea as drunk. In Buddhist circles is not the tea that you ordinarily drink. The real ceremonial tea of the Far East is not steeped tea leaves, but tea ground green tea grounds to a very fine powder. And this is has hot water poured over it and then with a whisk it is stirred up into a thick mixture. And drinking a few cups of this puts you in a state of extraordinary wakefulness and therefore has long been used by Buddhist monks for purposes of meditation.

It has a mild psychedelic or consciousness expanding effect. The Tibetans likewise brew an incredibly thick tea, which they mix with yak butter and to acid is an appalling concoction. But to them, very soothing and comforting and also wakeful. And as you know, throughout the AMA, Indian cultures, religion is very greatly centered around divine plants. The use of the peyote cactus, the use of yogi of mushrooms such as psilocybin Mexicana, the convulsive Alice type flower obliquely, the use of its seeds, and a very considerable number of other plants which have been cataloged by Professor Shorter's of Harvard. Even seaweeds. All sorts of. Funny things are considered divine plants, and the mushroom psilocybin Mexicana is

known, of course, as Tale Canal among the Indians, a word which means the flesh of God. To an enormous degree, then throughout the world there has been the use going back as far as we can find any record of some sort of plant either chewed or distilled or boiled or whatever, which transformed consciousness and was alleged to give mankind the vision of divine things. And therefore it was in the precise definition of the term, a sacramental plant. Now, then, the objection to this is very strong in the modern West. And there indeed have always been people who found that this kind of practice was to be deplored. And I want to add in a moment to go into the reasons why. But it must be said in the modern West that the use of any material aid to spiritual insight or development is always looked upon with disfavor because it is described as a crutch and our type of culture feels happier if it doesn't use a crutch. In other words, if you do it yourself somehow or other the use of a crutch or as people call it. With that question begging word, a drug seems to be something which is a sign of weakness. If you are a real gutsy fellow, and if you're going to get this thing in a manner which is natural, legitimate, and the manner in which it will really stay with you, you ought to work at it by your own efforts. And you will find this extremely exemplified in, say, Christian Science, where they didn't want to use even ordinary medicine for physical health, even though every Christian scientist is dependent upon daily food, both vegetable and meats, and eats them quite gaily without any feeling of guilt. Whereas actually he ought to realize that if he had sufficient faith, he would be able to live even without air. I suppose as a crutch on which we depend on Earth is a lamentable ball on which we have to stand in order to hold ourselves up.

But if you explore deeply into the doctrines and the history of almost all religions whatsoever, you will find that there is simply no. Do it yourself way. Invariably, whatever path and whatever method is followed, there comes a point in which the efforts of one's own will or of one's own ego have to be abandoned. You know, perhaps that in Buddhism there are two schools which are respectively called gimmicky and tricky. In Japanese, gimmicky means one's own power. Tariq Qi means another's power. And most forms of Buddhism are classified as gimmicky. On the principle of the Buddha's final words to his disciples, be lapse into yourselves. Be you a refuge unto yourselves. Take to yourselves no other refuge. Work out your own deliverance with diligence. And so in Zen in ten die in the Sarah Varda

or Southern forms of Buddhism, you will always find that meditation practice or spiritual growth is a matter of using relentless effort to control the mind, to be concentrated, and so on. But as this effort develops, its term always is that you reach an impasse in which your will and your ego comes to a state of absolute frustration, where you find that there is nothing that you can do to reform yourself, to make yourself unselfish, which is of course, a form of lifting yourself up by your own bootstraps that not only is there nothing that you can do, but is also nothing that you can not do. In other words, your energy will be as phony as your relaxation. And at this point, in the process of yoga or meditation or whatever it is, there must transpire a state of surrender of total giving up. And it is precisely at this moment that the transformation of consciousness, which all these various religions are after, can come about because in one way or another, all of the religions, without any question so far as I can see. I would say the great religions of the world, we might exclude a few weird cults, but all of them are concerned with achieving a state of consciousness which is no longer ego centric.

Furthermore, a state of consciousness in which we see through a trick which during the egocentric state we always play on ourselves.

And that trick is that we become unable to be aware of the relativity of opposites, black and white. Light and darkness. Good and evil. Pleasure and pain. Life and death.

All these things. All say one's self and the external world. While the South and the other.

All these things in the egocentric state of consciousness seem to be separated, opposed to each other, whereas the most elementary logic should tell us that they necessarily go together. In other words, if you are a superior person in any way, morally, intellectually, physically, you have no means of knowing that you're a superior person except through the presence of relatively inferior people. And where are they to disappear? You would be in limbo and you wouldn't know where you were at all. The higher always depends on the lower in the same way as the flower of the plant, depends on the soil, the rows upon the manure. And so to the subjective, the self goes along with the objective, what the self knows. And an inseparable union

that we have managed to screen this out of our normal consciousness and to conduct our lives as if we could make life exist without black and light, without darkness and pleasure, without pain. But when the egocentric state is surpassed, it is seen that these things all go together. And the curious consequence of this is not that the world is thought to be a near balance between opposing forces. Not a simple compromise.

But somehow it becomes obvious when you see the unity of all opposites that the world is transformed into a thing of glory. It's very difficult to explain that logically, but it simply is so with reference to this different kind of consciousness.

In other words, what happens is this that everything that you tried formally to exclude and to deny and to overcome is seen to be part of a harmonious construction so that the whole world is seen as profoundly harmonious with everything in it is as it should be.

And this is so difficult to explain to people who don't see it that there are many people who have this kind of experience remain tongue tied. Not only is it difficult to explain to ordinary people, but it's very shocking to ordinary people because it seems to undermine all the game rules and all the moral rules of the social order. And to be saying that it's the evil things and bad things are perfectly all right because they are actually in a secret harmony with the good. And if you understand that superficially and you are not a very intelligent person or a very sensitive person, you might indeed run amok and justify any kind of conduct whatsoever on the grounds that it's all part of the universal harmony.

And this, of course, is why there has through all the centuries been a kind of ease of terrorism, the kind of secrecy attached to these deep matters.

Those to the state of consciousness itself and to the various means of bringing it about, whether those means be sacramental or whether they be some form of meditation, prayer or other type of spiritual discipline.

In both cases, let me remind you, in both cases, there has always been a certain secrecy about it, or rather, these things have not been taught to people or given to people who were inadequately prepared.

And this is a grave, grave problem in the modern world, because we are today living in a world where there are very few secrets.

That is to say, scientific knowledge of any kind is of necessity, public knowledge, or at least public among scientists. There are types of scientific knowledge, of course, which laypeople simply cannot understand, because the language in which this knowledge is expressed say, for example, mathematical language has to be learned and is difficult to master. And so many popularization of scientific ideas are at the same time partial falsifications, because these ideas cannot be said in English or French or German, or even though they can be said in algebra.

So in a way, all knowledge gods itself, because to understand it, you have to follow to some extent the past, which was followed by the people who discovered it. But nevertheless, as a result of scientific technology in the modern world, an enormous number of things, very dangerous things made available to fools.

Not to mention the fantastic powers of destruction, which technology has given us. And so it is very difficult indeed to keep secrets in this day and age. Everything has been published, all the mysteries practically have been let out.

And in the sort of ancient Hindu philosophers, this would be regarded as a sign of the final decadence of the world. The coming on of the Kali yoga or the black destructive epoch at the end of the cycle in which the whole world is destroyed.

Be that as it may.

So I would start out by saying then that even among those religious or spiritual disciplines which follow along the lines of an extreme exertion of the will, they those gimmicky or self disciplines eventually come to a point which is the same as the charity. That is to say, those that rely on the power outside the individual will be beyond or deeper than the personal ego. They come to the same place.

Of course.

Really, the difference between the two schools depends upon a definition of oneself. If you start out by defining yourself as your ego, then what is other than you or a greater power than you will seem to be different from you. But if you start out by defining yourself as something more than your ego, then the power which transforms you will still be your own. For example, most people define their hearts as something other than themselves. We say I have a heart rather than I am a heart. The heart is an engine for most of us, which supports the existence of the ego. And somehow we have it. It's an engine that goes on in us, like the engine in our car, which if you're not a mechanic, you don't really understand. You just use it. And so if you think of your heart as other than you, it is something that mysteriously happens inside you beyond your control. But on the other hand, if you regard your heart as very much you as the center of your physical being. Then you will be accustomed to think when you beat your heart that you are doing it. So for people who come in the Judeo-Christian tradition, they are in time to feel that their heart is not themselves. The psalmist says, Behold, I am fearfully and wonderfully made. He looks at his own body and is astounded and says, Since I don't understand it, it must be the work of a God who is other than myself. On the other hand, when a Hindu defines himself, he doesn't define himself merely in terms of those types of behavior which are voluntary. He decides himself also in terms of involuntary behavior, and so his heart seems as much himself as anything can be. So it's really a matter of semantics as to what his self and what is other within you. Depends where you draw the line. But it seems to me unquestionable that in all spiritual traditions whatsoever, there comes a point at which the personal ego, the individual, will reach a limit by one means or another, and where it is transformed by something that is not willed, but seems to happen spontaneously.

The Christians call it Grace. The Hindus call it Prasad.

The Buddhists call it body illumination, but in every case it happens of itself or as the Chinese would say, it is, John, of itself. So spontaneous.

So there is really no grounds. For objecting to sacraments, because they are something that come to us from, as it were, outside and do something to us which is beyond the control and understanding of the will, it always is that

way. But now this is not an experience in which the will and the ego have no part to play, no part at all.

And here comes the danger of all types of transformation, of consciousness, mystical experience, sense of union with the divine or whatever you want to call it, however obtained.

It is essential that they be what I would call grounded, brought down to us, harmonized with everyday life and with human society. And this requires a disciplined.

Every tradition looks with disfavor upon those who simply steal the divine secrets and enjoy them without some kind of discipline. That should go along with it.

And thus the destructive effects of all these things are particularly manifested in people who have no capacity for the kind of discipline that must go along with them. And that is true not only of sacraments and divine plants and yoga practices. It is true of all things whatsoever which we might enjoy the cause enjoyment of any kind is really impossible without an accompanying discipline.

Just think of a few things which are pleasurable and which can be simply snatched and swallowed. Start with candy. Would there being such a thing as a palatable candy bar unless there was some expert in the making of sweet meats? Think of booze. You know, it isn't just alcohol up on throws down, that is to say, if you want to have any lining left to your stomach, but skillfully prepared wines and liquors required based on a long tradition of the vintners art, which is a discipline. Consider roaring along in a fast car and you have an exceedingly short career in this thrill. If you don't know how to drive and the car itself depends upon the skill of master mechanics, I can't think of any pleasure at all.

Which does not require an accompanying discipline. Take sex. A lot of people do take it like that, and they I guess have a kick out of it, but it has no profound pleasure to it unless there is the discipline of an intimate relationship with another human being, which requires a great deal of

intelligence. And also the merely physical aspect of sex is a considerable art which very few people ever seem to learn.

That is why our culture has sex on the brain and is perpetually thinking about it and perpetually obsessed with it in a kind of way arresting way because there is so little satisfaction and so little discipline and so little knowledge of how to use it.

So every pleasure whatsoever involves. A method of grounding it in method of integrating it with everything else, and thus if there are ways of attaining what is potentially the greatest delight of all the sense of the divine or whatever. I'm using that word as the vaguest possible word, the sense of transcending the gulf between the individual and the eternal universe. If you snatch that and have that experience and you don't do anything with it and you're not properly prepared for it, you're liable to get into the same sort of trouble as you would get through the insensitive use of any pleasurable thing whatsoever. And it is for that reason, then, that it is very true to say that psychedelic substances, the chemical chemicals derived from the divine plants are dangerous. There is no question about it, and especially those like LSD, which produce their effects as a result of taking an extremely small quantity.

You know, if you want to get drunk on beer, you have to get put down quite a bit of it. And there is a limit, you know, to how much beer one can swallow in an evening. It's a pure bulk, but you don't run into that kind of limit with far more potent substances which don't involve any difficulty in eating. You see the way the Indians take peyote cactus, it's pretty difficult to put down. It's nauseating even though they get used to it. But even so, to chew all that stuff. And so there is a limit set that way. But in these highly refined delicacies, there isn't that kind of limit.

And our culture is full of plain, downright goofy people who will try anything and don't know anything about it. And at the present state of affairs in the United States, the whole matter of psychedelic substances is in a state of inane confusion, which beggars description. So let me say, first of all, a little bit about the the the the nature of these things. They're called drugs, but this is obviously a word which is unclear. There is no definite clear line that can be drawn between a drug and something used for food,

say, like vitamins. A group of physicians and a group of lawyers got together not so long ago to see if they could arrive together as a legal definition of addiction. That is to say, dependence upon some chemical. And they kept finding that whenever they thought they were right on the definition that they've really got somewhere, that their definition also applied to dependence upon a foodstuff.

This is a very, very difficult thing to define now as between various types of chemicals that do produce changes in consciousness. There are wide differences.

All of them could be said to be addicting in perhaps a psychological sense. That is to say, supposing you belong to an in group where taking LSD is dirty guy.

It is a thing to do. And everybody compares notes as to how often and how much and engage in a kind of one upmanship with each other as to how often they've been on a trip.

Well, this is asinine because you're following this practice simply to be one of the boys or girls, as the case may be, and to remain in an in group when you should. If you have disciplined yourself in the use of consciousness transformation, you should assume come to see the folly of belonging to an in group.

So in that sense, some of these things could be said to be addicting. Others are addicting. In a much more physical sense, the opiate, for example, has a very difficult withdrawal symptoms if one doesn't use them constantly. But this addicting factor is not characteristic of all substances used for this purpose.

In other words, not everything that is used for the expansion of consciousness is a narcotic. This, of course, is. I'm going over things that some of you are elementary. The word narcotic means sleep inducing and that which makes one soporific which drowns or dims the senses. So of course, alcohol is a narcotic in sufficient quantity. Opium, likewise is a narcotic is used for dulling the sense of pain. Morphine is a narcotic in the strictest sense of the word, but substances such as mescaline, which is the

derivative of peyote or a chemical synthesis of the same thing that is in peyote is not a narcotic. LSD is not a narcotic. Psilocybin is not a narcotic from the mushroom. And cannabis is not a narcotic because these substances tend to do something very different from producing sleep. They tend instead to produce a peculiar kind of wakefulness, a sharpening rather than a dimming of consciousness.

And so they must not be lumped in the same category as things which are true narcotics. And I would say it would be part of the definition of a true narcotic. That is, it is also addicting as alcohol is addicting as the opiates are addicting, that you become dependent on them and only with great difficulty can shake them off. The same is true, of course, of tobacco. It is very difficult for a hardened smoker to drop it, and it is therefore addicting.

Although I doubt whether it is actually a narcotic in the sense of the sleep inducing thing or an insensitive something, it makes you insensitive.

Now, our absurdly paranoid government agencies have never learned in 50 years how to handle these problems, despite the lesson of prohibition.

The authorities still think that the only way to deal with even dangerous narcotics is simply to suppress them, not clearly realizing that this makes them all the more attractive and that it creates an enormous crime problem which without suppression would not exist because the minute you suppress something and it becomes illegal.

People know that there must be something extremely exciting about it, and it's it's very difficult to suppress these things and you can suppress it a little bit. In other words, you can pick out a few feral guys and make terrible examples of them by electrocuting them or putting them in prison for an incredible number of years. But this invariably only scratches the surface because when something wrong or illegal is really popular, there is no way of suppressing it because all the hotels in the United States would not be sufficient to jail all the criminals involved. This has never worked, and why people don't learn from history is beyond my comprehension. It becomes much worse as people become aware that there are an enormous number of varieties of things that will produce psychedelic effects and that in

particular such substances as LSD can be compressed into such small areas or volumes that the detection is virtually impossible.

So at the moment it becomes a racket and something. Therefore, which organized crime can put a good price on the possibilities of playing games with LSD are enormous. It's a real good racket and all it will do, the suppression of it is to encourage the proliferation of crime and lead to total nonsense.

We have never really understood what control is. We don't see the difference between controlling oneself and strangling one's self. In other words, the person who is a controlled automobile driver is certainly not a person who has no car or keeps his car locked in the garage. A very controlled dancer is certainly not a person who never dances. The control of things is not the suppression of them, but their use in a sensible and proper way. And this has not penetrated the consciousness of our authorities. You cannot suppress sex.

You cannot suppress mankind's fascination, curiosity for whatever motive in other states of consciousness than the normal. These things are eternally fascinating to human beings and will always be pursued. Whether you think it's a good thing or whether you think it's a bad thing makes no difference. It will be done so at the present time. For example, if some people wanted to make experiments with any kind of consciousness changing material, say LSD or masculine, they are in the ridiculous situation that they cannot even pay a psychiatrist to sit with them and take care of them while they do it, because that would be illegal. What they will therefore do is not have a psychiatrist, not have any experienced or responsible person, and they will try it out all on their own without any preparation and endanger themselves because these things will come under unfavorable circumstances.

And with people who haven't got a good psychic balance can bring about prolonged bouts of psychosis and lead to a good deal of trouble. But the difficulty is that we are, as a culture, not prepared for the control of these substances. And that is why there is a panic. That is why we are doing things that are worse than probably. Worse than allowing them to circulate freely.

I would not for one moment advocate the total free circulation of these things so that anybody could go into a drugstore and buy it.

But I think although I wouldn't advocate that, I think it would be better than suppression, less destructive.

But what you see we don't know, is how to apply a proper control to the transformation of human consciousness by means that are relatively easy because we are not clear.

One of the reasons is we are not clear as to the role in life of these chemicals, nor are we clear as to the role of the physician.

This I want to consider, you know, of course, that in ancient times there was no clear distinction between priest and physician. An individual might be primarily a priest and secondarily, a physician, but in course of time, the function of priest and the function of physician began to separate. And with the advent of scientific medicine, because the development of the sciences was always opposed by the church. Therefore, priests tended not to practice scientific medicine and the practitioners of scientific medicine being other than priests, the religious and the medical professions separated and in the development of medicine in the West. The deep concern of the physician was to preserve people from death to be a healer, and the function of looking after death was abandoned to the priest and the minister. So when the doctor in treating a patient gives up hope, he is out of road, he doesn't know what to do beyond that point.

And therefore, the priest is summoned.

So the the work of a doctor is throughout curative.

He is in all his activities opposed to death and regards death as the enemy. This is, of course, not true of every individual physician. It is true of medical ethics and of the generality of physicians. So that, of course, terminal cases. Are people being tortured, beneficent? Yes. With a good motive, but nonetheless being tortured by being kept alive in a state of near mummification, because while there is life, there is hope. And in the next few days, there might be some amazing medical discovery which would

cure them. And it would have been a shame to let them die and not reap its benefits. Yes, there always might be. So if the physician is in general out of role and does not know what to do in the face of death has a very important connection with another aspect of the physician's trade that he does not know what to do with chemicals or drugs, which do not have the function of healing a physical disease.

In a way, all consciousness expanding drugs have something to do with death. Why? Because all spiritual disciplines are, as young pointed out, preparations for death.

It is a commonplace of these disciplines, spiritual disciplines that what you do in them is die in the midst of life. You are born again a second time, and that death refers to the death of the ego.

That is to say, you leave behind the state of consciousness in which you thought you were no more than an isolated individual center of consciousness that drops back. And so in that sense, you've died. And spiritual disciplines very often involve, as an aide to that, the contemplation of death. We think it's rather ghoulish nowadays, but monks used to keep skulls on their desks. Buddhists meditate in graveyards. Hindu yogis meditate beside the burning guts on the banks of the Ganges, where they are always confronted with death. Knowing this is going to happen to me, good. Jeff once said that if anything would possibly save mankind from its idiocy, it would be the clearest possible recognition by every individual that he and all others around him are almost certainly going to die, because this, when it becomes something perfectly clear to you, surprisingly, becomes a source of intense joy and vitality. Because when you have accepted your own death in the midst of life, it means that you've let go of yourself and you are therefore free. You are not any longer plagued by worry and anxiety.

You know that you are done for anyhow. So there's no need constantly to fight to protect yourself, because what's the point? And it isn't just you see that people spend all their time really doing something to protect themselves. Like say, taking out an insurance policy or seeing that they eat properly. It's what we do that doesn't issue in any action at all. The constant inner worry, which leads to no action except more worry. And that is what

has given up. You see by a person who really knows that he's dead. So do you see that transcending yourself, going on the arm? Your ego is the great preparation for death.

Now then you see we come back to the medical profession. If this profession takes the side of the ego against death, opposes death, regards death as the supreme evil, then the doctor really is out of role at the bedside of a dying patient. And he also is out of role when it comes to the handling of drugs that are not designed to heal death, bringing sicknesses, as we ordinarily understand. But what happens? What happens? We'd actually very few people take priests seriously.

I mean, even even churchgoing Christians, because this is what happens when somebody in the family of a good Christian shows signs of mental derangement, the priest is very seldom called in.

One calls in a psychiatrist.

Why? Because in our culture, he's a scientist and the scientist has a far greater reputation for magical power than a priest or minister.

We only call in the priest when all hope is abandoned. The scientist hasn't been able to work and say, well, maybe proud. Do some good and the poor priest gets it. In our Catholic priest, our Anglican priest.

By and large, they are very used to handling death. They know what to do.

Come in and open the book at the right place without any embarrassment. Proceed to administer the last rites. And really, that's rather good. I mean, here is a man who knows what to do. It isn't flustered in the face of death. That in itself has a calming influence. Not a lot of people feel that this isn't really the way to handle it because they don't really dig or understand this. These last rites. And if the priest is called in only in desperation, this argues that he doesn't have very much power anyway, may have power to do something with the Lord in the world beyond, but very doubtful in this world.

So under such circumstances, both the priest and the physician. And I'm referring, of course, to the priest as he is found in the United States or in Europe at the present day. They need to take another look at death. And to bring out the all important fact that life without death has no value. Death, as Norman Brown pointed out in his book, *Life Against Death*. Death is what confers individuality upon us. It is your limits in time that constitute you just as much as your limits in space. Death, therefore, always overshadows the whole of life. And life would have no meaning, no point if it didn't have death to balance it in breath and out breath coming and going.

A rising and falling are mutually interdependent. So death is a very valuable and very important thing which is being swept under the carpet.

So then in a culture where priest and physician have become widely separated, the sudden bursting upon us of sacramental substances is an embarrassment to both. It is embarrassing, first of all, to the priest for many reasons, because supposing we were to say psychedelic substances are not the province of physicians and psychiatrists, they are the province of the clergy, everybody would throw up their hands.

But these people have had no scientific training. They only think about neurology. They don't know anything about the subtle effects of these things on the human organism.

How could they be responsible? And alas, it's true. The clergy have not had training in neurology and so much the worse for them. On the other hand, the psychiatrist, with very few exception and the neurologists have no no training in theology. And when they most of them and they talk about theology, they reveal their abysmal ignorance of the whole matter. So the thing absolutely fall back between two stools and there is no class of people, although there are individuals. There is no accepted. There is no recognized class of people who might be called, for example, field botanists. All CEO neurologists and we very much need the development of such a profession. And until we have it, we will be in a difficult situation as to how to deal with drugs, if you will, or chemicals that do not seem to have as their primary use the healing of a physical disease.

But there is a sense in which these substances are medicine rather than diet.

What is the difference between a medicine and a diet and medicine is something you need when something is wrong, when something is out of order. A diet is what you live on permanently. Of course, corrections in diet can have a medicinal effect.

But surely there is a very true sense in which we can say that our world, based on the ordinary egocentric consciousness, is very seriously sick, psychically sick.

I'm not going to you know, everybody knows why we can see it all around us, that we are stark staring, raving mad and are busy preparing to destroy ourselves, and that is a sickness which needs some kind of remedy and maybe even a desperate remedy. The use of things that would lift us out of the egocentric situation could therefore be met, considered medical as healing for a social disorder. But again, I would say that they used in that way should be used as medicine in the sense that they don't become diet, because in my experience and of course in this matter, everybody speaks for themselves.

But say, I consider just myself alone.

I wouldn't feel very put out if, say, LSD were to vanish from the earth tomorrow.

Because I have discovered that this is not the sort of thing you sort of take every so often, like you go to church or if you do that, it's something that you can take several times and gradually diminishing quantity and then you had it. Beyond that, it's up to you to integrate your vision with everyday life and with all the various kinds of knowledge that say enough is enough.

But there are other people who seem to think that the great thing to do is to start out with a little and then keep on going, making it bigger and bigger and bigger, as if they were looking for something that should lie at the end of the line.

And then it becomes a diet. Now, that is indeed getting hooked on medicine and doctors don't like to hook you up medicine, and very rightly because the ideal of a good doctor is to get rid of you as a patient. He doesn't want

chronic patients. Poor people always hanging on to him, always rushing for help. He wants to set you back on your own feet. And that is an excellent principle. This is where the doctor really has something to say to the priest. Course, priests tend, by and large, to want to hook you.

In other words, to keep you coming to church so that you will pay your dues. And the church will prosper. So the more people they can get hooked on religion, the merrier. Now, priests in this way ought to learn from the doctors and try and get rid of people by telling them the gospel or whatever it is they have to say and say, now you had it go away because you see, if you do that, you will create a vacuum and there will always be filled just as when the doctor the faster a doctor can get people out of his office, they go round and tell everybody, this man cured me. I didn't have to go back to. So more people will be coming in. There are always plenty and plenty of people never come to an end. So in a way, the religious man ought to handle a huge turnover of people coming through and going away, coming through and going away. Then he's really working. But he should not get them hooked on the medicine.

Indeed, there is a famous Latin phrase Crooks met Tina Mundy, the cross the medicine of the world, but people get hung up.

You see on the cross and Jesus, didn't you remember? According to the the Christian mythology, Jesus came alive again afterwards. He didn't get hung up only for a while. And so in the same way, if Christians really believed in the inner meaning of the doctrine, they wouldn't get hung up on the cross either, except temporarily. I am crucified with Christ. Nevertheless, I live.

So also, when it comes to the use of any technique whatsoever, whether it's yoga or LSD or what have you for spiritual awakening there applies to it. The Buddha's symbol of the raft, the Buddha likened his method, his dogma or doctrine or method to a raft. It's also called a genre of vehicle. Hence the Mahayana, the big vehicle, the Hindu Yana, the little vehicle. And it takes you across the river of which this shore is birth and death. And the other shore liberation nirvana. Now you get on that raft and you go over. And when you get to the other shore, you leave the raft behind. Same way they say in Zen Buddhism, their technique, the use of the Koran or meditation problem is like knocking at a door with a brick when the door is

open. You don't carry the brick inside, you leave the brick behind. So with all these things, they are means to pyre and they have as their objective deliverance from means. The Christian mystics speak of the highest state of contemplative prayer or union with God as a union without means. And I would extend the the sense of the word means even to ecstasy. In other words, ecstasy is in variables in the great religious traditions, not a final state. Ecstasy is an intermediate state. So, for example, in in Zen, when the experience of Satori or awakening comes about, there is an ecstasy. You feel marvelous. You feel as if you were walking on air. You feel absolutely unobstructed. You feel as happy as a lark. You feel, you know, this fantastic bang.

It's marvelous. But that in itself is only incidental.

Zen saying says that Monk, who has a story, goes to hell as straight as an arrow. In other words, to have it is to cling to it.

And if you think that the ecstasy is the important thing, it isn't. The ecstasy is an intermediate stage to bring you back to the point where you can see that everyday life that your ordinary mind, as they say in Zen, is the Buddha mind that everyday life. As it is, is the great thing and there is no difference between that and the Divine Life. So this is why you should read, especially there's a new little book out on Zen. Edited by Lucian Strike. What's the name of it, Jenna?

It's Powers Poems. Six. Yes. Well, yes.

This has got some very good things in it about how the great masters insist that for everything you seem to have attained, every great insight, every great ecstasy, you must drop it. Let go of it and immediately. Go ahead. Because in the end. Thank you. If you think that. Here it is. Zen poems, prayers, sermons, anecdotes, interviews by Lucian Strike and Takashi came out.

Don't say good. But they insist on the point that so long as you as you think that there is a state of affairs in which you can say about the big thing, whether it's God or whether it's Nirvana, Brahma, the Divine, the Tao, I've got it. You haven't. Because the moment you regard it as some sort of

object, some sort of state, some sort of thing, which you can lay your hands on.

You've put it away from yourself. Did one thing you can't lay hands on as you never find it out in a million years.

You can't find out who it is that wants to find out who it is. It wants to find out who it is that wants to find out. Now get at it. You see, but that's the thing. It's the thing that is most close to you, as Francis Thompson said, nearer his he than breathing closer than hands and feet. So what is absolutely central to you is what you can never make an object of knowledge. And so when you finally get to the point that you don't have to have anything because you're it and you don't even need to insist on yourself that you're it, because you have to insist on that, it means that you doubt it in order to go around saying to yourself. Be still and know that I am God. I mean, that's the beginners thing. That's for beginners. When they really get at the end of it, there isn't a trace. See? No. No means I left. No method. No. No getting hold of it. No meditation, no LSD, no nothing. Because it's just the way it is. But before a person sees that then means are used, whether it be yoga, whether it be chemicals, whether it be anything else.

So let me sort of sum up. In the last analysis. All spiritual awakening involves something beyond the will and the ego. You cannot do it yourself. So it makes little difference what you use for this.

Some ways are easier than others. It's easier if you use SEO Botany, a divine plant than if you just bang your head against a brick wall.

But with the very ease of it, there is the danger that you may neglect the discipline that must go with it. In the banging your head against a brick wall method, they are sure at least that you know the discipline before anything happens. And so that is the danger in a relatively easier way. But of course, as Aldous Huxley once said, to insist upon using the more difficult ways to attain the mystical state is rather like having to burn down your farmhouse every time you want roast pork.

The problem for us is that we don't have that.

The split between the role of priest and the role of physician has left those roles impoverished. And so there is nobody who is really competent to deal with death or to deal with preparation for death. And that's what makes it a problem for us.

Finally, that the most subtle danger in all these things, whether it be yoga methods or whether it be chemical methods, is fixation on ecstasy, not to know how to go beyond ecstasy and beyond looking at the divine as something that one can possess personally.

I was saying yesterday that psychedelic experiences tend to have two aspects. As a matter of fact, you can classify their effects in many different ways.

And people who say there are three things to be remembered or for things to be remembered about so and so are really making this in order to put a point across. You sort of classifications that are always 530 things to be remembered about anything. So don't take this too seriously. But I'm doing it to make a point.

And these two aspects are on the one hand, the alteration of sense perception and on the other hand, intuitive insight.

And if we could say that the intuitive insight is the aspect of psychedelic experience that corresponds most closely to the natural mystical experience, which does not necessarily involve the types of sensory alteration or alteration of perception so often involved with the chemicals. Nevertheless, it's hard to draw a very straight line between these two aspects because every so often the sensory alterations suggest some kind of insight. I, first of all, want to go into the nature of some of these alterations, typical alterations, and discuss them.

But first.

You are aware, I suppose, that these chemicals are often classified as hallucinogens. That is to say, chemicals which generate hallucinations. And this has seemed to me a very bad word indeed, because, of course, hallucination always carries with it some kind of condemnation. It's a pejorative word. And I have rarely come across an instance of where the

use of LSD or mescaline or psilocybin has created a genuine hallucination for a hallucination. Is the appearance of something to a particular individual unseen by others, which he believes to be part of the real world. In other words, if you saw a ghost, it might be claimed that this was a hallucination. If you took the ghost is really out there.

But things like that don't tend to happen.

What might be classed as hallucinations are of two kinds. Vision is seen with the eyes closed. But of course, you know that these are visions. You know that you are under the influence of a brain altering chemical and therefore unusual things are likely to happen, which you are not going to mistake for events in the external world. And therefore, when you close your eyes and behold, the most amazing patterns are constructed out of jewels, moving with splendid order in the dark or see infinite complexities of ferns where the stems sprout fronds and the front sprout fronds and the front let sprout from lands.

And forever and forever and forever, or marvelous arrangements of crystal arabesque translucent colored balls moving in space in many dimensions. Enormous temples, vast architectural creations with every kind of wall and tower and cauliflower going on forever and ever through gigantic spaces, getting involved in thistles with prickles upon prickles forever and ever and ever. Visions of Persian palaces, of courtyards, of outbursts, of dancing, girls and angels and knights in armor. All sorts of fantastic things will appear before closed eyes. But you know all the time that these are visions. And of course, they create the most extraordinary questions. What are they?

Because although they are visionary, although they aren't there in the external world, they very much are in the internal world and they must have some kind of neurological basis. What are we looking at when we see those things? This is a question which nobody knows how to answer for in some way. There must be a physiological basis for this kind of patterning. Is it that we are getting a glimpse of patterning processes within the brain, processes which organize our ordinary thinking about things?

After all, you know that when you use the telephone and you dial somebody, there is a machinery which handles it all.

But if you go and look at that machinery to find it has an extraordinarily interesting design. The patterns of electronic equipment are sometimes very beautiful, but you are not aware of those patterns. When you make a telephone call, you are aware of voices and that's it.

And bells ringing.

So it may be in the same way that within our minds, our brains that are perfectly marvelous pattern organizations, which we become aware of only under special circumstances. In other words, what one tends to do with under the influence of a psychedelic chemical is to become aware of being aware. That is to say, you turn your senses back on themselves and one is only inclined to do this when there is an alteration in the normal form of perception. That is to say, in seeing you do not notice your eyes, in hearing you do not notice your ears, especially if they're healthy. But if some disease should attack the eye or the ear or some temporary inconvenience and you see spots in front of your eyes, you know that those spots are within the structure of the eye. And if there is singing in your ear, you know that that singing sound is within the structure of the ear. And this turns the sense upon the sense. So in exactly the same way, if something alters your normal way of seeing things, your attention is diverted from what you see to seeing itself. And this, of course, this awareness of awareness, turning your back upon yourself, even at this still rather superficial level is the beginning of a process of self exploration and self-knowledge. But it takes a little alteration to do it, as it were, to fasten your interests, because when your eyes are seeing perfectly, there is nothing to fasten on. You see, the eye creates a visual space of total clarity and emptiness, although that's all inside your head and you find it difficult to attend to that which has no distinctive features. But when an alteration is introduced, there are some new distinctive feature to cite, but these are very hard to pin down.

I gave you an illustration last night of the feeling that everything is at a funny angle when a picture, as I said, is out of alignment. You know, it's wrong. It's clear now supposing everything gets out of alignment and everything has a sense of being funny. I don't mean funny haha. I mean a bit funny. Queer.

Everything is just odd, just a little bit odd.

It's as if everybody had suddenly gotten pointed ears and not only people, but everything has pointed ears on it. Little projectile sticking up to this point.

It is enough that elephant that's foxy. It's something something funny and leaves on trees suddenly all pointed ears.

We forget that this other impression is very strange, very hard to pin down. So one of the first inquiries that is always interesting in the psychedelic state is to discuss with yourself what is the difference between this way of seeing things and the normal way you can get a group of people sitting around and talking about that. And it becomes one of the oddest conversations because people can't quite put down what it is. They all agree there's something funny. Everything is a little bit off and yet it's. The same as it should look, but it's off.

And what do we mean by that? We really don't know.

And it would be very difficult to establish a physiological basis for this. It might be done. But you see, it's light as in the same way as when you put on colored glasses. Everything becomes colored with the color of the glass. And soon your consciousness will start to eliminate that effect. And it will begin after a while to look normal as it does when you wear sunglasses. So in the same way, if you put on a glass for every sense that you have and the name of that glass is funny, everything will look funny.

And so.

But nevertheless, this discussion, what is the difference between normal awareness and funny awareness focuses you on the whole thing of awareness, on the whole process, which does not ordinarily happen unless you do meditation practices designed to do exactly that.

So another thing that is comparable to this that happens is what I would call the feeling that everything is significant.

This is a funny word taken literally significant means something which serves as a sign which signifies something other than itself. I say this is a

very significant remark that you've made means that it has a deep meaning.

But there is another sense of significant, which means important.

Valuable, interesting in that sense.

Now, how can you possibly describe a state of mind in which everything appears to be significant?

Logically, this is absurd. Just like everything being off center at a funny angle. But nevertheless, there are however absurd it is, logically, it is nevertheless a characteristic of this state.

For example, that supposing somebody reads, somebody sits down and reads poetry.

Well, you see the meaning of the poetry in the ordinary way, but you also see a lot more than you normally notice. That is to say, every tone and texture of the reader's voice, every clearing of his throat, every pause to take a breath, every gesture is integrated into the poem. It becomes important. It becomes significant. It is as if there were some sort of signal system in the brain which attaches cues to various experiences so that, you know, for example, the difference between a direct experience and a memory. Some experiences have the here and now cue attached to them as when you sit and look at somebody, other experiences as when you close your eyes and remember the face of a friend who is not here, they have the memory cue attached to them. So you know that that is not a here and now. So in a similar way, our experiences are, we attach to them cues important. Notice this. There are other cues unimportant, don't bother. Or perhaps no cue at all. Now here in this state of consciousness, everything gets cued. Everything, everything you look at becomes important and you realize that it's only an arbitrary kind of human scheme of selection that says these things are important and those are not.

Because everything is important to something.

You then get this curious sense is that it doesn't really matter what you look at or what you listen to, anything will do.

Only there does remain a residual of value judgment so that you are still capable of saying, I would rather look at this than at that. But if it so happens that you just for the sake of experiment, choose to look at what you would rather not look at, it in turn becomes absolutely fascinating.

Among the other alterations I've thought of quite a number of them, I mentioned already the motion alteration where the world seems to breathe, where walls seem as if they were made of cloth with an electric fan behind so that they they wave where the pile in a carpet to look closely into it.

Every little bunch of threads constituting pile can start to wiggle.

Now, similar to that is what I would call the experience of grain in the census.

Once I was in this experiment and I was looking at the millions in windows like crazy, and although I wasn't seeing any more Malians than they actually are.

I wasn't seeing double. Nevertheless, the arrangement of one after another gave the impression of doubling. It was like seeing double. And yet on account, I counted the same as a person in the ordinary state of consciousness. That one seemed to be a replica of another, of another, of another of another. And the same would be true in looking at any sort of regular pattern in a carpet or whatever. But then the doctor said, look at your hold up a finger and see if you see that double.

And no, I said no. Oh, but yes.

But what I had seen was that just beside my finger, there was a wisp of cigaret smoke and this wisp being just at the same height as the finger right here became. A basis for an identical image of a second finger.

In other words, just the same way as you work the Rorschach blot into all sorts of shapes. So I work the Rorschach cloud of smoke in the air into a second finger behind beside the first. And for a moment it seemed just like it until I detected the source of the illusion.

This led to examination of stones and very quickly I suddenly somehow got into the impression that the whole space of the visual field seemed as if handfuls of pebbles had been thrown into it and the whole visual space was constructed out of ever so many insulating concentric circles. You know, for example, in the way that color pictures are sometimes reproduced. There are several techniques. They depend on the various kinds of screen that are used for printing. Well, there is a type of screen that is made up of ever so many circular patterns, all interlocking and into meshing with each other.

And so the whole visual world seemed to be based on a screen or grid of this kind.

Now, the interesting thing was that I could not at any point isolate actual lines in space forming this grid. Which did not coincide with some ordinary sense perceived object.

In other words, there was nothing to be seen that would not ordinarily be seen. And yet my eyes had organized what is ordinarily to be seen into this pattern of ever so many concentric circles.

It's as if. In other words, when you listen to an alarm clock, you know, the old fashioned kind of go tick tock, tick tock, tick tock, tick tock, tick tock.

Now they don't. They go. Tick, tick, tick, tick, tick, tick, tick, tick, tick. But you hear kick clock or tick tock because your mind resents the monotony of tick tick.

And then, you know, very afterwards you can rhyme doggerel to this clock and you can hear tunes in it. It becomes the beat and you fit tunes in with the beat and things like that. Well, in just the same way that you do that, so your eyes can organize what they see into patterns, which we would say in the ordinary way aren't there. They can pick out waves as I see a row of people sitting with their heads on top. There's a thing like this is the rippling right through, if you see.

And it was ever so many things like that can be done.

And so you stop when you see that asking questions, what is the right way to organize, the way you see the world? Everybody running around and agreeing, of course, that they see the world the normal way and the proper way. Yes. But is this actually so droll? It's an agreement. Supposing we had agreed to see it a different way, because the world, as I've often said, is essentially an enormous Rorschach blot. It's profoundly wiggly, any except in places where men have tried to straighten it out by building straight wall, straight highways and so on. But the natural world is wiggly all the way through, including our own bodies. Well, how are you going to interpret these wiggles? How are you going to decide how much of a wiggle constitutes one wiggle?

What is a unit of wiggle? See?

So we apparently what has happened in the course of minutes and many, many millennia is that persuasive human beings have said, well, now, look, this is the way it goes and everybody's got to agree with me. Surely this is this is the way it goes. And everybody says because this guy is kind of rough. Yes. That's right. That is the way it was. So whether these people were powerful, physically or powerful, persuasively, we've all more or less agreed to see the world the same way, although we have not agreed yet.

You see, to speak the same language, we're still using an enormous number of different languages. But these things you see these organizing patterns which we project upon the world are, as it were, the languages of another kind. They are patterning methods, methods of thinking, structures of thinking, which we use to organize the external world in exactly the same way that one uses the the string bag of longer tubes and latitudes in which the world is hung on to organize it all the celestial latitude and longitude to organize the stars. These webs, these grids are fundamental to organized thinking about the world numbers you see are a similar kind of patterning. And the mathematician knows all kinds of patterns. Lattice is matrices and so on, which can be used for organizing things.

So.

Another aspect of this grain experience in the senses is what I would call pointy ism, you know, pantheism is a school of painting that was invented

in France, especially associated with the name of Siva, where the painting is composed of my new dots in many colors. And this is a very common psychedelic phenomenon, similar to the concentric circles that I just mentioned, to see everything consisting of points. Once again, you are not able to specify actually to put a needle point on any one of these points. And yet everything that you see, the ordinary vision of the world seems to be made up of my new dots. And you begin to wonder. I offer you know that after all, you have many nerve ends all over your body. There are endings of nerves, and these are especially sensitive in the retina.

And you wonder. Am I becoming aware of the multiplicity of my nerve ends of every single unit that picks up the external world?

And therefore I see in the external world a point corresponding to each one of my nerve ends that picks it up?

Well, it might be that, but as you think about that, you are liable to get fascinated with the idea of one nerve in one point, one as it were. Basic unit of sensitivity.

And I have christened this basic unit the eenie meenie the anyway. It is a fundamental, you might say, a unit of conscious life sensitive life.

And when you begin to think about this one unit of conscious life, that extraordinary things begin to happen because you realize, well, we've got really down to simplicity now we've got this as well. One fundamental point, which is what is called in Hindu philosophy, A, Bindu B in the U Bindu is an atom, but not a physical atom in the sense of what our physicists mean by an atom. This is an intellectual atom, the finest that any grain can get. It's almost like the Euclidean point having position that no magnitude except that it isn't quite as abstract as that. The any we need is very much alive. It is a unit of and I use this word to indicate what is common to all senses, a unit of sight, of sound, of touch, of taste, of smell. And all these senses, as you begin to realize with psychedelics, are really one sense specialized in five different ways.

That's why you, in certain cases hear colors, see sounds and so on. It all seems to go together. Well, of course it would. Because they're all

specializations of our basic sensitivity. All senses are fundamentally a sort of touch. So the any meaning is is a fundamental unit of touch. Now, as you know about a neuron, a neuron is such that it can give either yes or no as a message. That is to say, either it fires or it doesn't.

So then the eeny weeny is like that. It's either black or white.

But you begin to see that it's both because black always involves white and white always involves black.

So this anyway is one but two faced.

Also, it's being one implies all the others, one implies many because you can't think one unless you can think many, you can't see many unless you can think one. The concepts are inseparable. One doesn't mean anything unless you know what many is. Many doesn't mean anything unless you know what one is. So suddenly the any weenie being one implies all the others. And being itself, it implies an outside, which is not itself.

But if you can't have the outside without the inside.

In other words, if you can't have the space around the any weenie without the any meaning, and you can't have any meaning without the space, then somehow it's very difficult to say that the any weenie with the one little unit and everything else are different.

Then they go together.

And this leads you into the most fascinating of all aspects of psychedelic experience, which I would call the experience of relativity. This gets us back to significance. What is it bought?

Now, we human beings think we're important and that we have a very complex civilization that we have, that our libraries, our cities, our organizations, our institutions, nations, our wonders of religion and philosophy and art and architecture and so on is the most complicated and the most significant thing that ever existed on Earth.

And when we look at and realize that there are little cells in our bodies that have a sort of independent civic life and that there are all kinds of microorganisms which when we see them, we don't see the familiar human shape.

We see something more or less globular. We say, well, that's a very primitive shape compared with the shape of man.

It doesn't have a highly organized nervous system as ours and therefore is obviously an inferior creature.

But with the psychedelic use, you have time to think about things you don't ordinarily think about.

There are now not so hurried, not so hurry. How do you know this thing isn't as complicated as you are?

You haven't been really looked. Start looking.

And we know a scientist can start looking and he can find that one small, tiny micro organism has very complicated indeed. And why wouldn't it be that from the point of view of this micro organism, its affairs are extraordinarily complex and very important? I mean, imagine just something that we know a lot about. It's a long way from a microorganism. It's considered a bee. What do bees know about subtle distinctions between different kinds of honey that we've never thought of? Supposing a bee is arranged that it does exactly what it likes. And yet at the same time, this is always socially acceptable.

Pretty groovy sort of civilization now. Wouldn't it be? You never have to stop to think. Would this offend anybody or anything like that? You do just what you feel like doing. And it's everybody. Except it's perfectly fine.

You play the rules automatically. Well, human beings would say that's not much of a challenge. After all, it's a much more significant if you could do something wrong, if you could make a mistake. Well, that's our way of thinking of it. That's our particular taste that we think it's more fun to play that way. They may think it's more fun to play it the other way. They say,

well, why don't you want to introduce all that nonsense for when you can live a perfectly satisfactory life like a bee? Why do you want to go and bring in a kind of principle of evil choice just to make everything messy? Well, it's another form of game. You know, every game has some kind of a forfeit in it.

You've got to lose something in order to find it to win it back. And that's the essence of a game. That's why you shuffle the deck of cards at the beginning to create chaos. So and then you work against it. You see that everybody has something as some kind of thing that's a forfeit to play their life game. Otherwise, there's been no game. See, we think it's important to survive. Well, it isn't. But we say so. You think it doesn't make the slightest difference whether you live a short time or whether you live a long time. After all, here are these fruit flies, drosophila. They come and go, come and go, come and go with extraordinary rapidity. Generation after generation in a few days. And but far from their point of view, this is perfectly satisfactory normal life because I think the same about myself. And if I cannot assume similar processes in other creatures which are going on in me, then I am reduced to total solipsism.

That is to say that there are people who argue that although you can learn Chinese, you will never. However much you study Chinese and however much you speak with Chinese people, you will never do anything really that understands Chinese because you weren't born with it. You are always translating it into English. And so you're permanently precluded from understanding another culture. Well, you can carry that argument right down to understanding another person of your own culture and say, well, he's another person and you never really know another person. So we all are broken up into island universes which have no real communication between each other at all.

Well, the only reason I reject that is that it affords that basis. It is a game rule which has very little play in it. In other words, it's like it's as boring as tossing to see whether it will be heads or tails. But the assumption that other people and other cultures really can be understood and that the further assumption that things that are not human, that maybe insects or mammals or fish also are highly civilized is far more interesting assumption than that.

They are merely creatures of no importance.

But so you see that, though, that it is an assumption that we ought to go on living and that. But it was he. It's a meaningless assumption when you really examine it because mere going on mere quantitative length of time is just so much time. It has no special qualitative meaning to it. So we say a person died a glorious death.

He died for some great cause, you see. And when he went out to sea. But we say that thing that went on for a few minutes. Short life. He was a young man. He went up in a band. But it was a glorious explosion. And everybody builds monuments to him and says he was a great man.

So there is a value then to the short and explosive as well as to the long and dull rock of a seen. But when you're really fixed on a game rule, you see like you want to go on living.

It's very, very difficult indeed to see that you really don't have to see.

In other words, what this so often comes down to this relativity. Well, let me postpone that for a moment. I want to further the idea of relativity. So what you see then is that at every level of being, all creatures are confronted with the same tasks and have the same problems and are really in the same situation. The infinitely small is as big as the big candy and the big is as small as the small can be.

Because after all, when you get down, down, down, down to the most Manute things you can conceive, it turns out that they are surrounded with spaces that are relatively as vast as the spaces between the bodies of the solar system or between the different galaxies on the large scale. So if there are beings of any kind of sensitivity, dwelling on these Manute points is whatever they will look out and are what we see as galaxies will not be visible to them at all.

They will find themselves in the same sort of universe we find ourselves in because the kind that you see, every creature that is sensitive finds itself in the middle. So each one of you is in the middle of the world because you radiate a sensitivity.

In other words, the extent to which your eyes will see your ears will pick up sound is always the so-called outer sphere.

And you can expand that sphere by instruments, telescopes and radio astronomy or whatever it may be.

Telephones.

But still, you are in the middle.

That's the most important place. Everybody's in the most important place. The middle. And we say, man, is the measure of all things. It's a funny feeling that man stands in the middle causing deaths. He knows, as it were, so much higher than himself and so much lower than himself.

Probably equal in both directions, so much bigger, so much littler. So when you get down to very tiny, that thing two feels at the same place that you do, but you might say, oh, well, but not.

But really, it's very tiny because after all, we are fairly tiny. And there may be, in other words, beyond all the galaxies that we are aware of, vast systems that we have no knowledge of at all. And they are, after all, bigger. Are they?

Are you sure bigger or are they just in the same place?

You see, eventually you can construct a scheme where you get bigger and bigger and bigger, and that bigger is the same place as the tiniest because round in the circle.

That's you might say at first. Difficult to think about, but it is perfectly logical concept, perfectly simple. Only it's unfamiliar.

So is the sense. You see, as this grows, you realize that everything is in the same position. I remember I was thinking about this once and at the same time listening to Hindu music. And the concept of this immense relativity was really moving in me and I was full of marvel at it. And it was

somewhat terrifying. Somehow the Hindu music is a very Hindu music is very deep stuff.

You have to have a quite a trained ear to go and see that it is something just as profound as anything written by Bach or Beethoven. But I suddenly said, you know, there are moments in this music when God himself calls out for help.

I don't know what I meant by that, but. But something like this.

In the Hindu philosophy, as you know, they believe that God plays hide and seek with himself and that he.

As it were, half the time, whatever time is anywhere half of it is. He gets lost deliberately and forgets that he's gone and he gets as lost as last can get, you know, which is the end of experience that we call the screaming moments.

And that's when God calls out for help. Immediately answers, of course, because he wakes up and finds out he really is. But once you begin to see through this relativity thing that everything is central. Everything is as important as everything else. However big, however little you realize it's all God in the same position. But now that begins to scare you because you say, well, I can't believe that I am God.

That would surely be very blasphemous because I all I'm not very good and God is good and that I am not very powerful.

And God is supposed to be all powerful things in what we put. You mean you're not powerful? Isn't a question of whether you are powerful or not powerful. Powerful and impotent are just two opposites of the same game. If you didn't feel some lack of power, you wouldn't feel any power. I mean, you couldn't be all powerful because that would mean nothing. There would be just nothing happening. You were all powerful that it would mean power and impotence to be able, not to be able. Our two phases of the same thing.

So in the same way is the voluntary what I can do and the involuntary. What I can't or can't help doing are they. They are phases of the same. You wouldn't know one without the other.

And you begin to see. Isn't that fascinating?

And then in a funny way, you begin to realize it's a sort of secret that you are willing.

What happens to you without your will?

Because you see that you couldn't will anything unless there was also that that was other that you couldn't will that was beyond your control.

And it begins to dawn. You begin to see the whole thing that you're not just something fighting the world or on your little lonesome, but that the whole thing that you think you're fighting is the other side of you. But you put the whole game is to make it seem as other and as strange as possible. That's fun, because that's getting way out. That's that's making excitement. And you say, well, now, why then can't I just switch it off?

Couldn't I suddenly realized, bang like this sitting here, that all that I is other than me, all that I don't well is really me. Why can't I just do that? See, I only ask you, you think you can't because you think about it superficially. Would you want to? Would you want the disintegration of the other? And find out that it's merely you in the sense of your ego?

The self has to contain something more complex than merely. Ego has to have an element in it which seems to resist.

See, when you move your arm like this, you have what are called antagonistic muscles and dependent on these is motion. I prefer to call them complementary muscles, but still they are called antagonistic. It's all right. So when this muscle contracts and the bicep contracts, this one relaxes. And so the opposite way when you do this. Now you see they play with each other against each other. And so they make a movement possible.

So it is with the voluntary or the involuntary with the power and the non power where I conquer and where I surrender.

Did you get this feeling now? See that? You see, I played it all the way through everything. Every creature, every center sensitivity, every weenie in the world is the same one. They're all in the same position. But the whole thing is to look as if they want it, because that's the the hiding part of the game, the concealing part, so that every single any winning or human being or whatever you want.

Any unit of sensitivity, however you want to measure it looks down and looks up and says, well, those things aren't me, though.

They're where they're very different things. Especially I don't like spiders or snakes or whatever it is that you don't like and. No, no, that's that's that's that's not human. And we talk about snakes, eyes, you know how they have no warmth in them. What do you think I'd look like to a snake? I often said, what about it? How do the teeth of a gorgeous girl look to an oyster? So then you realize, you see that the whole point of it is that those things have to look different. That's the whole point, that if you didn't feel they were not human and there was something else, you wouldn't know you were human. And so they on their side look at you and you as a human being have some claim, although it's probably merely relative to be the most predatory monster on us, because the fish stay in the sea, the birds pretty much stay in air, but human beings range through an ocean and everything after their prey is opposing, the sharks could walk.

So.

When all this starts in.

You begin to experience an extraordinary kinship with all other forms of life, not only kinship with insects and worms and bacteria and so on, but also people, because you begin to see that everybody is faced with the same problem you are. Everybody has the same death problem and that everybody's workings aren't to be easily dismissed as good and bad and say, well, that's good and that's bad and therefore I can feel. Well, what's the point of all this judgment?

As a matter of fact, people judge despite the fact that Jesus said judge, not that you'll be not judged, but what's the point of it all?

Well, the point of it all is so that I feel that I am right.

See, because you can despise other people in certain ways or other classes of people and say, well, they're not that terrible.

But you wouldn't know you were in the right unless you had all those terrible people around you. I was talking in a previous seminar about in groups. And just for those of you who weren't here. I'll say briefly. Everybody's trying to get themselves into an in group, that is to say, to be nice people. And everybody who does constitute an in group thinks that they're the nice people and that the outsiders, even though they belong to a very fancy in group, are all nasty people saying.

And so if you're in any given American town, say, long live on the right side of the tracks and you know, the nice people and they're all those bums and [Unrecognized] and whatever Mexicans over there and you say, are they on their hands, say, gee, those we really live a real life because we have to face poverty.

We have to where we are right down close to the bone. And here, although it is rough. The meat is sweet. And those people don't know it. Those wretched. They're all big buses. And they own all the land and they own all the property. And they are a worthless bunch of junk.

They're not even Christians and they don't want anything to do with them. And so they feel they're the real in Group C, but neither one can know it is the real in group without the contrast or the other thing. You will depend on people who you could look down on in order to be able to feel up. And so you should recognize this and say thank you very much for giving me the privilege of being an improved, because without you I wouldn't know where I was.

And so you see all these human games running together and you begin to feel, gee, isn't that marvelous? You know, at first it starts being a kind of cynical. You see everybody's out after himself and that some people are

very loving and very cooperative because they realize that this pays, that this makes other people love them and that they're playing a game just like the people who are hostile and grumpy and aggressive and rude. And they get their way that way will see everybody's playing the game, being selfish. And the first is gives you the horrors they are.

We all, after all. Nothing but little horrible island selves. Each one out for itself.

And as this becomes very uncomfortable, if you've got to you know, if you've been brought up with a Christian conscience, then you begin to see what is it that you're being selfish about? What is it that you love when you say, I love myself? This it becomes exceedingly puzzling. You realize that what you love when you love yourself is always some other object than yourself.

You like eating ice cream. You like beautiful views. You like your house. You like your friend. You like kissing beautiful girls. You like this, but it's. Not me.

You suddenly realize you can't separate yourself that you love from everything else that your self implies. Then you know, which is up. But it soon terrified and you suddenly see the whole thing. And this can become with psychedelics a very, very vivid thing. The whole universe has a colossal energy play going this way and that way. Totally indestructible. And it's all you.

And you didn't know it.

It doesn't mean you're the only one. This thing proliferates in millions and millions of centers, but it's all one center.

And you can get the physical sensation of the thing being enormous, as it were, sort of center of light, of joyous, loopy, glorious, loving bond like that. And this will only usually last for a few moments where you feel you've actually put your finger on the center of reality. And it is this true men, this luminous energy, just beautiful.

And then as as this passes off, you see, as it were, the reflected glory of this in everything you look at.

And at that moment, you see in the experience, you begin to come down.

And as you look more and more, you see, of course, I don't object to being in a different state of consciousness than what I've just been in.

You go back to being ordinary because now I've seen what ordinary consciousness is underneath. It's this fantastic game of hide and seek and perfectly all right to come back, because actually, since all is one, there is no difference between my perfectly everyday existence and this stupendous vision of glory that I have just seen, because the one implies the other. They go together. This is the game. This is the hide and seek. And so you can come back into an extremely integrated, restful, quiet sense of peace.

Never forgetting that you have seen relativity and that relativity is the key to the fundamental unity because that which is related all extremes are related to each other in a polar way. They are not things that are separate from each other, as if they are opposing forces of light and darkness came from such opposite ends of the cosmos that there wasn't even a joining point between them and met in a clash. It is rather that as a flower expands from a center and blossoms, you could draw diameters across it.

Picking out opposite petals, but they all come from the same center. I have left around a number of what I would call psychedelic books, which you will notice consist very largely of photographs of pattern in nature, crystal structures, shells, bone structures, leaf structures, animal kills, erosion patterns, patterns in marble, all kinds of pattern in nature, because for some reason or other, the strongest one of the strongest effects that I had from the use of psychedelics was a vastly renewed appreciation of this dimension of the natural world, a kind of perception that the whole world is pattern.

This is a very strange feeling because our common sense normally faces the world on substance. We think of an primordial and more or less solid stuff which is found in dense forms as in granite or a ball of steel and found in very refined forms such as a gas. And we think that all the world is shapes

of forms of this primordial stuff. But one of the extraordinary consequences of using psychedelics is that everything suddenly turns into transparency. I think that's what some physicists have tried to say. I'm thinking of Sir Arthur Eddington in particular, when he remarked that it seems to turn out that the stuff of the world is the same as the stuff of our consciousness. As if awareness itself and material substance were really not different. And whatever this means scientifically, the psychological implication of it is somehow to make the physical world light lighter in every sense, somehow less heavy, less burdensome and lighter in the sense of more permeated with light. If you look, for example, at those reproductions of Persian miniatures that I brought out, you will see what I mean by the vision of the world as being lit, interior lit, illuminated from within. Not the interesting thing about this from a scientific point of view is that the physical description of the world does not require the concept of substance. It requires only the concept of pattern because upon a physical analysis, all substances, however solid, are finally described in terms of patterns, the patterns of their molecules, atoms, electrons and so forth.

And it is always the description of the pattern that seems to count. Common sense seems to urge us to ask the question, but what's the pattern made of? In other words, if we see everything reduced to a lot of circles and winding lines, we want to know what are those lines made of?

But when you think it through. The only way anybody can ever tell you about them is to describe still smaller patterns within them. Nobody can really think of a way of talking about stuff, because if it has no pattern and it's just sort of homogeneous all the way through and has really no shape in itself, I can't imagine a way of talking about it. But you can not and describe and make out delineate patterns. And so the world takes on from this point of view what I would best call a musical quality. Music having the peculiarity of being a language, a form of art in which the principal delight is pattern and the whole meaning is in the pattern.

Music, you see, really doesn't mean anything at all. It's a great art, but one can have the absolutely magnificent music which represents nothing and describes nothing. One enjoys it simply for itself. In the same way as you

might enjoy fireworks or watching ripples on water or watching the shapes of clouds.

They don't mean anything.

And yet they're orderly. And so wonder comes peculiarly aware of this world as play. I have described an experience in the joyous cosmology, which was actually based on an experiment with the Mexican mushrooms with psilocybin in which. I was listening to some Hindu music at the time in which the players were doing nothing but vocalizing the rhythm of drums, and they have a way of doing it with the syllables that deed it. DA dee dee dee da da dee dee da. So on. And they get up to a tremendous speed saying this. And it was the most gorgeous babble.

And then they were playing these various instruments and all the sounds became I became peculiarly aware of the nonsense in them. There was, for example, an oboe sound which sounds like somebody singing with his nose pitched.

Oh.

Now there's a lot of them children love to do that. It makes a fascinating noise. Why is it fascinating? Heaven only knows. But in this southern of Brad. Brad. That sort of savage, they weave together with incredible skill. They have Hindu music involves the most complex orders of pattern. And to count it out is quite difficult. But they do it with Cannes summit skill, especially with drums. And as a result of listening to this, everything became that. Everything became Hindu music. And so people you see when we listen to our own music.

Well, that's very serious. And we take it all for granted. A violin and this is a piano. And these seem to be very normal noises. And we've so long been accustomed to them that we take them for granted. And we think that they're perfectly sensible. Whereas, of course, if you listen to it with New Year's there, nothing of the kind been taken like an organ, for example. What a monstrous construction of pipes and playing all these sounds through them, blowing through holes is simply fascinating when you hear the Hindus who do things musically that at first sight strike us as ridiculous

because they concentrate on using sounds that we avoid. But we do sometimes use those songs when we are, especially as children. I'm trying to see what funny noises we can make. And so they will do things with their voices that sound to us like some sort of clowning. But to them, of course, this is all perfectly normal and serious music, unless, of course, they are turned on when they're listening, as they very often are in India, and it's perfectly legitimate. Their thing that they did, they forbid, is alcohol.

It's difficult to get in India and.

But they dance a big bang. I remember I was having dinner in Kyoto with a Buddhist priest and a little party and naturally all the Japanese, including Buddhist priests, drinkers. And he passed around beer and Saki and fairly plentiful quantities was sitting at the table, a Hindu man, very intelligent fellow, and I noticed he refused them. So a little later I said to him, do not drink for religious reasons. He said, Oh, no, it is not that. It is just that I don't need it and I don't want to come myself. Was there something I don't need? I said, Do you drink then, bum? Oh, yes. You said you would like. It is a very good drink. And as you know, a ban is an infusion of cannabis indica. And so I suppose the Hindus hear their own music from that point of view very frequently. Cannabis is hemp vulgarly known as pot.

So that the impression you see of this music at the time and in the state of mind, I was in in becoming the music and becoming this sort of marvelous nonsense, everything became that. And so I could see life behaving as patterns do so often behave. Look at a tree. You see, first of all, the heavy outline of the trunk. Then the trunk gives birth to branches and the branches give birth.

The twigs and the twigs give birth. The leaves and the leaves give birth to has and veins. And if you go on looking with a microscope, there is wiggle after wiggle after wiggle after wiggle, all coming out. And yet all adding up to the perfection of this tree's pattern, like some sort of symphony. And so I could see all the wiggles and patterns of human imagination and behavior as being involved in this and the things that we call good, as well as the things that we call bad, the things that we call healthy, as well as the things that we call sick. The enlightened and illuminated and liberated point of view, as well as the egocentric and point of view in bondage, all of them as

being integral parts of this terrific playfulness which the Hindus call the Leila or sport of creation, or better play better than sport play in the sense of playing the piano, playing the drama and so on, not play in the sense of the trivial.

So it was one of the most astounding feeling of being entirely a patent and nobody was making the pattern. There wasn't a patina outside the pattern.

The pattern itself, was it? It grew itself. It created itself. It was spontaneous. It was all there was. And water.

Water was a..

And so one is constantly reminded of this by all natural forms and objects in which pattern is very apparent and in which at the same time transparency is apparent. These two aesthetic qualities go together to be suggestive of the psychedelic experience. And so it seems more than ever natural to surround oneself with not only the objects of human art, but with dried flowers and herbs and grasses and seashells and various kinds of rocks and crystals.

And I know a very great sculptor and she she's not a sculptor. She is really a mosaic artist and painter. And name is Louisa Jenkins. And she is a great admirer of Talha the Shah, not the very progressive Jesuit theologian.

She is a Catholic and she has caught this feeling of universal pattern from him. And her studio is an absolute London museum. And she sees the artistic significance of everything. For example, we were having dinner with her one evening and she was serving Japanese saki in those small cups. Cups were white and one of them dropped off the table and split in two and we were about to pick it up and throw it away. She said, oh, don't throw that away. I said, I have a use for it. And a little later she presented me.

It's hanging in the dining room there with a an amazing face made of a flat disk of cement and the socket cups have been turned upside down and used as the eyelids for this creature.

Well, the thing is that her whole studio contains yes, she's a painted this. This is Leviathan, the monster of the deep.

Her whole studio contains things like skeleton leaves, feathers of the most intricate type fish, skeletons, animals, bones, marvelous pieces of driftwood, gorgeous blocks of quartz, everything. That is absolutely fascinating. A child would go out of its head in that studio.

But somehow this intimates a world which is entirely design pattern and it has an extraordinary levity and joyousness to it.

It seems to be a world that is immaterial in the double sense of the fact that it is not material and that it doesn't matter in the sense of when something matters, that it is grave and thus heavy. It becomes, in other words, a universe whose whole meaning is playfulness. But playfulness must, in order to succeed, must have an aspect which simulates tragedy and can play and not play so that one can realize play. It is fundamentally play, but it plays very serious games or plays at seriousness.

Now, this leads me to a question that is important about the use of psychedelics. All the people who have been involved with it talk about games.

Game theory is very fundamental to it. Now, when Timothy Leary and Richard Alpert were at Harvard, both of them started out in their work as very, very respectable scientists in psychology. They knew all about statistics.

And Timothy Leary, while he had been here at Berkeley, had done some very careful statistical analysis of psychological mechanisms and so on. And and got his doctorate and was a very respected scientist.

Then they began working with psilocybin.

Well, they made what was to their colleagues the fatal mistake, not just of experimenting on subjects and making careful notes and analysis of how they reacted, but they took it themselves.

And then they slowly began to realize that what is called serious scientific inquiry is a kind of game.

And you can see it as that, of course, without being under the influence of a psychedelic.

Just by reading some of the literature, especially in the social sciences, where you will find it amazing jargon are used and that you have to be able to speak that jargon in order to belong to the academic fraternity. If you don't talk that way and if you don't acquire the special rituals of the fraternity, you are not one of the boys.

And an enormous amount of these investigations are truly trivial.

I remember for a time I was associated with a certain university which has a famous Department of Education that's in the state.

And I remember reading the subjects of Masters dissertations when their degrees were awarded at commencement.

And what they had done to see was to choose subjects about running schools which were as specialized as you could get. I mean, somebody got his master's thesis from writing about the relationship of windows in a classroom to the circulation of air for the children. Now, this is fundamentally a job for a constructor or architect or someone. I mean, you know, and this qualifies one for a master's degree in education is simply fantastic.

But all those sciences and this is particularly true of the study of English.

They want to become scientific and that means studying something minutely. Well, it's very important sometimes for a physicist or a chemist to study something extremely minutely. But what these other people are doing, because that the physicist and the chemist have acquired a certain power and status through their studies, they are simply trying to copy the method of doing things in spheres where this method is not particularly applicable. And so it becomes strictly a game, especially in psychology, where anything that is studied has more variables in it than anyone can think

about. And so but it does make a very, very pretentious thesis to put forward some really good psychological statistics. So I shall have more to say about psychological statistics and the humanities. But so it becomes a game of staying in a certain caste.

Well, they saw through this, you see, and they felt at once that it was really rather ridiculous that they were doing this game and the psychology department at Harvard University and all as they ought to be mumbling in their beards and looking very grave. So really, the funny thing was the union, the university couldn't stand it. And there was a question as to whether they were resigned or actually fired. It was probably both, but they just couldn't go on with it. But now then it followed from that that they had to react to the opposite extreme and play another game altogether, which was, of course. What game is that? The opposite of the academic game is obviously the beatnik game, which is another game, too, because that, too, has its uniform, its rituals, its language and everything. And the moment you begins to start talking that way, you align yourself with a certain group.

I mean, if you dig things instead of appreciating them.

So that that puts you in a certain thing because they are there in group language, just as the academic people do to all games.

But now the problem becomes this.

There is a danger when you see how gamey life is. Two of overtly to regard everybody as playing games so that when somebody says something to you which is supposed to be either serious or sincere, that two things are not the same. You treat it as a game gambit and a person who is by no means ready to admit that he is playing games is very, very put off with this. Because you say you don't take me seriously, you're treating me as just as if I were playing games.

And so to when people get swept away by the notion that everything everybody is playing games.

They're also liable to get what has been called the holy man syndrome. Which is I am divine and therefore I am above right and wrong. I can do

anything I please because after all, it's only a game. And this is one of the things that in what I would call imbalanced people is very liable indeed to result from the use of psychedelics. And one of the reasons why society is afraid of it.

And this really does present a considerable problem. Of course, we can look to the experience of the past to give us a bit of help in this, because in Asia there have, of course, for centuries been people who attained a state of consciousness involving the point of view, a that the world is a game and that it is fundamentally harmonious and that good and evil are ultimately reconciled. Johnson says in his book, those who would have good government without its opposite misrule do not understand the great principles of the universe. One might as well talk about having the positive principle without the negative principle. And such people are therefore either knaves or fools. Pretty bold statement, but nevertheless, the great Dao is sages, and the Buddhist masters have always known very well indeed how to handle themselves in terms of a relationship to ordinary society and have known how to take their holiness lightly. And if one has to have a halo, how to wear it over one ear. The if you will, as you consult, for example, the literature of Zen. And if you know anything about the way Zen is carried on here, you'll find an astounding ability of the great men to carry the.

Exalted spiritual state in a very human way. One of the great points of Zen is that its ideal is not to become a Superman. Only a man, a human. And so the Zen people do not aspire to any claim of super humanity.

And the last thing that they learn in the very long training, say, of a person who is going to teach them is you might think it would be the first thing, but it is the lasting.

The last thing is they learn is the Zen interpretation of moral precepts.

It comes right at the end, if you read this new book by Muro and Sasaki called The Zen Koan, which is just published there is by Muro discusses the all the stages of koan study. And right at the end comes the study of the precepts. The irritating thing about this book is that it doesn't tell you anything. It tells you a lot of headings, but no content. And one sometimes

wishes that they would either put up or shut up. But it does have in its marvelous translations of Zen poems which are well worth the price of the book.

But anyway, this this thing, this point does come out that it is all part of making a bridge between deep inside and the everyday life of the world. Just as I said, you can't go off into ecstasy, or at least you can. But it isn't a good idea to go off into ecstasy and not grounded. So in just the same way, it is not a good idea to go off into a state of God's omnipotence and divine holiness, etc. and not bring it down to earth.

And this is one of the things that I could really complain about among many people who have taken a great deal of psychedelic substances.

There is this tendency to pooh pooh everything, for example, I mean, and to do absolutely outrageous things. There is a movement afoot called the Neo American Church to put the whole thing on a religious basis. But what do you suppose they do? They have a number of what you might call elders of this church, but they call each one A boo hoo, b, double o h double o boo hoo.

Well, I mean, if some people are just going out of their way to make themselves ridiculous, it is this is the revolution, you see. And for some people, it is fired with a real revolutionary spirit that we are gonna make this thing work or we are going to turn the world on and we are going to do it on our terms.

Cos you can see from the standpoint of deep inside that it's a very cute idea to call a religious patriarch a boo hoo.

I don't know what boo hoo always means in American slang. In my slang it means a crybaby.

Or it means something. It could mean sort of a hot air bag and true Zen masters in their private references to each other.

Refer to one another as rice bags and tramps and bums and all sorts of things.

But outwardly, so far as their contact with the world is concerned, they wear the proper and dignified living out the governments of high officials, which they're expected to wear because people want someone who is in a position of great authority or responsibility to look like it.

So the pope is the only man you can't slap on the back and call Harry.

So it is of the essence of real insight that when you arrive at the point of understanding what for want of a better term, I must call the total harmony of the world. You have to see that in this scheme of things, there really is no person who is superior or inferior in the final sense of this of this world. That is to say, it becomes apparent.

That everybody at his level and in his place. Is manifesting the divine just as much as you are or as much as any Buddha is. This is why it said in the Buddhist scriptures that when you become a Buddha, everybody else does.

And so you have no basis for giving yourself airs and graces or for breaking other people's game rules in such a way as to cause hostility because they in their way playing their games, even if they are limited games, even if they're bad games, they too are all won with you.

And they are not knowing that they're enlightened is at the point where they are very important indeed. It seems sometimes that events could be put on different levels and the levels could be numbered and a level that occurred on number 23 where it was quite right would seem very wrong if it occurred at level 95.

But what happens to us often is that we see an event and think it's at that level 95 when it's really only at 23. And so it seems out of place and it seems quite wrong. So this sensation, this real thorough absorption of the point that from the situation of the deepest mystical union, from that standpoint.

At that standpoint.

All men are equal, all beings are equal.

The problem arises when you try to bring that standpoint into practical affairs.

You can make one of two mistakes.

One, by saying you are all equal, but I am more equal than the first because I know you're all equal and you don't. The other is the more common one. All men are equally inferior. This course is the one from which our culture suffers to a high degree.

This is what results in what you might call a sort of travesty of democracy. You see, all democratic thinking in the western tradition was based on German mysticism. The great tide of democracy came from people inspired by Tala and Eckhart and Souza and Rise Brook, the brothers of the Free Spirit, the Anna Baptist. The levels all those people were the seedbed of Democratic ideas and the idea of liberty. The. Their mysticism influenced George Fox and the Quakers.

But when you translate this, all men are equal in the sight of God to all men are equal on the level of politics and economics. Then the parody is are all equally inferior. And this is why it issued in the various fashions in the West for explaining greatness away as neurosis. Of psychoanalyzing all great saints and artists and so on and reducing their accomplishments to frustrations in sex and toiletry.

This gave everybody you see who was then really some kind of a bum. A sense of satisfaction in knowing that the great are, after all, just as inferior as you are.

And that is a democracy at its worst.

What has to be understood, I think, is this.

In order to integrate the level of mystical understanding with practical life, you have to remember one of the famous stories of Shri Ramakrishnan.

There was a student who had been with him and had been learning that all things in the world are Brahman, other supreme manifestations of the

design. And having heard this, he left the Masters Ashram and went walking down the road. And there comes along an elephant swinging its trunk and looking rather fierce. And there is a man riding on the elephant. And he says to this man, Hey, get out of the way. This is a fierce elephant. But he thought, I am Brahman. Elephant is Brahman. We are all one Godhead and no trouble can come. So he didn't get out, and as he approached the elephant swatted him with his trunk and threw him into the bramble bushes at the side of the road, from which he eventually extracted himself bleeding and bruised. And he went back to the master and said, and told what had happened. The master shook his head and said to him, but you should have realized that the manhood warning you was also Brahma.

Well, so it is like this when you see that all different, all people whatsoever, whether they be high or whether they be low, are manifesting the divine just as much as you are. Supposing you are in a high situation, you know, you really seen the mystery and you see that all people manifest it. You must stop to consider that what also manifests it is the differences between them. That they are arranged in a certain hierarchy, that the king being king and the cobbler being cobbler. They are. But you see, if we these are like these levels I was just talking about level 23 and 95. The cobbler at level 23 is doing all right. But what he is doing would not be appropriate at level 95 or however you want a number it or turn it around. So when we equalize things, we must also take into account.

Everything that is there to be equalized.

Put it in another way. You might say, if I really understand that all is the work of the divine, but would I, should I or should I not be angry when somebody like Hitler destroys millions of Jewish people? Many people jumped swiftly to the conclusion that, of course, I ought not to be angry and then jump to the next conclusion, which is that although I ought not to be angry if I'm not, I'm extremely cold hearted. But I would point out that my being angry at such a state of affairs would be as natural as water boiling when put over a fire. I would be very angry indeed. But this anger is included in the manifestations of the divine just as much as the villainy of the people who destroyed the Jews. They're going to be villainous. I'm gonna be angry. Is it follows like the shadow and the substance? And so you

might say then, if all is a divine, why do anything to change anything? If we see any sort of social injustice or what.

What you will disease if it's all designed to let it go? No. But included in the things that are is change, is irritation, is all the among the workings of the human being. And so the people who work to change things are just doing their stuff at their level and they have to be included in this thing, in this totality. Gotta one said we work with nature even when we work against her. So you have to have the most inclusive view possible in order to integrate these two points of view. And it's an oversimplification altogether to say when you've seen that the divine is in all things, you just cut up your legs, relapse into somebody and watch the world go by.

That's all right for old men and for people who are physically tired and weak. That's very proper. To sit on one's porch and in a rocking chair would be the American equivalent. That's fine. But obviously when you are young, you must be involved in the world because what has to be understood is there is no way of not interfering with life. Even when you glance around this room, you make an effect on it. The slightest little breath upsets things.

Not very seriously. Not very much. But still, it does our existence. The mere fact of existence is an interference. There is no way of not interfering because you are absolutely connected with everything that goes on and every move that you make has repercussions. So one has to interfere. Therefore, the question if you have to interfere. The practical question is how are several ways of doing it?

Which one, considering the fine points, can bring about dangers.

Things like the holy man syndrome. Incidentally, I should mention another point about the holy man syndrome.

Not so long ago, a young psychiatrist came to see me who had some experience in these matters, but he had a very noticeable chip on his shoulder and he was all for emphasizing the point that, say, Zen. He had read a lot about it was a con game.

He said, you know, you're a con man. I'm a con man. We're all we're all con men.

And he he he was everything he did and said had a sudden aggression about it, as if to want to say to make a great point that we are all crooks. Now, when you see that you smell a rat. See, it's all very interesting, but there's a rat here. This person is overcompensating and therefore he hasn't really understood.

If you have to go around, in other words, challenging everybody with your insight, it shows that you are not secure in it. You don't really believe it. Otherwise, you wouldn't have to brag about it.

And this is the result.

This is the cause of all most all the kinds of excess and disruptive behavior that come from the use of psychedelics.

People get the vision and they go mad with it. They just can't keep it out of their hearts. They have to go in and use it to kick the world in the teeth. I even know an old man who should know better. Who says that? When he's got spiritual nourishment, he's ready to kick the well in the pants again. It may be just a jokey way of talking.

I'm not so sure, but that little edge of somehow having to insist on it is the same state that I was talking about yesterday in the first seminar. When you understand it fully, you go beyond ecstasy and come back to everyday consciousness. Likewise, when you understand fully, you go beyond any special claim to be a holy man or to be a real devil or whatever exalted position happens to appeal to you and you'll come back.

But now there's some further wrinkle to this. There always is.

There are people, as you know, who are aggressively ordinary. And this is a peculiar phenomenon in the United States. Well, we very much in this country believe in being natural. And so we feel uncomfortable with ceremonies and with dramatic behavior or dramatic clothes or anything like that.

We feel that that's too much. It's showing off.

So reminds us of the aristocracies of Europe that persecuted our ancestors, I suppose.

And so we we we like things in this country to be folksy. And so we we we many of us were sort of beat up close and especially wealthy people. You'll find no wealthy people on vacation will wear real beat up clothes, jeans and a T-shirt and so on.

And look as grubby as possible because that's natural.

So that's now. And so also then when people realize that they're there in a very they've come to a great exalted insight and they're gonna bring it down to earth, they realize they shouldn't be aggressive about it.

They're gonna be as natural as possible. But you can spot just like that that their naturalness is funny.

It's put on. So I would say to to be natural, really. You don't have to put on any special guys or something for protecting yourself against other people.

But you have to do is to do what you like in the sense that really well, what you like play what role you like so far.

As long as you're comfortable with it for yourself and don't care whether it's natural or not, then it will be natural.

Don't try to be natural because immediately one can detect the seriousness of.

So now this brings me to the last question.

In view of the whole problem of the social adaptation. Unitary consciousness of the world as a total harmony on the one hand and our ordinary, normal consciousness of the world as an intensely competitive system, gravely serious disputes. We're discussing bringing these these things together, fertilizing the one point of view with the other. What are we going to do? So far about the practical problem of psychedelics. I pointed

out at the beginning that we the whole subject falls between two stools because as a whole, neither the clerical professions nor the medical profession are ready for it.

And this is true even of that aspect of the medical profession, which is strictly psychiatry.

The divorce of psychiatry and religion, and it is, generally speaking, a divorce. There are exceptions to this where clergy, for example, in many theological schools are trained in psychiatry and there are a number of small smattering of psychiatrists who are members of some kind of religious group. But by and large, psychiatry is attempting to be a pure science without any religious commitment at all.

And I get the feeling again and again and I talked to a great many psychiatric groups and I talked to them endlessly about methods of therapy and this, that and the other. But I realize I get with it. I realized a lot of it with a funny intuition.

They are completely superficial. They don't even know what therapy is, what they're aiming at.

And so often this is not always the case. Therapy means success in getting a person to behave like everyone else. And to give him the same sort of tastes that everybody else has. So that he's a safe norm.

But even when this is not the case and many therapists say who follow Maslow, Carl Rogers and our most brilliant men, I still get this feeling that psychiatry is dying on the vine for lack of any metaphysical foundations.

Now, I said I was going to say again something about statistics.

Such statistics as there are are showing up today shows that psychiatrist psychiatric treatment by using other methods than the drugs they're using in asylums to quieten people down, psychiatric treatment is extraordinarily ineffective.

Samples show approximately that of any control group.

One third of the psychiatric patients recover from their symptoms in three to five years, and one third of patients under the care of a general practitioner receiving no psychiatric treatment also recover inside three to five years.

And those who were under the treatment of the psychiatrist came out a good deal poorer financially. I don't want to say this in a way as belittling the seriousness and the skill with which many psychiatrist are trying to study their problems.

But they do have an abominably superficial concept of the human organism and of the human mind.

One would think that a psychiatrist would be eager, above all, to explore every possible modification and state of human consciousness. We should be expert. He should know his way around inside all of them.

Just as a linguist wants to master many languages so a psychiatrist should master many madness and many mystical states. He should run the whole gamut from mystical vision to catatonic schizophrenia and know them all from the inside, because then he is in a position to communicate with his patients. He cannot communicate while he remains a mere professor of psychiatry. See? Psychiatry is not something that you can study like the history of Persian pottery.

It's all out there and it's objective and science on an it never had to get involved to be a therapist.

Effectively, you have to be right on the inside. You have to get mixed in with it. And even though this may you may lose a certain objectivity in scientific impartiality by doing this, you what you've got to acquire is the art of being able to get involved and then come out again and be scientifically impartial and then get in again.

That's difficult, but it's worth trying. But the reason you see the psychiatrist is afraid so often to get involved because he's scared of losing his own sanity. And he knows, you know, that we walk on pretty thin ice so far as our sanity is concerned. And so don't muck around that.

He's seen too many of his colleagues work for a long time in asylums who had to be quietly removed to another eye socket. That happens all too readily.

But it is the fear of insanity more than anything, which makes one insane fear of getting lost in all those strange corridors and bad dreams where you're going through mazes, corridors, worrying whether you ever get out without anybody.

What crazy people have an awful time with that corridor syndrome because there are other corridors of the mind.

Therefore, there is a certain protection of one's sanity in being able to go into various states and above all, what I as I said a little while ago, a moment ago, was that the thing that strikes me about psychiatry so forcibly is its lack of a metaphysical foundation.

In which you see it is simply imitating the fashionable point of view of scientism in the 19th and early 20th centuries. To push across the point of view that this universe is trivial.

It is nothing but whatever you want to say, nothing about something or other, definitely nothing but desperately important to get everything down to nothing, but so that we can say no mysteries left about this matter associated with it.

And that said that that said and a manifestation of hostility you see of hatred of life lying under that, because aged people were too afraid of letting themselves go to be able to admit that they could look at this well and say, wow, look at that.

Isn't that marvelous? Oh, really interesting.

Do you think you think these things are marvelous?

But it is as if it's not sophisticated because you see one of the one of the the games of aristocracy in Europe is always to look bored. And there are all sorts of you could put a whole history together of how people copy the

attitudes of their superiors in order to get one up. So if it's good to look, board was a mark of extreme aristocracy and great wisdom. The scientific world, which was a part venue, then imitated a bored attitude to everything so as to gain its status or involved in different. And so that they had no reason to be bored. They were just imitating people. And the aristocrats had some reason to be bored. I'd seen everything that had all pleasures. They were blasé.

So look at psychiatry in turn picked up. The attitude is nothing, but it's just the libido or something and or it's just mental mechanisms or is just neurochemistry or something like that. One of the funniest things about LSD is that maybe it's just neurochemistry, but by when you get inside, neurochemistry is something if you think chemistry matter.

Good heavens, what are your nervous system? You suddenly it is like a conducted tour inside the nervous system. You begin to realize that the nervous system is one of the wackiest things going. It's fantastic. You can't just dismiss it as a nervous system as of nasty porridge in a bottle.

So then this is the thing.

I think that the crucial point that has to be developed before we can handle these substances intelligently is a medico religious rapprochement. And that means reforms on both sides and they are beginning to happen.

You know, you're probably aware that there's a huge theological ferment going on in both Catholic and Protestant churches and among the Jews. The top's blown off the occasional references to it in the paper. But my clergy friends are thinking things today that they couldn't possibly be thinking about 10 years ago.

They're as revolutionary as almost any group I know. You should talk to the local rector here in Sausalito or any crowds of them all over the place. Things are happening.

And what is essentially happening is that they are consciously facing the fact that they need a kind of religion which is much more profound than anything they've hitherto been dealing.

And they are open to the dimension of religion, which has been consistently ignored for centuries. Which I'll call the mystical dimension of at last. Admitting that religion is not just believing certain ideas and following certain patterns of behavior, but must indeed involve the transformation of consciousness, not in the sense of an emotional blow out like a revival meeting, but something which involves a crucial change in the sense of human identity. There is therefore weaving together at this time a whole pattern of movements. More and more it becomes in the biological and ecological and physical sciences clear that the individual is inseparable from the cosmos.

That after all, you are an expression of everything that's going on.

You know, something that rattles around in this universe that came into it as a stranger from somewhere else. And so that behind the facade of everyday consciousness, there are depths of oneself just as truly one's self as your own will, which altogether go beyond your individual organism. And that these we can become aware of these depths, and as we do so, become delivered from being plagued by impermanence and death and temporary suffering.

The psychiatrist has to know this, too, because if he sits in his office and has nothing under in his belly, you know.

That is the what I would call the certainty of eternity. Somewhere here.

He's really just as neurotic as the person he's sitting with and is putting on a mask attitude, looking wise, playing the scientific role, distance of objectivity, not get involved with the patient.

Use all the little tricks when he's really wet behind the ears. You know, you learn a whole bag of tricks. Even if you've been through a didactic analysis yourself, you can just have a whole domain of trickery, therapeutic gambits. There's a little underneath.

So I think that some psychiatrist should be ready to take their medicine.

I mean, LSD. And just for an introduction.

To the realization that there are more things in heaven and earth than I dreamed of in your philosophy.

Human Consciousness

Transformation of Consciousness

Buddhist philosophy speaks of the four invisibles: water to the fish, out to the bird, mind to mankind and enlightenment to the ignorant.

Because you see, you never know your own element. Now, it's impossible, therefore, to give a definition of consciousness because we don't know anything outside it.

Just as the fish doesn't know anything outside water and the bird doesn't know anything outside air.

We don't know unconsciousness.

We only know when we have been unconscious.

And so we are in a very difficult fix to attempt to define the subject of the seminar.

We all know what it is, and yet none of us know what it is. We know we are conscious.

It's the same sort of problem just to try to say what color your eyes are.

I don't mean whether they're blue or brown, but the color of the iris, the lens of the eye, because we say it has no color. It's transparent. It's like pure glass. And yet that might be a color to somebody who had a different kind of eye.

An Englishman and an Hindu were once sitting in the backyard of the Hindu's home, and the Hindu was talking about the necessity of a background for the perception of any figure. So he said. Against what background do you see those flowers? And he said, against the background

of the hedge and against what background? You see the hedge. He said the background of the hills. And against what background? You see the hills.

He said the background of the sky. And he said it against what background? You see the sky. And the Englishman fell silent. The Hindu said, it's the background of consciousness. There you see we reach a limit.

And you can talk until all is blue about whether consciousness and reality are the same thing.

Whether there really is ever any such thing as pure unconsciousness. Whether consciousness is tunnel, whether as the subjective idealists would say in philosophy, there is primarily mind and all so-called physical and material existence is something in mind or something in consciousness.

You can debate that subject forever and ever and ever and come out nowhere.

There is no answer to the question when asked in that way.

But it is helpful as a start to make things at once more simple and perhaps a little more difficult by.

Overcoming at the beginning the traditional opposition between the spiritual and the material or the mental and the material.

By the trick of talking about all things, whether spiritual or physical, in terms of pattern.

Because that's all anybody can really talk about pattern.

You see, it's fundamental to our common sense, which was highly influenced by Aristotle and the Book of Genesis, that all forms are composed of some substance in roughly the same way as sculptures are made of stone.

Or parts made of clay.

But a serious physicist no longer thinks in such terms about the material world.

He doesn't think it's made of anything.

Because what the physical process of nature is, is patterns.

You could say patterns of energy, but that's using the old ceramic language patterns aren't made of energy. The patterning is the same thing as the energy.

So if you use the verb patterning as what the universe is, then you'll get something that you can talk about. You can describe patterns. You can measure them.

You can say what a pattern is doing, although a pattern isn't a thing, a pattern is a verb, it is a process, it's an activity. So we can say patterning is what is going on and consciousness is a kind of patterning, as we shall see. Just so are flowers and human beings and stars, trees, water, our everything. Even space itself is a form of patterning. And this means, in other words, that the universe is what physicists would call an energy field.

And likewise, consciousness is a field in the same way that space is obviously a field, that is to say an area in which things happen. That's the primary meaning of field. A field is a playing field, a field in which something happens like an arena. Only when you use the word field in more in the sense of physics, you mean a field of forces like a magnetic field, like a gravitational field.

And the curious thing about fields is that they exercise their energy in a non mechanical way.

For example, if gravity were non field, that is to say, if it were the ordinary sort of exercise of energy like the propagation of heat or like someone pulling, then when you put something on the ground, you put a good heavy lead plate on the ground that would be absorbing so much gravitational energy and therefore anything you put on top of the plate would be less acted upon by gravity than the lead plate itself. And then anything on top of

that would be still less. And you would reduce the energy of gravity by piling things up.

But you don't it doesn't make the slightest difference to the gravitational field. So in the same way, if you take an electrical coil, say a surrounding a plastic tube, you can put a current through that and you create a field within the tube. You can put your hand inside the tube, but nothing will happen to it. But the minute you put something that is like steel inside the tube, it will get hot, but no heat will be generated until the steel is inside the tube because the coil plus the steel equals heat.

But the coil has to polarize with the steel inside before anything happens at all.

So that shows us that what is operating as a field.

Now, think then of the world as a field characterized by patterning, which for which another name is energy. And. We are going to have to treat consciousness in rather the same way.

Now, one thing that is characteristic of all end of all energies, all energies whatsoever or patterning whatsoever, is that we find it convenient to think about it in terms of the spectrum.

So there is a spectrum of light, the visible spectrum running from red to violet and beyond the visible spectrum. There is a very big invisible spectrum because our eyes respond only to a small section of the measurable spectrum of light. So we have infrared rays at one end and ultraviolet at the other. And then so on our two cosmic rays, gamma rays, hard x rays, all sorts of things on the invisible bands of the spectrum. So in exactly the same way, there is a spectrum of sound. And if anybody was a sufficient scientist of cookery, they would devise a spectrum of taste.

There are certainly a spectra of other kinds of vibration than sound and light.

And there are likewise conceivable spectrum of shapes.

Spectra of emotions.

So we could talk to of a spectrum of love ranging at the red end from lust or the Freudian libido to Divine Love at the Violet and Divine Charity and in the Middle Greens would be things like friendship and endearment and so on.

Each emotion, as a matter of fact, could be thought of as having its own spectrum. Now, then, the curious thing about the world is that it's a kind of interlocking of spectra.

Which the best analogy would be weaving. The interesting thing about weaving is that you've got the two cross groups of cross threads which give you the pattern, the warp and the weft.

And if you pull out either one, there is no pattern, nor is there any cloth. It all falls apart. It needs both the warp and the weft for there to be any pattern at all.

And they together constitute the cloth. Now let's look at a similar illustration in the ordinary, everyday world of this interlocking of patterns. Let's take the photograph of a face in a newspaper. If you examine this photograph under a magnifying glass or even with the naked eye, you will easily see that it isn't a continuous face as faces are supposed to be. But it is a whole collection of dots.

Some are heavier, some are light. And according to the heaviness and lightness, as you stand back, you get, as it were, the illusion of their being present in terms of those dots, a human face.

Now, let me pose the question, what is the relationship between the form of the face and the grid work of dots?

At first sight, that doesn't seem to be any relationship between them at all because the printer uses exactly the same kind of screen with which this process is done for any face whatsoever. So the kind of screen he uses makes no difference at all to whose face it is. Anybody's face can be on it

or any other shape. So you might say the fact that he is using a grid is completely irrelevant to the form of the face.

Take still another illustration. The radio.

When you turn on your radio and it comes on first thing in the morning, the announcer does not say the sounds you are now hearing are vibrations of a diaphragm activated by electromagnetism. This is mediated to through a network of transistors and broadcasting station with such and such people. He does does not intrude the mechanics of radio.

He comes right on saying This is station so-and-so. Welcome. This is this morning's news or whatever it begins with.

So it would seem that the structure of the radio, the wiring, the transistors, the speaker have absolutely nothing whatsoever to do with the message that's coming across it.

They live they are in two different worlds altogether.

So it would seem then take another possibility.

What about the brain?

Is thought in emotion or consciousness itself a function of the brain? If we knew a great deal about the anatomy of the brain, would that tell us a great deal about the patterns of human thinking? Or would it tell us as little about the patterns of human thinking as knowledge of radio engineering tells you about the technique of Bach, whom you hear over the radio?

See, there's a real puzzle.

And this is one of the interesting subjects brought out in this extraordinary book called *Understanding Media* by Marshall McLuhan. And I don't think he's clearly answered it because he is trying to say that what is most important is not so much the message or what is supposed to be the content of any method of extending our nervous system, such as radios, such as televisions, such as printing, such as photography.

He is trying to say that the message is the medium.

That is to say you are influenced by television, not so much by the advertising and all the group that comes across on it, but by the fact of being in touch with the world through this particular electronic system with all its peculiarities.

That's a very interesting idea. And he's put up an argument for it, but I'm not convinced that his argument is quite solid.

But I want to go into this question, because obviously you would not hear any music except you had an orchestra in your room.

Were it not for your radio on your phonograph.

And as a matter of fact, even if you had an orchestra in your room, you wouldn't get them to produce any music without those instruments. Now, let me ask the question in another way is that what is the relationship between the piano and what you play on it?

Any you can play anything practically on a piano. And the structure of the piano doesn't make any difference. And yet without it, you couldn't play.

So we've never seen anybody thinking without a brain.

So what is the relationship between? Well, again, you see, it's rather like warp and woof.

The walk goes one way and the wolf goes the other, but by the interlocking of the two, you get something.

So what you've got then are spectra of different kinds. See, when you dial and you move the dial. What you're doing is you're changing the wavelength of your radio.

That is to say, you are moving from one end of the spectrum of waves slowly to the other.

So the spectrum of radio meshes with another spectrum which is being used in the production of music. As a matter of fact, the production of music is an interlocking of many spectra. But we won't go into that because the emotional spectra are involved, spectra of speed, of dexterity, of harmonics, all kinds of things go into this.

So you get the picture of the world as an enormous web where spectra mesh with spectra of all kinds. And they're all mutually interdependent. And through them, it all hangs together.

And the peculiar fact of these spectra is that they come in together, come into being together, almost. The world is not you.

You don't see things appearing in nature except some with certain insects and birds that actually practise weaving. But you don't see plants and trees being exactly woven. What seems happen seems to happen more than that. Is that warp and woof come into being together at the same time. In rather the same way that back and front necessarily come into being together at the same time or head and tail, you don't see creature born as a head and then later developing a neck trunk, feed and tails. It just doesn't work that way. It comes in together, head and tail. Even the spermatozoa has a head and a tail. So then what I want to go into, of course, is the spectrum of consciousness and its many transformations, the different ray and the huge range of the spectrum is extraordinarily fascinating.

So then let me be. Let me first be sure that we are quite clear about this physical conception of the world.

You see, you can also call these spectra if you want to dimensions.

And dimensions is a very useful idea.

You can see that you can't have a physical existence in terms of point line surface.

Each of those is a dimension.

It's not till you get the so-called third dimension, although it should correctly be called the fourth time. The fifth is not till you get the so-called third dimension that anything is physically manifested.

Then you're there. Now, you could say these dimensions are quite different from each other.

The surface is a very different thing from a line, as is a line from the point.

But somehow they all go with each other in a way that we don't normally think of as a kind of.

In other words, dimensions don't seem to bear the same sort of relationship to each other as do opposites, least not in our ordinary thinking.

We think that opposites are mutually exclusive and that you can't have something that is hot and cold.

At the same time, it's either hot or cold, but dimensions are not mutually exclusive.

Dimensions are always dimensions of the same field or the same thing.

And so then you have to think that therefore, of what we've hitherto called the mental and the physical, the spiritual and the material as dimensions of the same thing. Dimensions of patterning, dimensions of energy.

So then you've got this fantastic universe with all these interlocking spectra and dimensions.

And this, of course, is the real harp that the angels play when they talk about you going to heaven and playing the harp. What are you doing?

You've got a spectrum of strings.

And from that, though, when you play the harp, you don't play all the strings at once. Would that be just chaos like when you play the piano? Just don't take your elbows like this and slouch in the whole thing down.

You select.

So throughout nature, all these spectra that are interlocked are being selected from. That is why the eye is select. Only a narrow band of the spectrum of light by the ears to select a narrow band only of the spectrum of sound.

And further than that, by the use of attention, we screen out all sorts of things we don't want to notice. Our senses are further selective to see by influenced by thought. And so this is analogous to plucking the strings of a harp where you make choices as to which strings you will pluck. So when the angels played our harp, the music is everything you see.

So that's the real meaning of what you do in heaven when you go and play the harp. You become one with God and you create the universe. That's the real me.

Well, now, what about the spectrum of consciousness?

I'm going to designate I couldn't avoid it.

I tried to, but I couldn't. A sevenfold spectrum.

That's number seven is awkward. Every kind of phony artist is hung up on seven.

And I wanted to get away from that, that I somehow couldn't manage it.

So let's let's take it like this.

We're going to see from one end the most dull dimension of consciousness or band of consciousness and landing up at the other end of the brightest. So you begin with number one, which is sleep.

And of course, there are two kinds of sleep dreamless.

I'm dreaming.

Number two is top us, as in the state of going to sleep or under the influence of alcohol.

You feel no pain at all or your sort of investor ties than your senses a dollar in blood and you don't feel like being very active.

3 Waking consciousness.

Only I have to qualify this because the others are awake, too. But I mean, our normal everyday consciousness, which we're going to call symbolic.

And I'll explain why as we go through these in detail. Number four.

Sensory consciousness. Number five, cellular.

Number six, molecular. And number seven.

We will just give the name light to it.

Now, I want to make it perfectly clear that these names that I have used are not claiming to be exact scientific names.

They are simply suggestive. We do not yet have a science of consciousness in the sense, the Western sense of science that doesn't exist. And that's one of the things we shall eventually have to do. So these names are rather symbolic names than exactly scientific names. And you must keep that in mind. Now, it's rather interesting that this particular spectrum should best be drawn not on the usual way a spectrum is drawn, which is simply a band, but it should be drawn as a circle of which each of these is, as it were, a cut in the pie so that beyond here is again, sleep, deep sleep, dreamless sleep, because, you know, the Hindus have a way of classifying the states of consciousness, which isn't quite the same as this. They start out with no one. This one.

The waking state, then they take no to the dreaming state. Number three, the dreamless state. And number four, this one, which is called Turiaf simply, which means the fourth and which cannot be described.

And they would say that when you go to bed at night, you think first into the dreaming state. Then you go down into what they call social party, the dreamless state, and you may get back into the fourth.

And that is why sleep refreshes you, because you are new. You as an individual are withdrawn into the center of the universe, into the Ottoman or the Brahman, the primordial reality, the ground of being used to express what she got from the Ark of Burma.

And so that's why you are refreshed every night. That's how you get there. You know who you are really deep in, because as the Hindus teach, everybody is really it.

That is to say, the Godhead is playing at being dreaming up, being whoever it is, your particular personality.

And then it's only at night then when you sleep, that you go back again to being the undivided one and only single essence of the universe. Only when you wake up, you forget about it.

Why?

Because in the primordial state there's nothing to remember. There's no time. And you have to have time working for memory to work.

So imagine then this things as a circle. I say at the top of the circle you have number seven.

Brilliant.

And then the colors of consciousness going right round and meeting again here, here and here.

So you kind of have black and white next to each other at the top.

If we all put this in terms of color, then all the other colors connecting them all the way round. Because, of course, you see black and white, as I will show you later on in the seminar, are astonishingly creative.

You can do everything with black and white.

Black and white really contain all color.

And this is why the Chinese theory of the universe is based on the opposition of the yang and the yin, the positive and negative. The name's Yang and Yin are derived respectively from the north and the south sides of a mountain. This is the primordial image. The yang is the south side of the mountain, which is bright. The yin is the north side of the mountain, which is from the shadow.

Now nobody ever saw a one sided mountain can't be such a thing.

So in the same way, you cannot have a yang without yin.

The symbol of the Armenian, you know, well, I don't even need to draw it. The two interlocked commoners one black, one white and each with the opposite color as its eye so that they look like two fishes chasing each other.

This is a very profound symbol because the idea which goes with it is this that young and in our way of process, where the yin aspect is the crest and the yang aspect is the trough. And likewise, in the same way as you can't have a one sided hill, you can't have half a wave. Half a wave doesn't exist anywhere in nature. There are no half waves of light, no half waves of sound that are always complete waves or none, because you cannot have the crest without the trough and you can't have the trough without the crest.

It just won't work.

Now, however, there is a pulse in this. There is a point where the young force reaches an ascendancy and then begins to drop into the end, where the yin force reaches an ascendancy and begins to rise into the young.

And the Chinese are always thinking about this in relation to tendencies in natural and human affairs, where, for example, the young force of a storm will reach a peak point where it must drop over into the yin force of calm, where the whole book of changes call. The aging is based on this. The aging is a marvelous play with yang and yin, you see. Just let me say this

about it in parenthesis. When you want to make a decision and you've got all the facts and released all the facts, you have got time to collect as you could go on collecting facts about any decision forever.

But the time comes when you have to make it and you say, now I've got all the facts and they really don't help me to decide. Because I might go one way and I might go the other. Let's flip a coin. And everybody's always doing that.

But you see, a coin only gives you two possibilities, two answers, it is either the thing answers yes or no. So the Chinese have a coin, as it were, to flip. Which gives you 64 possibilities.

And you take one of them and it doesn't give you a yes or no answer. It gives you a kind of thing like a Rorschach blot.

Really, it doesn't look like a Rorschach blob, but that's what it is into which you read your situation and make up your mind accordingly.

And this is done, you see, by combining the yang and the yin in a complex pattern, the lead, the imaging consists of hexagons and they are composed of two kinds of lines, an unbroken line.

Like this is a young or positive line and a broken line like this is again on negative lines.

Then they've got them now. There are.

If you take a figure with three lines, which we'll call a tri gram, see?

There are eight ways of making such a tri gram with Yang and the N lines.

This one happens to mean fire, no water, no fire excuse me, fire two positive and one negative in the middle.

Now, if you've got eight tri grams was a possibility of making out of those eight tri gram, 64 extra grams.

So this one would be water and you would get one which was fire and water together.

So to each of those. The book of changes attaches an oracular remark.

And if you look up the Balkans, when you buy a certain process, got your hex the ground, it gives you some light on your decision and the direction it should take by bringing it out of you by its remarks in the same way as a Rorschach blot brings out your psychological disposition.

So that 64 ways of tossing a coin, if you had a 64 sided coin, you could do it that way.

If you could make such a thing, you probably could, but that would be spherical.

So from Yang in the end, from the the extremes of polarity, because you see that light is as intense the alive as you can get. But if you go too far into light, it will burn you up and you'll get darkness. People don't know and they don't realize that the farthest you can get into darkness, it'll start getting bright.

Because you can't have darkness without light any more than you can have light without darkness.

So when we were babies, we were never told this. But it's the secret that light and dark go together. It is the only real secret there is.

Black and white. But what do we we we we've forgotten the secret because with black and white, we're playing another game which is called All Black Might Win. That's what makes everything a thrill.

If you knew you would always win in any situation, it would be just a pushover and life would suddenly seems to have any interest whatsoever.

You would be, as may imagine yourself in total control of everything that happens. A kind of Jehovah type. You would be bored to death. Everything would do. Just what? No surprises? Nothing. You see, when in a game

you're playing a game and the outcome of the game becomes known. Supposing in the course of bridge, the four players all suddenly realize together that one of them has all the cards, it will take the tricks. What do they do? They don't play the game. They cancel it and begin again. Shuffle the pack. When in chess, two pundits are sitting there meditating. One of them suddenly says, Well, it's obvious in 53 movies you're going to win.

They cancel the game. So in the same way, an omniscient God who knew the whole future would cancel the universe and say think up another.

So it is fundamental to the game of black and white that it must seem that black will win and eat up white. That in other words, nonexistence will triumph over existence. Or rather, let me put it this way. Non being will triumph over being, because the secret is that existence is being and non being isolating so that every time you get being you'll get none being just as everything is vibration.

The spectra of vibration, lightest vibration. If I sit next to a girl at the movies and I want to make flirtations with her, I put my hand on her knee and I leave it there. She seems to notice that if I gently pattern me, she'll know I'm there all the time because I go on and off, on and off, on and off, on and off, on and off. And that is energy. You see that that's something happening. And so everything is on off. Only sometimes on off happens so fast that you don't notice the OP. For example, light is a palace station then. And but all light seems to be constant. And so we don't notice the off because our retina is retaining the image of on while the off is happening in the light. So we don't notice the OP except if you'll get an hour flight, you can notice a little flicker to it. And that's why they don't allow our flights in sawmills, because sometimes the flickering of the Arclight can synchronize with the movement of the teeth on the saw.

In such a way that the saw seems to be still when it's actually moving and people get very serious accidents that way.

But everything is on off now, then sometimes you see we don't notice the off, but at other times we don't notice the on. And that is when we were asleep. When in other words, or when we're dead. When the trough the off

section takes a long spin because you see there are big vibrations and little vibrations. Some vibrations happen so fast that we can't measure them.

Others happen so slowly that it takes a century, may take a million years for a single swoop of the curve that goes down or that makes the upper crust of the wave easy. When you look at the wave pattern, you must realize that the crest is measured from the top to the middle of each trough and that the trough is measured from the top of each crest to the bottom of the trough.

They overlap.

So if you can argue it's all trough, you can argue it's all crest. It's a funny world.

So the argument that it's all trough and that maybe just a little bit of crest about winning like that point. These are the people who say, well, we are flashes in an eternal darkness. The pessimistic point of view. Then there are the people who say there really is no death at all. Death is just an illusion that seems to happen. The optimistic and the optimistic point of view is essential to the pessimistic as the pessimistic is essential to be optimistic. You wouldn't know who you were. You see, if you didn't have both points of view. I'm not going to see. And when I teach, I don't try to persuade anybody.

And everybody is at liberty to disagree because I wouldn't know what I was thinking unless there were people to disagree with me.

So in the same way, supposing you're in the social scene like here in Ohio.

There are nice people and there are not so nice people.

There are various kinds of nice people, various kinds of not so nice people. There are, for example, nice people who belong to the country club set.

There are nice people who belong to the art, he said, nice people who belong to the social service set and so on.

And then there are nasty people who would be very variously be defined as the poor, the beatniks, the generally disrespectful people who live on the wrong side of the track or the wrong part of the hill or whatever it is all the wrong town and not the nice people collector boost and maintain their collective ego by talking about how dreadful the nasty people are.

And the nasty people boost their collective ego by talking about what frightful bourgeois squares the nice people are, but they don't need a group realize that they have a symbiotic relationship just like bees and flowers only, whereas the bee flower relationship is harmonious.

The symbiosis of different social groups is this harmonious because each group needs the other to know who it is.

Whereas if you were the only kind of people that well, you wouldn't know who you were. See, in a totally conformist society. Someone is sitting next to you is just like you. There's no point talking to him because you might just as well talk to yourself. In other words, really, truly to be yourself. You need other you don't know what you mean by self unless you know what you mean by other. So this is how young Indian the polarities generate everything. And are absolutely essential to each other. Now, the funny thing is this. If you belong to a certain group of saved or elected people and you know you're saved and elect because of the damned people outside, whether this is a social salvation or spiritual salvation or any kind of salvation, you want to think of financial salvation, whatever. When you realize that you only know who you are because of the, as it were, adversary or enemy or outgroup. You start laughing because that's very funny. It's the contrast from suddenly thinking, you know, wow, those bastards outside and suddenly realizing that they are enabling you to take this pose of coming on tough, which you think is great. And you start laughing. And this is why society, as we now know it, is afraid of this ever getting let out. This is real, really simple. This is terrible subversive stuff.

I mean, all that Marxist is just as just the same thing as us backwards. It's the collectivist idea of the state as opposed to the individualist idea of the states.

But the individualists become collectivists through huge corporations. Lenin said he would love to see these great corporations growing up because it would be just so much easier for the state to take over that already provided the organization.

But you see, there is a tendency within our economy to become a collectivist economy just by progressing with its own whatever it's doing with its so-called free enterprise.

And there will be naturally, therefore be a tendency in a collective economy to fall apart because it all gets so boring and stop everybody out on his own initiative. Again, this thing goes round and round. But the important thing is that we're supposing you believe in a free enterprise economy you must have in order to maintain your solidarity, especially in a very great country. You must have an external enemy. And if there wasn't one, you'd have to invent one because it keeps everybody on their toes. It keeps us from slacking on the job and said, got to beat those fellows and that. Terrible. So we've got to be very serious about that and see how are we. And of course, we lose your sense of humor. When you get so serious, you don't really know underneath that it's a game and you become a butcher. On one extreme or communist on the other. So you have to keep if you want to be a sane human being, you have to know right in the back of your head, right back here, what the Germans call a hint of Dunker, which is where the back of your mind.

You have to see the point that enemies need each other.

Cops and robbers.

Where would the cops be for a job if there weren't any robbers? How would you know you were law abiding if the weren't criminals?

It's tricky, but it's very dangerous teaching, very subversive, because you might think I would say if I realized that what I said is simple. It doesn't matter what kind of a person I am and do anything I want because evil is necessary to good. There's no fun in that attitude because that simply says I won't play.

If you want to sit by yourself under a tree and not play, I guess you could do that provided you don't interfere with our game. And if you come and interfere with our game and say, well, now look, care, you people, you're all wrong.

No, because you think you ought to be good. But it doesn't matter whether you're good enough, you mustn't do that. Don't interfere with a game in order to have this kind of knowledge. That's why all this kind of knowledge has always been esoteric.

And in any esoteric school, people were tested first before they got it. In order to find out what he was civilized. In other words, you can't give powerful tools and powerful knowledge to people who aren't civilized and who have no humor and who have no graciousness.

That's why it's difficult when young people get hold of knowledge, that is that for which they're not emotionally prepared and they are given full and total instruction on birth control when they're four years old. It means nothing at all.

It may mean something positively dangerous, but nowadays you has no way of concealing these things. I said it's a secret, but in the world of science, there are no secrets.

So I don't feel any compunction about talking about these things because if I don't, somebody else is going to because an awful lot of people know about it.

But that is the inside dope. If I may say so. That this. These extremes lead each other and can't manifest without each other.

And the point is how to keep your head when you know that.

So let's have an intermission.

Well, now this morning I was dealing mainly with two key ideas, one of which was the physical universe as a system of inter meshing spectra. Depending on each other and playing with each other in the same way as

warp and woof in weaving. And I underline the notion that these spectra are different dimensions rather than components of the physical world.

And that although I'm using the word physical here, I'm using it in the sense of its original meaning natural rather than the later meaning that has been attached to it.

That is the same material world, the world envisaged by analogy with ceramics. The material world considered as a world made out of stuff.

You see, as we all know, stuff is supposed to be something inert and stupid, which can't do anything.

And therefore, in order that stuff may be found in intelligent shapes, it has to be informed by an external energy, an external intelligence, so as to be brought into shape. And this is the idea of the world based upon the analogy between creation and carpentry or creation and ceramics or creation and sculpture.

Just in parentheses, good.

Sarah, Sarah, ceramics and sculptors don't treat their medium as if it was stupid.

They know that the potter, who is a good potter, knows that there is life in clay and that he has to respond to that life in order to do the work of pottery properly. But those who are not themselves artists don't know this.

And therefore the public has been bamboozled for centuries on the notion that patterns have to be composed of some sort of basic stuff. That was I was trying to substitute for that sort of conception of the world.

The idea of interweaving spectra, which are different dimensions of energy or of patterning, and I used advisedly the verb patterning as distinct from the noun pattern, because when you use nouns in combination with verbs, you obscure language. Watch out for this. This underlies many people's misunderstanding of things is the differentiation of noun and verb.

It's an entirely unnecessary differentiation and it gives one the impression that wherever there is an action going on, that is to say something appropriately described by a verb.

There must be some other kind of thing than an action which is described by a noun. And to this is ascribed the origin of the action.

So when you say there is thinking because the verb has to have a subject which is a noun, someone says, well, who is thinking?

Obviously there can't be any thinking without a thinker, without a who thinks. And that is a question, a problem that arises simply because it is a convention of our grammar, that every verb has to have a subject which must always be a noun. So a noun stands for a thing and a verb stands for an event. And we therefore suppose that events are caused by things. But if you ask a person what he means by a thing, he will never be able to tell you. He will give you a series of synonyms such as object, fact, whatever. But all these are simply alternate words for thing. Then what do you mean by an event, set process, etc.? And he is equally vague.

You can always describe the events in terms of things, and equally you can describe things in terms of events.

If I want to say ordinary while the cat sat on the mat, the dog went for a walk around the house. That's noun verb language. But I can equally say while the cutting sat on the matting, the doggy went walking around the dwelling. And I've changed the whole sentence into verbs and it's still as clear as it was in the beginning. Or I can turn it all into nouns.

The cat seat upon the mat, the dog upon the walk around the house. It's all known.

But in one in a known world, of course, you will have a static world in the verb world. You will have a dynamic world, but there aren't. For example, if you take the word fist, is a fist a noun? Yes, but it describes a process. It's an it's not properly a noun because this noun suddenly vanishes. This thing, fiscal fist disappears the minute I open my hand.

What happened to it? See, I stopped fisting and I went into handing.

So in the the verb language has a little edge over the noun language as being better suited to the kind of process that nature is.

So when you realize that you can discuss the whole of nature in the verb language, you don't have to ask the question who started it? You don't, in other words, have to seek for a noun as the explanation of the verbs. You don't have to seek for something that is not process to start process off. So this then is the language I'm using when I talk about patterning as the basic goings on of the physical world and patterning can be described and measured and so on and so forth.

So then.

The other point that I was making particularly was there in in the spectrum you have the extremes of the spectrum. The sound and the silence, the light in the dark space and solid and I was showing how by the yin yang philosophy of the Chinese how these extremes are not opposites but pose, they go together. They require each other. You know, one in terms of the other. And so in this way, you don't have the world as an opposition of light and darkness, of being a non being in such a way that one of the poles could exist alone.

And either being on on being non being or being because the whole nature of poles is that without both of them that are neither.

And so if we have a parallel universe.

Then.

You don't, as it were, have to worry as if this was something to worry about, that the play, the music of existence might cease forever and ever and ever in that kind of cosmology argument that's now going on. Know there are two dominant theories of cosmology among physicists. One is the steady state theory and the other is the explosion theory. The steady state people want to make out that hydrogen free hydrogen in space is all the time, as it were, coagulated and forming itself into new bodies.

Whereas the explosion theory, people who have the edge of the argument at the moment say there was originally an enormous concentration of energy which blew up and expelled all the galaxies from it, which went floating out.

And the whole thing is gradually dissipating itself, radioactivity until it will reach a state of quiescence.

And of course, if you have a Judeo-Christian mind, which thinks of time in a linear way instead of a circular way, you'll think that's awful because the whole thing is running down. And when it's finished, that'll be it. But you see, I always want to ask the question whether, well, what was it like before the big bang went off in the beginning? We're probably pretty much the state, same state of affairs was when it all petered out in the end. In other words, whatever happened once can always happen again. Given enough time or given enough something or other. So I doubt I'll settle for either the steady state theory or the big bang theory doesn't make much difference, except by way of describing the pattern, how it happens. The question of whether it happens, I always figure that whatever did happen could happen again.

You know, I like to think about myself.

Well, I'm a kind of a funny phenomenon that this universe is doing and it's done me this time. It may be to me again later on, maybe a million years from now, you'll do. Do me again. Not quite the same way, but rather like me near enough to be me. You know, like you play the piano and you play a certain piece and then you stop and the piece is dead. Then you think, well, it's played again. You play the same piece again. It's the same piece, but it's a different playing.

Play the tape recorder. I've got the tape on here. I can play it. Then it stops. Then several days later, we put it on and play it again. It's a little different, probably, but same same process.

And every time the universe plays any one of you, each one of you, it plays as I do, everybody calls himself I, and you feel like your eye just as much as I feel I. That is to say that you are the middle, the sensitive center out of

which everything looks. And you call yourself I. Well, that's my name. And everyone is I. The only trouble about being I is that you can only be one at a time when a child asks, who would I have been if you if my father had been someone else? Mummy. Well, a funny questions children ask. Well, you learn how to be someone in order to be anyone, but every someone is I. And it's all, as it were, the same, I am looking out through different eyes, like you put an electric light inside a black sphere and make holes in the sphere and all the holes are different, but the light at the bottom of it's the same.

Something like that. That's kind of a rough analogy.

But any anyone knows from a physical point of view that every organism.

Is simply.

A pattern of behavior which can't be separated from the pattern of behavior which we call its environment.

It's all one pattern except the one pattern like everyone pattern. Take give me a pattern. And every pattern of these bamboos, there's a pattern and every pattern has wiggles in it.

And subway calls and sub sub wiggles see the main wiggle as the stem. Then the tweet come out as a sub sub wiggle. The leaf comes out as a sub, some wiggle. And if you look into the ether, a sub sub, sub weevils. And that's the way it goes. They all belong to the pattern. It's difficult to to say who's wiggling, what is the stem wiggling the leaves or the leaves wiggle in the stem. Both arguments are equally valid.

The universe is doing me and I'm doing the universe because the universe depends on my optic nerves and all that structure to turn the sun and light wouldn't be light if the wonder the eyes. That's like a hand on a drum. If there's no skin on the drum, there will be no noise.

Takes two to make love, to make an argument and do anything.

That's the annual.

Now let's go through this spectrum or begin to go through it. I'm not going to go all the way through it this afternoon.

You begin at the end of sleep torpor and we'll go as far as number three.

Do you know that sleep is a very mysterious subject? Scientific students of sleep are not yet at all sure what sleep is.

Apparently people need it, but nobody really knows why they need it from a strictly scientific point of view.

And we need we apparently need to dream in sleep also. People who are deprived of dreams get very, very restless and unhappy. But we're not quite sure why we need dreaming. I mean, we've got all sorts of theories, the Freudian and the unions and so on. They think we know they know why we need to dream.

But it hasn't been really rigorously established scientifically why we do or why we need to sleep.

But from a naive point of view, you can say, of course I need to sleep because after I've had a whole day of business and friends and work and so on.

It's just too much. There's too much input. I want to digest it. And while I'm digesting it, I don't want any more input. I don't want any more information. So I want to be turned off.

That's, you know, one of those simple, commonsense things that everybody knows but has not yet been fully explained. So sleep is this marvelous thing that we have, which is a forget a process that is apparently essential to our psychic health.

Every twelve hours or so and. If you don't get it, you start getting worried.

As a matter of fact, insomnia is a thing that is rather curious.

Because if you do get insomnia, the worst thing of all to do is to worry about it.

Invariably, if I can't sleep, I don't try to go to sleep.

I get up and work or do something or I read a very difficult book, especially one that is big and weighs a lot.

This is a good way to go to sleep.

But if you have insomnia, don't try to ever try to go to sleep. Nobody can try to go to sleep. Lots of mothers think they can get their children. And they said, darling, try to go to sleep. And your mother say to you, try to go to sleep. But she wanted to get you out of the way. That was the only reason she said, try to go to sleep. She thought perhaps if she it was good for you and that you ought really to get your sleep.

Like telling some child that it's got to eat its spinach and, you know, the child can start chewing and chewing and chewing on meat or spinach, which tastes of nothing, and it chews it into a absolute hard, stiff pulp. There's just nothing to be done with it except spit it out. You know, they've already extracted by their teeth instead of their stomach all the vital juices of the thing. And all that remains is roughage. And you say to children, you must go to the bathroom after breakfast every day regularly. You must be regular, otherwise your constipated. And that's bad. This is a form of the double bind. No, you are required to do that, which will be good only if it's done voluntarily.

So go try to go to sleep. It is impossible. Sleep has to happen because it's a spontaneous activity and can be helped as we shall see when we come to consider tapas.

But by and large, sleep is a spontaneous activity in as a way of turning yourself off to get away from the bombardment of awareness and forget because forgetting renews.

And that also is a function of all demolitions, of deaths, of destruction, of patterns, of knocking down buildings, of the whole change process in the universe, because we want to do what we've done before.

And so went after a hard day's work where people have been irritating and combative. You go home or you go to the local bar and you down a number of martinis, they turn you off and they put you into a state of near torpor or what is quite correctly and scientifically called this learned and funny word, not curses.

Now, cozies Narcissus, you know, is connected with not curses. It means or reduced consciousness, reduced sensory input.

And the reason why Narcissus is associated with not curses is that Narcissus, when he saw his reflection in the water, didn't know it was himself. And he became so fascinated by this image in the water that he became unaware of everything else.

He got hung up, or, shall we say, to use current slang hooked on his own image, and he didn't know it was his own image. That was the only reason he could get hooked on it.

So Narcissus and now coasts are associated and so not the normal the permissive narcotic in our culture is alcohol and other narcotics like opiates exist. But you must remember that you can only correctly use the word narcotic or something inducing the state of consciousness, which is the topper.

Now you can do it by massage, by relaxation exercises, by hot tubs. Many, many ways of inducing topper.

I mean, you and you are not in top. You're not truly relaxed because you tend to lose muscular tones, which you always retain in true relaxation, but you begin to go like a limp rag. Now there's a place for that in life and it's good as an way of sleep induction for people who have insomnia and are so anxious that they don't allow themselves to be turned off. I would want to say in general a good word for sleep and torpor, because a lot of people are against them who spend ski, who was good, just sort of Saint Paul.

And as much as a misinterpreted in a way to always felt that his life was a war against sleep, that intense light consciousness should conquer darkness. That's a stupid idea to be a human being.

You have to love the light. But you also must trust yourself to the darkness. Be able to let yourself go in the faith that you'll arrive back all in one piece.

I have a friend whose name is Charlotte Selva, and she does the kind of work for which there is no name. She calls it sensory awareness, and one of her experiments is to get a person to lie on the ground.

And simply she says to them, now it's all right. The ground is going to hold you up. So just lie down. And there's nothing else you need to do because the ground is firm and it will hold you. Then she examines the person's body after a while and says, look, do you know what you're doing?

You're trying to hold yourself together as if your skin weren't strong enough to contain you. You're doing this all the time to keep yourself from falling apart.

Why do you do that if you don't hold yourself together? You're just going to go there and disappear. And it's not gonna be right for green jello. No, you won't. In the same way a lot of people wonder why we would wear such ridiculous clothes, especially women.

Men are pretty bad, but women tie the men and do it around the neck. You know, the necktie is a symbol of slavery.

It's a noose to strangle you. But you feel tight that really held in here and held in by the belt. And women wear girdles, hold them in like this. And then the coat that fits your body jacket, you know, put it on and it fits and you're squeezed or you get this tight pants that hug you. And, you know, there are other people, of course, don't know they're there till they're sitting on spikes. Then they really know they're there. And a lot of people make trouble for themselves in order to be able to sit on spikes so that they know they're there. And supposing instead you switch to another kind of clothes, you wear Japanese clothes. I often wear Japanese clothes because they happen to be for men, the most comfortable form of clothing ever devised. There's only one place where it holds you, and that's the belt. But you wear the belt not round your waist, but below your belly, and you wear it rather loose.

Otherwise, the garments are flowing.

They don't interfere with the nature of the cloth because the cloth is woven on erect a linear pattern. The cloth is straight like this. So when you get a Japanese kimono, it folds up instantly for packing. But you try to pack a western man's jacket or a woman's suit jacket. And there's absolutely no way of folding the thing at all. So it always comes out of your suitcase needing to go to the pressing, but you take a kimono and you put it on and it falls exactly according to its own nature around you.

And they're very dignified.

And you feel but you don't feel closed in. Now, that makes some people terribly uncomfortable if they don't feel pinched and pull together. They don't feel dressed and feel this is ongoing around the bathrobe. And a lot of people can't wear a bathrobe beyond a certain hour of the day because they don't feel that they're respectable. I mean, you can perfectly well get up and put yourself into the most beautiful. Any kind of gorgeous bathrobe you want to run around and do your work if you don't have to go to the office. Even if you had to go to the office, they ought to allow you to wear interesting robes. And furthermore, I once asked the Japanese why he didn't wear a kimono anymore.

And he said, you can't run for a bus in a kitchen. Well, it's perfectly true. Less you hoist it up and tied into the belt. You can't. And that's rather undignified.

But the thing is that in this age that is now forthcoming, when we're going to cut down the working hours because of automation. People have got to learn to saunter and dawdle. Otherwise, they'll get into mischief. And so clever forms of clothing, which are supremely comfortable but which require a kind of a sauntering attitude to life, are going to be very important for the future of civilization.

This pitch for the criminal market. But this is all to do with letting yourself go into the earth, into the darkness, as it were, and trusting the world that lies below you as much as you might trust the world that lies above you.

Drop.

Fall freely in space. That's a marvelous sensation. It's like floating. That's why people do skydiving. Because just until they pull that parachute. Now the sensation of flying. Even though they're dropping very fast, they get the sensation, total freedom. That's what everybody's looking for.

So we get that in a way and sleep in the arms of Morpheus.

And the idea is sleep as healing. Some psychiatrists are very keen on the idea of putting their patients by hypnosis and other methods into long, long periods of sleep where they feel completely secure. Looked after. Nothing to worry about.

I have a favorite sleeping place. It's a house on top of the hills and Hollywood. There's a great eucalyptus trees and underneath us there is a deck.

And I like to get a sleeping bag and lie on my back.

Underneath this eucalyptus trees look up at the stars through the shadows of leaves and just go see if there's a marvelous feeling.

Well, now.

We come now to this, the things of sleep, where I will say this one thing about dreaming and about Topper. We know the motto in vino veritas.

In wine, the truth comes out cos it also as a subtle double take.

Meaning all popular sayings have many levels of meaning. And it's a Christian saying in vino veritas belongs to the Western culture. It also means in the wine is the true blood of Christ.

The Catholic mass.

That refers to the fact that life requires death, drinking blood.

But in the census, in vino veritas, the person reveals himself. Lets go of himself, let his unconscious come out when he is drunk or also in sleep, when the dreams come up and show the inner side of things.

You will see in that way that these two states can, in a certain sense, be creative. They let things come up which are normally put down because number three, spectrum, the waking state of what we will call symbolic consciousness is highly guarded. It is the most guarded of all these states.

Now that I want you to understand them, that the ordinary state of consciousness, what you call normal consciousness, is by no means a frank, objective awareness of the real world.

Not by any means at all.

It is a state of highly cultivated.

Hothouse reared.

Special ways of perceiving the world in accordance with symbolic formulae.

And it all depends on your orientation to the physical world as to what you see in it. You know, the story of a tailor who went to see the pope and they asked him what was he like? He said he was a 41.

Or a woman who says to a man, you saw Mrs. So-and-so today. Now, what was she wearing? She had no idea. You didn't notice, but you saw. But she didn't pay attention because you weren't interested in watching out on. But once you got off or whatever it be.

So we notice according to what we are programed or conditioned to notice by our social conditioning, that is to say, our upbringing, our education, our professional needs, our survival needs. So do we notice what's happening? Now, supposing somebody from an entirely different planet came into this room and started looking at us and he wasn't programed to notice the things that we notice, he would ask the most amazing questions about what we are doing. He had noticed that we most of us have standard ways of holding our

hands. Why do why does somebody abuse it like this? Why do some of you sit like this? Why do some of these that like this?

Why don't you do this? Well, not the obvious thing to do with your hands. Just let them hang.

Very few people ever do that because they feel a funny feeling.

They get that they've got a couple of wet fish down here.

They know what to do with them.

Then he'd notice all sorts of funny things about us that we would know never occurred to us to think about.

And he would notice, for example, you might say, well, what color is a human face? You know, the comic strip artists tell you pink or brown.

They do a black outline and then they color the whole face pink. Now for a change, take a real good look at a face and you'll start seeing that dial.

It just doesn't have a particular color. Not only does it depend where the face is in relation to the available light and what it's reflecting, but also it's a patchwork of all kinds of subtle color changes and it's full of funny has and spots and all sorts of things which we are not supposed to see, especially on ladies.

No girls. Men don't care so much if they have a house somewhere. The girls carefully pluck hairs out with tweezers and make them disappear so as to get as smooth the texture as possible. The Japanese go so far as for a beauty to cover herself completely with the white paste so that she's got complete pancake makeup.

Dead weight and the when the Japanese photographer takes a picture of you, you'll never recognize herself because he he works out every wrinkle, every shadow and presents. He was a complete mask because it's inauspicious to have shadows. When a westerner first painted one of the emperors with the shadows showing, they said, but you can't paint the

emperor that way. His face is not dirty. And besides, it's an auspicious day of a shadow fall on the imperial visage.

So you can see shadows. The artist Rembrandt torture to see shadows. Leonardo Torch would receive shadows. But modern painters have discovered that shadows and darkness, shadows and light, shadows of color, shadows are full of vitality. So you'll begin to get a vivid purple shadows.

People say, well, but you don't go round with the Purple Shadow on you, do you?

You mean do you think that a shadow is brown because you haven't ever looked at a shadow? You don't realize that shadows are absolutely vibrant with light. We'll go more into that later when we come to this number seven.

But there it is.

And see the the the the world that we see or think we see is actually not the world at all, but is a selection of things that are in the world, a selection governed by certain symbolic processes, what a man ought to look like, what a woman ought to look like. And we try ourselves to dress and to behave in such a way as we live up to their symbolic requirements that are expected of us.

So then.

We think that's a certain kind of work that is worthy of being done and you ought to be. Tinker, tailor, soldier, sailor, doctor, lawyer, merchant, chief, well, whatever it is, and you ought to fit into one of these rose costs. There are innumerable things one might do infinite.

But we we'd like to get classified. We want to know whether you're Republican or whether you're a Democrat, whether you belong to the left wing or to the right wing, whether you are a Christian, a Jew, Baptist, Methodist, whether you are a Mohammed or what you are, just so long as we can get you put into a local compartment, that is to say, into a symbolic classification.

Now, what is the reason for that?

Well, this kind of consciousness here is based on a very peculiar specialization of the human brain, which we call in everyday life conscious attention.

That is the capacity to focus or concentrate awareness.

Upon a what we call any one thing at a time.

It's as if, in other words, conscious attention were a spotlight. And that the rest of awareness were a floodlight.

In other words, every nerve and in your body is receiving input all the time. Is in this sense energized, is aware of everything that comes to its into its periphery.

So you are taking in the totality of your surroundings, but conscious attention is flipping from point to point to point to point like this.

And is making sense out of what it sees by adding it up with memory.

It's an immense advantage from some points of view to be able to have this faculty because it does the same sort of thing for the human organism that Radar does for a ship. That is to say, the function of radar is to scan the surroundings of the ship and watch out for unexpected changes in the environment.

And radar is a scanning process. In other words, it is the beam that goes out and bounces against things and feeds back the bounce to the screen.

So in exactly the same way, consciousness or conscious attention is always scanning the environment and watching out for new eventualities that might be threatening or that might present favorable opportunities for some sort of advancement.

Now, conscious attention has to be programmed as to what to attend to. What is important to look out for so that we say to baby now when it with teaching it language. Watch out for the cars on the street.

Watch out for that dogs. Watch out for this. Watch out for that. This is programing the baby's radar.

But we as a human community have put so much importance and so much psychic investment into our radar that we believe ourselves to be that.

We identify the self with the radar and not with the rest.

So that we get this sort of a situation when I say I. I say I do this, I walk, I talk, I think I run, I hit. But other things, such as the beating of the heart, the breathing of the lungs, the functioning of the glands, the constellation of the shapes of the bones are all defined not as think anything I do, but as something that happens to me just in the same way. When it rains, it happens to me. I don't rain.

But I do want.

And so, in other words, what has happened here is that we have identified ourselves with the IRA.

The point of origination, of conscious attention and with the point of voluntary control. That's me. Anything else happens to me.

So in this way, we have disowned most of ourselves. It's not me. The body you have is merely a vehicle that you go around in like an automobile. So if I would say to some.

Young woman gee, you're beautiful.

She might well reply if she were highly influenced by our culture. Oh, you're so like a man. All you think about is bodies. I may be beautiful, but I got my body from my parents and I want to be admired for myself and not for my chassis.

See, she's a little chauffeur. She declined to say she had disowned herself.

She disowned her body and said it was given to me by my parents. I'm not responsible for it. Or a child in rage can say to his parents. I never asked to be born.

It was you who brought me into this world. And that child doesn't know that when the father was going after the mama and there was just an evil gleam in his eye. That evil gleam in your father's eye was you. Just as it was you. That was the little spammer.

That made it was you that was that fetus.

The justice if if your heart is you, all that was you to.

But you see this waking consciousness in public consciousness ignores that altogether because it sets limits and rather arbitrary limits to what you are. You are just that voluntary center. You are that a beam of consciousness that sweeps over the environment and sees things in series one after another. Especially if you use a language which uses an alphabet, alphabet, spell everything out one after another, and you see, in other words, these sort of words strung together into sentences which build up meanings. Whereas on the other hand, if you work in terms of an idea graphic language, although it's true that an idea graph has parts like words, do the parts of a word always follow each other in this direction, whereas the parts of an idea graph may go in an entirely different direction.

See?

This, which is the Dow in Chinese. I take it in all at once. I need a sentence to translate that word in English.

But it's more of a picture than it is like ordinary words.

And as you grasp all the elements of the picture simultaneously, you see the form all together at once. That is nearer to the way nature exists. Nature things in nature exist all together at once. Everything's happening all together, everywhere, all at once. No. And we say, well, in words, it won't stop for you to describe it. Take too long. By the time you describe it, it is all different.

So.

We do see.

Luckily for us, have an aspect of our organism which is paying attention to all the things we don't notice.

This is how you can walk without stumbling, how you can drive a car downtown and at the same time carry on a conversation with a friend because it is your subconscious, as it were, or whatever you call it, that is taking care of the driving and is watching out for the red and green lights and the other cars. Your while your consciousness is preoccupied with the conversation.

So, however, in a culture where the value of spotlight consciousness is exalted and that is you, then do you see you have an exceedingly great need for state number two.

For Topper, because the spotlight is so bright and you can have too much of it so fast.

And also if you identify yourself with that, only you identify yourself with the troubleshooting aspect of your organism and you become relatively unaware of the amazingly harmonious and happy status of your organism that are going on all the time. And in times you see certain kinds of cultures, certain epochs in history, people emphasize that you've always got to be on the watch and they regard it as very simple to relax into the beautiful, wonderful processes that are going on in us that are harmonious constantly say, to enjoy breathing.

That's a silly thing to do. Most people would say they wouldn't enjoy breathing. What's that going to achieve? This is all goes back to see to this Christian idea, brethren, be sober, be vigilant to your adversary, the devil as a roaring lion, walking about seeking grooming, he may devour whom resists steadfast in the faith.

No to him. Christian does not see them on this holy ground. How the powers of darkness prowl and prowl around Christian often fight them.

And while he is going on all the time. See, you are never safe. Just as there are.

Termites in the basement gnawing away, parasites in your blood.

Probably little or few little cancer cells kicking up somewhere. How does the doctor inspect checkup once every two months? Watch, watch, watch, watch. It's coming. See, it's coming. And you've got to correct it here. Correct it there. Keep everything going. Otherwise, the weeds keep coming in. You don't watch out. The birds are all over the roof. Birds, you know, keep watching human beings. The minute the birds got any idea that a house is really vacant, they're going to move in. Squirrels, rats, everybody is waiting. And so on the spiritual level, there are the demons that just waiting.

So stay away. Don't dare go to sleep. Don't ever relax, because if you do, it will come.

Watch them for and pray.

You never know when it's gonna happen.

So this is the complete identification of man with his troubleshooter.

Just got to be on the watch.

The only difficulty about us is that when you manage to protect yourself so successfully against all the powers of darkness, you reach a point where you become the kind of creature that is no longer worth protecting. It's the same sort of thing that happens. But if to defeat the Nazis, you have to become Nazis. What was the point of the fight? If to defeat the Gestapo and the Secret Service of the red Chinese and all that plot, we have to have a secret police ourselves who are going to be just as bad as those. What what? What is gained? What are you protecting?

See that the biggest farce of all is this. If you want to know the real lowdown on the next war. Join the Air Force and be safe, because the only people who are really going to be protected are the guards. You know, you'll be able to have either be way up there or else you'll be in great vast basements in Nevada, where they've built under mountain airports with all

sorts of oxygen tanks and supplies and things the last forever, because what a farce the whole thing has become.

The original idea of gods and soldiers was to protect the women and the children. Now, what we do is we have the women and children bombed out of existence in the cities, whereas the guards are guarded. So all guarding eventually becomes guarding of guards. It's circles of defense, protecting circles of defense. And in this way, mammals turn into mollusks. A mammal is so constructed you see that the hard stuff is on the inside and the soft stuff on the outside. A mollusk is the other way round with the hard stuff on the outside, the soft stuff on the inside.

Well, nature favors a bit mammals over mollusks because a mammal is more sensitive, more responsive to the.

You go donk on it and it doesn't feel anything, whereas a mammal is really pliable, which is why, of course, in military tactics we abandon Dharma.

The knight in armor was completely helpless once he was on lost as he you see, he wore this armor, but he depended upon the forward rush of the horse and his lance to Brisbane blow through everything. But once you manage to unwholesome. He was a clumsy as thing. He was like a lobster and all you had to do was to knock him down and crack open his shell with a cannon.

So increased mobility was found to be more effective.

So now this watch business watch God always, always be watching to see, as I say, it creates it protects it encourages a style of life which eventually is not worth living because it is like being the great dictator. It is like trying to be God if you are the great dictator and you are in charge of everything. You should read a Hindu book called The Arthur Shuster.

This deals with advice to a man who is a Chakravarty, and that means a turn of the wheel. We would say a big wheel. Who is the supreme ruler?

And it tells him, first of all, that he must not trust anyone. No friends for you, my boy. No intimacies.

Keep your own counsel and especially watch out for women. They have a way of worming secrets out of you for their favors, which you want so much. So don't ever get too close to a woman.

You can have concubines and prostitutes and everything like that to satisfy your physical needs. But don't fall in love and trust no one.

Then arrange it so that everybody around you mistrusts everyone else. You set up what's called a black, a kind of negative Mandela. Mandela has a circle of power. You arrange it that your immediate ministers are at odds with their subordinates. Why? Because if your immediate ministers do anything to betray you, they are subordinates who want to occupy their superior position will sneak on them to you. Then you'll knock off the Grand Vizier and put someone in his place because he is fool enough to want to get up there. But still, then, outside that rank you have another rank of people at odds with those. And so all the way down. Divide and rule. Then you live at the center yourself, and you have a secret passage connecting your innermost center with somewhere down the river where you've got a boat waiting in case anything goes wrong. And on the way out was a stone, which you can remove. And when you remove this key stone, as you escape through your underground passage, the entire palace will collapse. Kill everyone. It gives you architectural instructions how to do this. Then, of course, you have to have poison testers for your food. Eat nothing until someone else has eaten it and see if they drop dead. And then you have to have guards standing beside you always day and night.

But there are other guards secreted behind panels in the wall who are watching the guards guarding.

And so you can't really ever sleep except with one eye open. You can never be like an ordinary inconspicuous individual and take a carefree walk in the park.

Because you have got to be in control 24 hours a day. So do you see how Big Brother? This is a Hindu version of Big Brother is the greatest prisoner of all. He is the captive of his own survival system. He can never go this way. Maybe find it very difficult to go this way. He has to be all the time playing God, playing the personal autocratic monarch of the universe. Now,

you may think this very courageous and so on, but in the end, the game isn't worth the candle.

That's forward.

So always watch it that what you fight for is worth fighting for and that it's something other than fighting for, fighting for because otherwise you start fighting for fighting for fighting for fighting for fighting for fighting.

So these then, in sum, are the advantages and limits of waking consciousness. That it is a version of the world where what is important is what is valuable for survival, where we live for a future where we live.

Always watchful for trouble.

Because death is the thing most of all to be avoided.

But this is a form of life which is always in danger of becoming not worth living and which totally ignores.

A whole world of experience going on all the time around us, which is magical. Gorgeous. And far surpassing in depth and wonder most of the things which ordinary waking consciousness people call pleasures.

Yesterday afternoon, I was working mainly on the contrast between the normal state of waking conscious attention, which was this one, number three and what you might call the generalized awareness of the human organism. And I was making the using the metaphor of conscious attention as a spotlight and the generalized awareness of the organism as a floodlight and showing how by identifying ourselves with the spotlight operation of consciousness and with the vibrant voluntary neuromuscular system we attained to a very partial conception of ourselves and a very partial and symbolic view of the world, that is to say.

We see what we learn to notice and we screen out everything else.

We really don't notice anything that we don't also have a name for. And children are constantly asking when they're learning to talk. What is this and what is that? And you'll notice that children very often point to things

for which we don't have any names and they want to know what it is. For example, we don't like some of the American Indians have a name for dry space. Nor do we have a name for the inside surface of a cylinder. There may be a mathematical term for it, but in ordinary speech, the inside surface of the cylinder doesn't have a name for it except long phrase the inside surface of a cylinder. Nor, for example, do we see any connection between having six toes and pushing aside the branches of a bush to get through. But in an American Indian language, those are the same ideas. It's all based on the idea of V U V the branches to get through. And you asked to your foot.

You have a sixth one being off at the edge.

You see now what you notice. What the way the world seems to you, the way it's logical. Connections seem to depend on whether you have words for it or whether you have symbols for it.

So then what happens is as a result of concentrating on or of using, shall I say, over using over exercising the faculty for conscious attention.

We come to have a sensation of our own existence as beings, definitively separate from the outside world. The world beyond the skin and from most of what goes on in our own bodies.

And this state of affairs we could call alienation when this state of affairs exists all by itself.

But it is not necessary for that state of affairs to exist all by itself. The spotlight consciousness can be supplemented by increasing use of the floodlight consciousness so that it becomes balanced. We assume that the baby, before it is learned conscious attention and before it has learned any words, is all the time using floodlight consciousness. With a little bit of spotlight and therefore would feel as Freud supposed oceanic, that is to say, at one with its surroundings, where later words are used and it is taught to be itself and to construct the outside world.

As society constructs it and conceives it. Then the baby develops a sense of having a separate ego. And this development is brought about by means of a strategist, a stratagem which gives the infant a great deal of confusion.

Because since the baby is given a sense of identity by parents and teachers and relatives and other children, it is unable to resist the pressure put upon it by the social group.

The pressure of a group, even upon an adult, is enormously powerful, much more so on a child.

So the odd thing is that by the commanding pressure of this group, the child is informed that it is free. That is to say that it is an independent agent and an originator of actions for which this separate identity is to be held responsible. And in that you see there is a weird gimmick because the baby is told that it must be free. You are ordered to be free. That is to say, you are required to do actions which will be acceptable only if you do them voluntarily. And this basic contradiction that underlies our sensation of personal existence is the result. Why most people are confused and why there is a nagging sense of frustration underlying all civilized human existence. Because you are trying to solve a self-contradictory and therefore insoluble problem. How to be responsible. You see, the word responsible carries its own contradiction.

It carries freedom.

You are able freely to decide upon your own actions. But you must be responsible. You must do what you're told.

So that paradox creates then the sense of the separate ego, which is, if anything, is a hallucination, a hallucination, because it does not correspond to any kind of scientific facts whatsoever. The separate organism, although separate, although having a clear outline and identity in that sense and although every human character is unique and different from all others.

Nevertheless, every organism goes with its environment in separately and the behavior of organism environment is a single field of behavior. These are the facts as they are seen by physicists, biologists and ecologists.

But our experience, our sensation of our own existence is not in accord with the facts. So what it seems is necessary for us to do is not, as it were, to try

to get rid of the sense of having a separate ego. You can't do that. You can't wash off blood with blood.

And if you try to get rid of it, you actually intensify the hallucination that it exists. As a real thing, but the ego exists in the same way as the equator. That is to say, it is a social institution.

An imaginary boundary which has a certain convenience to it. But when you start mistaking social institutions for physical processes, you are under a hallucination.

So then could we possibly go to a state of consciousness in which without giving up the spotlight? That is to say, the faculty for conscious attention and for constructing symbolic worlds by selection among our sense impressions. Could we do that? Not sort of all by itself in a vacuum, but against the background of more generalized awareness. Because after all, every particular activity, every tracing out of details, as I pointed out yesterday, requires a background. So the background of ordinary attentive consciousness looking at is generalized awareness. And the more you become aware of generalized awareness, the more you realize that you and the external world. Right out to the furthest known galaxies are a single process.

And so when this begins to appear, one moves into state number four, which I have called sensory awareness.

There is a Zen saying.

When looking for the pillow in the dark. The mind is all in the hand. Now, it's very interesting how you can, as it were, shift your mind all over yourself.

Normally one thinks of it as in the head, although for Chinese and Japanese, the center of the mind is always in the center of the chest, which they call Shin and Chinese or choro in Japanese. And that means the heart mind.

And they feel that they think from here we feel, of course, that we think from here and that we have a little man inside our head who is the ego

directed at all. But you can as the saying, you are looking for the pillow in the dark or you're looking for the soap in the bath tub. When all the water's cloudy, the mind is all in the hands.

Now, beyond that, you can very simply get into a state of consciousness where you.

Your mind seems to be all over you.

Where instead of feeling that you are looking at things, you feel rather that you are becoming them.

And the whole external world comes on.

One could only say in a very different way from the usual.

The reason why this can happen is, of course, that all that we feel about the external world is in fact a state of our own bodies. What you are seeing now in front of you is how it feels inside your head in the optical nervous center's. Your brain and all that goes with it is translating whatever there is in the outside world into states of itself called color, shape, weight, texture and so on. So all that you see is you really physically, but also one must add to this that one of the things in the external world is you.

So you are both outside and inside. You are something in nature, but all that you know of nature is you. You'd have to take these two things into consideration simultaneously. So sometimes it might feel as if everything you see is inside your skull.

And the next moment, it might feel that your scholars in the middle of everything. Then the next moment everything is inside you and then you are in the middle of everything you see. Sort of capping process like this.

So in this state.

You find that you less and less discriminate between what is important to be looked at and what is not important to be looked at.

In order to enter this state, the first thing that is necessary is to slow down.

To suspend judgment on what you ought or ought not to be doing.

And here I would say then that I'm describing the initial stage of a process of meditation. And in talking in general about meditation, it is absolutely essential to understand that one cannot meditate correctly if you do it as a preparatory exercise for something else.

Meditation is not. Self-improvement do not enter into it under any such delusions. There is no one to be improved. Meditation is a form of enjoyment. It's a way of digging the universe.

I may put it so slightly, meditation is not meditating on anything. This always bothers Orientals. When somebody says, well, while we do this or that, we meditate. Well, the Western always says, what do you meditate on? An Oriental can't understand that. You don't meditate on anything. Meditation isn't about anything. It isn't like thinking about. It's simply a clarification of consciousness.

And can be about anything or nothing.

And so to enter the state of mind, which is called Janna, which when translated into Japanese becomes Zen, Jonna is a yoga word. The first thing that's necessary is then to slow down and to abandon notions of what it is important to do and what it's not important to do. And instead of closing your eyes, keep them open, keep your ears open, keep all senses open, but don't program them.

That is to say, don't tell them what they're supposed to look at. Let them simply fall upon or let everything that is there to be heard or seen arrive by itself and let the senses work by themselves. That is to say, let your eyes see whatever they want to see, that your ears hear whatever they want to hear. Let your nose smell whatever it wants to smell and let your sense of touch, feel whatever it wants to touch. And in general, let your mind do whatever it wants to do. Of course, as a matter of habit, the mind tends to be incessantly chattering. Words set up constant circuits and there are one skull is full of voices.

They're not always your voice. Your mother's voice. Your father's voice. Your Aunt Matilda's voice. Your teacher's voice is still talking to you. When you think and if you listen very carefully to your thoughts, you will hear other people in your head, because you see you are not you. You are an amazing collection of what George Herbert Mead called the interior eyes. Others. And all this chorus of voices is constantly directing your life and propagandizing you.

You have now to tell them to shut up and try to let thinking, that is to say, interior talking stop. Now you can't force it to shut up. And that is why one of the classical aids to meditation is concentration. To find something to focus the attention on so that the chattering will cease and it should be something interesting, something that is not interesting in the sense that you can think a lot of ideas about it, but something which is enormously fascinating for its purely sensuous aspects.

The female form is not too appropriate for this purpose, nor the male form for women.

If they find that very fascinating because it has so much social junk attached to it, so many associations, so one inclines to choose something like jewelry or a crystal or a flower or a purely abstract play of light patterns or something like that as what is called a support for contemplation, something which you don't need to think about, that which you can look at in rapt. And as you acquire this way of becoming wordlessly interested and fascinated with any focal point of consciousness, you will begin to see as your eyes move that the whole world is like that.

That.

For example, you become aware of the myriads of colors playing around on the floor. This isn't the question are trying to see how many things you can notice. You know, a game that children play is that a tray of assorted objects is displayed for them for one minute and then cupboard and you write down how many things you saw on the tray. It's not like that at all because on any given tray there are infinitely many things and you could never count them all out.

It isn't the point of how many things can you see. The point is like having a clear window to look through instead of a dirty one.

So that the whole of the sense sorry, I am, that is to say, everything seen, tasted, touched and smelled becomes much clearer and none of it as.

As you learn not to think about it. It becomes much richer than it is when you think about it.

And so everything starts to be more real, more alive, more glowing, and you suspend also judgments about things. What is good? What is bad?

And in doing this, you introduce yourself to a fascinating world.

That is why some Indian yogis practice what is called Mona, which is silence, maybe silent somehow for 10 years, some or all their lives, because after you have practiced silence for a month, you get silence in your head as well.

Now, there are dangers to being a monkey when you see the clouds.

You become the cloud. And if you are wondering down a street where there's a riot going on, you're liable to join the riot. Because that's what's happening. You just go with it. So one doesn't enter into mana without a guru and without some kind of a discipline which protects you that were builds a protective wall around your experiment just in the same way as a bird builds a protective wall, the shell round the young chick when it is before it's ready to hatch. So in the ordinary way, therefore, you can't expect a Western person negotiating a high civilization to be a mountain or to be silent all the time but you for the sanity of any Western person involved in this kind of civilization.

It is very important for him indeed to be silent some of the time and I mean silent inside the head. Just as you must stop talking occasionally if you want to hear what anything anybody else has to say. So you must stop thinking in order to find out what there is to think about. If you talk all the time, you will have nothing to talk about except talking. If you think all the time, you will have nothing to think about except thinking.

And so you will exhaust yourself and come to a dead end.

Which is called psychosis.

So for health, it is very important to stop thinking.

Not always so that you find that you get a non-thinking state as background to the thinking state, and this corresponds to floodlight awareness as background or spotlight awareness in Zen Buddhism. The word non-thinking state is called Noonan.

This is Japanese moon and.

No. No.

Nen thought it means thought and it also means blocking.

Having a jerky mind, let's call it that.

So this state I'm describing is the state of Montana of no thought. But it doesn't mean a kind of anti intellectual attitude.

Huckabee in the 17th century, M. writes in one of his poem. He uses the phrase taking hold of the no thought in the midst of thoughts. So that means having a mind that has, in a way, like a mirror dancer. The Chinese, Darwish said the perfect man employs his mind as a mirror. It grasps nothing. It refuses nothing it receives but does not keep.

And so the poem says the wild geese do not intend to cast their reflection. The water has no mind to retain the image.

So it weighs a mind as it then that is has no attachments.

Now, attachment is a word that has associations in English, which do not quite does doesn't quite give the Buddhist feeling for the meaning of the word. But the slang term that we now use a hang up is the right translation for attachment. When you say a person's all hung up or he has a particular hang up, that is the Buddhist meaning of attachment. It means a mental fixation. Or an emotional fixation on some particular pattern of life.

So to get rid of hang ups, one must first get rid of thinking after you've got rid of it completely and have thereby revived the background.

The mirror, as it were, the mirror mind.

Then you can go back to thinking and you can think against the background perfectly comfortably and not get hung up on thinking.

And so in this way, you get an extraordinary feeling of life going on as a single process all the time, which doesn't stick you and it are all one. And it's got all kinds of differentiations within it so that it doesn't become some sort of a formless blur. But it is sort of.

It flows like water, as water has all the patterns in its network of sunlight.

The ripples, so on. So in the same way the world has all this, but it constantly flows because of no hang ups.

So then the royal road to the state is giving up the sense of urgency that you ought to do something, something is required of you.

And understand, for example, that looking at a rubber band on your fingers.

Can be quite as important as anything else you can do.

In other words, being here at this moment and listening to the sound of my voice without paying the slightest attention to what it means can be as important as anything there is in the universe.

Why not? Is the tree outside important? It's beautiful. Is it worth looking at? Why certain? But it's not achieving any great mission in life. She's being a tree, as Emerson said in his essay.

I think on compensation, these roses under my window are not concerned whether they are better than last year's roses, or whether next year's roses will be better than they.

There is simply the rose it lives for today. And that's the point.

When you learn the art of meditation in this way, you will see other people rushing around wildly like chickens with their heads cut off and they think they're going somewhere and they're completely deluded.

They're there and they don't know it. That's why they're rushing around so wildly.

But you, by this means, can begin to learn that you are there now and that the extraordinary thing, as you see the world in this way, especially as you see people in this way and from this point of view, you realize that people are valid natural processes, just like trees and birds and clouds. Now, do you ever criticize a cloud for being badly shaped? Did you ever see patterns in foam make an aesthetic mistake?

Well, no, I'm just doesn't.

There was once an 18th century classicist, one of those people who enjoyed formal gardens and kind of Greek palaces, who criticized the stars for not being symmetrically arranged, but that would never occur to us today. We don't want to see our stars in wretched geometrical patterns.

We love to see the scatter of them and the curious groupings of the sky in a marvelous, irregular order. A marvelous, odorless order, you might call it.

The funny thing about clouds and stars and mountains and all natural outlines is that.

They are beautiful and we know that they have a quality which distinguishes them from being masses when you know a mess when you see it.

But these things don't apparently make Mrs..

So in a way, human beings don't either.

And when you see human life as something that is just the same kind of thing as the shape of a tree or a cloud or like that, you stop judging it.

And you have to know that about yourself. And this is the beginning of everything.

This is the beginning of every kind of wisdom to see that you really don't have to go anywhere.

You don't have to get any better than you are because with all your defects, your selfishness, your neuroses, your sicknesses and everything. Well, fish have neuroses and sicknesses and so on. And so your plants you often see in plants that got bumps on them or some queer little diseases and so on.

And they they they all have those sort of troubles. That's life. But when you realize that you're an authentic projection of the universe, just as you are at this moment, then there's nowhere to go. No need to do anything. And out of that peace comes energy. Real energy instead of phony energy, which is trying to lift yourself up by your own bootstraps. The usual kind of human energy which gets progressively nowhere with more and more business.

Now, beyond this state, there is going to follow another, which I have numbered five. I called it cellular awareness. And I must repeat the fact that I use this word cellular, not in a strictly scientific way, but as a good way of describing the kind of awareness that it is, how it feels from the inside, because it is as if every cell in your body became alive.

Now, you know yourselves, don't talk English.

But they are a very, very subtly and highly organized things.

If you've ever seen a model of a living cell, you've seen the most fantastic object and those cells are engaged in all sorts of activities, but they don't structure the world the way you structure it because they don't use that language.

And so as you get into cellular awareness, you begin to feel rather like the artist who paints in a pointless fashion, that everything is dots, little tiny vortices.

You become aware of the texture of things to an extraordinary degree.

It's almost as if the world had been photographed through a screen which put into the senses a feeling of intense detail as if every one of your nerve ends.

Had was now detected in sending its separate message to the brain.

And so this makes the world looks highly textured.

There are no more such things as blank, green or blank white spaces, all space is rich.

And that is what those painters are representing in doing spaces with dit, dit, dit, dit, dit, dit, the brush like this.

And also, you will notice that certain kinds of painting, particularly as a Persian miniatures, if you look at them, you will see the artist is painting the world as the Arabian Nights describe the secret garden into which Aladdin went, where all the trees were made of jewels and where everything looked as precious as if it had been carved by a master carvers.

And they try with their art to give the impression that the more you look into the background, you see suddenly that the background of a pillar, that the painter hasn't made it white. He has put a design into it in white, but just a slightly different shade of white complex design.

You feel that within the design that is still another design and that it has an infinitely carved, rich texture.

This is this is why Oriental art in general, you find this among the Chinese at a certain period.

You find it constantly in India, you find it in Persia, you find it in the Moorish work and you find it too.

In early Celtic manuscripts like The Book of Kells, the Lindisfarne Gospels and so on. This such fascination with what seems to be a world of infinite detail.

And this, of course, is the world of paradise. This is what all those angels and whatnot are about.

Now, from cellular consciousness, you can pass to what I would call, again, symbolically molecular consciousness. Not that you are going to be aware of molecules.

No. But it is as if suddenly. This is the state which Buddhists are part of, the state, which the Buddhists call such a..

It's as if it can be rather frightening because everything becomes perfectly meetings, people.

Everything that's going on is just jazz, almost electronic. Jazz is a dancing process of energy.

And you feel sort of lost in it. Well. Well, what's supposed to happen? I mean, well, what's it all about? It's just dancing energy.

And you can.

You have to be careful here because this is the danger point in the meditative process, because here you can suddenly get the vision of hell and the vision of hell is that this world is a monstrous mockery, that it is meaningless in the worst sense of that word.

It is just a gyration, a pointless gyration of particles or a wave equals or whatever, which is tormenting itself.

It keeps itself going on with a certain kind of hope in order that it may eventually destroy things. And then you see the horror of biology as the mutual eating society. What a ghastly conception it all is. And everything is phony. People say they are people, but they're not. They're just robots. Everything is made of plastic or enamel tin. Everything is just buzz.

That's a danger you see here.

But if this happens to you and you get the feeling that everything is pointless, everything is just mechanical buzz. What you do is what an Arab

does in a sandstorm. He knows there is no possibility of conquering the sandstorm.

So he kneels down sort of in a fetal position and takes his world noose and covers himself completely and waits.

Until the storm is over. If he gets covered by sand, it is usually porous enough to admit some error breathing or in the same way as an ocean liner in a typhoon.

They just turn off the engines and drift is the only thing to do.

So in the same way, if you ever get into this particular kind of psychic horrors.

Just let it be.

And it will resolve itself.

And it's important to go through that state in a way important to realize that you don't know anything, you don't know what it's all about. You don't understand the universe.

It's all incomprehensible words and systems were just a way of whistling in the dark. We all whistled in the dark together and agreed that we had the same whistle. And that was great. But we really don't know anything. Anybody who opposes us is an authority about anything at all. Business making an authoritative noise.

And he may be able to make some remarkable demonstrations, for example, by interfering with diseases in various ways. We can make people healthy for a time until we can't make them healthy anymore.

This may be a good thing. It may not be a good thing.

It might be best not to interfere with nature, but simply to let human beings alone and regulate by a kind of in unnatural homeostasis their own population level. And let's let it happen. There is no way of proving

conclusively that our way of dealing with these things is better than doing nothing.

But life is, in a way, an experiment all the time. One's whole existence, the very shape of one's body is just coming on the sea. Come on, somehow. And so one way is this. We all come together, come on together, looking like each other and having certain common characteristics. We'll look at a snake skin. Every scale is rather like the other and it's all coming on together.

So you suddenly see that there is no particular reason why you should be this way rather than that, that everybody is putting on a good show, a big act.

And if you're not ready for that, if you're not educated to the point where you can understand that situation, you may get very nervous.

You say, well, everybody always wants to know what am I supposed to do?

So this is a common question. What am I supposed to do? How am I supposed to feel? I'm not an authority. I want someone to convince me that the way I'm doing it the right way. But don't you realize whenever you accept authority, you accept it on your authority?

You say I believe the Bible because why do you believe the Bible?

Because it says Jesus says in the Bible that we should believe the Bible nobility.

It's all. It's your opinion that that is an opinion to be accepted.

It's on your own authority. You create the power of your own teacher and you create the power of your own government. That's the saying the people get swapped. Government deserves.

And if you don't like it and you don't overthrow it, well, then that's your problem. But always you see authorities springs from you. So. So also does the way you define yourself, you accepted society. And its suggestions

always rather tacitly, but you did so here in this amazing moment of seeing the world as a big act, as a big buzz, as jazz doing this.

This this is this is this is this is this is this is this. It's all vibration.

And you see absolutely no compelling reason why it should be that way rather than any other way.

Well, if you don't panic, you see them. Then you get into the domain that Buddhists call such a..

It is just as it is.

Now, if it's a big act, who's doing it? Who is the actor?

What what lies behind all this jazz? That's the big question.

And it is through asking that question that we moved from six to seven.

Into the state that I called late.

Because when you become aware of energy jazzing this way and that way, and on top of this, you have already, don't forget, become aware that you and the outside world are a single energy system.

Then what is it?

Do you realize, for example. I do not exist to I at all unless there's something else that's other. And that immediately is the clue to the fact that itself and other polar, they go together. How did they go together? All right. Put it the other way around. What would you do if you were God?

If you were the works, in other words, if you were this whole capacity for patterning energy, what would you do? Well, first of all, have to draw the line somewhere and then proceed.

You'd have to make a difference.

Because if something makes it doesn't make a difference, it doesn't matter, does it? So if you want to make matter, you've got to make a difference.

Well, if you take that along and you try all the amazing differences that can be tried and you differentiate this from that and so on and so forth, among all the possibilities of being God, you will eventually arrive at what you're doing now.

To be it just this sort of circumstance, because this will be one of the infinitely many things to do. With certain restrictions on you. Which, of course, you tacitly originated because you wouldn't know where you were without them. Then you suddenly see with this astounding clarity that the the energy may symbolize itself to you as a sensation of intense light. You see, our understandings have a way of representing themselves to us in sensuous imagery. We say when very happy I was walking on air, you could have knocked me down with a feather. He saw the light. Everything became clear. Are you transparent? Now, these are not necessarily meant literally, but in intense cases of insight.

There is a literal sensory feeling corresponding to the inside. And when something becomes utterly clear in a way that is emotionally and intellectually overwhelming.

You are liable to have the feeling of intense light inside your head, or sometimes a feeling that everything looks transparent as if it were glass. But it's still there. You don't actually see through it.

Don't see the pattern on the chair behind somebodies head, but they look transparent because things have become clear and it has become at this point a light shattering lay clear that everything is it the light, the energy coming on at you in different ways and you are coming on at it and it's all one coming on.

You can see that light is the basic component of black things. There is nowhere that isn't light. And if you can't see it, you can hear it.

It comes on at you in all kinds of disguises.

So here you see its tabling, here it's handling and in here it's revolting, it's dancing, all sorts of patterns and Europe.

Now.

As I said, this may clothe itself, this comprehension in the sensation of vivid light as being the ultimate component of the might say the very inside stream of the nerve.

Reduce it all down to what it is fundamentally. That's why when you blow up the atom, you get this light because it's all locked in it.

But then simultaneously, you remember how I described yesterday the fellow who gets to the hub of the wheel and gets his piece there. Then he gets energy and then he goes out to the circumference again. Well, then you see that there really is no difference, not fundamentally between this state of illumination and what we call number three or ordinary everyday consciousness.

You suddenly realize that the way things are now in the perfectly ordinary life are the same thing as the late.

Which is sort of undifferentiated and overwhelmingly brilliant. The same energy that seems to you light in that state, pure light. Then you understand is just what you're looking at. That sitting in this room, you are sitting back in the middle of the beatific vision.

Only we have we were taught before then to sort of put down the world by saying, well, this is prosaic, ordinary, everyday life.

And we were sitting in a lecture room and on sort of funny chairs, which as perches for the human body.

And, you know, having a lecture on very ordinary matter of fact.

And you see from this point of view, there's nothing ordinary about it at all. While we so the Zen poem. Supernatural power, a marvelous activity, drawing water, carrying wood.

Well, now I want a deal this afternoon with a troublesome aspect of the whole problem of the transformation of consciousness.

Which has received during the past few years and even more during the past few months.

An enormous amount of publicity.

And that is, of course, the connection between alterations of consciousness and development of mystical states of awareness with drugs.

And the first thing we have to do in considering a question of this kind is to clean up our semantics.

First of all, I want to say a little bit about artificial and natural. Because there are certain contexts in which the word natural means good and artificial means bad.

And I, for the life of me, I cannot get to the bottom of this.

Because nothing is more artificial than the distinction between the artificial and the natural.

The bird's nest is as artificial as a house. So is a business. Everything done by artifice is artificial, I suppose. And yet if you look as the Chinese do at art as a work of nature, you wonder what all this means. Artificiality, in one sense is acting with skill or with art. It means in Latin, *factum* is from the root *facere* to make ours artists. Artifact what is made by art. So a sculpture, painting, in fact, anything well and skillfully made as an artifact or a work of art. Doesn't have to be fine art to be a shoe, a dress or cooking pot, anything. In fact, our museums are stocked with the everyday objects of the ancients, which we consider works of art.

I don't know whether in the future there will stop museums with aluminum saucepans and things like that. It remains to be seen.

But then the artificial also has a secondary sense of something that looks too much as if it were a work of art.

What we call affected, studied or contrived. When you get what looks like a drinking glass made of glass and you suddenly find out it's made of plastic, you'll get a feeling of the artificial and second sense something pretending to be what it isn't. Something that lacks what you expected. The cool heavy quality of a glass and suddenly it's featherweight and has no substance to it. Or when a person behaves in an artificial way, you feel they are awkward about it. They are putting it on and what they are putting on at you is entirely different from what they feel underneath. Then you say their behavior is contrived or artificial. And I suppose we could use the word artificial this way to mean that to have a kind of a bad sense. So then that arises the troublesome question.

Is there any difference between natural and artificial ways of taking transformations of consciousness which lead you to great insights and understandings? And this is, of course, comparable to the problem of travel. It is natural to walk. You are endowed with legs. Is it unnatural to ride a horse, to take a carriage, to drive an automobile, to take a jet plane? Is that artificial or is it an extension of human capacity in the same way as a bird's nest? That's a very difficult question to decide if you have time. Of course, it's fun to drive to the East Coast. Practically no one bothers to walk nowadays. That would be very abnormal. But of course, if you drive or even take a bicycle, you do see the country and you are aware of the great transition that you're making from one coast to another.

But you sure can't swim to Tokyo. If you're going to go there at all, you acquire, you require at least the artificiality of the boat, and the Pacific is a big, big, empty bunch of water and one bit as much like another unless you landed an island. So you may as well take the plane. There you are in 13 hours. What a difference from the day when they drifted across by the currents, took sailing boats.

Well, you could say when they got there, they really knew they were there. Nowadays, traveling by jet is simply like going inside an elevator. You get the say, whereas the elevator, if it goes too fast, goes down from the 10th floor to the first. And you feel your stomach has been left on the. Traveling by jet, you are apt to feel that your psyche hasn't caught up with you and left it back in New York. And here you are in the higher the times all

different. And it's earlier in the day than practically when you started and you feel sort of this arranged, but all the same. Would it be reasonable to argue that you ought not to travel by jet planes, that you should leave and proceed in a proper, slow manner? Of course, the people who can't afford to travel by jet will tell you so that their way is obviously more natural than yours, and that you are cheating when you take the jet.

You're a wretched capitalist or something, but you see, this is an internal debate goes on and on and on and is a kind of one upmanship.

The real question is, of course, if you take a jet plane to the Orient, what are you going to do when you get there?

That's the real question. Are you going to go to all the best European style or American style hotels and visit Japan as if you were inside a glass case?

That would be pretty artificial because after all, you could just sit home and see color movies for all that goes.

And I do take her people to Japan on and off and some of them like to get mixed up in the life of the country. But some of them absolutely want to be wrapped in cellophane and hygienic.

They can't stand the idea of eating Japanese food. A Japanese bathtub as deplorable as for a Japanese toilet. It is unspeakable because they are so rigid and adaptable that they won't learn new ways of doing things. So it does make a difference whether even if everybody goes by Jet, how they relate themselves to the new environment when they get there. That's the important question. And that depends on whether they're adaptable personalities or rigid personalities.

How stuck they are. How how their identity is glued to certain ways of behaving. There are some people who, unless they have a certain same kind of breakfast every day, are just not themselves.

I remember I used to eat at the lunch counter in England, where an extremely square young man was often there at the same time I was, and he would invariably order three small beef sandwiches. This place specialized

in rather small sandwiches, and he ordered everyday three beef and a glass of beer. And if it had ever changed, he would have had a complete psychic upheaval.

But now the same the question of the jet plane and as to say the technical means of arriving somewhere is in a way parallel to the question. Will you travel in these states of consciousness by.

There are many ways of doing it.

You see that are the methods of meditation, some of which are quite difficult and take a very long time.

They are like walking or do what want to have technical help, that is to say.

What about the chemistry of the matter? Do these states of consciousness correspond to various states of chemistry? Now, in traditionally spiritual people in our culture are horrified at this idea because everything to do with chemistry is labeled artificial. In the bad sense.

As if somehow or other anything achieved by chemical change isn't real. But it is somehow synthetic.

Like plastic glass instead of real glass or like synthetic vitamin C instead of vitamin C derived from rose hips or wonder bread instead of real bread.

But this isn't so easily solved.

The word drug to begin with is an alarm word, except in certain contexts. Nobody is alarmed when they see the notice drugstore. That's folksy and natural and longs as part of our life. Pharmacy is a little more threatening. Actually, a drugstore is OK. But when you say about somebody, he takes drugs. You are a pretty dreadful.

That sounds. It's got the idea of drug equal dope.

And as everybody knows, a dope fiend is a character with circles under his eyes who lies around all day in a kind of stupor, experiencing inner fantasies and bliss, probably sexual and all sorts of weird things going on.

And he is in a frightful state where he depends on taking more and more of this stuff and he gets increasingly dependent on it.

And oh my. That's terrible.

Cause some of one's best friends are alcoholics.

There is a little difference being in status from being a dope fiend, although an alcoholic, of course, can lie around and do nothing for hours and hours and just drink and get more and more dependent on it and have to drink more and more in order to keep going. I mean, you get to feel guilty about it. He has to drink more in order to stop his sense of guilt hurting because he finds out he can't stop. So he has to go on some kind of a status symbol in being alcoholic.

It goes with the culture and it's a mildly approved sin.

People can boast about alcohol, how much they can drink, what fun. It was the drunk we had the other night. And you can get away with it.

The Chinese and the Japanese have absolutely no sense of guilt whatsoever in connection with imbibing alcohol.

They are known among people who use other chemicals as juices, and they are amazing. You see a party of Japanese businessmen going down the street night, all with their arms around each other's necks and swaying across the street and singing. Nobody bothers. They're quite harmless. They're not going to fight anybody. The police don't care.

There they are. Everyone says it's all right. They're happy.

The great Chinese poets are full of references to the joys of getting gloriously drunk and then writing poetry. There was one famous Zen monk who used to get very drunk, and then he had soak his hair in Sumi ink and splash it all over a piece of paper, and then he'd wash it out and look at this thing that he had done, and he would do a Rorschach blot on it until this thing became a landscape.

Then all you'd have to do was to touch his brush to certain points. And what's this land magnificent landscape would appear.

But he had to get to just the right degree of drunkenness to let go and slosh this paper with his inky hair.

I was one day talking with a Zen priest who a student of mine several years ago, and he said, I had a letter from my teacher this morning.

Oh, I said, that's interesting. How is he? Oh, he's fine. But he said he's very drunk. He drank too much. I said, this is your teacher. He goes entertains ideas. And my Zen teacher. He said, he riven mountain where? Very cool. The only way to keep wandering socket.

And so nobody has any any any feeling about it that it's bad, but it.

It is a drug and it is a narcotic. In the strict sense of the word of one that in quantity will induce not coasts or torpor, even sleep.

So you see, the word drug, though, isn't normally applied to alcohol.

If somebody says the doctor says to a patient, are you taking any drugs at this time?

The patient thinks that C, penicillin or whatever, you know, sleeping pills, barbiturates and says, no, no, I'm not taking any drugs.

Forgot to mention alcohol because that doesn't come. Not recognized as a drug. So you see how loaded the word drug is.

So if we want to keep our conversation clean, we don't use it. There's too many double takes and funny associations. We say instead, chemical. Nice, neutral word.

So you see them. There are states of consciousness that correspond to chemistry.

Here we get another difficulty.

There is a certain prejudice going with the word chemical to say that life. To talk about biochemistry as if life were explainable entirely in terms of chemistry or controllable in terms of chemistry seems to be a put down to life. There are many. It's it's it's much within the culture that we live in that mine should always triumph of the matter. This is why Christian science is so popular in the United States and all kinds of so-called metaphysical things, divine science, religious science, et cetera, et cetera, et cetera. All concentrate over, think positively and all will be well. Keep your thoughts pure and clean and strong and always look on the better side of things. And then the physical world money and all that sort of thing will take care of itself. And if it doesn't, well, be happy just the same mind over matter. This is a great thing in America.

But it's impossible to practice because one is also material.

If you could perfectly practice mind over matter, of course you should abstain from eating and not be dependent on this murdering business that we all have to do in order to stay alive. You should certainly renounce aspirin. You shouldn't take vitamins, their chemicals and in a sense, drugs, coffee, tea, all that. That's very wicked. And of course, don't drink wine.

When Italian people are asked to specify what they spend on liquor, food, etc., they always list the wine under food. Liquor means strong drink because they consider wine as healthy, normal, everyday drink that everybody naturally has. And the French would think of it the same way.

You see how culturally relative these ideas are. Depending on what you're used to and how you're used to classifying things.

But you see the chemistry, the chemistry of things.

Is simply a certain way of describing what happens. You can describe anything from a chemical point of view. In other words, you take an oil painting by a great master and it there is a chemical description of it possible and musical composition can be described in terms of the physics of sound and accurately measured in those terms. But the only thing is that the language of chemistry is rather clumsy when you are trying to explain what the artist was attempting to convey through his painting.

And the language is the physics of sound is rather clumsy when you're trying to explain the intentions of Mozart.

And from some points of view, also, the language of biochemistry was clumsy when you are attempting to discuss the nature of various intellectual or spiritual insights.

But nevertheless, there is a chemical aspect to all spiritual things. Just as for every photograph, whether it be a photograph of a great saint or a striptease artist in the newspaper, there is at the basis of all of them that grid, which is necessary for reproducing a photograph at all.

So let's not be too snobbish about our relationship to processes that have chemical and physical descriptions attached to them.

Even the Catholic Church.

Admits there are such things as sacraments.

And that through the physical agency of water, a person may be given the grace of baptism and through the physical agencies of bread and wine, he may partake of the body and blood of Christ.

Using physical means to a spiritual end.

And I always detect in people who want to make mind entirely superior to matter, matters completely subordinate to mind a certain kind of spiritual pride. Which in Christianity is the most insufferable of sins. G.K. Chesterton used to recommend as a spiritual exercise, putting your head on the ground and looking between your legs so that you could see everything as if it were hanging from the earth.

Everything dependent on the earth dependent means in Latin, hanging down, hanging from. And this is a good point of view.

Because you see, as I may have indicated in the seminar, I think it is in this, people who are too spiritual are like wine or drink, which is pure alcohol, it

has no body. And people who are too material are like Grenadines. It's a soft, sweet drink with no bite, no spirit.

And we have to follow the middle way. So therefore, there are chemicals which bring about changes of consciousness. Which can be.

In my opinion, aides to the meditation process.

I remember a Chinese doused philosopher once said to me, when you start meditating, you should have a few drinks.

It will increase your progress by about six months.

That's a dangerous attitude and it's a very Chinese attitude. That may be true for Chinese people. I will, I will. I don't. I don't like to work that way myself.

But when it comes to what can be done with the type of chemicals that have been called psychedelic. That is a very meaningless word.

That means nothing at all in Greek except perhaps soul destroying. But it is meant to mean mind manifesting.

I call them psychotropic, which, although it is a very vague term, just means consciousness or mind changing. Of course, all the narcotics are psychotropic. They change. The mind is very difficult to find a word for those chemicals that have to do with these states. But there are in a way, these certain ones to be considered.

And we can say they are roughly form into three types because the cannabis or Indian hemp there is masculine.

And psilocybin. And then as LSD.

These are the principal ones that are under discussion today. And over here, of course, you see in this demand we have alcohol.

Opiates. And I suppose barbiturates.

In other words, the true narcotics.

Well, now.

In the use of any of these substances. There are three factors to be considered or what is called more strictly three variables.

One is the chemical itself.

Two is the setting in which it is used. This the surrounding circumstances, both physical and social.

And three, the set and the set means the attitude and character of the person using them as background. What he brings to it.

And because there are three variables, it's impossible to say of any one of these chemicals that they are specific in what they do. And so in a way, everybody has to speak for himself because he speaks of what happens in the set and setting in which he uses them. But some generalizations can be made. All things being more or less equal. But you always have to take it with a certain grain of salt and with certain reservations.

So what we're talking about them is the alteration of consciousness, which these things will do pretty much of themselves. And then over and above that. What they will do given the optimal set and setting.

Now, from my point of view, I do not know and nobody really knows whether any of these chemicals are specifically therapeutic. There have been in the past therapeutic uses of cannabis or Indian hemp. Old I looked at a British materia medica dated 1918 and there were all sorts of ways in which this was then prescribed. But there is no conclusive evidence that these are specific chemicals to be given for specific ailments. And normally you see when a physician prescribes a drug of a chemical of any kind, he feels that he is only justified in introducing the subject into the human system for purposes of healing a specific disease. With the exception, perhaps of vitamins, which are he feels our health builders and could, as a matter of cost, be taken as dietary supplements. In that case, he is using these chemicals as diet rather than medicine. There is an important

difference you see between medicine and diet. Medicine is for a specific occasion, diet for a regular occasion. And if it is medicine, it is important, too, that you do not become hooked on medicine. One of the most important differences between the practice of a physician and the practice of a clergyman is that a physician is trying to get rid of his patients as fast as possible. He wants to cure them and send them away so that the medicine can be stopped and they don't have to come to his office or hospital anymore. Whereas a clergyman is trying to get you hooked on the medicine. He wants you to continue to come to church to pay your pledge to be there every Sunday and become a regular member or disciple of the congregation.

It's rather funny.

So many, many centuries ago, the physician and the priest to the same person, they had an argument at one point and they split because the physicians became more and more empirical in their approach. And the priests became more scholastic. The difference between a scholastic and an empiricist is that the scholastic knows everything that is written in the book, and he takes his idea of truth from the books and serves as a very ancient and venerable book like the Bible or the Vedas or the Confucian classics. The Scholastic looks for all truth in their pages.

He does not look outside for just the same reason that the theologians would not look through Galileo's telescope because they said, well, if it agrees with what is in the Bible, we do not need to look through it. If it does doesn't agree with what's in the Bible, it must be the work of the devil. But increasingly, physicians began to take an empirical point of view, which was opposed to the scholastic and the theological, and therefore priest and physician could not be the same person. But this has had unfortunate results in that it has impoverished both professions. If somebody is seriously disturbed in mind today and he goes to a clergyman, the clergyman will immediately send him to a psychiatrist. Because no clergyman today feels except perhaps a few Catholic priests, that he has the power to cast out demons. When did you last year of somebody being exorcised? So in other words, the club most clergy do not believe in their religion. They do not have any sense that they possess any true power anymore. And so instead

they send you to some psychiatrist. Now, this is not true by any means of all psychiatrist, but as I find it is true of most psychiatrist and especially those who are the residents and the permanent staff of mental hospitals.

The moment a patient there begins to talk about religion, they know he's crazy because of religion from the point of view of the philosophy of science at the end of the nineteenth century, which was the birth time of psychoanalysis and of a great deal of modern psychiatry. It was the fashion then to regard all religious beliefs as purely superstitious. And that philosophy has carried down to the present day. There are some awkward alliances between psychiatrists and clergymen. And there is a thing called pastoral psychology or pastoral psychotherapy. There are psychiatrist teaching in theological schools. But the arrangement between them is unhappy or has been because especially when you say, well, a lot of people's troubles are due to their sexual repressions. You take a Freudian standpoint about that. Well, the church can't agree with you because the church is a sexual regulation society above all else, whatever. Otherwise, it pretends sexual irregularity is about the only thing you can get kicked out of the church for.

So then the doctor, the physician feels out of role when he prescribes medicine. There being no disease.

He doesn't like to do that in the same way the doctor is shoved out of role when a patient is certainly dying and nothing will help.

He is not allowed by his ethic to administer some painless death pill to the patient, but instead it is much worse than that.

He often feels obliged to keep the patient alive as long as possible. In a state of suspended animation on the ends of all sorts of tubes.

Feeling very uncomfortable and miserable because although, however, he may be doped up against actual physical pain, all the family's savings are going away, and the great difficulty drags on and on and on. And furthermore, the general hospital attitude to a dying patient is one of absolute falsehood. To say you're coming on, you'll be all right. Maybe a couple of weeks from now and all the friends come and say, cheer up. Oh,

boy. The things are not so bad as they seem. They don't add very probably they're much worse. But there there's a complete failure to face death as an important event.

And that is not the physician's fault. It is that a very complex thing. His role has been socially defined in such a way that he is out of role in these emergencies as he is out of role when it comes to using chemicals for something other than the curing of disease.

Now, in my own opinion, these particular chemicals look as if they are not going to be therapeutic agents, agents, but research tools. Just as you magnify your senses with a telephone which enables you to hear for thousands of miles with television, which enables you to see for thousands of miles over the telescope, over the microscope, which enables you to see things totally invisible to the naked eye. May I ask whether these things are bad artificiality? Whether it is really wrong to use telephones, television, microscopes, telescopes? Is that bad?

Well, if it's all right to use a microscope outside your skin.

Here it is, a brass gadget with lenses in it. It is all right if it's outside your skin. Couldn't it be all right to use an instrument inside your skin, which would do a kind of magnification process from within the nervous system, provided that this does not seriously damage you? I suppose you can ruin your eyesight by using microscopes.

But if it's not damaging and if you handle it expertly, anybody can have fun looking through a microscope and see all the little things go wiggle, wiggle and see the jazz go by. But if you happen to have biological or chemical knowledge, then a microscope is an extremely useful tool, as is the telescope to an astronomer or to a navigator.

So I regard these substances as instruments for investigation of the nature of consciousness. Which require careful use because like all things that take you into unfamiliar realms, all exploring is dangerous. It's dangerous to explore outer space. It was dangerous to settle the West because there you encountered wild Indians. In this sort of situation, you don't encounter wild Indians, but you encounter psychoses. And that is always dangerous, of

course. And you might get into a psychosis, especially if you were predisposed to do so in the first place.

But just because something is dangerous doesn't mean at all that we shouldn't do it. It's dangerous to practice yoga. You can go crazy with that. Lots of people have it's probably less dangerous to practice yoga than to drive on the freeway. It's probably safer to take a ride by plane than to practice yoga or to take LSD. But certainly LSD is not so unsafe as to drive your car on the freeway or even around town.

So assuming the responsible use of these substances, really things can be done with them.

So let's consider the possibilities of each of these three groups that I've put up here. I am going to show that normally speaking, what they will do and how far they will go of themselves.

This one cannabis will of itself go about this far.

In other words, it will add the dimension of the sensory consciousness to the symbolic.

Pretty much of itself, and obvious incidentally, is commonly known as marijuana and it is a non habit forming chemical.

Which has a usually calming but sensory alerting and intensifying effect, which is perfectly harmless if not used in very large quantities.

And practically every medical authority who's ever published anything on it agrees with this position.

It does not lead to anything except itself unless it so happens that somebody is selling it to you who really wants to sell you heroin.

Then he will try to tempt you.

Say are sincere.

Come on, try some real good stuff. See? And there a kids say to take heroin, but heroin belongs over here and moves in this direction.

It's a narcotic.

Cannabis belongs on this side of symbolic consciousness, moves in this direction.

These two masculine and psilocybin will of themselves take you about that far.

Into what I described in this morning session, then various characteristics of what I call the cellular consciousness, both of them are curious in respect that of course, you know, that masculine is the same as peyote. It is a distilled synthetic which corresponds to the active the main active principles in the peyote cactus and is used by the Indians of the Southwest for a religious sacrament. They are. That is the Native American Church, which is a Christian Indian church, which has a very good reputation as a kind of a law abiding, pleasant people.

The characteristic symptomatology of both these substances this incidentally is psilocybin is also from the Southwest.

That is a synthetic of the active principle of certain mushrooms that are to be found principally in the state of war. Harker But actually along the whole west coast of America, as far north as Vancouver. The Mushroom psilocybin Mexicana Heim is the principal ones so used. And likewise here again, this mushroom which is called Tail Canal or the flesh of God, is taken for religious purposes in a sacramental way. Both of these, as I would say, have a general atmosphere about them, which is rather earthy. They go extraordinarily well with the vegetative world. They bring to life one's vision of nature and water and plants and sky in an extraordinary way. On the other hand, LSD has a more. I can only call it electronic feel about it. I don't know why, but the possibility of LSD by itself is to get to about here. And all that I described as the molecular kind of consciousness. LSD is produced from wheat, ergot from first of all life surging acid, which is derived from wheat. Good. And then refined into a very complex molecule

diet. Ethyl am I'd of Lysacek acid and the dye AFL made in particular is number 25. So it's LSD 25 as the normal.

Correct. Initials for it.

The peculiarity of this substance is what? A lot will be done by a little. It is given in microgram doses.

Now a microgram is a millionth, not a millionth of a gram thousandths. An a milligram is a thousandth of a gram, the millionth of a ground. And that you can't see vitamin B 12 is also given in my micrograms.

And as little as 75 or even 50 micrograms will produce the characteristic effects of LSD in most human subjects. 100 will certainly do it. I would say any dosage over 200 involves risks. And so when irresponsible experimentation involves people vying with each other as to how much they've taken and they start to go up towards a thousand that they've been just plain stupid mean who knows? Like sitting around them, man and a great drunk and betting on whether you could demolish a whole quart of whiskey in an hour. Well, what a ridiculous thing to do. I mean, that's like trying to land a jet aircraft on the freeway is just stupid. And so one always feels that in the use of these things that they have the same sort of dangers that high powered things of any kind have rifles or automobiles or planes and therefore that the use of them should be licensed. The question is, we don't know quite how to license them because we don't know who is really qualified to decide. This is one of the most problematic things of the whole of our technological advance. Who is to decide? Because you seem to be a qualified expert on any of these subjects. It isn't enough to be a psychiatrist alone. It isn't enough to be a psycho pharmacologist. That is to say, one who specifically studies the biochemistry of the neurology of these substances. The psychiatrist should also have some knowledge of religion, of sociology, of mythology, of you might say, mythology, including symbols and all that sort of thing. Those that should go along with it. And you see, we don't yet train a class of person who has all these disciplines at his disposal.

And so every trained class of person who belongs in a particular category. Minister, psychiatrist, pharmacologist, all feel it a bit of a disadvantage and

therefore reluctant to assume responsibility for this kind of investigation. But you see, the trouble is, he's one of those things you can't get out of. Somebody has got to assume responsibility for it because it's happening. All these things are being used and nothing is going to stop their use. You can't prohibit LSD, at least you can write it down in the books that it is prohibited and you could tell the police to stop it. But why? The police are harassed enough with enough jobs as it is. Why send them on a task considerably more difficult than looking for needles in a haystack? LSD can be disguised so as to appear like almost anything.

It can be made into gun for envelopes. It can be disguised as Kleenex or blotting paper or peanut butter or honey or just anything you choose. And so it is. So my nude, it is tasteless. It has no odor. So there is no way whatsoever of concealing this. It is the perfect secret weapon. It is the perfect elixir. You know, the thing that is the mystery and therefore, it can induce. It's fantastic paranoia.

Not only it's so funny when you read some of the alarmist notices written about LSD from people who have never taken it. They read just as if they had taken it and then had a bad trip because they've got paranoia. They see it on all sides everywhere. This menace creeping in, in the marmalade, in the drinking water.

You know, to just drop a pound of it in the local reservoir, the whole town's turned on.

So like the general in Dr. Strangelove who is objecting to the communist plot to put fluoride into the water and destroy our natural juices, similar personalities are terrified that there's a big communist bloc of something or other to circulate LSD to undermine the youth of America and make them all peaceable so that they won't fight.

Well, that's not the way to handle things. All these things are best when they're out in the open.

And then when we can have no paranoia about it, no hiding things as it is, supposing a group of students who are not out for kicks, incidentally, kicks as a way of putting down young people. That's not taking them seriously. If

you want to put down the young people and say they're only out for kicks, you have no business sending them to fight wars in Vietnam, which is a very responsible undertaking. So if a group of kids in college decide that they, for serious reasons of religious or personal investigation, want to take LSD, it would be very sensible of them to ask a psychiatrist to come over and sit with them for the day, and they would each put up enough money to pay him for his time, but they are not allowed to do so. That would be illegal. It would be illegal for the psychiatrist to take part in such a thing. That's the kind of nonsense you get to. So that what happens instead is that crime takes over and organized crime hasn't really moved into LSD yet because there aren't been enough enthusiastic graduate chemistry students who would manufacture it. And they're idealists and they only want to make a relatively small amount of money on it. And they want to turn everybody on. They want to turn on the president, the United States, the president of the Russian republic and everybody. They want to get high on LSD to make them see things.

And here lie the dangers that the only way of getting LSD at the moment is on the black market. Genuine researchers cannot get it right now. Now, black market LSD is liable to be loaded with many other things, especially if it comes from the syndicate. It is apt to be spiked with heroin so as to get you hooked. Other people mix it with amphetamines to scoop up the effects.

Then also the idealistic graduate student may give you a larger dose than you thought you were buying. And so it's twice what it says on the bottle. And since there is no control over the quality of manufacture, it is as bad as the state of affairs in prohibition when people were drinking highly deleterious bathtub gin. Nobody in his senses will take black market LSD.

You don't know what you're getting.

So by comparison with black market LSD, these other materials are not nearly so dangerous if taken in moderation. This really isn't dangerous at all.

It's just that probably if people smoked it, it would give the liquor industry a bit too much competition for comfort.

So they're now each of these I've drawn a characteristic limit point where I said it will take you of itself. But then with a little push. If you've got the background and the initiative and the what what have you. The training, you can take each one of them further. In fact, you can take even this one right the way through to here. And this. Likewise.

But you see, there's a corresponding effort or whatever you want to call it, involved in each case.

And you see, generally speaking, their effects are everything that I described under the terms of sensory consciousness, the sense of being time slowed down, being at one with the full physical environment, finding enormous delight and significance in what would ordinarily be called insignificant or unimportant patterns. The tones of people's voice, the fantastic vibrations of musical instrument that different qualities of texture and so on is very much emphasized here, which is why this is a favorite chemical among musicians. Here one goes into this very much the utter fascination of the microscopic world, of texture, of the splendor of nature. I picked up with the using masculine a rotten log about so long, so thick with fungus on it, you know, that kind of shelf like fungus that grows. And in the state of masculine, this looked like a piece of jewelry, a great big thing made of ebony and ivory. And heaven only knows what all of it looked as if it had been my nuclear carved by a man like Cellini.

It looked like a superb work of art instead of just a rotten old log. With LSD.

The same initial sort of effects, but with it is apt to go for a while.

A kind of a strange sensory jazz.

Walls start to breathe, to waver ripple. Supposing you see something like.

Let's take a sea urchins shell.

You can look at it and all the nipples on it start to wiggle.

Not only to your eyes, but also to a sense of touch.

Meanwhile, the shell breathe in and out with the nipples wiggling on it and you wonder now what's the reason for that? Is this a hallucination? What's going on?

You know, it's obviously the effect of the chemical, but I begin to wonder about this because I have tried to establish why they wiggle. And I find if I hold my eyes quite still on a certain point, they stop wiggling. But if I in the normal way, let my eyes drift hither and yon over the thing, it wiggles.

So I begin to think, well, after all, my eyes are gelatinous and my brain is a pretty gooey mass of stuff. Maybe that thing is seen in the eye and on the soft surface of the retina actually do wiggle a bit. Only we learn not to see that.

After all, when birds walk. Have you ever watched? When a bird walks, its head goes like this.

Now if you do that, you'll get your landscape going. You see. But obviously, surely birds don't permanently live in a landscape that goes like this when they walk. In other words, they screen that out and they make a constant. So likewise. We've learned socially that all these lines in this room are straight. They're not wiggly. They're made of a solid substance. And they don't wiggle. Well, maybe they do in our in our eyes only we've learned to ignore that. Just as we can see, I don't have binocular vision. And so if I look at something, I should be seeing it double. But I don't because I repress psychologically. One of the eyes I can be either.

But I've simply repressed that information so that I see like anybody else. So these changes are rather strange. And not only do colors become intensely vivid, but songs boomed through them.

And then you get to a point where you can see light in terms of sound, in terms of shape, all the senses seem to be one sense, fundamentally a kind of fundamental sense of touch that you touch light with your eyes, you touch sound with your ears. You touch wood with your fingers. You touch gas with your nose. And you touch taste essences with your tongue.

But it's all one touch. And then beyond that, you get into something else.

When the sensory jazz wears off, the effect seems to go to deeper levels of one's mind. And I would say for me, the most startling property of all these three chemicals in their varying ways is that they substitute for either or fit thinking and feeling both AMD. That is to say, they facilitate polar feeling and thinking. You see, according to a staff psychology, our normal attentive consciousness is captured by the figure rather than the background, by the moving rather than the stationary enclosed figures with clear outline against the background. When your attention in such a way that you see the figure and ignore the background if on an empty blackboard.

I draw this figure and say to an audience, What is it? Most people will say It is a circle. It is a ball. It is a desk. Very few people will suggest that I have drawn a hole in a wall, you see, because attention goes here.

But you realize obviously you couldn't see the figure without any background. Now you find you can reverse the tension between figure and ground fairly easily. You see this either as a ball or as a hole in the wall. But it's difficult to see it as both in the same way, you know, that figure of two faces in profile which are about to kiss each other and they are a black silhouette. But the area between the profiles forms a white chalice. Now it's very difficult to see simultaneously kissing faces and white chalice. You tend to see one or the other because the two images are incompatible unless perhaps you form the concept of it as a loving cup. Then you may be able to see both because what you see depends to a large extent on the concept that you're using. If, for example, you have a concept of number which goes one to three many, then you can never know that a table has four corners. You haven't got the number for it has many corners because it's a one above three. Anything above three is many.

So there's no difference in concept between a table with Four Corners or a table with 20.

For those primitive kind of earth musicians. So then polar thinking becomes characteristic of all of these in here and increasingly felt that the inside goes with the outside.

In the same way that the back goes with the front, that you go with your circumstances.

It isn't that you are pushed around by them as a puppet, but that you and your circumstances, you and your environment are all the real you. That's what you're doing. And so you experience, even though the circumstances may not be what would ordinarily be called harmonious. That is to say, pleasant circumstances.

You realize that there is an unbreakable harmony between your behavior and the behavior of the external world. And so this polarity becomes very important, but it can scare the wits out of you. And this is a danger point.

If you say now, then all right. If inside goes without side, likewise good goes with bad.

As I said before, you wouldn't know you were law abiding people unless there were some criminals around to compare yourselves with. By comparison, you know that you're law abiding. Well, now you begin to worry.

If God goes with dad, who's in charge around here, who.

Who's to say what's right if, after all, everything works out in the end, if anything goes. And therefore, you can start to get worried. How will I know? What will I depend on in myself that I will behave in what is considered a sane way at the next moment? Will I suddenly be overcome with a passion to kill somebody in Ireland and in this way, not knowing which end is up because everything is so relative? It feels as if you when you put your foot, your psychic foot upon what you hope to be firm ground, the ground immediately collapses and you find yourself freely falling in space. And this is terrifying. You are afloat. You are in the floating world. You are in the relative universe in which there is nothing to hang on to because the only thing that might be valuable unto is you.

In other words, suddenly the eternal rock, the firm foundation upon which the Saints of the Lord is supposed to build the rock of ages in which you're supposed to be able to hide yourself. All that has gone and it seems at first that there is nothing, nothing, nothing to cling to.

And so the sweat can fall from you until you say, well, that's really the way it always was.

When I was born, I was kicked off the edge of a precipice. And I've been consoling myself all this time by hugging to a big chunk of rock that fell off with me. But, you know, there is no security. And if you go with it, you see and you don't try to fight and to find something to cling to, it's all right. Then you discover that the void that you were so frightened of is the clear light. This thing.

That it isn't empty in the ordinary sense of the word at all. But once you let go of your clinging, that is all you let go of. There's no you to let go of. Really, all the thing to do is stop clinging. Because that's what that does is bunch you all up. It's like going around like this.

For the totally paranoid thinking, what's gonna to happen?

Oh, come on, loosen up. You can't do anything if your hands are tied up here all the time holding on to yourself. You know, you're trying to get armor, pulling up your own belt and try to lift yourself off the ground this way. You never get anywhere, but when you let go. Then there's the possibility of doing something. Well, I hope that people will get some sense about these things and that those of us who are interested in their responsible use will be able to use them responsibly and through that be able to educate the public into a sane behavior with these things, just as we are able, to some extent, to educate the public to behave sensibly with automobiles and whiskey.

We haven't done too good a job, but at any rate, we do make a try out.

Nature of Consciousness

I find it a little difficult to say what the subject matter of this seminar is going to be, because it's too fundamental to give it a title. I'm going to talk about what there is. Now, the first thing, though, that we have to do is to get our perspectives with some background about the basic ideas that, as Westerners living today in the United States, influence our everyday

common sense, our fundamental notions about what life is about. And there are historical origins for this, which influence us more strongly than most people realize. Ideas of the world which are built into the very nature of the language we use, and of our ideas of logic, and of what makes sense altogether.

And these basic ideas I call myth, not using the word 'myth' to mean simply something untrue, but to use the word 'myth' in a more powerful sense. A myth is an image in terms of which we try to make sense of the world. Now, for example, a myth in a way is a metaphore. If you want to explain electricity to someone who doesn't know anything about electricity, you say, well, you talk about an electric current. Now, the word 'current' is borrowed from rivers. It's borrowed from hydrolics, and so you explain electricity in terms of water. Now, electricity is not water, it behaves actually in a different way, but there are some ways in which the behavior of water is like the behavior of electricity, and so you explain it in terms of water. Or if you're an astronomer, and you want to explain to people what you mean by an expanding universe and curved space, you say, 'well, it's as if you have a black balloon, and there are white dots on the black balloon, and those dots represent galaxies, and as you blow the balloon up, uniformly all of them grow farther and farther apart. But you're using an analogy—the universe is not actually a black balloon with white dots on it.

So in the same way, we use these sort of images to try and make sense of the world, and we at present are living under the influence of two very powerful images, which are, in the present state of scientific knowledge, inadequate, and one of the major problems today are to find an adequate, satisfying image of the world. Well that's what I'm going to talk about. And I'm going to go further than that, not only what image of the world to have, but how we can get our sensations and our feelings in accordance with the most sensible image of the world that we can manage to conceive.

All right, now—the two images which we have been working under for 2000 years and maybe more are what I would call two models of the universe, and the first is called the ceramic model, and the second the fully automatic model. The ceramic model of the universe is based on the book of Genesis, from which Judaism, Islam, and Christianity derive their basic picture of the

world. And the image of the world in the book of Genesis is that the world is an artifact. It is made, as a potter takes clay and forms pots out of it, or as a carpenter takes wood and makes tables and chairs out of it. Don't forget Jesus is the son of a carpenter. And also the son of God. So the image of God and of the world is based on the idea of God as a technician, potter, carpenter, architect, who has in mind a plan, and who fashions the universe in accordance with that plan.

So basic to this image of the world is the notion, you see, that the world consists of stuff, basically. Primordial matter, substance, stuff. As parts are made of clay. Now clay by itself has no intelligence. Clay does not of itself become a pot, although a good potter may think otherwise. Because if you were a really good potter, you don't impose your will on the clay, you ask any given lump of clay what it wants to become, and you help it to do that. And then you become a genius. But the ordinary idea I'm talking about is that simply clay is unintelligent; it's just stuff, and the potter imposes his will on it, and makes it become whatever he wants.

And so in the book of Genesis, the lord God creates Adam out of the dust of the Earth. In other words, he makes a clay figurine, and then he breathes into it, and it becomes alive. And because the clay become informed. By itself it is formless, it has no intelligence, and therefore it requires an external intelligence and an external energy to bring it to life and to bring some sense to it. And so in this way, we inherit a conception of ourselves as being artifacts, as being made, and it is perfectly natural in our culture for a child to ask its mother 'How was I made?' or 'Who made me?' And this is a very, very powerful idea, but for example, it is not shared by the Chinese, or by the Hindus. A Chinese child would not ask its mother 'How was I made?' A Chinese child might ask its mother 'How did I grow?' which is an entirely different procedure from making. You see, when you make something, you put it together, you arrange parts, or you work from the outside in, as a sculpture works on stone, or as a potter works on clay. But when you watch something growing, it works in exactly the opposite direction. It works from the inside to the outside. It expands. It burgeons. It blossoms. And it happens all of itself at once. In other words, the original simple form, say of a living cell in the womb, progressively complicates

itself, and that's the growing process, and it's quite different from the making process.

But we have thought, historically, you see, of the world as something made, and the idea of being—trees, for example— constructions, just as tables and houses are constructions. And so there is for that reason a fundamental difference between the made and the maker. And this image, this ceramic model of the universe, originated in cultures where the form of government was monarchical, and where, therefore, the maker of the universe was conceived also at the same time in the image of the king of the universe. 'King of kings, lords of lords, the only ruler of princes, who thus from thy throne behold all dwellers upon Earth.' I'm quoting the Book of Common Prayer. And so, all those people who are oriented to the universe in that way feel related to basic reality as a subject to a king. And so they are on very, very humble terms in relation to whatever it is that works all this thing. I find it odd, in the United States, that people who are citizens of a republic have a monarchical theory of the universe. That you can talk about the president of the United States as LBJ, or Ike, or Harry, but you can't talk about the lord of the universe in such familiar terms. Because we are carrying over from very ancient near-Eastern cultures, the notion that the lord of the universe must be respected in a certain way. People kneel, people bow, people prostrate themselves, and you know what the reason for that is: that nobody is more frightened of anybody else than a tyrant. He sits with his back to the wall, and his guards on either side of him, and he has you face downwards on the ground because you can't use weapons that way. When you come into his presence, you don't stand up and face him, because you might attack, and he has reason to fear that you might because he's ruling you all. And the man who rules you all is the biggest crook in the bunch. Because he's the one who succeeded in crime. The other people are pushed aside because they—the criminals, the people we lock up in jail—are simply the people who didn't make it.

So naturally, the real boss sits with his back to the wall and his henchmen on either side of him. And so when you design a church, what does it look like? Catholic church, with the alter where it used to be—it's changing now, because the Catholic religion is changing. But the Catholic church has the alter with it's back to the wall at the east end of the church. And the alter is

the throne and the priest is the chief vizier of the court, and he is making abeyance to the throne, but there is the throne of God, the alter. And all the people are facing it, and kneeling down. And a great Catholic cathedral is called a basilica, from the Greek 'basilikos,' which means 'king.' So a basilica is the house of a king, and the ritual of the church is based on the court rituals of Byzantium.

A Protestant church is a little different. Basically the same. The furniture of a Protestant church is based on a judicial courthouse. The pulpit, the judge in an American court wears a black robe, he wears exactly the same dress as a Protestant minister. And everybody sits in these boxes, there's a box for the jury, there's a box for the judge, there's a box for this, there's a box for that, and those are the pews in an ordinary colonial- type Protestant church. So both these kinds of churches which have an autocratic view of the nature of the universe decorate themselves, are architecturally constructed in accordance with political images of the universe. One is the king, and the other is the judge. Your honor. There's sense in this. When in court, you have to refer to the judge as 'your honor.' It stops the people engaged in litigation from losing their tempers and getting rude. There's a certain sense to that.

But when you want to apply that image to the universe itself, to the very nature of life, it has limitations. For one thing, the idea of a difference between matter and spirit. This idea doesn't work anymore. Long, long ago, physicists stopped asking the question 'What is matter?' They began that way. They wanted to know, what is the fundamental substance of the world? And the more they asked that question, the more they realized they couldn't answer it, because if you're going to say what matter is, you've got to describe it in terms of behavior, that is to say in terms of form, in terms of pattern. You tell what it does, you describe the smallest shapes of it which you can see. Do you see what happens? You look, say, at a piece of stone, and you want to say, 'Well, what is this piece of stone made of?' You take your microscope and you look at it, and instead of just this block of stuff, you see ever so many tinier shapes. Little crystals. So you say, 'Fine, so far so good. Now what are these crystals made of?' And you take a more powerful instrument, and you find that they're made of molecules, and then you take a still more powerful instrument to find out what the molecules are

made of, and you begin to describe atoms, electrons, protons, mesons, all sorts of sub-nuclear particles. But you never, never arrive at the basic stuff. Because there isn't any.

What happens is this: 'Stuff' is a word for the world as it looks when our eyes are out of focus. Fuzzy. Stuff—the idea of stuff is that it is undifferentiated, like some kind of goo. And when your eyes are not in sharp focus, everything looks fuzzy. When you get your eyes into focus, you see a form, you see a pattern. But when you want to change the level of magnification, and go in closer and closer and closer, you get fuzzy again before you get clear. So everytime you get fuzzy, you go through thinking there's some kind of stuff there. But when you get clear, you see a shape. So all that we can talk about is patterns. We never, never can talk about the 'stuff' of which these patterns are supposed to be made, because you don't really have to suppose that there is any. It's enough to talk about the world in terms of patterns. It describes anything that can be described, and you don't really have to suppose that there is some stuff that constitutes the essence of the pattern in the same way that clay constitutes the essence of pots. And so for this reason, you don't really have to suppose that the world is some kind of helpless, passive, unintelligent junk which an outside agency has to inform and make into intelligent shapes. So the picture of the world in the most sophisticated physics of today is not formed stuff—potted clay—but pattern. A self-moving, self-designing pattern. A dance. And our common sense as individuals hasn't yet caught up with this.

Well now, in the course of time, in the evolution of Western thought. The ceramic image of the world ran into trouble. And changed into what I call the fully automatic image of the world. In other words, Western science was based on the idea that there are laws of nature, and got that idea from Judaism and Christianity and Islam. That in other words, the potter, the maker of the world in the beginning of things laid down the laws, and the law of God, which is also the law of nature, is called the 'loggos.?,.' And in Christianity, the loggos is the second person of the trinity, incarnate as Jesus Christ, who thereby is the perfect exemplar of the divine law. So we have tended to think of all natural phenomena as responding to laws, as if, in other words, the laws of the world were like the rails on which a streetcar or

a tram or a train runs, and these things exist in a certain way, and all events respond to these laws. You know that limerick,

There was a young man who said 'Damn, For it certainly seems that I am A creature that moves In determinate grooves. I'm not even a bus, I'm a tram.'

So here's this idea that there's kind of a plan, and everything responds and obeys that plan. Well, in the 18th century, Western intellectuals began to suspect this idea. And what they suspected was whether there is a lawmaker, whether there is an architect of the universe, and they found out, or they reasoned, that you don't have to suppose that there is. Why? Because the hypothesis of God does not help us to make any predictions. Nor does it— In other words, let's put it this way: if the business of science is to make predictions about what's going to happen, science is essentially prophecy. What's going to happen? By examining the behavior of the past and describing it carefully, we can make predictions about what's going to happen in the future. That's really the whole of science. And to do this, and to make successful predictions, you do not need God as a hypothesis. Because it makes no difference to anything. If you say 'Everything is controlled by God, everything is governed by God,' that doesn't make any difference to your prediction of what's going to happen. And so what they did was drop that hypothesis. But they kept the hypothesis of law. Because if you can predict, if you can study the past and describe how things have behaved, and you've got some regularities in the behavior of the universe, you call that law. Although it may not be law in the ordinary sense of the word, it's simply regularity.

And so what they did was got rid of the lawmaker and kept the law. And so they conceived the universe in terms of a mechanism. Something, in other words, that is functioning according to regular, clocklike mechanical principles. Newton's whole image of the world is based on billiards. The atoms are billiard balls, and they bang each other around. And so your behavior, every individual around, is defined as a very, very complex arrangement of billiard balls being banged around by everything else. And so behind the fully automatic model of the universe is the notion that reality itself is, to use the favorite term of 19th century scientists, blind energy. In

say the metaphysics of Ernst Hegel, and T.H. Huxley, the world is basically nothing but energy—blind, unintelligent force. And likewise and parallel to this, in the philosophy of Freud, the basic psychological energy is libido, which is blind lust. And it is only a fluke, it is only as a result of pure chances that resulting from the exuberance of this energy there are people. With values, with reason, with languages, with cultures, and with love. Just a fluke. Like, you know, 1000 monkeys typing on 1000 typewriters for a million years will eventually type the Encyclopedia Britannica. And of course the moment they stop typing the Encyclopedia Britannica, they will relapse into nonsense.

And so in order that that shall not happen, for you and I are flukes in this cosmos, and we like our way of life—we like being human—if we want to keep it, say these people, we've got to fight nature, because it will turn us back into nonsense the moment we let it. So we've got to impose our will upon this world as if we were something completely alien to it. From outside. And so we get a culture based on the idea of the war between man and nature. And we talk about the conquest of space. The conquest of Everest. And the great symbols of our culture are the rocket and the bulldozer. The rocket—you know, compensation for the sexually inadequate male. So we're going to conquer space. You know we're in space already, way out. If anybody cared to be sensitive and let outside space come to you, you can, if your eyes are clear enough. Aided by telescopes, aided by radio astronomy, aided by all the kinds of sensitive instruments we can devise. We're as far out in space as we're ever going to get. But, y'know, sensitivity isn't the pitch. Especially in the WASP culture of the United States. We define manliness in terms of aggression, you see, because we're a little bit frightened as to whether or not we're really men. And so we put on this great show of being a tough guy. It's completely unnecessary. If you have what it takes, you don't need to put on that show. And you don't need to beat nature into submission. Why be hostile to nature? Because after all, you ARE a symptom of nature. You, as a human being, you grow out of this physical universe in exactly the same way an apple grows off an apple tree.

So let's say the tree which grows apples is a tree which apples, using 'apple' as a verb. And a world in which human beings arrive is a world that peoples. And so the existence of people is symptomatic of the kind of

universe we live in. Just as spots on somebody's skin is symptomatic of chicken pox. Just as hair on a head is symptomatic of what's going on in the organism. But we have been brought up by reason of our two great myths—the ceramic and the automatic—not to feel that we belong in the world. So our popular speech reflects it. You say 'I came into this world.' You didn't. You came out of it. You say 'Face facts.' We talk about 'encounters' with reality, as if it was a head-on meeting of completely alien agencies. And the average person has the sensation that he is a someone that exists inside a bag of skin. The center of consciousness that looks out at this thing, and what the hell's it going to do to me? You see? 'I recognize you, you kind of look like me, and I've seen myself in a mirror, and you look like you might be people.' So maybe you're intelligent and maybe you can love, too. Perhaps you're all right, some of you are, anyway. You've got the right color of skin, or you have the right religion, or whatever it is, you're OK. But there are all those people over in Asia, and Africa, and they may not really be people. When you want to destroy someone, you always define them as 'unpeople.' Not really human. Monkeys, maybe. Idiots, maybe. Machines, maybe, but not people.

So we have this hostility to the external world because of the superstition, the myth, the absolutely unfounded theory that you, yourself, exist only inside your skin. Now I want to propose another idea altogether. There are two great theories in astronomy going on right now about the origination of the universe. One is called the explosion theory, and the other is called the steady state theory. The steady state people say there never was a time when the world began, it's always expanding, yes, but as a result of free hydrogen in space, the free hydrogen coagulates and makes new galaxies. But the other people say there was a primordial explosion, an enormous bang billions of years ago which flung all the galaxies into space. Well let's take that just for the sake of argument and say that was the way it happened.

It's like you took a bottle of ink and you threw it at a wall. Smash! And all that ink spread. And in the middle, it's dense, isn't it? And as it gets out on the edge, the little droplets get finer and finer and make more complicated patterns, see? So in the same way, there was a big bang at the beginning of things and it spread. And you and I, sitting here in this room, as complicated human beings, are way, way out on the fringe of that bang. We

are the complicated little patterns on the end of it. Very interesting. But so we define ourselves as being only that. If you think that you are only inside your skin, you define yourself as one very complicated little curlique, way out on the edge of that explosion. Way out in space, and way out in time. Billions of years ago, you were a big bang, but now you're a complicated human being. And then we cut ourselves off, and don't feel that we're still the big bang. But you are. Depends how you define yourself. You are actually—if this is the way things started, if there was a big bang in the beginning— you're not something that's a result of the big bang. You're not something that is a sort of puppet on the end of the process. You are still the process. You are the big bang, the original force of the universe, coming on as whoever you are. When I meet you, I see not just what you define yourself as—Mr so-and- so, Ms so-and-so, Mrs so-and-so—I see every one of you as the primordial energy of the universe coming on at me in this particular way. I know I'm that, too. But we've learned to define ourselves as separate from it.

And so what I would call a basic problem we've got to go through first, is to understand that there are no such things as things. That is to say separate things, or separate events. That that is only a way of talking. If you can understand this, you're going to have no further problems. I once asked a group of high school children 'What do you mean by a thing?' First of all, they gave me all sorts of synonyms. They said 'It's an object,' which is simply another word for a thing; it doesn't tell you anything about what you mean by a thing. Finally, a very smart girl from Italy, who was in the group, said a thing is a noun. And she was quite right. A noun isn't a part of nature, it's a part of speech. There are no nouns in the physical world. There are no separate things in the physical world, either. The physical world is wiggly. Clouds, mountains, trees, people, are all wiggly. And only when human beings get to working on things—they build buildings in straight lines, and try to make out that the world isn't really wiggly. But here we are, sitting in this room all built out of straight lines, but each one of us is as wiggly as all get-out.

Now then, when you want to get control of something that wiggles, it's pretty difficult, isn't it? You try and pick up a fish in your hands, and the fish is wiggly and it slips out. What do you do to get hold of the fish? You

use a net. And so the net is the basic thing we have for getting hold of the wiggly world. So if you want to get hold of this wiggle, you've got to put a net over it. A net is something regular. And I can number the holes in a net. So many holes up, so many holes across. And if I can number these holes, I can count exactly where each wiggle is, in terms of a hole in that net. And that's the beginning of calculus, the art of measuring the world. But in order to do that, I've got to break up the wiggle into bits. I've got to call this a specific bit, and this the next bit of the wiggle, and this the next bit, and this the next bit of the wiggle. And so these bits are things or events. Bit of wiggles. Which I mark out in order to talk about the wiggle. In order to measure and therefore in order to control it. But in nature, in fact, in the physical world, the wiggle isn't bitted. Like you don't get a cut-up fryer out of an egg. But you have to cut the chicken up in order to eat it. You bite it. But it doesn't come bitten.

So the world doesn't come thinged; it doesn't come evented. You and I are all as much continuous with the physical universe as a wave is continuous with the ocean. The ocean waves, and the universe peoples. And as I wave and say to you 'Yoo-hoo!' the world is waving with me at you and saying 'Hi! I'm here!' But we are consciousness of the way we feel and sense our existence. Being based on a myth that we are made, that we are parts, that we are things, our consciousness has been influenced, so that each one of us does not feel that. We have been hypnotized, literally hypnotized by social convention into feeling and sensing that we exist only inside our skins. That we are not the original bang, just something out on the end of it. And therefore we are scared stiff. My wave is going to disappear, and I'm going to die! And that would be awful. We've got a mythology going now which is, as Father Maskell.?, put it, we are something that happens between the maternity ward and the crematorium. And that's it. And therefore everybody feels unhappy and miserable.

This is what people really believe today. You may go to church, you may say you believe in this, that, and the other, but you don't. Even Jehovah's Witnesses, who are the most fundamental of fundamentalists, they are polite when they come around and knock on the door. But if you REALLY believed in Christianity, you would be screaming in the streets. But nobody does. You would be taking full- page ads in the paper every day. You would

be the most terrifying television programs. The churches would be going out of their minds if they really believed what they teach. But they don't. They think they ought to believe what they teach. They believe they should believe, but they don't really believe it, because what we REALLY believe is the fully automatic model. And that is our basic, plausible common sense. You are a fluke. You are a separate event. And you run from the maternity ward to the crematorium, and that's it, baby. That's it.

Now why does anybody think that way? There's no reason to, because it isn't even scientific. It's just a myth. And it's invented by people who want to feel a certain way. They want to play a certain game. The game of god got embarrassing. The idea of God as the potter, as the architect of the universe, is good. It makes you feel that life is, after all, important. There is someone who cares. It has meaning, it has sense, and you are valuable in the eyes of the father. But after a while, it gets embarrassing, and you realize that everything you do is being watched by God. He knows your tiniest innermost feelings and thoughts, and you say after a while, 'Quit bugging me! I don't want you around.' So you become an atheist, just to get rid of him. Then you feel terrible after that, because you got rid of God, but that means you got rid of yourself. You're nothing but a machine. And your idea that you're a machine is just a machine, too. So if you're a smart kid, you commit suicide. Camus said there is only one serious philosophical question, which is whether or not to commit suicide. I think there are four or five serious philosophical questions. The first one is 'Who started it?' The second is 'Are we going to make it?' The third is 'Where are we going to put it?' The fourth is 'Who's going to clean up?' And the fifth, 'Is it serious?'

But still, should you or not commit suicide? This is a good question. Why go on? And you only go on if the game is worth the gamble. Now the universe has been going on for an incredible long time. And so really, a satisfactory theory of the universe has to be one that's worth betting on. That's very, it seems to me, elementary common sense. If you make a theory of the universe which isn't worth betting on, why bother? Just commit suicide. But if you want to go on playing the game, you've got to have an optimal theory for playing the game. Otherwise there's no point in it. But the people who coined the fully automatic theory of the universe

were playing a very funny game, for what they wanted to say was this: all you people who believe in religion—old ladies and wishful thinkers— you’ve got a big daddy up there, and you want comfort, but life is rough. Life is tough, as success goes to the most hard-headed people. That was a very convenient theory when the European and American worlds were colonizing the natives everywhere else. They said ‘We’re the end product of evolution, and we’re tough. I’m a big strong guy because I face facts, and life is just a bunch of junk, and I’m going to impose my will on it and turn it into something else. I’m real hard.’ That’s a way of flattering yourself.

And so, it has become academically plausible and fashionable that this is the way the world works. In academic circles, no other theory of the world than the fully automatic model is respectable. Because if you’re an academic person, you’ve got to be an intellectually tough person, you’ve got to be prickly. There are basically two kinds of philosophy. One’s called prickles, the other’s called goo. And prickly people are precise, rigorous, logical. They like everything chopped up and clear. Goo people like it vague. For example, in physics, prickly people believe that the ultimate constituents of matter are particles. Goo people believe it’s waves. And in philosophy, prickly people are logical positivists, and goo people are idealists. And they’re always arguing with each other, but what they don’t realize is neither one can take his position without the other person. Because you wouldn’t know you advocated prickles unless there was someone advocating goo. You wouldn’t know what a prickle was unless you knew what a goo was. Because life isn’t either prickles or goo, it’s either gooey prickles or prickly goo. They go together like back and front, male and female. And that’s the answer to philosophy. You see, I’m a philosopher, and I’m not going to argue very much, because if you don’t argue with me, I don’t know what I think. So if we argue, I say ‘Thank you,’ because owing to the courtesy of your taking a different point of view, I understand what I mean. So I can’t get rid of you.

But however, you see, this whole idea that the universe is nothing at all but unintelligent force playing around and not even enjoying it is a putdown theory of the world. People who had an advantage to make, a game to play by putting it down, and making out that because they put the world down they were a superior kind of people. So that just won’t do. We’ve had it.

Because if you seriously go along with this idea of the world, you're what is technically called alienated. You feel hostile to the world. You feel that the world is a trap. It is a mechanism, it is electronic and neurological mechanisms into which you somehow got caught. And you, poor thing, have to put up with being put into a body that's falling apart, that gets cancer, that gets the great Siberian itch, and is just terrible. And these mechanics—doctors—are trying to help you out, but they really can't succeed in the end, and you're just going to fall apart, and it's a grim business, and it's just too bad. So if you think that's the way things are, you might as well commit suicide right now. Unless you say, 'Well, I'm damned. Because there might really be after all eternal damnation. Or I identify with my children, and I think of them going on without me and nobody to support them. Because if I do go on in this frame of mind and continue to support them, I shall teach them to be like I am, and they'll go on, dragging it out to support their children, and they won't enjoy it. They'll be afraid to commit suicide, and so will their children. They'll all learn the same lessons.'

So you see, all I'm trying to say is that the basic common sense about the nature of the world that is influencing most people in the United States today is simply a myth. If you want to say that the idea of God the father with his white beard on the golden throne is a myth, in a bad sense of the word 'myth,' so is this other one. It is just as phony and has just as little to support it as being the true state of affairs. Why? Let's get this clear. If there is any such thing at all as intelligence and love and beauty, well you've found it in other people. In other words, it exists in us as human beings. And as I said, if it is there, in us, it is symptomatic of the scheme of things. We are as symptomatic of the scheme of things as the apples are symptomatic of the apple tree or the rose of the rose bush. The Earth is not a big rock infested with living organisms any more than your skeleton is bones infested with cells. The Earth is geological, yes, but this geological entity grows people, and our existence on the Earth is a symptom of this other system, and its balances, as much as the solar system in turn is a symptom of our galaxy, and our galaxy in its turn is a symptom of a whole company of other galaxies. Goodness only knows what that's in.

But you see, when, as a scientist, you describe the behavior of a living organism, you try to say what a person does, it's the only way in which you

can describe what a person is, describe what they do. Then you find out that in making this description, you cannot confine yourself to what happens inside the skin. In other words, you cannot talk about a person walking unless you start describing the floor, because when I walk, I don't just dangle my legs in empty space. I move in relationship to a room. So in order to describe what I'm doing when I'm walking, I have to describe the room; I have to describe the territory. So in describing my talking at the moment, I can't describe it as just a thing in itself, because I'm talking to you. And so what I'm doing at the moment is not completely described unless your being here is described also. So if that is necessary, in other words, in order to describe MY behavior, I have to describe YOUR behavior and the behavior of the environment, it means that we've really got one system of behavior. Your skin doesn't separate you from the world; it's a bridge through which the external world flows into you, and you flow into it.

Just, for example, as a whirlpool in water, you could say because you have a skin you have a definite shape you have a definite form. All right? Here is a flow of water, and suddenly it does a whirlpool, and it goes on. The whirlpool is a definite form, but no water stays put in it. The whirlpool is something the stream is doing, and exactly the same way, the whole universe is doing each one of us, and I see each one of you today and I recognize you tomorrow, just as I would recognize a whirlpool in a stream. I'd say 'Oh yes, I've seen that whirlpool before, it's just near so-and-so's house on the edge of the river, and it's always there.' So in the same way when I meet you tomorrow, I recognize you, you're the same whirlpool you were yesterday. But you're moving. The whole world is moving through you, all the cosmic rays, all the food you're eating, the stream of steaks and milk and eggs and everything is just flowing right through you. When you're wiggling the same way, the world is wiggling, the stream is wiggling you.

But the problem is, you see, we haven't been taught to feel that way. The myths underlying our culture and underlying our common sense have not taught us to feel identical with the universe, but only parts of it, only in it, only confronting it—aliens. And we are, I think, quite urgently in need of coming to feel that we ARE the eternal universe, each one of us. Otherwise

we're going to go out of our heads. We're going to commit suicide, collectively, courtesy of H-bombs. And, all right, supposing we do, well that will be that, then there will be life making experiments on other galaxies. Maybe they'll find a better game.

Well now, in the first session this afternoon, I was discussing two of the great myths or models of the universe, which lie in the intellectual and psychological background of all of us. The myth of the world as a political, monarchical state in which we are all here on sufferance as subject to God. In which we are MADE artifacts, who do not exist in our own right. God alone, in the first myth, exists in his own right, and you exist as a favor, and you ought to be grateful. Like your parents come on and say to you, 'Look at all the things we've done for you, all the money we spent to send you to college, and you turn out to be a beatnik. You're a wretched, ungrateful child.' And you're supposed to say, 'Sorry, I really am.' But you're definitely in the position of being on probation. This arises out of our whole attitude towards children, whereby we don't really acknowledge that they're human. Instead, when a child comes into the world, and as soon as it can communicate in any way, talk language, you should say to a child, 'How do you do? Welcome to the human race. Now my dear, we are playing a very complicated game, and we're going to explain the rules of it to you. And when you have learned these rules and understand what they are, you may be able to invent better ones. But in the meantime, this is the thing we're doing.'

Instead of that, we either treat a child with a kind of with a kind of 'blah-blah-blah' attitude, or 'coochy-coochy-coochie,' y'know? and don't treat the thing as a human being at all—as a kind of doll. Or else as a nuisance. And so all of us, having been treated that way, carry over into adult life the sense of being on probation here. Either the god is somebody who says to us 'coochy-coochy-coochie,' or 'blah-blah-blah.' And that's the feeling we carry over. So that idea of the royal god, the king of kings and the lord of lords which we inherit from the political structures of the Tigris-Euphrates cultures, and from Egypt. The Pharaoh, Amenhotep IV is probably, as Freud suggested, the original author of Moses' monotheism, and certainly the Jewish law code comes from Hammurabi in Chaldea. And these men

lived in a culture where the pyramid and the ziggurat—the ziggurat is the Chaldean version of the pyramid, indicating somehow a hierarchy of power, from the boss on down. And God, in this first myth that we've been discussing, the ceramic myth is the boss, and the idea of God is that the universe is governed from above.

But do you see, this parallels—goes hand in hand with the idea that you govern your own body. That the ego, which lies somewhere between the ears and behind the eyes in the brain, is the governor of the body. And so we can't understand a system of order, a system of life, in which there isn't a governor. 'O Lord, our governor, how excellent is thy name in all the world.'

But supposing, on the contrary, there could be a system which doesn't have a governor. That's what we are supposed to have in this society. We are supposed to be a democracy and a republic. And we are supposed to govern ourselves. As I said, it's so funny that Americans can be politically republican—I don't mean republican in the party sense—and yet religiously monarchical. It's a real strange contradiction.

So what is this universe? Is it a monarchy? Is it a republic? Is it a mechanism? Or an organism? Because you see, if it's a mechanism, either it's a mere mechanism, as in the fully automatic model, or else it's a mechanism under the control of a driver. A mechanic. If it's not that, it's an organism, and an organism is a thing that governs itself. In your body there is no boss. You could argue, for example, that the brain is a gadget evolved by the stomach, in order to serve the stomach for the purposes of getting food. Or you can argue that the stomach is a gadget evolved by the brain to feed it and keep it alive. Whose game is this? Is it the brain's game, or the stomach's game? They're mutual. The brain implies the stomach and the stomach implies the brain, and neither of them is the boss.

You know that story about all the limbs of the body. The hand said 'We do all our work,' the feet said 'We do our work,' the mouth said 'We do all the chewing, and here's this lazy stomach who just gets it all and doesn't do a thing. He didn't do any work, so let's go on strike.' And the hands refused to carry, the feet refused to walk, the teeth refused to chew, and said 'Now we're on strike against the stomach.' But after a while, all of them found

themselves getting weaker and weaker and weaker, because they didn't realize that the stomach fed them.

So there is the possibility then that we are not in the kind of system that these two myths delineate. That we are not living in a world where we ourselves, in the deepest sense of self, are outside reality, and somehow in a position that we have to bow down to it and say 'As a great favor, please preserve us in existence.' Nor are we in a system which is merely mechanical, and which we are nothing but flukes, trapped in the electrical wiring of a nervous system which is fundamentally rather inefficiently arranged. What's the alternative? Well, we could put the alternative in another image altogether, and I'll call this not the ceramic image, not the fully automatic image, but the dramatic image. Consider the world as a drama. What's the basis of all drama? The basis of all stories, of all plots, of all happenings—is the game of hide and seek. You get a baby, what's the fundamental first game you play with a baby? You put a book in front of your face, and you peek at the baby. The baby starts giggling. Because the baby is close to the origins of life; it comes from the womb really knowing what it's all about, but it can't put it into words. See, what every child psychologist really wants to know is to get a baby to talk psychological jargon, and explain how it feels. But the baby knows; you do this, this, this and this, and the baby starts laughing, because the baby is a recent incarnation of God. And the baby knows, therefore, that hide and seek is the basic game.

See, when we were children, we were taught '1, 2, 3,' and 'A, B, C,' but we weren't set down on our mothers' knees and taught the game of black and white. That's the thing that was left out of all our educations, the game that I was trying to explain with these wave diagrams. That life is not a conflict between opposites, but a polarity. The difference between a conflict and a polarity is simply—when you think about opposite things, we sometimes use the expression, 'These two things are the poles apart.' You say, for example, about someone with whom you totally disagree, 'I am the poles apart from this person.' But your very saying that gives the show away. Poles. Poles are the opposite ends of one magnet. And if you take a magnet, say you have a magnetized bar, there's a north pole and a south pole. Okay, chop off the south pole, move it away. The piece you've got left creates a new south

pole. You never get rid of the south pole. So the point about a magnet is, things may be the poles apart, but they go together. You can't have the one without the other. We are imagining a diagram of the universe in which the idea of polarity is the opposite ends of the diameter, north and south, you see? That's the basic idea of polarity, but what we're trying to imagine is the encounter of forces that come from absolutely opposed realms, that have nothing in common. When we say of two personality types that they're the poles apart. We are trying to think eccentrically, instead of concentrically. And so in this way, we haven't realized that life and death, black and white, good and evil, being and non-being, come from the same center. They imply each other, so that you wouldn't know the one without the other.

Now I'm not saying that that's bad, that's fun. You're playing the game that you don't know that black and white imply each other. Therefore you think that black possibly might win, that the light might go out, that the sound might never be heard again. That there could be the possibility of a universe of pure tragedy, of endless, endless darkness. Wouldn't that be awful? Only you wouldn't know it was awful, if that's what happened. The point that we all forget is that the black and the white go together, and there isn't the one without the other. At the same time, you see, we forget, in the same way as we forget that these two go together.

The other thing we forget, is that self and other go together, in just the same way as the two poles of a magnet. You say 'I, myself; I am me; I am this individual; I am this particular, unique instance.' What is other is everything else. All of you, all of the stars, all of the galaxies, way, way out into infinite space, that's other. But in the same way as black implies white, self implies other. And you don't exist without all that, so that where you get these polarities, you get this sort of difference, that what we call explicitly, or exoterically, they're different. But implicitly, esoterically, they're one. Since you can't have the one without the other, that shows there's a kind of inner conspiracy between all pairs of opposites, which is not in the open, but it's tacit. It's like you say 'Well, there are all sorts of things that we understand among each other tacitly, that we don't want to admit, but we do recognize tacitly there's a kind of secret between us boys and girls,' or whatever it may be. And we recognize that. So, tacitly, all of you really

inwardly know—although you won't admit it because your culture has trained you in a contrary direction—all of you really inwardly know that you as an individual self are inseparable from everything else that exists, that you are a special case in the universe. But the whole game, especially of Western culture, is to conceal that from ourselves, so that when anybody in our culture slips into the state of consciousness where they suddenly find this to be true, and they come on and say 'I'm God,' we say 'You're insane.'

Now, it's very difficult—you can very easily slip into the state of consciousness where you feel you're God; it can happen to anyone. Just in the same way as you can get the flu, or measles, or something like that, you can slip into this state of consciousness. And when you get it, it depends upon your background and your training as to how you're going to interpret it. If you've got the idea of god that comes from popular Christianity, God as the governor, the political head of the world, and you think you're God, then you say to everybody, 'You should bow down and worship me.' But if you're a member of Hindu culture, and you suddenly tell all your friends 'I'm God,' instead of saying 'You're insane,' they say 'Congratulations! At last, you found out.' Because their idea of god is not the autocratic governor. When they make images of Shiva, he has ten arms. How would you use ten arms? It's hard enough to use two. You know, if you play the organ, you've got to use your two feet and your two hands, and you play different rhythms with each member. It's kind of tricky. But actually we're all masters at this, because how do you grow each hair without having to think about it? Each nerve? How do you beat your heart and digest with your stomach at the same time? You don't have to think about it. In your very body, you are omnipotent in the true sense of omnipotence, which is that you are able to be omni-potent; you are able to do all these things without having to think about it.

When I was a child, I used to ask my mother all sorts of ridiculous questions, which of course every child asks, and when she got bored with my questions, she said 'Darling, there are just some things which we are not meant to know.' I said 'Will we ever know?' She said 'Yes, of course, when we die and go to heaven, God will make everything plain.' So I used to imagine on wet afternoons in heaven, we'd all sit around the throne of grace

and say to God, 'Well why did you do this, and why did you do that?' and he would explain it to us. 'Heavenly father, why are the leaves green?' and he would say 'Because of the chlorophyll,' and we'd say 'Oh.' But in the Hindu universe, you would say to God, 'How did you make the mountains?' and he would say 'Well, I just did it. Because when you're asking me how did I make the mountains, you're asking me to describe in words how I made the mountains, and there are no words which can do this. Words cannot tell you how I made the mountains any more than I can drink the ocean with a fork. A fork may be useful for sticking into a piece of something and eating it, but it's of no use for imbibing the ocean. It would take millions of years. In other words, it would take millions of years, and you would be bored with my description, long before I got through it, if I put it to you in words, because I didn't create the mountains with words, I just did it. Like you open and close your hand. You know how you do this, but can you describe in words how you do it? Even a very good physiologist can't describe it in words. But you do it. You're conscious, aren't you. Don't you know how you manage to be conscious? Do you know how you beat your heart? Can you say in words, explain correctly how this is done? You do it, but you can't put it into words, because words are too clumsy, yet you manage this expertly for as long as you're able to do it.'

But you see, we are playing a game. The game runs like this: the only thing you really know is what you can put into words. Let's suppose I love some girl, rapturously, and somebody says to me, 'Do you REALLY love her?' Well, how am I going to prove this? They'll say, 'Write poetry. Tell us all how much you love her. Then we'll believe you.' So if I'm an artist, and can put this into words, and can convince everybody I've written the most ecstatic love letter ever written, they say 'All right, ok, we admit it, you really do love her.' But supposing you're not very articulate, are we going to tell you you DON'T love her? Surely not. You don't have to be Heloise and Abyla to be in love. But the whole game that our culture is playing is that nothing really happens unless it's in the newspaper. So when we're at a party, and it's a great party, somebody says 'Too bad we didn't bring a camera. Too bad there wasn't a tape recorder. And so our children begin to feel that they don't exist authentically unless they get their names in the papers, and the fastest way to get your name in the paper is to commit a

crime. Then you'll be photographed, and you'll appear in court, and everybody will notice you. And you're THERE. So you're not there unless you're recorded. It really happened if it was recorded. In other words, if you shout, and it doesn't come back and echo, it didn't happen. Well that's a real hangup. It's true, the fun with echos; we all like singing in the bathtub, because there's more resonance there. And when we play a musical instrument, like a violin or a cello, it has a sounding box, because that gives resonance to the sound. And in the same way, the cortex of the human brain enables us when we're happy to know that we're happy, and that gives a certain resonance to it. If you're happy, and you don't know you're happy, there's nobody home.

But this is the whole problem for us. Several thousand years ago, human beings devolved the system of self-consciousness, and they knew, they knew.

There was a young man who said 'though

It seems that I know that I know,

What I would like to see

Is the I that sees me

When I know that I know that I know.'

And this is the human problem: we know that we know. And so, there came a point in our evolution where we didn't guide life by distrusting our instincts. Suppose that you could live absolutely spontaneously. You don't make any plans, you just live like you feel like it. And you say 'What a gas that is, I don't have to make any plans, anything. I don't worry; I just do what comes naturally.'

The way the animals live, everybody envies them, because look, a cat, when it walks—did you ever see a cat making an aesthetic mistake. Did you ever see a badly formed cloud? Were the stars ever misarranged? When you watch the foam breaking on the seashore, did it ever make a bad pattern? Never. And yet we think in what we do, we make mistakes. And we're

worried about that. So there came this point in human evolution when we lost our innocence. When we lost this thing that the cats and the flowers have, and had to think about it, and had to purposely arrange and discipline and push our lives around in accordance with foresight and words and systems of symbols, accountancy, calculation and so on, and then we worry. Once you start thinking about things, you worry as to if you thought enough. Did you really take all the details into consideration? Was every fact properly reviewed? And by jove, the more you think about it, the more you realize you really couldn't take everything into consideration, because all the variables in every decision are incalculable, so you get anxiety. And this, though, also, is the price you pay for knowing that you know. For being able to think about thinking, being able to feel about feeling. And so you're in this funny position.

Now then, do you see that this is simultaneously an advantage and a terrible disadvantage? What has happened here is that by having a certain kind of consciousness, a certain kind of reflexive consciousness—being aware of being aware. Being able to represent what goes on fundamentally in terms of a system of symbols, such as words, such as numbers. You put, as it were, two lives together at once, one representing the other. The symbols representing the reality, the money representing the wealth, and if you don't realize that the symbol is really secondary, it doesn't have the same value. People go to the supermarket, and they get a whole cartload of goodies and they drive it through, then the clerk fixes up the counter and this long tape comes out, and he'll say '\$30, please,' and everybody feels depressed, because they give away \$30 worth of paper, but they've got a cartload of goodies. They don't think about that, they think they've just lost \$30. But you've got the real wealth in the cart, all you've parted with is the paper. Because the paper in our system becomes more valuable than the wealth. It represents power, potentiality, whereas the wealth, you think oh well, that's just necessary; you've got to eat. That's to be really mixed up.

So then. If you awaken from this illusion, and you understand that black implies white, self implies other, life implies death—or shall I say, death implies life—you can conceive yourself. Not conceive, but FEEL yourself, not as a stranger in the world, not as someone here on sufferance, on probation, not as something that has arrived here by fluke, but you can

begin to feel your own existence as absolutely fundamental. What you are basically, deep, deep down, far, far in, is simply the fabric and structure of existence itself. So, say in Hindu mythology, they say that the world is the drama of God. God is not something in Hindu mythology with a white beard that sits on a throne, that has royal prerogatives. God in Indian mythology is the self, 'Satchitananda.' Which means 'sat,' that which is, 'chit,' that which is consciousness; that which is 'ananda' is bliss. In other words, what exists, reality itself is gorgeous, it is the fullness of total joy. Wowee! And all those stars, if you look out in the sky, is a firework display like you see on the fourth of July, which is a great occasion for celebration; the universe is a celebration, it is a fireworks show to celebrate that existence is. Wowee.

And then they say, 'But, however, there's no point in just sustaining bliss.' Let's suppose you were able, every night, to dream any dream you wanted to dream, and that you could for example have the power to dream in one night 75 years worth of time. Or any length of time you wanted to have. And you would, naturally, as you began on this adventure of dreams, fulfill all your wishes. You would have every kind of pleasure you could conceive. And after several nights of 75 years of total pleasure each, you would say 'Well, that was pretty great. But now let's have a surprise. Let's have a dream which isn't under control, where something is going to happen to me that I don't know what it's going to be.' And you would dig that, and come out of it and say 'That was a close shave, now wasn't it?' Then you would get more and more adventurous, and you would make further and further gambles as to what you would dream, and finally you would dream where you are now. You would dream the dream of the life that you are actually living today. That would be within the infinite multiplicity of the choices you would have. Of playing that you weren't God. Because the whole nature of the godhead, according to this idea, is to play that he's not. The first thing that he says to himself is 'Man, get lost,' because he gives himself away. The nature of love is self-abandonment, not clinging to oneself. Throwing yourself out, for instance as in basketball; you're always getting rid of the ball. You say to the other fellow 'Have a ball.' See? And that keeps things moving. That's the nature of life.

So in this idea, then, everybody is fundamentally the ultimate reality. Not God in a politically kingly sense, but God in the sense of being the self, the deep-down basic whatever there is. And you're all that, only you're pretending you're not. And it's perfectly OK to pretend you're not, to be perfectly convinced, because this is the whole notion of drama. When you come into the theater, there is an arch, and a stage, and down there is the audience. Everybody assumes their seats in the theater, gone to see a comedy, a tragedy, a thriller, whatever it is, and they all know as they come in and pay their admissions, that what is going to happen on the stage is not for real. But the actors have a conspiracy against this, because they're going to try and persuade the audience that what is happening on the stage IS for real. They want to get everybody sitting on the edge of their chairs, they want you terrified, or crying, or laughing. Absolutely captivated by the drama. And if a skillful human actor can take in an audience and make people cry, think what the cosmic actor can do. Why he can take himself in completely. He can play so much for real that he thinks he really is. Like you sitting in this room, you think you're really here. Well, you've persuaded yourself that way. You've acted it so damn well that you KNOW that this is the real world. But you're playing it. As well, the audience and the actor as one. Because behind the stage is the green room, offscene, where the actors take off their masks. Do you know that the word 'person' means 'mask'? The 'persona' which is the mask worn by actors in Greco-Roman drama, because it has a megaphone-type mouth which throws the sound out in an open-air theater. So the 'per'—through—'sona'—what the sound comes through—that's the mask. How to be a real person. How to be a genuine fake. So the 'dramatis persona' at the beginning of a play is the list of masks that the actors will wear. And so in the course of forgetting that this world is a drama, the word for the role, the word for the mask has come to mean who you are genuinely. The person. The proper person. Incidentally, the word 'parson' is derived from the word 'person.' The 'person' of the village. The 'person' around town, the parson.

So anyway, then, this is a drama, and what I want you to is— I'm not trying to sell you on this idea in the sense of converting you to it; I want you to play with it. I want you to think of its possibilities. I'm not trying to prove it, I'm just putting it forward as a possibility of life to think about. So then, this means that you're not victims of a scheme of things, of a mechanical

world, or of an autocratic god. The life you're living is what YOU have put yourself into. Only you don't admit it, because you want to play the game that it's happened to you. In other words, I got mixed up in this world; I had a father who got hot pants over a girl, and she was my mother, and because he was just a horny old man, and as a result of that, I got born, and I blame him for it and say 'Well that's your fault; you've got to look after me,' and he says 'I don't see why I should look after you; you're just a result.' But let's suppose we admit that I really wanted to get born, and that I WAS the ugly gleam in my father's eye when he approached my mother. That was me. I was desire. And I deliberately got involved in this thing. Look at it that way instead. And that really, even if I got myself into an awful mess, and I got born with syphilis, and the great Siberian itch, and tuberculosis in a Nazi concentration camp, nevertheless this was a game, which was a very far out play. It was a kind of cosmic masochism. But I did it.

Isn't that an optimal game rule for life? Because if you play life on the supposition that you're a helpless little puppet that got involved. Or you played on the supposition that it's a frightful, serious risk, and that we really ought to do something about it, and so on, it's a drag. There's no point in going on living unless we make the assumption that the situation of life is optimal. That really and truly we're all in a state of total bliss and delight, but we're going to pretend we aren't just for kicks. In other words, you play non-bliss in order to be able to experience bliss. And you can go as far out in non-bliss as you want to go. And when you wake up, it'll be great. You know, you can slam yourself on the head with a hammer because it's so nice when you stop. And it makes you realize how great things are when you forget that's the way it is. And that's just like black and white: you don't know black unless you know white; you don't know white unless you know black. This is simply fundamental.

So then, here's the drama. My metaphysics, let me be perfectly frank with you, are that there the central self, you can call it God, you can call it anything you like, and it's all of us. It's playing all the parts of all being whatsoever everywhere and anywhere. And it's playing the game of hide and seek with itself. It gets lost, it gets involved in the farthest-out adventures, but in the end it always wakes up and comes back to itself. And when you're ready to wake up, you're going to wake up, and if you're not

ready you're going to stay pretending that you're just a 'poor little me.' And since you're all here and engaged in this sort of enquiry and listening to this sort of lecture, I assume you're all in the process of waking up. Or else you're pleasing yourselves with some kind of flirtation with waking up which you're not serious about. But I assume that you are maybe not serious, but sincere, that you are ready to wake up.

So then, when you're in the way of waking up, and finding out who you are, you meet a character called a guru, as the Hindus say 'the teacher,' 'the awakener.' And what is the function of a guru? He's the man that looks you in the eye and says 'Oh come off it. I know who you are.' You come to the guru and say 'Sir, I have a problem. I'm unhappy, and I want to get one up on the universe. I want to become enlightened. I want spiritual wisdom.' The guru looks at you and says 'Who are you?' You know Sri-Ramana-Maharshi, that great Hindu sage of modern times? People used to come to him and say 'Master, who was I in my last incarnation?' As if that mattered. And he would say 'Who is asking the question?' And he'd look at you and say, go right down to it, 'You're looking at me, you're looking out, and you're unaware of what's behind your eyes. Go back in and find out who you are, where the question comes from, why you ask.' And if you've looked at a photograph of that man—I have a gorgeous photograph of him; I look by it every time I go out the front door. And I look at those eyes, and the humor in them; the lilting laugh that says 'Oh come off it. Shiva, I recognize you. When you come to my door and say 'I'm so-and-so,' I say 'Ha-ha, what a funny way God has come on today.'"

So eventually—there are all sorts of tricks of course that gurus play. They say 'Well, we're going to put you through the mill.' And the reason they do that is simply that you won't wake up until you feel you've paid a price for it. In other words, the sense of guilt that one has. Or the sense of anxiety. It's simply the way one experiences keeping the game of disguise going on. Do you see that? Supposing you say 'I feel guilty.' Christianity makes you feel guilty for existing. That somehow the very fact that you exist is an affront. You are a fallen human being. I remember as a child when we went to the serves of the church on Good Friday. They gave us each a colored postcard with Jesus crucified on it, and it said underneath 'This I have done for thee. What doest thou for me?' You felt awful. YOU had nailed that

man to the cross. Because you eat steak, you have crucified Christ. Mythra. It's the same mystery. And what are you going to do about that? 'This I have done for thee, what doest thou for me?' You feel awful that you exist at all. But that sense of guilt is the veil across the sanctuary. 'Don't you DARE come in!' In all mysteries, when you are going to be initiated, there's somebody saying 'Ah-ah-ah, don't you come in. You've got to fulfill this requirement and that requirement, THEN we'll let you in.' And so you go through the mill. Why? Because you're saying to yourself 'I won't wake up until I deserve it. I won't wake up until I've made it difficult for me to wake up. So I invent for myself an elaborate system of delaying my waking up. I put myself through this test and that test, and when I convince myself it's sufficiently arduous, THEN I at last admit to myself who I really am, and draw aside the veil and realize that after all, when all is said and done, I am that I am, which is the name of god.'

And when it comes to that's really rather funny they say in Zen when you attain Satori nothing is left to you at that moment but to have a good laugh. But naturally all masters, Zen masters, yoga masters, every kind of master, puts up a barrier... and says to you, he simply plays your own game. You know we say anybody who goes to a psychiatrist ought to have his head examined. Because you when you go to a psychiatrist, you define yourself as somebody who ought to have his head examined. Same way, the Zen masters say anybody who studies Zen or comes to a Zen master ought to be given thirty blows of the stick. Because he was stupid enough to pose the question that he had a problem. But you're the problem. You put yourself in this situation. So it's a question fundamentally do you define yourself as a victim of the world or as the world? You can define yourself, you see, if you if you identify you with what you call the voluntary system of the nerves and say "only that's me" and that's really a rather limited amount of my total performance, what I do voluntarily. Then you've designed yourself as the victim in the game. And so you are able to feel that life was a trap, something else whether it was God or whether it was fate or whether it was the big mechanism the system, imposed this on you. And you can say "poor little me." But you can equally well and with just as much as justification define yourself not only as what you do voluntarily but also what you do involuntarily that's you too- do you beat your heart or don't you? Or does it just happen to you? And if you define yourself as the works then nobody's

imposing on you. You're not a victim, you're doing it. Of course you can't explain how you do it in words, because words are too clumsy. And it'd take too long to say, you'd get bored with it. But actually, then you can say, with gusto: "I am responsible, for this life, whether comedy or tragedy. I did it." And it seems to me that that is a basis for behavior and going on which is more fundamentally joyous and profitable and great than defining ourselves as miserable victims, or sinners, or what have you.

In last night's session, I was discussing an alternative myth to the Ceramic and Fully Automatic models of the universe, I'll call the Dramatic Myth. The idea that life as we experience it is a big act, and that behind this big act is the player, and the player, or the self, as it's called in Hindu philosophy, the Atman, is you. Only you are playing hide and seek, since that is the essential game that is going on. The game of games. The basis of all games, hide and seek. And since you're playing hide & seek, you are deliberately, although you can't admit this—or won't admit it—you are deliberately forgetting who you really are, or what you really are. And the knowledge that your essential self is the foundation of the universe, the 'ground of being' as Tillich calls it, is something you have that the Germans call a hintengedanken. A hintengedanen is a thought way, way, way in the back of your mind. Something that you know deep down but can't admit.

So, in a way, then, in order to bring this to the front, in order to know that is the case, you have to be kidded out of your game. And so what I want to discuss this morning is how this happens. Although before doing so, I must go a little bit further into the whole nature of this problem.

You see, the problem is this. We identify in our experience a differentiation between what we do and what happens to us. We have a certain number of actions that we define as voluntary, and we feel in control of those. And then over against that, there is all those things that are involuntary. But the dividing line between these two is very inarbitrary. Because for example, when you move your hand, you feel that you decide whether to open it or to close it. But then ask yourself how do you decide? When you decide to open your hand, do you first decide to decide? You don't, do you? You just decide, and how do you do that? And if you don't know how to do it, is it voluntary or involuntary? Let's consider breathing. You can feel that you

breath deliberately; you don't control your breath. But when you don't think about it, it goes on. Is it voluntary or involuntary?

So, we come to have a very arbitrary definition of self. That much of my activity which I feel I do. And that then doesn't include breathing most of the time; it doesn't include the heartbeats; it doesn't include the activity of the glands; it doesn't include digestion; it doesn't include how you shape your bones; circulate your blood. Do you or do you not do these things? Now if you get with yourself and you find out you are all of yourself, a very strange thing happens. You find out that your body knows that you are one with the universe. In other words, the so-called involuntary circulation of your blood is one continuous process with the stars shining. If you find out it's YOU who circulates your blood, you will at the same moment find out that you are shining the sun. Because your physical organism is one continuous process with everything else that's going on. Just as the waves are continuous with the ocean. Your body is continuous with the total energy system of the cosmos, and it's all you. Only you're playing the game that you're only this bit of it. But as I tried to explain, there are in physical reality no such thing as separate events.

So then. Remember also when I tried to work towards a definition of omnipotence. Omnipotence is not knowing how everything is done; it's just doing it. You don't have to translate it into language. Supposing that when you got up in the morning, you had to switch your brain on. And you had to think and do as a deliberate process waking up all the circuits that you need for active life during the day. Why, you'd never get done! Because you have to do all those things at once. That's why the Buddhists and Hindus represent their gods as many-armed. How could you use so many arms at once? How could a centipede control a hundred legs at once? Because it doesn't think about it. In the same way, you are unconsciously performing all the various activities of your organism. Only unconsciously isn't a good word, because it sounds sort of dead. Superconsciously would be better. Give it a plus rather than a minus.

Because what consciousness is is a rather specialized form of awareness. When you look around the room, you are conscious of as much as you can notice, and you see an enormous number of things which you do not notice.

For example, I look at a girl here and somebody asks me later ‘What was she wearing?’ I may not know, although I’ve seen, because I didn’t attend. But I was aware. You see? And perhaps if I could under hypnosis be asked this question, where I would get my conscious attention out of the way by being in the hypnotic state, I could recall what dress she was wearing.

So then, just in the same way as you don’t know—you don’t focus your attention—on how you make your thyroid gland function, so in the same way, you don’t have any attention focused on how you shine the sun. So then, let me connect this with the problem of birth and death, which puzzles people enormously of course. Because, in order to understand what the self is, you have to remember that it doesn’t need to remember anything, just as you don’t need to know how you work your thyroid gland.

So then, when you die, you’re not going to have to put up with everlasting non-existence, because that’s not an experience. A lot of people are afraid that when they die, they’re going to be locked up in a dark room forever, and sort of undergo that. But one of the interesting things in the world is—this is a yoga, this is a realization—try and imagine what it will be like to go to sleep and never wake up. Think about that. Children think about it. It’s one of the great wonders of life. What will it be like to go to sleep and never wake up? And if you think long enough about that, something will happen to you. You will find out, among other things, it will pose the next question to you. What was it like to wake up after having never gone to sleep? That was when you were born. You see, you can’t have an experience of nothing; nature abhors a vacuum. So after you’re dead, the only thing that can happen is the same experience, or the same sort of experience as when you were born. In other words, we all know very well that after other people die, other people are born. And they’re all you, only you can only experience it one at a time. Everybody is I, you all know you’re you, and wheresoever all being exist throughout all galaxies, it doesn’t make any difference. You are all of them. And when they come into being, that’s you coming into being.

You know that very well, only you don’t have to remember the past in the same way you don’t have to think about how you work your thyroid gland, or whatever else it is in your organism. You don’t have to know how to

shine the sun. You just do it, like you breath. Doesn't it really astonish you that you are this fantastically complex thing, and that you're doing all this and you never had any education in how to do it? Never learned, but you're this miracle? The point of it is, from a strictly physical, scientific standpoint, this organism is a continuous energy with everything else that's going on. And if I am my foot, I am the sun. Only we've got this little partial view. We've got the idea that 'No, I'm something IN this body.' The ego. That's a joke. The ego is nothing other than the focus of conscious attention. It's like the radar on a ship. The radar on a ship is a troubleshooter. Is there anything in the way? And conscious attention is a designed function of the brain to scan the environment, like a radar does, and note for any troublemaking changes. But if you identify yourself with your troubleshooter, then naturally you define yourself as being in a perpetual state of anxiety. And the moment we cease to identify with the ego and become aware that we are the whole organism, we realize first thing how harmonious it all is. Because your organism is a miracle of harmony. All these things functioning together. Even those creatures that are fighting each other in the blood stream and eating each other up. If they weren't doing that, you wouldn't be healthy.

So what is discord at one level of your being is harmony at another level. And you begin to realize that, and you begin to be aware too, that the discords of your life and the discords of people's lives, which are a discord at one level, at a higher level of the universe are healthy and harmonious. And you suddenly realize that everything you are and do is at that level as magnificent and as free of any blemish as the patterns in waves. The markings in marble. The way a cat moves. And that this world is really OK. Can't be anything else, because otherwise it couldn't exist. And I don't mean this in a kind of Pollyanna Christian Science sense. I don't know what it is or why it is about Christian Science, but it's prissy. It's got kind of a funny feeling to it; came from New England.

But the reality underneath physical existence, or which really is physical existence—because in my philosophy there is no difference between the physical and the spiritual. These are absolutely out-of-date catagories. It's all process; it isn't 'stuff' on the one hand and 'form' on the other. It's just pattern— life is pattern. It is a dance of energy. And so I will never invoke

spooky knowledge. That is, that I've had a private revelation or that I have sensory vibrations going on a plane which you don't have. Everything is standing right out in the open, it's just a question of how you look at it. So you do discover when you realize this, the most extraordinary thing that I never cease to be flabbergasted at whenever it happens to me. Some people will use a symbolism of the relationship of God to the universe, wherein God is a brilliant light, only somehow veiled, hiding underneath all these forms as you look around you. So far so good. But the truth is funnier than that. It is that you are looking right at the brilliant light now that the experience you are having that you call ordinary everyday consciousness—pretending you're not it—that experience is exactly the same thing as 'it.' There's no difference at all. And when you find that out, you laugh yourself silly. That's the great discovery.

In other words, when you really start to see things, and you look at an old paper cup, and you go into the nature of what it is to see what vision is, or what smell is, or what touch is, you realize that that vision of the paper cup is the brilliant light of the cosmos. Nothing could be brighter. Ten thousand suns couldn't be brighter. Only they're hidden in the sense that all the points of the infinite light are so tiny when you see them in the cup they don't blow your eyes out. See, the source of all light is in the eye. If there were no eyes in this world, the sun would not be light. So if I hit as hard as I can on a drum which has no skin, it makes no noise. So if a sun shines on a world with no eyes, it's like a hand beating on a skinless drum. No light. YOU evoke light out of the universe, in the same way you, by nature of having a soft skin, evoke hardness out of wood. Wood is only hard in relation to a soft skin. It's your eardrum that evokes noise out of the air. You, by being this organism, call into being this whole universe of light and color and hardness and heaviness and everything.

But in the mythology that we sold ourselves on at the end of the 19th century, when people discovered how big the universe was, and that we live on a little planet in a solar system on the edge of the galaxy, which is a minor galaxy, everybody thought, 'Uuuuugh, we're really unimportant after all. God isn't there and doesn't love us, and nature doesn't give a damn.' And we put ourselves down. But actually, it's this funny little microbe, tiny thing, crawling on this little planet that's way out somewhere, who has the

ingenuity, by nature of this magnificent organic structure, to evoke the whole universe out of what otherwise would be mere quanta. There's jazz going on. But you see, this ingenious little organism is not merely some stranger in this. This little organism, on this little planet, is what the whole show is growing there, and so realizing it's own presence. Does it through you, and you're it.

When you put a chicken's beak on a chalk line, it gets stuck; it's hypnotized. So in the same way, when you learn to pay attention, and as children you know how all the teachers were in class: 'Pay attention!!' And all the kids stare at the teacher. And we've got to pay attention. That's putting your nose on the chalk line. And you got stuck with the idea of attention, and you thought attention was Me, the ego, attention. So if you start attending to attention, you realize what the hoax is. That's why in Aldous Huxley's book 'Island,' the Roger had trained the myna birds on the island to say 'Attention! Here and now, boys!' See? Realize who you are. Come to, wake up!

Well, here's the problem: if this is the state of affairs which is so, and if the conscious state you're in this moment is the same thing as what we might call the Divine State. If you do anything to make it different, it shows that you don't understand that it's so. So the moment you start practicing yoga, or praying or meditating, or indulging in some sort of spiritual cultivation, you are getting in your own way.

Now this is the Buddhist trick: the buddha said 'We suffer because we desire. If you can give up desire, you won't suffer.' But he didn't say that as the last word; he said that as the opening step of a dialogue. Because if you say that to someone, they're going to come back after a while and say 'Yes, but now I'm desiring not to desire.' And so the buddha will answer, 'Well at last you're beginning to understand the point.' Because you can't give up desire. Why would you try to do that? It's already desire. So in the same way you say 'You ought to be unselfish' or to give up you ego. Let go, relax. Why do you want to do that? Just because it's another way of beating the game, isn't it? The moment you hypothesize that you are different from the universe, you want to get one up on it. But if you try to get one up on the universe, and you're in competition with it, that means you don't

understand you ARE it. You think there's a real difference between 'self' and 'other.' But 'self,' what you call yourself, and what you call 'other' are mutually necessary to each other like back and front. They're really one. But just as a magnet polarizes itself at north and south, but it's all one magnet, so experience polarizes itself as self and other, but it's all one. If you try to make the south pole defeat the north pole, or get the mastery of it, you show you don't know what's going on.

So there are two ways of playing the game. The first way, which is the usual way, is that a guru or teacher who wants to get this across to somebody because he knows it himself, and when you know it you'd like others to see it, too. So what he does is, he gets you into being ridiculous harder and more assiduously than usual. In other words, if you are in a contest with the universe, he's going to stir up that contest until it becomes ridiculous. And so he sets you such tasks as saying— Now of course, in order to be a true person, you must give up yourself, be unselfish. So the lord steps down out of heaven and says 'The first and great commandment is `Thou shalt love the lord thy god.' You must love me.' Well that's a double-bind. You can't love on purpose. You can't be sincere purposely. It's like trying not to think of a green elephant while taking medicine.

But if a person really tries to do it—and this is the way Christianity is rigged—you should be very sorry for your sins. And though everybody knows they're not, but they think they ought to be, they go around trying to be penitent. Or trying to be humble. And they know the more assiduously they practice it, the phonier and phonier the whole thing gets. So in Zen Buddhism, exactly the same thing happens. The Zen master challenges you to be spontaneous. 'Show me the real you.' One way they do this getting you to shout. Shout the word 'moo.' And he says 'I want to hear YOU in that shout. I want to hear your whole being in it.' And you yell your lungs out and he says 'Pfft. That's no good. That's just a fake shout. Now I want to hear absolutely the whole of your being, right from the heart of the universe, come through in this shout.' And these guys scream themselves hoarse. Nothing happens. Until one day they get so desperate they give up trying and they manage to get that shout through, when they weren't trying to be genuine. Because there was nothing else to do, you just had to yell.

And so in this way—it's called the technique of *reductio ad absurdum*. If you think you have a problem, and you're an ego and you're in difficulty, the answer the Zen master makes to you is 'Show me your ego. I want to see this thing that has a problem.' When Bodhidharma, the legendary founder of Zen, came to China, a disciple came to him and said 'I have no peace of mind. Please pacify my mind.' And Bodhidharma said 'Bring out your mind here before me and I'll pacify it.' 'Well,' he said, 'when I look for it, I can't find it.' So Bodhidharma said 'There, it's pacified.' See? Because when you look for your own mind, that is to say, your own particularized center of being which is separate from everything else, you won't be able to find it. But the only way you'll know it isn't there is if you look for it hard enough, to find out that it isn't there. And so everybody says 'All right, know yourself, look within, find out who you are.' Because the harder you look, you won't be able to find it, and then you'll realize it isn't there at all. There isn't a separate you. Your mind is what there is. Everything. But the only way to find that out is to persist in the state of delusion as hard as possible. That's one way. I haven't said the only way, but it is one way.

So almost all spiritual disciplines, meditations, prayers, etc, etc, are ways of persisting in folly. Doing resolutely and consistently what you're doing already. So if a person believes that the Earth is flat, you can't talk him out of that. He knows it's flat. Look out the window and see; it's obvious, it looks flat. So the only way to convince him it isn't is to say 'Well let's go and find the edge.' And in order to find the edge, you've got to be very careful not to walk in circles, you'll never find it that way. So we've got to go consistently in a straight line due west along the same line of latitude, and eventually when we get back to where we started from, you've convinced the guy that the world is round. That's the only way that will teach him. Because people can't be talked out of illusions.

There is another possibility, however. But this is more difficult to describe. Let's say we take as the basic supposition—-which is the thing that one sees in the experience of *satori* or awakening, or whatever you want to call it—that this now moment in which I'm talking and you're listening, is eternity. That although we have somehow conned ourselves into the notion that this moment is ordinary, and that we may not feel very well, we're sort of vaguely frustrated and worried and so on, and that it ought to be changed.

This is it. So you don't need to do anything at all. But the difficulty about explaining that is that you mustn't try and not do anything, because that's doing something. It's just the way it is. In other words, what's required is a sort of act of super relaxation; it's not ordinary relaxation. It's not just letting go, as when you lie down on the floor and imagine that you're heavy so you get into a state of muscular relaxation. It's not like that. It's being with yourself as you are without altering anything. And how to explain that? Because there's nothing to explain. It is the way it is now. See? And if you understand that, it will automatically wake you up.

So that's why Zen teachers use shock treatment, to sometimes hit them or shout at them or create a sudden surprise. Because it is that jolt that suddenly brings you here. See, there's no road to here, because you're already there. If you ask me 'How am I going to get here?' It will be like the famous story of the American tourist in England. The tourist asked some yokel the way to Upper Tuddenham, a little village. And the yokel scratched his head and he said 'Well, sir, I don't know where it is, but if I were you, I wouldn't start from here.'

So you see, when you ask 'How do I obtain the knowledge of God, how do I obtain the knowledge of liberation?' all I can say is it's the wrong question. Why do you want to obtain it? Because the very fact that you're wanting to obtain it is the only thing that prevents you from getting there. You already have it. But of course, it's up to you. It's your privilege to pretend that you don't. That's your game; that's your life game; that's what makes you think you're an ego. And when you want to wake up, you will, just like that. If you're not awake, it shows you don't want to. You're still playing the hide part of the game. You're still, as it were, the self pretending it's not the self. And that's what you want to do. So you see, in that way, too, you're already there.

So when you understand this, a funny thing happens, and some people misinterpret it. You'll discover as this happens that the distinction between voluntary and involuntary behavior disappears. You will realize that what you describe as things under your own will feel exactly the same as things going on outside you. You watch other people moving, and you know you're doing that, just like you're breathing or circulating your blood. And

if you don't understand what's going on, you're liable to get crazy at this point, and to feel that you are god in the Jehovah sense. To say that you actually have power over other people, so that you can alter what you're doing. And that you're omnipotent in a very crude, literal kind of bible sense. You see? A lot of people feel that and they go crazy. They put them away. They think they're Jesus Christ and that everybody ought to fall down and worship them. That's only they got their wires crossed. This experience happened to them, but they don't know how to interpret it. So be careful of that. Jung calls it inflation. People who get the Holy Man syndrome, that I suddenly discover that I am the lord and that I am above good and evil and so on, and therefore I start giving myself airs and graces. But the point is, everybody else is, too. If you discover that you are that, then you ought to know that everybody else is.

For example, let's see in other ways how you might realize this. Most people think when they open their eyes and look around, that what they're seeing is outside. It seems, doesn't it, that you are behind your eyes, and that behind the eyes there is a blank you can't see at all. You turn around and there's something else in front of you. But behind the eyes there seems to be something that has no color. It isn't dark, is isn't light. It is there from a tactile standpoint; you can feel it with your fingers, but you can't get inside it. But what is that behind your eyes? Well actually, when you look out there and see all these people and things sitting around, that's how it feels inside your head. The color of this room is back here in the nervous system, where the optical nerves are at the back of the head. It's in there. It's what you're experiencing. What you see out here is a neurological experience. Now if that hits you, and you feel sensuously that that's so, you may feel therefore that the external world is all inside my skull. You've got to correct that, with the thought that your skull is also in the external world. So you suddenly begin to feel 'Wow, what kind of situation is this? It's inside me, and I'm inside it, and it's inside me, and I'm inside it.' But that's the way it is.

This is the what you could call transaction, rather than interaction between the individual and the world. Just like, for example, in buying and selling. There cannot be an act of buying unless there is simultaneously an act of selling, and vice versa. So the relationship between the environment and the

organism is transactional. The environment grows the organism, and in turn the organism creates the environment. The organism turns the sun into light, but it requires there be an environment containing a sun for there to be an organism at all. And the answer to it simply is they're all one process. It isn't that organisms by chance came into the world. This world is the sort of environment which grows organisms. It was that way from the beginning. The organisms may in time have arrived in the scene or out of the scene later than the beginning of the scene, but from the moment it went BANG! in the beginning, if that's the way it started, organisms like us are sitting here. We're involved in it.

Look here, we take the propagation of an electric current. I can have an electric current running through a wire that goes all the way around the Earth. And here we have a power source, and here we have a switch. A positive pole, a negative pole. Now, before that switch closes, the current doesn't exactly behave like water in a pipe. There isn't current here, waiting, to jump the gap as soon as the switch is closed. The current doesn't even start until the switch is closed. It never starts unless the point of arrival is there. Now, it'll take an interval for that current to get going in its circuit if it's going all the way around the Earth. It's a long run. But the finishing point has to be closed before it will even start from the beginning. In a similar way, even though in the development of any physical system there may be billions of years between the creation of the most primitive form of energy and then the arrival of intelligent life, that billions of years is just the same thing as the trip of that current around the wire. Takes a bit of time. But it's already implied. It takes time for an acorn to turn into an oak, but the oak is already implied in the acorn. And so in any lump of rock floating about in space, there is implicit human intelligence. Sometime, somehow, somewhere. They all go together.

So don't differentiate yourself and stand off and say 'I am a living organism in a world made of a lot of dead junk, rocks and stuff.' It all goes together. Those rocks are just as much you as your fingernails. You need rocks. What are you going to stand on?

What I think an awakening really involves is a re-examination of our common sense. We've got all sorts of ideas built into us which seem

unquestioned, obvious. And our speech reflects them; its commonest phrases. 'Face the facts.' As if they were outside you. As if life were something they simply encountered as a foreigner. 'Face the facts.' Our common sense has been rigged, you see? So that we feel strangers and aliens in this world, and this is terribly plausible, simply because this is what we are used to. That's the only reason. But when you really start questioning this, say 'Is that the way I have to assume life is? I know everybody does, but does that make it true?' It doesn't necessarily. It ain't necessarily so. So then as you question this basic assumption that underlies our culture, you find you get a new kind of common sense. It becomes absolutely obvious to you that you are continuous with the universe.

For example, people used to believe that planets were supported in the sky by being imbedded in crystal spheres, and everybody knew that. Why, you could see the crystal spheres there because you could look right through them. It was obviously made of crystal, and something had to keep them up there. And then when the astronomers suggested that there weren't any crystal spheres, people got terrified, because then they thought the stars would fall down. Nowadays, it doesn't bother anybody. They thought, too, when they found out the Earth was spherical, people who lived in the antiquities would fall off, and that was scary. But then somebody sailed around the world, and we all got used to it, we travel around in jet planes and everything. We have no problem feeling that the Earth is globular. None whatever. We got used to it.

So in the same way Einstein's relativity theories—the curvature of the propagation of light, the idea that time gets older as light moves away from a source, in other words, people looking at the world now on Mars, they would be seeing the state of the world a little earlier than we are now experiencing it. That began to bother people when Einstein started talking about that. But now we're all used to it, and relativity and things like that are a matter of common sense today. Well, in a few years, it will be a matter of commonsense to many people that they're one with the universe. It'll be so simple. And then maybe if that happens, we shall be in a position to handle our technology with more sense. With love instead of with hate for our environment.

Education for Nonentity

Throughout Asia and Europe, Americans have the undeserved reputation of the most materialistic civilization that ever existed. The undeserved reputation, because never was their culture so completely unmaterialistic. I define a materialist as a person who loves material, and who reverences it, and who delights in using it to its best advantage. And if you will examine the system of education which most of our children are compelled to pass, you will discover that it imparts no knowledge whatsoever of any kind of materialistic competence. Our education is exclusively bookish, and is designed on the whole to train people to be bureaucrats, bankers clerks, insurance salesman, teachers, and we hope intellectuals. It is a curious thing but in its weak moments, it admits that there are a lot of people going through the scheme who really never qualify for graduate school. Or for college. And for these it must provide rather regretfully some courses which train them for other things. It's always a joke among Europeans that in American colleges you can take get an A.B. you can get credits towards an AB for courses in basket-weaving. And this isn't really so funny as it looks, because when it is the ideal that sort of everyone should go through college if possible. You have to adjust to facts. You can't have a nation, you can have a society, in which everyone is always occupied in intellectual and computational pursuits. A few people have to be around who know how to handle the material world in a gracious way. And for these people we provide only regretfully, as an afterthought. The people who might otherwise be dropouts in high school. Should be given some courses which would prepare them for trades in carpentry, metallurgy, even perhaps auto mechanics. Furniture makers. Cooks. And so on.

But as a rule because these kinds of education in the academic world are provided only with regret. They are provided in the slovenly fashion. We do not, we simply do not relate to the material world. And we are increasing lacking, in any kind of competence, in handling physical matter, except in such far out cases as people who make jet aircraft, and certain very sophisticated types of scientific instruments, where it is absolutely necessary that there be the highest degree of mastery. Aside from that, because of the lack of material competence, it is simply astonishing that the

wealthiest nation on earth, simply does not know how to enjoy itself. In a material and obvious way.

Now, you would think, if you were just an ordinary kind of horse-sense kind of person, that the richest nation on earth, would have a whale of a good time. Even though doing a factory job, that when the hours of work are over, that people would go home, with all the money that they earn, which makes them princes, by comparison with the Indians and Chinese. That they would go home to fantastic banquets, marvelous orgies, and riotous pleasure all the night through. It would just simply be common sense to people who do not suffer from the Protestant Ethic. But in fact, what happens is this. That we've got life strictly divided into two categories: work and play. Whack on the home is something that you do. To get money paid to do it because so much work is so deplorably boring that nobody wants to do it so they'll pay someone else to do it instead. So while you do it you watch the clock. You put in your hours, and then you get money for having done it, and then you're supposed to go home and enjoy yourself and have fun. Well what do you do? You get home, and instead of having fun, the main thing is to watch T.V.. And to me is an electronic reproduction of existence, which is cut off from you by a glass wall. It has no smell. If you're very rich, it has color. But you are as in a zoo, where you look at something beyond the bar, it says Do not touch. You cannot touch it you cannot mingle with it, you merely witness it in a passive way, and while you do this, you are served a TV dinner, which is something that was originally animal and vegetable, that has been frozen so as to deprive it of almost any taste at all. And it has been warmed over, and you eat it, not because you enjoy eating it but because it's good for you. It enables you to continue living, because it has been carefully studied and it has it exactly the right amount of calories, carbohydrates and vitamins and many of such preparations are served. You can take the scientific formula that's the thing for you which it contains. It tastes of nothing whatsoever and you while you watch this show going on. You may wash it down with a soft drink, its vaguely alcoholic, called beer. And in the meantime you're absorbed by the spectacle going on in front of you in which you do not participate. And it goes on long enough to be tired enough to go to sleep. This is supposed to be a life of pleasure.

Generally speaking we really are not materialistic all. We don't love material. We hate it. And we are devoted to the cause of converting it as fast as possible into junk and poison gas. We are not people who love time, which is one of the measurements of material, and space, which is another we want to abolish it. We want to get as fast as possible from one place to another to get rid of space and to get rid of time. And the result of this is of course, that as we get rid of space and time as we make all places almost immediately accessible by jet aircraft, all places become the same place. So naturally, the tourist is beguiled into taking a holiday in, somewhere else. The palm tree and so on. They'll make it like. That of course it isn't. Honolulu is the same place as Koney Island. Atlantic City. Tokyo just the same. It is simply an extension of Los Angeles one of the suburbs. Because the faster you can get from place to place, the more you have conquered the limitations of time and space everywhere is the same place. So. The Differences between people, the things that we want to see when we go to foreign places are increasingly. Except something provided enough for the entertainment of tourists to deceive them into the idea that they really did get somewhere else.

You look at another aspect of this. One of the basic things about material existence is of course eating food. And as I just indicated. In the case of the TV dinner, we eat food that is good for us. You know, it's always said that the French eat with gusto but the British eat apologetically. And we've inherited the British tradition. We eat in a way...it's rather animal to eat. It's a little vulgar that you have to stick it down into your stomach and it passes through your chest and intestines, and so on that's. It means after all that you're an animal, and not simply an angel. And therefore, there should be a good reason for the vulgar act, and the good reason is that it's healthy. And therefore when you, really, ideally, it should all be concentrated into a pill so that you wouldn't have to waste time valuable time over me but taking the necessary ingredients for a rather shameful fact that we have to exist in physical bodies, and get rid of it.

And so therefore, when you study in general the art of cooking in the United States, from coast to coast, it is pretty poor. It is not something that has done out of love, but something that is done out of. And so, we are great adepts in what I will call eating the menu instead of the dinner. The dinner

itself is thrown together you know, it's simply a job. All sorts of people have a certain amount of professional training cook, not because they like cooking but because it's a job through which you can make money. Money which is perfectly abstract and inedible. This is a fallacy you see, this division between work and play, that anybody who regards being a cook in a restaurant, which is something which is simply a job that you have to do you know to make money and therefore can go out and have fun in something else besides cooking has been absolutely deluded. He has been persuaded to spend a very substantial part of his life doing something which he hates doing in order that he may earn the wherewithal to do what is really fun later on. And this, insofar as our education is oriented towards. Training people for jobs. This is the colossal fallacy. The only jobs working at, are those which you thoroughly enjoy. And it is possible to enjoy sorrily say in a restaurant. You are allowed to take delight in it, and to reverence the fishm the flour, the vegetables, the fruit, which are provided for you to work with.

But as things stand what happens is exactly the reverse. You go into a restaurant, which probably has colored photographs on it. And it says something like this. Filet of Colorado Mountain Trout. Fried to a delicate golden brown in bread crumbs. Garnished with fresh garden peas. French fried potato wedge. The last time I encountered this, it was a restaurant where they had the nerve to keep an open kitchen. And when I saw the so-called filet of Colorado Mountain Trout. Incidentally this was in Wyoming. It was a severe rectangle of some off-white substance, which rattle when it hit the griddle.

You know, the whole thing was completely mechanical, because there was in this process absolutely no love for the work itself. The cook in other words was wasting his precious time in life by going through the motions of being in order to get money for enjoyment. Now, the thing that has to be understood fundamentally in the process of education for life. Money is an abstraction. It cannot of itself by any pleasure whatsoever. Because all pleasures involves skill and love. Enough love to discipline yourself to enjoy the pleasure. I live in, as I told you in the introduction, in Sausalito, which is a lovely waterfront town north of San Francisco. We have a law. With pleasure craft. Sailing boats, motor cruisers, which for the most part

nobody ever except cocktail party. People go out because sailing is a difficult craft. These boats were advertised as something you want to have to enjoy yourself, but when you got them couldn't enjoy yourself unless you knew how to sail have time to do that because you were so busy making money. So all these boats stand around, and nobody really enjoys them at all. Because they won't take the trouble. Having been persuaded that money is wealth.

Taken another case of this delusion. You can make a lot of money say, in the grocery business, by turning out shoddy products in excellent packages. You cheat on the weight and you cheat on the quality. You make more and more money. Fine, but when you've got it what are you going to buy with it? Other people's shoddy products. We have cars with built-in obsolescence which are nothing but toy rocket ships. We have, as I said, various kinds of foodstuffs, which are increasingly lacking. We have houses which are made of ticky tacky. We have entertainment in which there is no participation. You're not allowed to join, you just watch.

We are busily fouling our own nest. Have you smelt the air today in this town? It all smells of some kind of funny acid . And these is supposed to be people who are rich and wealthy and know how to enjoy themselves. It's a farce. And to some extent, the reason for this farce is the whole education process.

I want to look at this, but I want to look at it from the standpoint of bringing up children in this culture and the whole structure and nature of the family. That's where that's where the puzzle begins. Have you noticed that over many years, a large number of the jokes in most of our popular magazines where they print cartoons, have to do with father as a clown. Take Dagwood in the comic strip. The incompetence of dad, who is always some kind of a idiot. Whereas mom has to handle the real problems in the family and is therefore the realist in the picture. Dad is a clown. Why?

Because he goes away to a mysterious place called the office factory. In which the family as such have no part and. He brings back a thing called money and they want to see that. Now you can get it. Just so long as you bring it back because they're not interested in what you do. When you come back from the various rat races in which you are engaged making money,

you're supposed to be a good pal to the children, play with them. Off to your wife and appreciate what she's done. They have no interest in what you do. They couldn't care less. And furthermore, you as a father. You as a mother. Are expected to live for your children. Americans have a sense of guilt because they have not done right by their children trying to do right by their children. They always family haven't quite succeeded somehow. We are child centered families, constantly feeling guilty because we haven't brought them up. Now for we call in every kind of specialist an expert in the Pfizer to tell us what we should do with our children. The difficulty is that the family as an institution is not surviving in industrial culture it is an institution designed for an agrarian.

The family was built around the farm, where the children worked on the phone and understood and were brought up into the interest of the small shop or the workshop, such as you find in an agrarian culture. It's fascinating to notice today the transition from agrarian to industrial culture in a country like Japan where it's been extremely rapid. Let's take the craft of carpentry in Japan. The Japanese have been some of the best carpenters in the world, absolutely marvelous, knowing how to make the most complex joinery constructions without even using a blueprint, doing it by feel and by eye. In order to train a person to do this kind of carpentry he has to begin to learn when he's seven years old. But as it is now, because Japan is transferred to being an industrial culture you may not bring up your child in your profession as a carpenter you have to send the child to school, where you can learn to be an insurance salesman.

The child gets through school, get through high school. When the child gets out is not interested in carpenter it's interested in girls. As the final round of that for a while and then get married and then again to learn the carpenters trade and it's too late to be anything but somebody who follows the blueprint. Therefore this marvelous craft which the Japanese cultivated for centuries is being lost. For what? I know many carpenters in the United States today who take enormous pride in their work. Who love to produce a beautifully finished object made of wood. But they cannot find jobs. Because no employer can afford that time for his workman to finish a product. It has to be turned out looking good on the surface with a sort of veneer and varnish. But anything thrown in on the underside, so I don't

wear out and they have to do another one so nobody has any satisfaction in the job.

And the reason is that that the family no longer holds together, because the family...the man in the family has to go away and it has absolutely no relation to his living relationship with his wife and his children. Therefore, naturally, he's regarded as a clown. When he comes home, he's not really a very good pal to his children. Because the children would find a real relationship with their father by joining in his work with him. Every little child wants to join his parents while they work. They go into the kitchen they would much rather play with the pots and pans and anything else they want to help they naturally want to join in but they cannot and therefore instead of being allowed to join in. With their parents they are given propitiatory objects called toys. You may have a toy store you may have toys dolls and pretend that you may not actually be baby because it might be an accident.

So the children are propitiated with every kind of fake plastic things that every adult is suppose to use. Especially those real adults, that go out and fight the wars, you know, then they have a plastic gun. Now the children are not satisfied with this, they are absolutely frustrated because these toys fall apart and they don't really work they don't know what's expected of. The child they're not real and it's. Christmas Day when you think about Christmas Day in the average family. After the children of their fake presents which were dolled up to look as if they were the treasures of princes. And they get the plastic toys and they find everything doesn't work. And by time for Christmas screaming tantrum. Because they know inwardly they're being insulted, they're not allowed to participate in the real world. Doodeedoodeedo. You don't really count.

And so as the whole educational process continues, they are educated for unreality, for nonentity, because they are being progressively fooled....You see, it works like this. You know this story of a donkey who has a carrot suspended in front of it, and it's attached to a stick which is a donkey's collar. So it can always chase it but never catch it. So this is what we do. We send a child into kindergarten. And make him literate, more or less. Run Spot Run, and all that. And then, the inducement is, if you learn this, you

get into first grade. And wowee, if you do this, you'll get into second grade, and so it's kind of a come-on.

You'll go through the step-by-step educational process, and there's going to be a big event, and when you get out of grade school you'll go to high school. And you're going to get step-by-step through high school because there's a thing coming! Got to college Whew, made it that far. And step by step you go on and you get to graduate school. If you're smart at this point, you'll stay there. But if you don't go into graduate school so you can just stay in the academic scheme of things, you get into business. That's getting out into the world, that's graduation. See now you're really, you're an adult. Well then the first thing is you get into a sales meeting, they're going to say is get that quota. And if you make that quota, they're going to give you a higher quota. And that thing at the end of the line, it's there. The thing that all the advertisers say, by the time you earn this and get that, you're going to the get the right kind of car, the right kind of speedboat, trackbot, the right kind of clothes and everything. The right kind of drinks and you'll be there. So you work along at this, and you're earnest. Finally here forty five you end up as vice president of the company. I've arrived. I'm there. But I feel vaguely cheated because I feel just the same as I've always felt. I haven't caught up with the thing I've promised. We've got a program for you. Just right when you're sixty five you'll be able to drop what you really want to do. By that time you're not interested. Prostate trouble, bad teeth. You're just falling apart, because you ate all the stuff that you make with. To make money if the money goes nowhere absolutely.

So you know you end up feeling cheated, and the reason the simply this. That education regarding the process of preparation. For something which never happens now is going to happen. But it was you were always getting prepared for life. A real education is an entirely different thing. Education in the real sense is not preparation for life it is actually living. It is the child participating in adult concerns. And doing it now and realizing that the point of the process in which the child is engaged is not to prepare the child for the future but to enjoy doing today. Because the whole point is that there is no point whatsoever in making plans for the future, except people who are capable of living in the present. If you are not capable of living in the present, plans are useless, because when those plans come to fruition, you

will be incapable of enjoying them. Don't worry, if you're not capable of living in the present, don't make any plans. If you are capable of living in the present then some plans may be useful, because they will produce something which you can enjoy and take part in. But it seems to me that the absolute point of any educational system that has any worth whatsoever is the progressive allowing of children to participate in activities that adults consider real and important. And that should begin very early. Instead of saying to children, no, you go away and play while we do what's important, let them in on what we consider important at once. This is very difficult in what we call the child-centered family. If you see, you regard what you do in life as not say your profession, your vocation, your job, if you regard that merely as a means to an end supposing you are making money in a factory producing something worthless and trashy, but it pays. And you justify this on the grounds that it will give you money to bring up your children to do something better than you are doing, you are fooling yourself. Because your child will copy you. And if you exist simply to bring up your children for something better than you have, then your children will do nothing but exist to bring up their children to do something better than they have. And [they] will always be frustrated. If on the other hand, you are doing something in life you have a vocation, a work which you're doing which you are really interested in and which you feel really enjoy. And it's this that you live for, and not for your children then your children will catch your enthusiasm. And they in turn will find something that they can live for and be really interested in, and in turn their children will become interested. But we are unfortunately a culture, because we always have the sense of we have, we do everything possible we can for the good of the children. You should not live for your children. You should live for your own good, and then your children will learn, from your own example, how to live.

So then, education then is a progressive letting children in to adult life. Not a preparation. The whole idea of preparation should be discarded. There is simply increased participation in what we are doing. I have just come from a very primitive area where the educational system is sloppy, thank goodness. I watch builders at work, and their wonderfully skillful with brick. And here are the older men working on a house. And the little boys running errands while they help. And they feel one with their fathers. Dad isn't some obscure being off there, who they occasionally meet in the

evening, and who does something completely mysterious, and who is supposed to chum up with them on a completely play basis. What is dad? And he plays about something. About the mousey and the teddy-bear. And having done that he's done his duty, he's satisfied his penance. For having had them. But these so-called primitive Mexicans, have their children working with them. I'm not speaking of Mexico City, and the great industrial slums of Mexico. I'm speaking of a very far out. I'm not. In a curious competence, and curious wisdom. Little men who can be trusted to do all kinds of things. But you see we are abandoning all responsibility for our children by sending them to be educated by other people. Lying. Around. Like you. Somehow haven't done right by our children, and we want to give them the best that we have. The whole trouble. With. The idea. In the Christian location that's the thing you're really. Not sure. If you really have that with you, the children will catch it from you. will actually. Be inspired by joining. The problem is you see, that in industrial culture, there are very few opportunities to bring about that state of affairs. Imagine going to the bank bringing your children along with you to peek over the counter while you hand out the cash. Put in the checks. In any important thing we do, get rid of our children. We get a babysitter. When we going to have fun in the evening at the babysitter and keep the children out of it, for heaven sakes. And this is simply symbolic of the fact that children are utterly excluded from real life. They're put in these completely artificial schools. Where they learn to be cerebral and merely literate. They learn nothing of the the fundamental art of handling matter. What are the fundamental arts that we need in this life if we are to become if we are to enjoy ourselves? We need good food, well-cooked. Isn't that fundamental? You will have to eat all you need to. Go. But you if you don't live to eat, the food that you need won't be very nutritive to enable you to live well. Take any trouble. It looks when you get. Materials you've got some onions you've got some fish you've got a slice of beef. You can cook that probably unless you love it. All those are dead creatures which have died in your honor. What are you going to do about that? The only way to deal respectfully with a creature that has died in your honor is to give it an honorable cookie. The dead cow you are eating is becoming you, and the least you can do for it is to let it enjoy itself as you. Are for. In the kitchen and you are a priest at that altar. And you should reverence that that gorgeous thing. Look at a beautiful mackerel. At the supermarket. You've

got this thing it's a living being dying to give you life the best thing you can do for it is very loyal and you should. See that it's exactly right people have no idea how to cook fish in this country, they cook it till it's dry and tasteless, because they don't watch it. To the exact moment when it's right. That's cooking is regarded as a troll something to. Do. With the kitchen most kitchens are like bathrooms you know you go to the bathroom clean up excrete and so on which is sort of. The way the kitchens also whitewashed places with white refrigerators and white washing machines white sinks. Look like surgeries or bathrooms. I have always found a formula, wherever you find a colorless kitchen, you will find tasteless food. The real life. There's a great. Bubble and everybody gathers around with eager appetites while they watch out that's going to be just great everybody just sitting around the fire began. And instead of having. The power. From the kitchen. Actually the lady of the house ready to go rushing around. The kitchen. And everybody would gather. Nothing. Except a very few. Calls.

So on the average, across everything just measure everything. You have the right amount. In the other camp. Everybody just. Wants another important thing in life of material. And material who thinks that the material. Was there for great deal of trouble but he has a house. Together. By. Design to be very. Very much. Like that. If you like to live in the you want to live in. In the flat areas there are four design a house which is appropriate to a. House which will not disturb which will fit in with the contours of nature and the vegetation of nature that already exists which is what you want to live in and enjoy and. Take another important aspect of material life. Looked at the furniture and. You know it's. Really one of the things that we suffer from that we have too much. We have these enormous cultural. Look like they were going to place. Over stuff months. And. All kinds of. Stuff too. Because it's simply. Thrown together by people who didn't like doing. Much better have a very few pieces of furniture made by an artist to enjoy making the top drop thrown together and is it always invariably advertised in what it is and causes frustration bitterness and disappointment in the sense of having been cheated. Draws. And we have an amazing pretentious bed. There is possible to move around when it comes to moving house great weight and inconvenience. Unlike practical material such as Japanese we know how to sleep. From the point of view of material. That's. Coming from. Don't know. Some exceptions on the West like. I'm wearing the.

Violation of the nature of cloth. That's the. Law. Great stuff which will. Actually. Be made. To prevent. The way without making it so that. The. Human Body. Which is not in the nature of pop culture Hang on let me just. Shaped in this way it doesn't. Violate the nature of thought. And if it does not come. Let's take for example trousers. Designed for women. Women look. Very uncomfortable. But we. Abstract. Kinds of complicated. Everything to make it sound. And. Rightly. So that if you want. To day five. From. Mexico. Well. Absolutely. By magnificent. People. Joining. Here. And we. Don't joy. To enjoy what's the point of going around. What else. Fundamental material. Everybody ought to know about. Love me. That's very fundamental. This is something that our children. Through hearsay. Or through a few courses in hygiene in high school which. Are facts about nothing of the art. And this is picked up in a sloppy way because we're. I mean here is the real deal in this culture where we say we are material. In fact what happened. Everything to do with. Sexuality. Is regarded as fundamentally. Associated toys. And therefore. Something basically prohibited. By. Man brought up in the W A P culture. That it's really supposed to be fun and so they sort of snicker about. It's always on the side something. That you don't really enjoy unless you feel it's dirty. You're doing something you're not supposed to then it's kind of fun and so there's a perpetual hypocrisy about the whole thing. And no one ever I mean the most the most than the most reprehensible thing you do in this culture is to come out say with a book. On the love. Which would be comparable to a book. On the. Show. Every. Possible in the contract between. Approach. But. It's all right so long. It's all right so long. As the moment it's something. We. Show we are not. Do not. Do not love. So as a result we have a culture which instead of being. Struck. Which for example confuses money with wealth You know the situation. But you don't count. It getting along. Not perhaps because you thought you were paying too much for what you. Found. But instead you got that caught. Up with the real world. You know. Not mentioning how much of it is fake but. That is your. Stuff you're going to live on and it's in your car and you're going to go away with it you lost the money.

So you know the abstract thing, the amount of money. That is more important than the actual situation. So likewise going back to the subject. Of. The way things look the way. It. Is much more important than what you.

Look at the figure fashionable. Done in such a fashion way. Take it off and. Then a kind of a letdown. In other words. The point down that I'm trying to get out while we are providing ourselves on being material. We have not mastered it. Except. Engineering dimension where we really have done a good job a jet plane is a remarkable triumph. Even though polishes distance even though it makes every place the same as every other place it is a self triumph of material. But in the fundamental life. Raising children in love making the biggest material incompetence. Ever exist. Because we are. Abstract that of how it looks rather than how it. How it appears rather than how it tastes. And so I would think what I'm saying is that we need an education. Which brings us back. To nature in the sense not. The law. But our being focused on the material. And knowing that is where you live and what you do. To be completely relate to the physical natural material or whatever you want to call it here and now. You know that's the only place you don't live anywhere else. And to be able to live richly and fully in that situation instead of constantly preparing. For something else. Altogether. I think this means. The easing of the school. Throwing a lot of it back on. The school system is a huge baby. And then but that in turn requires that parents be in a position to take care of their children. As if they're engaged in occupation which necessarily take them away. What does that go back to in the line of cause. It goes back to the fact that people are engaged in occupation. Which simply make money. And which they do not really enjoy and which they do not really live with. And that is why among young people today under twenty five. Corp. Job hunters I mean you know people who are looking for bright Talent Corp going around our colleges having increasingly difficult for the right of the student the less they want to get involved in the traditional kind of corporate life. Because that takes them away. From any work. Which will involve the participation of. The woman they love.

So people are looking for ways of living. Whereby they don't live fragmented abstract, work life that is completely cut off from the rest of truly. So we are facing a very. In which young people want to return. And even. Make very little money. It will at least have the satisfaction. Of being an actual relationship with the real world in which we live. I don't know. What it. Will be very disruptive. We know. That are by far better by far contact.

Ecological Awareness

When I talk in academic and scientific circles about mystical experience, I have to be very careful of my terminology. And so I alter the phrase ‘mystical experience’ and call it ‘ecological awareness’ because it really amounts to the same thing. But the terminology is much more acceptable in the scholarly environment because, after all, mysticism is a dirty word associated with mist and vagueness. On the other hand, there is this difficulty that—in our universities today—ecology has not quite come of age as a science, although its importance is vastly recognized. Ecology—being the science which studies the relationship between organisms and their environments—is a multi-disciplinary science and, therefore, its existence on any campus today runs afoul of departmental politics.

You notice, you see, that all our universities are based on the idea that there are departments of knowledge. And if you trace the history of universities over several centuries, you will see that the classification of departments keeps changing. There was a time in the Middle Ages when, for example, theology was the queen of the sciences and, therefore, had high rank as a department—as today the department of physics or chemistry would have—but now it has almost completely disappeared. There is a department of—yes, maybe—of the history of religions, which occupies an obscure set of rooms in the philosophy building or something like that, which is way off at the edge of the campus. But you cannot keep these departments fixed because, as between, say, biology and physics, we develop a science of biophysics. As between biology and chemistry, we develop a science of biochemistry. As between physics and mathematics, we get mathematical physics. As between physics and astronomy, we get astrophysics. And the formations keep changing, and this has very difficult political consequences for the simple reason that the faculty members and chairmen of departments are jealous of their positions. And they’re always apt to say—when these new hybrid departments start out—that these people are dabblers. In other words, they should get a thorough grounding in biology, zoology, botany, bacteriology, and all those separate departments before they should dare venture into such a thing as ecology, which involves all those different sciences and more.

What is not generally understood, however, is a most peculiar thing, and very difficult to explain. In the academic world—you know how students have to go through prerequisite courses? They're supposed to take this before they take that. Well, it's been found out, increasingly, that this is completely unnecessary. That, for some reason, as time goes on, students develop the ability to absorb bodies of knowledge for which it was thought they had no prerequisites. In the same way as—let's say, in the childhood of anybody now aged roughly fifty—it was very difficult to understand Einstein's Theory of Relativity, and you always had to have a demonstration on a blackboard, and all sorts of diagrams. But now young people get this idea instantly, they have no difficulty in absorbing it anymore than we had difficulty in absorbing the notion that the Earth was spherical. We were no longer embarrassed. Our common sense was no longer offended by the thought that people living in the Antipodes would be hanging upside down. In this sort of way, common sense, a feeling for knowledge, adjusts itself. And more and more it becomes obvious that there have to be ways of linking together the departments of knowledge. It's almost as if the established departments—like physics, chemistry, history, anthropology, and so on—were like huge paving stones, and it's always between the paving stones that the little things begin growing. So the growing edge is in the interstices between the departments.

Now, therefore, ecology becomes of absolutely primary importance in the modern world because, as so many of us have often said, Western man is equipped with technical powers such as have not been seen in known history, and is using those powers to alter his environment, but doing it in a way and in a spirit that may, instead of altering the environment, merely destroy it; what I call "Los Angelization instead of civilization" is taking over, and we are fouling our own nest. And, therefore, I approach this whole matter because of my interest in the Chinese and Japanese philosophy of nature, wherein there is not this sense of hostility between the human organism and its environment, but rather a sense of being one with it and collaborating with it. And thus it's been my particular interest to see in what way this Far Eastern attitude to nature—based originally on the philosophy of Taoism—is applicable in a technological civilization. Because there is one school of thought that says, "Of course, we've got to press technological progress as far as possible," and we, therefore, get a

proliferation of so-called growing communities, which are very evident here in California and remind some of us of the growth of cancer cells rather than the growth of anything of a biologically healthy nature. And this is called progress, and people say you can't stop progress. Don't be sentimental! And, on the other hand, there are the people who really do want to stop this. And I find that—to some considerable extent among young people who are, shall I say, digging the drop-out scene—there is a very definite wish to, as it were, join the American Indians, to get rid of concrete, to go back to green grass. As Gary Snyder put it the other day: “When you want to go from Sausalito to Big Sur, don't take the freeway. Don't even take the side roads. Find an old trail and walk it. Because the journey will be worth taking then.” And he feels, for example, that all the state park rangers should busy themselves with opening up trails so that more and more young people can walk, and have stations a day's walk apart where they can rest for the night, or where there are congenial farmers and friendly people with homes who will accommodate them. And so we will set up, as it were, a whole network of communications and culture entirely apart from the freeways and the suburban subtopia that sprawls all over the place. Because, like any good Indian—American Indian, that is—they sit around waiting and watching because they know that one of these days this whole industrial civilization is just going to disappear into gas and will leave them as they were in the beginning. You see, these are two completely extreme points of view. And I want to explore, rather, the possibility that there is a middle way: that technology is not a purely unnatural manifestation, that it is a perfectly proper development of human capacities, but that it has to be used in the right spirit and with the right care in such a way that we do not disturb, irremediably, what are called the balances of nature.

The idea that there are balances of nature, that no species, for example, should get so out of hand as to become top species and really dominate all the others—as human beings are trying to do—goes back, of course, to the fundamental Chinese notion of nature as the balancing of two forces, called the yang and the yin—or, in Japanese, inyo. The whole of the Book of Changes—which is a very, very ancient text fundamental to Chinese ways of thinking and to Chinese logic—is based on an analysis of the processes of nature in terms of the relative balancing of these forces. Perhaps “forces”

is not quite the right word. It is—you see—obvious to a Taoist, to Buddhists, to Hindus, that this universe is a single system of energy, but there is no way of defining and putting your finger on that particular one energy. And even energy is not quite the right word to use because energy indicates something in motion, and we do not know or realize motion except in relation to stillness and vice versa. So, whatever energy-stillness is, fundamentally, cannot be thought about, defined, or talked about in any way. It is basic to everything that we both experience and don't experience. It bears somewhat the same relation to our everyday life as the diaphragm in a loudspeaker bears to all the sounds that you hear on the radio. Every sound—of the human voice, of all kinds of musical instruments, of airplanes, of automobiles, and so on—anything you can hear on the radio is actually the vibration of a diaphragm. But the radio does not proclaim this fact. The announcer does not come on first thing in the morning and say, "All the sounds that you will hereafter hear are vibrations of a diaphragm, including this sound, and not the actual wind in musical instruments and human vocal cords." No, because wherever any circumstance is constant, we tend—in the course of time—to ignore it. We rule it out of all practical politics because it is basic to everything. It's as in an equation: when you get two terms that are identical on either side of the equation, you can just cancel them out. They make no difference. But, in a way, this is a very difficult point because, obviously, it is highly important that the diaphragm be there because otherwise there wouldn't be any voices or music. And yet, the diaphragm as such makes no difference to the distinctions between voices, and musical instruments, and so on. From a logical point of view, it is absolutely meaningless to talk about anything which is common to everything, which is the substratum, or ground, of being.

But the categories of logic do not embrace all knowledge. And it is possible for human beings, once again, to become aware in a certain way of this substratum. Not, however, as an object—not as something you can take out and look at—but nevertheless to be very strongly and almost sensuously aware of it and, in so doing, regain a new sense of one's own identity, one's own being: not as one of many things, one little event among many events that are all coming and going and temporary, but a sense of one's actual self as being this single energy field—which can't be, however, defined or identified—and, through realizing that, to take away the frantic anxiety that

we have to secure ourselves as separate organisms, and to fight with other organisms, and play these elaborate games of one-upmanship, and—above all—to overcome the anxiety which leads us to regard nature itself as our enemy that has to be conquered and subjugated.

I shall, of course, return in later sessions to the nature of this realization, but I only want to say in passing that there's a very peculiar thing about it, namely, that the realization I'm speaking of is not something like a belief. It is not an idea for the simple reason that the fundamental energy of the universe cannot be embraced in an idea. It cannot be embraced in a concept, in a form of words, in an explanation, because it eludes all classification. Because it is the which than which there is no whicher, and therefore is not in any class. Secondly, if you try to catch hold of it and somehow possess it, you are doing what is called in Zen "putting legs on a snake." Because there is no need to possess it: you are it, and if you try to possess it you imply that you're not. So by trying to catch hold of it you—as it were—push it away; although you can't really push it away because the very pushing is all it, you see?

So there are people who are divided into two schools of thought: those who believe that by exerting their energies to get hold of it they can achieve something, and the opposite people who think that by doing nothing at all one achieves it. But both are wrong because both the attempt to get it and the attempt to try not to get it are actually attempts to get it! And there is no need to. But nevertheless, by going into this—by meditation and so on—it is possible to realize that we are identical with the fundamental energy of the universe, that that is our real self—and although it doesn't make a difference because all differences are, in a way, made by it, therefore it makes no difference to differences—nevertheless it's completely basic. You see, it's as if what has happened to us is: supposing you're a gambler, and you've got involved in a game where you're playing, actually, for peanuts, and you are immensely wealthy. When you get extremely absorbed in the game, even though you're only playing for peanuts, you can lose your temper and you can be anxious as to who's going to win, who's going to lose, am I going to lose my peanuts, you see? Whereas you really have nothing to worry about at all, but you got so absorbed in the details of this game that you've forgotten the larger context in which the game is

happening. So, in exactly the same way, every individual is so absorbed—myopically, with his mind—in the details of his birth and death that he’s completely forgotten the context in which birth and death is occurring. And so, just as the chicken—when you put his beak to a chalk line—can’t get off it and is hypnotized, so we have been systematically and progressively hypnotized by our whole upbringing into the sensation that we are only this particular ego in this body. And we believe that and feel it so firmly that the context in which all this has happened is completely repressed.

Now, therefore, I want to propose a few things, first of all, in thinking about this, and I would ask you to listen to what I have to say, temporarily postponing the question “What are the practical consequences? What should we do about it?” I want to start with a consideration of our ancient ideas about the relation of the individual to the world in terms of fate and free will—or determinism and free will—because if we actually were aware of all the information that is coming to us through our senses, we would have a very curious sensation which would bug us because we wouldn’t be able to find words for it. It would be like this: you would first of all realize that if you didn’t be so selective—in other words, if you didn’t pay attention to this detail and that detail, but were just simply aware of it all in general—you would get the funny feeling, in the first place, that you were just a puppet, that you were automatically responding to all kinds of physical and social influences around you, and that you couldn’t help yourself. You might object to that, or you might alternatively enjoy it. You might get a sensation that you were just floating. You didn’t have to do anything, you didn’t have to think about any problems, you didn’t have to worry about what you ought to do, you would just feel yourself responding, and that would be a very pleasant feeling if you liked it. But, on the other hand—depending on your personal constitution—you might feel terribly threatened by it, and you would interpret this sensation as a feeling of unreality. Have you ever suddenly felt that you were dreaming everyday life, that it wasn’t quite real, and it spooked you? So you say, “Gee, it ought to be happening!” See? And I feel like I’m going around in a dream. Because occasionally, our mind slips. It’s like the tuning dial of a radio: it occasionally wanders off and you get another station. And so, in the same way, our minds occasionally slip into another way of seeing things, and

people get accidental illuminations, and psychoses, and all sorts of funny things.

But you would get this as a preliminary sensation, and you would interpret it as feeling that you are a puppet on the end of strings being manipulated by events only because of your previous background, wherein we have—all of us—been conditioned to believe that part of our life is not under our control and part of it is. There is this distinction between the voluntary and the involuntary. The voluntary: what we do; the involuntary: what we have to accept passively. The borderline between them is not at all clear. Breathing, for example, is something we have to go on doing, and yet you can acquire the sensation that you are doing the breathing and controlling it according to your will. It's a very vague distinction here. But if you took in all the information—see, you can feel yourself making a decision out of the blue. You say, "I'm going to do that!" Like that, you see? And you don't have any awareness of anything that leads up to it. It just happens, you see? And because that awareness is screened out you interpret this act of making a decision as a different kind of act from breathing or from growing hair. Well, actually, it isn't different, but we think it's different because of unawareness. When you make a decision it happens—as the Chinese say, *zìrán*; *shìsen*—"of itself," "naturally," "spontaneously." But we feel that there are things that happen of themselves in contrast to certain things that I do, and that is because of incomplete awareness.

But then, if that awareness were to change—and you were to realize that everything is happening of itself, including your decisions—because of your background, you would then veer over to the opposite point of view: everything is happening involuntarily and I am left out; I am a puppet, I simply have to obey. You see? But this would be incorrect. The point is, rather, this: we don't have a system of nature which is either deterministic or voluntaristic. The relationship of the individual to the environment is not one of the individual as some little thing in the environment, which is moved by the environment and responds to the environment passively. Nor, oppositely, do we have a situation in which the individual is a center of activity that, all of its own, to some extent alters and changes the environment. Both of these opinions are based on lack of awareness or ignorance—ignore-ance—that the behavior of the individual and the

behavior of the environment are the same process. And you can look at the process from two points of view. You can look at it from the point of view of “It’s all happening to me,” or you can look at it from the point of view “I’m doing it.” These are just two poles of two ways of looking at the same thing.

If, for example, you realize that your neurological organization is creating the external world—in other words, there is no such thing as light, weight, heat, color, shape, except in terms of the human nervous system or some other animal nervous system—then, from that point of view, you can see your nervous system as evoking the whole universe. But you can take an opposite point of view which is equally true, which is that the human nervous system is something in the external world and is entirely dependent on sun, and air, and light, and temperature, and so on and so forth. Both points of view are true, but we have not yet—especially in the West—become aware of a logic which can integrate them. And so, when we first come to experience this thing as being so, we tend to interpret it in terms of our old logics and our old ways of thinking, so that one person may say on feeling this, “I feel as if I’m just floating around, passively responding to the operations of nature,” and another person going to the opposite extreme will interpret this experience as saying, “I suddenly realize I’m God. That I actually govern and control everything that happens.” These are two ways of looking at exactly the same thing. The point being, then, that there is just the one process which is equally the behavior of the organism and the behavior of the environment; that you can look at this process from many points of view, define it in many ways, but you can’t really split it up.

And so, the consequence of this—although I’m not going into this at the moment in any full way—is to learn to act and behave in terms of this vision of the world. Not as your acting upon the world, not as it acting upon you, but as the unfoldment of a process which, as you understand it, you become more intelligent and act more intelligently. Intelligence is a function of the degree to which you realize that your behavior is one with the behavior of the rest of the world. The more you realize that, the more one would say you appear to be better in control—although you’re not actually controlling it. The difficulty—the essential difficulty—that lies in the way of most people seeing this is the fixed notion that the world

consists of separate things and separate events. As Teilhard de Chardin put it: “The only real atom is the universe.” The word ‘atom,’ you see, in Greek, is ἄτομος. ἄ: ‘non.’ τομος: ‘cut.’ The uncut. It’s the same idea as in Lao-Tzu: “the uncarved block.” There’s a great symbol of naturalness. What cannot be further divided? And so de Chardin says it is the universe that is the only real atom. Because if you take anything out of the universe and separate it, you will find that it is raveled at all of its edges. It is not, in other words, cleanly divisible.

But this is something which is left out of our ordinary awareness, because in our ordinary awareness we overlook the connections that go between so-called things and so-called events and make them, actually, nothing but aspects of one event. It’s as if we were looking at everything through a sort of Venetian blind where intervals are ignored and cut out. Our senses are, of course—as we know—screening devices. The eye responds to a very narrow spectrum of the various forms of light vibrations. We do not see x-rays or cosmic rays. Likewise, our ear responds only to a rather narrow spectrum of sound. We keep screening out. And, therefore, not only do we screen with our senses—with the organs of sense—we also screen with the thinking systems by which we interpret what we sense. It’s a further act of screening. And so, as a result of this, there are gaps. And these gaps are symbolized by the fact that we ignore space.

We think—as we all sit around here in this room, you see—that the spaces between each of us as we sit here is nothing at all; it’s not important. But actually, it’s tremendously important. The spaces between people—and space as a marvelous thing in itself—is as important as, for example, the intervals between tones in music. It is the intervals and the hearing of the intervals that enables you to hear melody. And so it is the space between everything which, instead of being something that divides, it joins. But we ignore it and don’t see that space—like the diaphragm in the radio—space is that in which everything happens; and without space, no happening. It’s fundamental but ignored. And there are many other things besides. All kinds of mutual influencing constantly going on, but this is ignored because, for one reason—for two reasons. One: we don’t have time to bother with it. We don’t think it’s important. And we don’t think it’s important because we have been trained to regard only certain things as

important. And that's why in the process, say, of mediation as it's understood by Buddhists and Taoists, you stop valuing and putting a price on all the various things that you could be aware of. You stop thinking and you are simply aware, and it suddenly strikes you then that everything is equally important. And you start being amazed at things that you never were amazed at before; absolutely fascinated. You hear the sound of water, and that's quite as important as anything I've got to say! Only, you don't translate it, see? The wisest thing I heard in Japan when I was last there, from Morimoto Rōshi: he said, "the sound of the rain needs no translation." We were talking about translating Buddhist texts into English. He said, "You don't need to do that. The sound of the rain needs no translation."

So when you get that perspective and you realize that the divisions of one thing from another are all conceptual: cut out the concepts and see it afresh, and there are no divisions. There are connections. It doesn't mean that—in the continuum of the physical world—that there are no lines, that there are no solids and spaces, and all this kind of thing. It doesn't mean, in other words, that if you saw the world correctly it would all become a homogenized mass. A lot of people think that that is nirvāṇa, you know? It doesn't mean that at all. It stays just exactly as you see it now, but it has a completely different sense to it in which all the wiggles in this world are not separated, but it's a continuous wiggle.

I'm greatly interested in the philosophy of wiggles because this is a wiggly world. Look at the hills. As you fly—as I've just been flying, getting some perspective of nature from an airplane—and it's clouds and mountains; all wiggles. But just every now and then one sees these little squares and rectangular patterns and things, and you know that's human beings busy trying to straighten things out.

They somehow disapprove of wiggles because wiggles are difficult to control, they're slippery. And you want to put that thing there, and say "Now! Now, come on!" But you see, the trouble with a wiggle is: how do you count wiggles? How do you count the wiggles in a cloud? I mean, formally speaking, is one wiggle a smooth curve—like that, does that constitute a wiggle? Or—supposing it has bumps on it—are those each a subordinate wiggle? And how many wiggles does the bump have? It has

lots when you start looking at it in a magnifying glass. It goes on for ever. So: wiggles of the world, unite! You've nothing to lose but your names!

So, you see: this great continuous wiggleness—for purposes of being controlled and managed—is broken down into what we call things and events. But these are no other than conventional—that is to say, socially agreed—divisions between the various forms of nature. But nature is really formless in the sense that it's all one form. Not in the sense that there are—nothing that we could stick the name 'cloud' on—but that the name... naming the cloud a cloud does not separate the cloud from the sky, actually. Just as, when you pick up water in a sieve, you don't succeed in separating the water into strips like you would if it was cheese going through a sieve. So, all our categorizing leaves the world undivided. In fact, it is simply a way of being able to talk about it in order to agree how we are going to control it and what we're going to do with it.

Now, this is a point that is so fundamental that I do want to be sure that it's clear. To say you see that there really are no things and no events is, to most people, shocking and startling; it's an affront to common sense because we feel—you know... damn it, this is a shoe! [Alan slaps his shoe] And it's a thing! It's there! You see? And that, actually, this isn't a shoe at all. You know, a 'shoe' is a noise. And if this is a noise at all, it's this sort of noise, you see? [Alan slaps his shoe again] You can use it for a hat, or it has all sorts of possibilities. But it isn't the shoe.

Audience

[???

Yeah. Yeah, right. So, if you see that the idea of separate things is an abstraction—let's call it that—then this most of all applies to you as an organism: you are not a separate thing. You are, first of all—you can look at it from two points of view. On the one hand, a living organism is something like a flame. A flame, although it appears on a candle to be constant, is a stream of gas. And a flame is never the same for two microseconds. It's a constant flowing of energy. Or, take a whirlpool in a stream: it appears to have a constant form, but it's flowing all the time. So, in exactly the same way, all our bodies appear to have constant form, but we are a flowing of

energy. So we keep coming in and out. Also, it isn't only in this way that we're the constant flow; that you cannot say "I'm a separate event," but it's also because every thing that could be called—could be recognized—as a wiggle or a unit of any kind in this world has its existence only in relation to all the rest of them.

This is the principle that, in Buddhist philosophy, is called *jiji muge* (事事无碍): 'the mutual interpenetration of all things and events.' This is very important. I'm sure some of you have recently read in, say, the *Scientific American*, about holograms: a method whereby you can take a small square out of a photographic negative and, by the use of laser beams, reconstruct the whole negative out of which it was taken. Because the little part is nurtured and comes to be in a field of forces in such a way that all the lines of force within the little part imply the lines of force of the total photograph when it was taken. It can be reconstructed. Maybe Wynn can explain this more accurately than I can. But this is essentially the hologram. Because, you see, every part—anything that can be designated as a part of something—implies the whole just as the whole implies the part. Thus, a clever anthropologist can take a jawbone and can reconstruct from the jawbone, through all his anthropological knowledge, the beast or man to which it originally belonged. He'll say, "A jawbone like this, you see, implies this kind of a skull," and so on and so forth.

So, every single thing in this world exists only in relation to the whole system, to all the other things, because—the important point to realize here is that existence is relationship. Relationship is another word for existence. There is no yang without the yin. It is the relationship of yang and yin that enables yang to be possible and yin to be possible, solid to be possible and space to be possible, up and down, life and death, being and non-being. It is a relationship. So that, for example, if I have a drum but there is no skin on the drum, it doesn't matter how hard I hit it, it will make no sound. Because the sound is the relationship of the drum skin and the hand. And you can carry that principle all the way along; that, in other words, if I shout in a completely non-resonating environment, I will make no noise. In other words, if I shout in a vacuum, there is no sound because I have to make waves, you see? And I can't make waves if there's no water.

So, existence is relationship all the way along. And fundamentally, then, the relationship of all of us together, of all society, constitutes every one of us. We are—as individuals, as personalities—what we are in terms of a human community and of an interlocking complex of communities. And you may remember when you were children—I remember it very vividly how my personality changed in relation to each community that I went into. In other words, I was one boy at home, I was a completely different boy among my peer group in school, I was another boy altogether when visiting my uncle, and I realized I had all these different personalities in relation to different communities. And eventually, I put them together in some sort of way and integrated. But I feel, still—although I’ve got it more or less together—I like to come on differently in different sets of people and play the joker. Which, instead of playing a fixed role, and you can say, “Well, is that always you? Can we rely upon you always to have this sort of behavior, mannerisms, and reactions?” I say, “No, I’m not going to get fixed up in that. I’m going to play tricks!” But you did notice that, you see, when you were a child, because—you see—you were being defined all the time by the groups you were in. And so you are what you are, as a person—that is to say, as playing a role in life—in relation to the groups with which you move. And that is a little model of the fact that everything is what it is in its place.

Now, for example, it has been a sort of convention of scientific thought hitherto—especially in the kind of science of the 19th century—to try to understand anything and say what it is by a process of analysis. You understand it by asking, “What is it made of? How is it composed? How was it put together?” And so you dissect it. You get your microscopes out and you try to dissolve it down to the smallest possible component parts. And that gives a certain explanation of it, you see? But what is equally important is to look in the other direction. What anything is is defined not only in terms of what it’s made of, but of when it is and where it is: its context in time and space. Just as the meaning of a word is dependent on the context of the sentence, or the paragraph, or the book in which it is found. So, likewise, we, with our rather myopic way of looking at things.

Because analysis—the ability to analyze and to think analytically—comes from great skill in dividing wiggles. See, you may think that this is a very,

very fine wiggle. You see? But I can make wiggles so little that you can't keep track of them, because you're not as sharp as I am, see? I'm going to make wiggles and we're going to have a little competition: who can make the smallest wiggle and keep track of them? Because that's a test. If you can keep track of them and you can prove it to someone else. Of course, if you get down so small [that] nobody can keep track of you, then they don't know whether you're a charlatan or not. But if you can keep track of the wiggles and prove to other people that you kept track of them—see, this is the whole game of scholarly one-upmanship: if you can keep track of it. It's the same with certain kinds of music, you see? You can do very complicated rhythms, and they'll believe you if you can do it again. It's not enough to do it once, they say, "Do that again! Or was that a fluke?" That shows, you see, that you're in control and you've been able to count out the beats.

So, through the analytical mind—which pays attention to the details—we have got great skill in doing that. But you do that at the expense of neglecting completely the other side of things: in what context does every individual wiggle happen? See? That's just the other side of it. It's very important to define the wiggle, but you can't define the wiggle unless the wiggle has an environment. The outside of the wiggle is just as important as the inside. So, in the same way, everybody has an outside and everybody has an inside. We identify ourselves with what is inside—we say, "That's me"—and thereby ignore the fact that what is outside you is just as much your outside as what is inside you is your inside. And that's always overlooked.

And, I mean—when I talk about your outside I don't mean just the surface of your skin. I mean everything outside your skin, that's your outside. And if that isn't functioning in a certain way, the inside doesn't function either. They go together. It's like when a snake moves: the snake makes a curl, and so one side of it is convex and the other side is concave. Which side moves first? Why, they both move together. And so, in the same way, the inside world and the outside world are not different—in the sense that they're not separate. They're different, yes: one's inside, the other's outside. But they're not separate. They move together. Only, we're unaware of it—in the

ordinary way—through a kind of psychological myopia of fixing on, of being hung up on certain ways of looking at things.

There's a Buddhist word—kleśa (क्लेश) in Sanskrit, bonno (煩惱) in Japanese—that we normally translate 'attachment' or 'defiling passion.' The exact translation of kleśa in modern American is 'hangup.' It's a perfect word for it: to have a hangup. And so, to be hung up on a fixed way of looking at things that the world is only divided in this way, and that way, and the other way is to fail to see what I've been describing, then, as the going-togetherness, the inseparability of all insides from all outsides and vice versa, and of all organisms from their environments and vice versa.

You can get this very clearly when you realize that, if you get hung up on the viewpoint of separateness, then even your body is not a unity. You are just a mass of cells. And if, then, you take in physics: you're not even cells, you're molecules. Not even molecules, just atoms. Not even atoms! Just subatomic particles; wavicles, or whatever. And you disintegrate everything into that, and you realize that there are vast spaces between all these tiny little wiglets—whatever they are; wavicles—huge spaces. Y'know, if a molecule in your body was magnified to the size of a tennis ball, the nearest one would be quite a way away. Well, what ties all this together, you know? How can you look at that as a unity? Well, it's tied together by space, fields of force, gravitation.

And so, in exactly the same way, look at us behaving around here from a larger level of magnification, and you could very easily see that we are just as tied together as the molecules in our hands, and that generation after generation—you know—we come and go. You look at the leaves coming on the trees in the spring, and you can say—you can describe this in so many different ways. You can say "These are new leaves. Last year's leaves fell off and have fallen into the ground, and now a new generation of leaves come which are quite different." And if a leaf had an ego—you see—it would say, "Wowee! I've come into being! I'm new." But from another point of view you could just say, "The tree is leaf-ing again." This is something the tree does, like every so often a man gets up in the morning and he shaves: he's shaving. See? And he stops doing that; the next morning, he's shaving again. Now, is the shaving as if something that has

an ego? And that every day's shave is a different shave? It is, from one point of view. It is different, but it's also shaving; it's the same.

It's because we're so fascinated with the individual details of people that, generation after generation, we say they're quite different. But somebody who really was from Mars and didn't understand people would say they keep on coming, they're just the same ones coming back. So every year's leaves are the same old leaves coming back, see? They die, they are re-absorbed, and they keep coming back. The thing keeps doing it again, but there are these spaces in it, you see? It's like the troughs between the crests of a wave. And we say—where there are those spaces we don't see anything—so we say, “That's finished!” So, when you die you think, “Well, that's finished. Too bad!” But, you see, what you are—really—is the energy field, and it keeps doing you! It keeps people-ing. And it's you who keep people-ing. Who else is responsible? Only, of course, we mustn't admit that we're responsible for this because the whole game is to pretend you aren't. See? It's happening, but it has nothing to do with me; I'm not in control of this.

In this morning's session I was emphasizing primarily the theoretical aspects of ecological awareness, showing how our differentiation between separate things and events is an abstraction and that the whole world is an inseparable unity. Not of separate parts, but of the kind of system in which everything that might be called a part—when we talk about it—everything that might be called a part is, in fact, an expression or function of the whole thing. And that—if we came to our senses—we would be aware of ourselves not as only on the inside of our skins, but we would be aware that the outside is us, too. That there is a relationship between the organism and the environment, the subject and the object, and the individual and the world such that the two presuppose each other. And I did get around to the point of mentioning—towards the end—the reason how and why this can become apparent if our minds are not constantly obsessed with verbiage. If, in other words, we can come to contemplating, seeing, feeling the actual world without putting names and labels on it—in other words, to see it directly rather than thinking about it—for, as I said, these separations are conceptual.

Now, I want to take this into a more practical dimension this afternoon. And that is to say that, hand in hand with this whole question of overcoming the hallucination of separateness, there goes also the formation of a new style of relationship to the material present. It's very important, you see—first of all—to realize that all reality is present, that the present moment is where you have always lived and where you will always live. There is no other time than now. Time past and time future are also abstractions. But in our culture, in particular, we have a very bad relationship to the material present, and not only to the present but also to that aspect of the same thing which is material. And this comes out so strongly in the way in which we educate our children: we do not—in our schools—really have anything very much which relates people to the material present, and thus our achievements in regard to the handling of the material present are extremely shoddy.

School prepares people for a kind of Brahmin's existence, that is to say, for literary, verbal operations. It educates us to be bureaucrats, insurance salesmen, banker's clerks, accountants, and lawyers, maybe doctors, and so on. And a person who is going on—say, in high school, and is thought not fit for college—is encouraged to take reluctantly offered courses in trades and manual skills. And in England—where the state of affairs is much worse than it is here, even—they always make jokes about American universities where you can get a B. A. degree in basket-weaving. Because that's in for a dig; that is loss of face in an academic community: that there should be basket-weaving courses. Bad enough to have a degree in physical education. But the point of the matter is that we are so obsessed with the life of abstractions, with problems of status, with problems of the world as symbolized rather than the world to be symbolized, that most of us don't relate to physical existence at all.

Now, I remember—and I mentioned this in one of those leaflets I sent out—but I remember very well in 1936, in London, at the World Congress of Faiths, when Suzuki Daisetsu was present—he's the one who's written all the essays on Zen Buddhism; the great scholar—and he had made a very, very significant contribution to the congress; various lectures and discussions he had held. And at the final meeting of the congress they took over the Queen's Hall—great big auditorium—and they set as the subject

matter for the evening: “The Supreme Spiritual Ideal,” upon which representatives of all the great religious traditions got up and delivered themselves of volumes of hot air. Finally, Suzuki was the last speaker. And he got up and he said, approximately, “I am feeling very confused tonight. I am simple countryman from a faraway place, and I find myself in this assembly of so many people. I am asked to talk about supreme spiritual ideal. Seems to me, I do not know what supreme spiritual ideal is, so I look up ‘spiritual’ in dictionary. I cannot understand.” He said, “You have, around here, very big city, and I walk along street, and very prosperous. But it’s not right. You have spiritual over here, you have material world over here. And both are unreal.” And then he went on to give a description of his house and garden in Japan. And at the end of it, he had a standing ovation, for—somehow—he was real; he came across as somebody who’s lovable, intelligible and human, as distinct from a mere preacher.

And he made this intensely important point that if you understand the spiritual correctly, it is not different from the material. The material is the spiritual. But in order to see why that is so, one first has to make a clear difference between the material and the abstract and to understand that the abstract doesn’t mean the same thing as the spiritual. The abstract world is a world of symbols, a world of words, a world of concepts which has the same relation to the physical universe as the menu to the dinner, or as money to wealth—I mean money in the sense of bookkeeping entries in a bank or dollar bills. One must be very careful, therefore, not to confuse the spiritual and the abstract. If by the spiritual we designate the domain of ultimate reality—the unified or, more strictly, non-dual energy of the universe that I was talking about this morning—that has nothing whatsoever, really, to do with abstractions. What we call physical reality—the material world—is much closer to what would be meant by ‘spiritual’ than anything abstract is. But the thing is that when we form in our minds—the average person who talks about the physical world, he has a concept of the physical world which is what really should be referred to as ‘materiality’ when one uses that word in a put-down way.

If, for example, we talk about—I could even say this to theologians and they would eventually understand me—if we talk about the evils of the flesh, the word ‘the flesh’ doesn’t mean the body in the sense of this [Alan

(presumably) indicates at his own body]. The flesh, as something evil, represents a conception of the body as something to be exploited in order to satisfy one's spiritual emptiness. And thus, too, when we speak of materialism: we aren't really talking about materialism, we're talking about an abstract conception of the value of the material world. Real materialism would, of course, be the love of material, which is something quite different from materialism as one sees it in practice. So it's very important to realize that when we say "the physical world" and we talk about matter as something which is antithetical to the spiritual, you are not talking about this [Alan indicates at his body] because all this doesn't have those kind of qualities that we would call materiality as against the spiritual. If you really get in touch with your senses, with the so-called physical world, you're in for many surprises.

First of all—if you go back to the point I made that there really is only the present—you will see that what we call this physical world is not something expanded in time, stretched out over time, and it is not material also in the sense of being composed of stuff. You see, one of our problems in the West is we think about the relationship of the spiritual to the physical by analogy with form and matter, or rather, with clay as matter and the form as the pot made out of the clay. And therefore, we've never been able to put the two together because our conception of matter as something essentially like clay—a sort of primordial stuff—this has no intelligence, nor does it possess energy. Therefore, when you think of the world as a sort of cooperation—or a mixture of form and matter—you have, therefore, to invoke an external agency to inform matter and to bring it into shape, to order it, and to produce art.

But this dualism of form and matter is really rather meaningless. Nobody ever saw an immaterial form or a formless material. There really is no such thing as 'stuff' out of which the universe is made. 'Stuff' is actually a word for looking at the world with bad focus. When your focus on something is not clear, it is fuzzy. And this fuzziness, or indistinctness, is 'stuff.' When your focus on the world is clear, you see pattern, you see details, you see structure. Now, as you look more deeply into any structure it starts to get fuzzy again, and therefore, you ask "Of what stuff is this structure made?" 'Stuff' meaning fuzz. But then again, when you turn up the level of

magnification and it once again becomes bright and clear, you see within the great structures and the great patterns smaller ones.

So, you always encounter the world as patterning, never as stuff. And so, our physical world that surrounds us is, in a way, immaterial. It is a fantastic pulsation of vibrations which give an illusion of solidity in just the same way as if I take a lighted cigarette in the dark and rapidly revolve it, you get the illusion of a continuous circle of fire. So, the apparent motion of the present moment from the past to the future gives an illusion of continuity as if there were something extended in time. And in exactly the same way, the table—because it is vibrating with such tremendous energy—gives the illusion of solidity in exactly the same way as the blades of a propeller or an electric fan when they're in rotation. And in the same way as you'll come to trouble if you try to put your finger through the fan, the only reason you can't get your finger through the table: it's going even faster than a fan, and it bounces your finger off. When you feel hardness your finger is being bounced off because of this tremendous energy that lies in and as the table. Likewise, it's also in your finger.

So, what we're actually confronted with, what is here and now—nowever—is certainly not a material world as we ordinarily conceive it, but is something intensely magical and strange. And the more—Spinoza once said, “The more you know of particular things, the more you know of God.” And then, put it in another way: if you want to find out what is the spiritual, what is Buddha-nature, what is Brahman, what is Tao, the best way is to go directly to the physical world and find out: the physical world as you are it, and as everything around you is it; the immediate experience.

Now, to go back. This, as I said, is something which our culture—which WASP culture in particular—neglects, because we are obsessed with abstract attainments. And this goes back to some curious factors in our history. To introduce this matter I have to refresh your minds about caste, strangely enough. In ancient Hindu society, there are four castes, respectively: brahmins, who are priests, theologians, philosophers, and intellectuals; kṣatriya, who are warriors and rulers, politicians; vaishya, who are merchants; and shudra, who are laborers, blue-collar workers. These castes have something peculiar about them in the fact that they are

eternal—let me say perennial. They still exist, even though we don't admit it. There are kṣatriya people around and they are very different from brahmins. The typical fraternity American with his crew cut and his—uses alcohol, is aggressive, likes football, and so on—he's a kṣatriya type. The professorial, quiet fellow is a brahmin. The businessman is a vaishya, and our blue-collar people are shudras. They're still there. And they're all necessary to each other; they balance each other in a very fascinating way. The brahmin cannot get on by himself, he needs the kṣatriya, the vaishya, and the shudra. And likewise, every one of them needs the others.

But there was a curious revolution in Europe at the time we call the Reformation. When the vaishyas got the upper hand of the brahmins and the kṣatriyas, the feudal aristocracy began to lose power in the face of, say, the great merchant bankers of Italy and the burghers of central Europe. The brahmins, who were the priests of the Roman Catholic church, began to lose power because their doctrine was criticized and fell under suspicion. For, you must see that the Protestant religion was the creation of the burgher cities of Europe, of places like Geneva, Frankfurt, and—one must add—London, Edinburgh. And immediately, money values began to dominate Christian theology. For example, the number of holy days was very strictly cut down by on Protestant sects because those were holidays and the merchants didn't want their apprentices taking all these holidays off and not busying themselves. And so, always connected with the Protestant ethic are the virtues of frugality, saving money, saving up for the future, and in such things are vaishya ideals running a bit wild. And thus, you see, the common-sense ethic—that is to say, the basic conception of the good life as it is held in the United States—is very largely a creation of bourgeois Protestantism. We have a very bad relation to the material present. Because that's one thing that the vaishya can't maintain by himself anymore than the brahmin or the kṣatriya or the shudra could maintain it by himself.

We have a whole world based on these two things: save up, there's a good time coming—so, put your money aside, invest it—secondly, which is somewhat contradictory: happiness consists in the possession of things. A lot of people, when they feel inadequate, bored, unfulfilled, try to get rid of this sensation by going shopping. A lot of people spend all their daytime shopping. That's the thing to do. You go out and shop. There are women

galore who go into San Francisco every day just to shop and come back loaded with all kinds of things. But these things are not true material possessions—for at least two reasons. Number one: most of them aren't well-made. Number two: you can't use that many things. You can store them, you can put them away, you can show your friends that you've got this and that, but you can't live in six houses at once, you can't ride more than two horses at a time—unless you're doing some sort of a circus act, you know? You can't drive more than one car at a time. So we tend to become absolutely overloaded with possessions and have the greatest difficulty, therefore, in moving ourselves around. Because every time we move, we have to carry all the stuff with us.

Let's take the comparison between a Japanese living room and a British, American, or German living room. You see, the Japanese living room: you have a table, and some cushions, and the floor. And you don't have any beds because you sleep in a futon, in a quilt, and that's delightful. You don't, therefore, have to haul beds around, you don't have overstuffed chairs which stand in most rooms like gun emplacements—you know, these huge things, vast things that have to be pushed around, very heavy. We, in other words, are absolutely cluttered with enormously heavy objects. And it doesn't redound to our true material comfort because we're always using our muscles to lug them around. They have to be taken care of, they have to be cleaned, the moths have to be kept out of them. They're a perfect pest! So we don't really understand furniture.

Now, I would think furniture, and a house, and a shelter over you is one of the most important things in life. Shelter is fundamental. But when you see what shelter most people in the United States have provided for themselves, you're aghast. Clapboard boxes—miles and miles and miles of them—that you wouldn't want a dog to live in. Have you ever looked at the furniture in Dagwood's home? The absolutely uninspired junk. It has nothing whatsoever to recommend it. It isn't good design, it isn't fun, it's just nowhere.

What's something else of material importance that, really, after all, we ought to know something about? Clothes. Well, by and large, we are shockingly clothed as compared with many other people. Men go around

looking like funeral directors in the most uncomfortable survivals of military uniforms. Women wear frocks and dresses, and things to cover up amazing systems of pulleys and blocks and tackles. And, you know, it's sleazy and they have no real joyous color. Occasionally—I mean, we all know exceptions—but I'm talking about the generality of the culture. The clothes don't look as if anybody really enjoyed wearing them. They're worn because one has to be dressed and covered up, and decent. And therefore, they're worn rather apologetically. To get, furthermore, they wear out in nothing flat. And to buy good clothes you have to go outside the country. There are, of course—if you want to dress in a rather traditional way, you go and get British tweeds from the Hebrides. But if you want to dress colorfully and beautifully you have to go to Mexico and get gorgeous materials. Or to India, and get silk for saris. Or to Java, and get batiks for sarongs. And these things will last forever. They are beautifully made by people who had a real enthusiasm about making them.

Because in the life of the people who make such things, they don't make a differentiation between working and playing. But in a culture where you work, and play is different—you work in order to make money to play—this is insane! Because you spend most of the time working, and then if all you carry... if you don't really value the work—I mean, you're lucky if you've got work that you really enjoy doing—but if you don't really value the work, all you get out of it is money. Then you come home with that and you're supposed to play. Well, you're pretty tired, to begin with, and we just don't play. That's all there is to it. You might play Saturday, or something, when there's a day off. But in the evening very few people actually play. They sit and passively watch television. And they got all the money in the world—I mean, compared with Hindus and African and so on, we live like princes. But we don't enjoy it. Not really. There's no gusto for it. You would think that people would come home and have orgies, and banquets, and... with all that money, and they don't! It's just a—sort of—constant disappointment.

Well, going back to clothes: I can illustrate another way in which our clothes are made without regard for material values. Most clothes are made of cloth, and when you weave cloth, cloth has a certain nature. It comes out in a long, wide strip which is rectangular. We take this material, woven this

way, and we try to fit it to the contours of the body by shaping it, by doing things with rectangular material that rectangular material just doesn't want to do. To fit the sleeves of a man's jacket—it doesn't want to do that. And therefore, our jackets don't fold up properly. Whenever you take them out of a suitcase they have to go to the dry cleaner's to be pressed, or your wife has to iron it. Our shirts—a man's shirt is the most ridiculous construction. It will not fold unless you're an expert laundress. There's nothing you can do about it. And it always comes out of a suitcase ruffled. And it requires all kinds of care to get the thing ready to be wearable. And it's white and gets filthy, and nothing flat. There's no rationale to it whatsoever. Nor to the necktie, which has to be worn with it; sort of noose to strangle you with.

But if I may point out: a Japanese kimono is quite different. It follows the nature of cloth. The rectangular forms of the cloth, if you stretch it out like that, it hangs in a rectangle right here from your sleeve, and it falls over you. It hasn't been forced to fit you, and therefore, it fits you comfortably. The cloth conforms itself to you by its nature, and therefore, gives you a certain dignity. I once saw a Tibetan woolen garment. It was a cloak. And it was prepared by their method, which is: they have a method of pounding wool rather than weaving it. And they make it into a great big—again, it's a rectangle. And it's a double rectangle: the front one and the back one. The front one is split down the center, and at the sides there's a place for the sleeves to go through, and beyond that, it's stitched. So you just got this sort of—if you put it out like that, it's like a sort of sandwich board. But we had this one evening, and we got every man in the room to put it on—and there were about five men—and it turned all of them into kings. They looked absolutely regal in this thing, it was so dignified and so exquisitely beautiful.

I have a Japanese friend who told me he always wore Western clothes in Japan, and I asked him why. I said it's absurd. I said, "You have the most comfortable clothes anybody ever invented. What on Earth do you go around in a Western business suit for?" "Oh," he said, "I wouldn't be seen dead in Kyoto in a kimono. You can't run for a bus in a kimono." It's true. But what a degradation, you see, of the human being: you've got to be someone who's got to run for a bus now, you see? Whereas if you put on a kimono, you're very comfortable but you have to be leisurely. You have to

stroll rather than rush, and that slows you down. Because, you see, all people who are in a rush are not related to the material present.

Supposing—let's take—you're in a rush to get coffee when you get up in the morning. What do you do? You take instant coffee. And that's a punishment for being in a hurry. It doesn't taste of coffee; not really. So, because you forced it—it's like forcing the growth of tomatoes: they don't taste of tomatoes anymore. Forced apples: they're called 'delicious.' They're nothing but wet pith. So this is very important. This is showing that we aren't here. We're insane: we're not all there, as they say. But trying to get to something—the result, the thing we thought we wanted, the thing that we thought would be what would make us happy; you've got to get something.

Now, it's true: in order to not be hungry, you have to eat. And therefore, when you eat there's a certain satisfaction. You feel alright. But then, when you begin to consider that life is going to wear out, and there are all sorts of problems—disease, change, and misfortune—and you get depressed. And then, in order to feel happy, you eat when you don't need to eat. Then you begin to get obesity and indigestion, and wonder why the possession of all this great food isn't doing anything for you—it's supposed to! And so, in the same way with property of all kinds: when it is used to get the thing that you look forward to in the future and don't seem to have now, it becomes a complete delusion. And you can't understand, because you think that the possession of these things ought to make you happy. The admen have persuaded you that if you could get this kind of car, this kind of yacht, this kind of house, this kind of scene—whatever it may be—that's the thing in life, that's what's important, and it doesn't make people happy at all. And then they wonder why it doesn't, and feel cheated, and they have to go to psychoanalysts and churches and things like that to be persuaded that it's coming sometime, somehow; the thing that always seems to be missing. And there's nothing missing at all! Except—I mean, supposing you're absolutely starved and you just don't have the normal flow of energy through your organism, then, of course, you need food. Or, if you're freezing, you need shelter. But in the ordinary way, when you are fed and sheltered, there isn't anything missing. It's all here, but nobody is here to see it; everybody is wandering off to something else in the distance.

And, of course, this is preeminently true with two other aspects of life. I've discussed housing, furniture, and clothing. But, more specifically, food in the White Anglo-Saxon Protestant culture is unbelievably bad when you consider it by and large. The reason being that we eat food because it's good for us. And that's a dreadful thing to do because it means that you look at the food from the point of view of abstract dietetics rather than concrete taste. And wherever dietitians get interfering with cooking, it is utterly destroyed. In every university from coast to coast, where you would think would be centers of culture, the institutional food is unbelievably abominable, and the scholars are ashamed to come out about it and protest and lay down the law because they're supposed to be devoted to higher things. And, after all, what you eat—just so long as it's got the right chemicals in it—isn't very important.

But what this is—you see, the trouble with that is two things: to eat in order to live—sort of, that it's good for you—is... what do you mean, "good for you?" It means that it helps you to go on into the future. But what is the point of going on into the future when all the meals ahead of you are these unappetizing things that are just going to enable you to go on into the future? And the second thing is that eating in this spirit is very disrespectful to all the creatures you have killed in order to eat. It's even disrespectful to an onion to eat it improperly. Onions are living creatures, and if you cut up an onion for dinner you should reverence the onion, you should respect it. Because if you don't have a feeling of love for the onion, for the fish, for whatever you eat, you won't cook it properly and you won't enjoy it. Cooking is a process of loving. And it is a paying of respect to these marvelous beings which we ingest in order to go on living. So this entirely futuristic, dietetic attitude to food is—again, you see—a question of purely quantitative thinking, of lack of relation to the material world.

I may make out: one other rather important aspect of life is lovemaking. Here, again, is a subject entirely neglected in our education—from any practical point of view. I mean, [there are] a lot of theoretical works, some of which are fantastic and grotesque. But as a fine art, when you compare what goes on in most bedrooms with the things that are suggested in the Kama Sutra, the difference is amazing. That there could be a real great art as between lovers—husbands and wives, and so on—is something, again,

that we don't consider because—once again—although sex is fun, we go about it not really because we enjoy it—we can't admit that—but it's good for us, it's a healthy outlet. And also, it's necessary—of course—for having children, and that's also something for the future, you see?

And, likewise, when it gets to children: we don't relate to children in the material present very well. This is especially true of what one calls child-centered families. Here is a frustrated mama and papa who feel guilty for some reason or other. Either they didn't really make it in life the way they wanted to make it, and they hope their children will. And they feel that, anyway, the reason why I am earning a living and you are a housewife is that it's for the sake of our children. We live as husband and wife in order to bring up children. Now, this is completely backwards. If a husband and wife have a vocation in life—that is to say, they are deeply interested in and devoted to living—supposing the husband is a doctor and he is fascinated with healing people, and that's really what he's about, the children—if permitted to do so—will catch his fascination. If the wife loves working in the kitchen, the children actually want to help. But we don't allow them to because what we do is: in an industrial society you can't possibly have children around the factory or the office. In more primitive agricultural societies you can have children around the farm, around the shop, and so on, and in countries like Mexico—and it used to be so in Japan before they shrilled them all off to school—the children worked along with their parents and learned their crafts.

But now we, first of all, say no, no! We're going to do some—we're going to propitiate you with toys. And these are fake plastic replicas of things that adults play with, like guns and dolls, and they're always frustrating. They never quite come up to expectations. The children, therefore, break them and it reduces them to fury, and at the end of the day every household I know—in good, nice, American homes where there are children—they are strewn from end to end with disintegrated plastic. Papa is coming home from the office with a mysterious commodity called money—which is... you've got to bring it, but nobody's really interested—and so the house has to be tidy for him to get back. Therefore, there's a screaming, knock-down, drag-out battle with mama trying to get all the children to clean up and throw this stuff away. And he comes home from a job in which nobody is

interested because they have no part in it. The wife knows nothing about it except in a theoretical way, the children know nothing about it because it's something he does off there. And then, all his interests—if he has any interest in his job at all, off there, with the community of people with whom he works in that situation—he comes back, and with people to whom he now has absolutely no real relationship whatever he's supposed to be a good pal and nice, kind husband. And that is why, in all our comic magazines, the father of the family is portrayed as a clown. Invariably. All the jokes are on poor old dad. Whew!

But again, you see: this is abstractionism. It's a result, for example, that the whole family set-up in our culture is an institution hanging over from agrarian civilization, which just doesn't work in an urban-industrial civilization. And we keep it up because that's the way things are supposed to be, and we've never re-thought human relationships in immediate relation to this new kind of situation in which we're living. So those families that thrive and get on reasonably well with each other are fortunate flukes—of which there will always be a certain number.

I could go on endlessly with this discussion of our lack of relation. I mean, let's just take our notions of feminine beauty: they're entirely fabricated by some curious creeps who edit Vogue magazine and Harper's Bazaar to make stuffed dummies who, when actually encountered, are about as comfortable as falling into the middle of a bicycle. And, you know, poor women: they're always having to live up to the image of some movie star, or somebody, who is the great type of the day. They feel their husbands will be disappointed if they don't look like that. And that's because we set up these ideal external surface forms of beings, having no sensitivity to the substance, to the weight, to the volume, to the temperature, and—above all—to the smell.

It is, indeed, the sense of smell—among all matters of the material present—is the most repressed in this culture. And therefore, interestingly enough, it is one of the main channels of unconscious communication. Whatever is repressed is, as Jung would say, put into the unconscious and thereby activated in a special way. So a great deal of ESP—or telepathic communication: intuitive likes and dislikes we form for other people—are

the result of the sense of smell which we don't recognize consciously because we are not attending to it. And the word 'smell' means bad smell: it smells. You know the story about Dr. Johnson—who never bathed, you know?—and he was traveling in a coach, and a very dignified lady got in, sat down, and said to him, "You smell." He said, "Madam, on the contrary: you smell. I stink!" But, you see, smell is essentially bad smell.

In English, there are only three adjectives peculiarly used for qualities of smell: fragrant, acrid, pungent. All other adjectives used for smell are borrowed from taste or some other sense. It's repressed, you see? We're not really aware of smell. And so, we want the human body to smell of disinfectants and things like that, rather than its own natural, interesting flavors. And so, everybody is scrubbed, and over-cleaned, and squirted with alcohol or something, so that they shan't smell. But, actually, they do smell, only they smell of a kind of a lab instead of people.

So you can see in these many, many ways that we're not here, and we're not present to materiality because of the strange notion—you see—that the material present is a hoax. You say:

Lay not up for yourselves treasure upon earth, where moth

and rust doth corrupt

But lay up for yourselves treasure in heaven

Well, the way we've interpreted that saying is: lay up treasure in the future. Take out your eternal life insurance policy, you see? So: it's coming.

Actually, "treasure in heaven" is now, but we think that the real now-world, you see, is disintegrating, crumbling, and therefore is bad. But that's not the reason. The fact that—yes—the real-world now is always unceasable. It's changing. You can't grasp it; there's nothing to hold on to. But that's why it's spiritual. When you lean on it, it collapses. But don't lean on it. Live in it, but don't lean on it; don't try to hold it. Because in just the same way as when you embrace someone and you try to hold too hard—you squeeze the breath out of them and therefore you strangle them—so, in the same way, you don't grab hold of the world. You can't sense it that way. I cannot feel

whatever this is by [Alan hits the object] doing this, you see? I can't get the maximum taste out of beef by grinding it to pieces with my teeth and forcing my tongue against it. Because what I do is I dull the nerve ends. It's a kind of a light touch; you let it flow through your fingers.

And so, by letting life slip—and it's always slipping; it's nowever changing. The more it runs, the more it stays. The more it stays, the more it runs. That's the way it is. And if you don't hold on to it, it's always here. If you do hold on to it, it's always running away. So you suddenly discover that (this is the most shocking thing, you see) that the physical world—right here and now, this absolutely concrete moment— is everything that you could ever have imagined the beatific vision to be. This is quite startling that it's so if you are really wide awake.

I have thought of a sort of fantasy, and I'll try and describe it. When you read about the beatific vision in the Paradiso of Dante, you get this fantastic description of the sort of rainbow-rose: at the center, vivid white light which you can't look at. Just dazzling white light. And then, as it goes out from that, you get all the colors of the spectrum going out into violet and then going out into black. But it's black so transparent, like obsidian, that it's not... it's luminous black. And then, again, suddenly, vivid white in a great arc comes around the black, and it does the trick again. And now, that's not all it can do. The rays start waving, see? And the whole thing starts shimmering like waves. And then it says, "Now, that's not all we can do." Then they do curlicues. Every conceivable kind of complexity. Then they start making angles. All the light starts dancing, you see? Ka-doo de-da, che-doo de-dah, che-doo de-dah, cha-cha-cha! And you see—you could imagine those Buddhist mandalas where there are radiances full of myriads of Buddhas, all dancing, all rattling bells and thunderbolts and swords, and the whole thing is going ka-cha ka-cha ka-cha, and suddenly it goes into another dimension, see? There's more of it. And then it starts getting sound dimensions going with all this color, and smell dimensions going with the sound. And the sound gets so deep, and so bass, and so vibrant that it becomes solid, and you can touch it. And the thing gets more and more complicated. And suddenly, before you know where you are, here it is. We're just that thing, [which has] reached this degree of complexity. See?

Just like that. But it's never somewhere else, you see? You don't get it anywhere but here.

Now, if you try to find it here, and say, "Now, golly! Let's do this right now! I've really gotta pay attention to now." See? And you try to look at that, you see, and bring now into focus and really look at it: you're still pushing it away. It has to come to you by—you can't seek now, because the moment you seek it you're not looking at the real now, you're looking at one just ahead. See? So in some, this necessity of relating to the material present is one of the cardinal components of a good ecological attitude. Because greed—which is, essentially, discontent with the present (admittedly, some people living at the edge of poverty have an inadequate material present from a physical point of view)—but it is the greed of the well taken care of that is so terrifying: people who have enough to eat, and wear, and're clothed, and are still greedy, and therefore go out to exploit this Earth and drag every last ounce of wealth out of it—which is immediately turned into rubbish and poisoned gas—because they can't be alive here at the moment.

So, let's take an intermission

In yesterday's session—two sessions—I covered first the ecological conception of an organism's relationship to its environment—and thus, of course, of the individual's relationship to the universe—and I was trying to show you that this is not a question of two systems that are separate, acting upon each other or interacting. It is a question, rather, of a single system of energy expressed with great complexity which is one process, one activity. It is possible to become aware that this is so, not simply theoretically, but as a matter of sensation. And when one becomes aware of it in that way, the feeling is at first curious and is apt to be misinterpreted. It can be felt either as if you were sort of floating—that is, completely passive: not doing anything, not making any exertion of will, but as if all your behavior was simply happening. That is one way of feeling it. Another way of feeling it is the sensation that you are God and making everything happen. These are the polar opposite ways of feeling the same thing. And when people, for one reason or another, slip into this kind of sensation—and it can happen by accident—they may jump to very strange conclusions depending on their background, their religious upbringing—because it is that background

which gives them a language in which to express to others and to themselves how they feel. But you must be very clear about this and understand it theoretically thoroughly—just in case this ever happens to you—so that you won't be accused of being crazy.

It is not, you see, that your own individual organism is the puppet of everything else, responding to it as a billiard ball responds to being hit by a cue. It is not also that you, as an individual, are an independent source of energy which pushes the world around. Both these views are based on a false assumption that the individual organism is really separate from the world; that's the false assumption. And we think about this situation by analogy with billiards because Newton thought that way, Descartes thought that way. And Newton and Descartes have molded the common sense of the average person living in the 20th century, even though our science has abandoned the mechanics of Newton—it certainly has in physics, it certainly has in biology. Although I find that, in psychology, people still talk and think in a Newtonian way. That, for example, Freud structured the organism of psychology, of the human psyche, by analogy with hydraulics. So you must call Freudianism a form of psycho-hydraulics: the unconscious is the deeps, sexual energy is represented like the flow of a river which can be dammed up, repressed, it has to be provided with outlets—these are all hydraulic terms. And hydraulics is a form of Newton's mechanics. Because, you see, in Newtonian mechanics—which is based, really, on billiards—the balls are standing for atoms, and they bang each other around. And so everything is explained, the movement of ball A, is explained by the behavior of balls B, C, D, E, and so on insofar as they impinge against it. And you have to go back, and back, and back, trying to figure out how it all started. Who pushed it first? And who pushed him? You see?

Well, this model won't do anymore. Things just don't behave that way because they are not separate from each other in the first place. This is the point I wanted to make clear in this first round of discussion that we had yesterday: that the differentiation of the world is not separation anymore than when you see many waves on the ocean, they are different waves but it's all the one ocean waving. And you can't have half a wave, for example: a wave that is crest without trough. That's—half-waves are just not found in nature. And so, in the same way, you can't find solids except in space, and

you won't find space except where there are solids because they are aspects of each other in rather the same way as in magnetism: the positive and negative, or north and south poles, are always found together. You can't have a purely north-poled magnet. And in order to have a current—an electric current—flowing, it must be polarized. It will not flow until both poles are hitched. So, in the same way, there is a polar relationship between the individual and the world. They are both aspects of a single energy. And so, there is no question of things being controlled, and moved, and pushed by other things as billiard balls are, or billiard balls appear to be from a certain superficial point of view. We've just got this huge being—although 'being' is not quite the right word because existence is composed of being and non-being, corresponding to solid and space, crest and trough of wave. Because, fundamentally, the energy of the world is vibratory. It's on and off, and there is no off without on, no on without off. To be or not to be is not the question, because to be implies not to be as much as not to be implies to be. So in the Taoist Chinese philosophy it is said that being and non-being arise mutually. It's like the egg and the hen: you don't find eggs without hens, nor do you find hens without eggs. A hen is, as a matter of fact, one egg's way of becoming other eggs. It all goes together.

But we don't see this for the simple reason that we are primarily involved in using a method of perception which is analytic, which spotlights various features of the world and does so with the aid of naming, or giving symbols to, those features of the world which we consider significant and, therefore, ignoring features of the world which we don't consider significant and for which, therefore, we don't have names. Haven't you noticed how often children point at something and say, "What is that?" And you can't make out exactly what it is they're pointing at. They are pointing out something they've noticed but which adults don't consider important, and they want a name for it. We don't have a special word for dry space. We don't have a special word for the inside surface of a tube. But American Indian languages have such words. Eskimos recognize five different kinds of snow, but the Aztec language has one word for snow, rain, hail, and ice. You can see the geographical reasons for that. So, according to what you consider important, you have names. And according to naming, you identify separate things. But they're only separate in a purely theoretical way. They're not materially separate, not physically separate.

And so it's immensely important that we become aware of this fact, because if we're not aware of it we do the most stupid things. We try to solve problems by altering what are only the symptoms of problems. We try, for example, unilaterally to abolish mosquitoes, forgetting that mosquitoes go with a certain kind of environment and play a very important part in it—not to mention other insects which are killed when we kill the mosquitoes. And so, in this way, we are doing things without recognizing that they're going to have unpredictable results in unexpected places. Same way if you put certain drugs or certain operations in the human organism: you've got to be very careful of what you're doing and you have to study the organism very carefully in order to know what consequences this will have. If you farm in a certain way without due respect for the ecology of the whole area in which you're working you can get the most appalling results. And, characteristically, our technological civilization is much too heedless of these ecological connections.

Therefore, in order to overcome our characteristic sense of hostility to the external world—and to stop conquering nature with bulldozers, or conquering space with rockets—we have to realize that the external universe is just as much ourselves as our own body. That we have—each one of us—an inside and an outside. And if the inside of your skin is your inside, what is outside your skin is your outside. And the two are inseparable, they are polar. Because you can't have an inside without an outside or an outside without an inside—except [if] you construct something like a Klein bottle that is a sort of freak. Maybe the universe, as such, is a Klein bottle; who knows.

However, the second point I was making, which arises directly from this—and this was the burden of the second session—was that this ignorance (or ignore-ance) of the inseparability of all different things goes hand in hand with a bad relationship, or an inadequate relationship, to the material present. I was showing that the material present is the only time there is. Other times—past times, future times—are abstractions; there never is anything but the present. But you mustn't, of course, think of the present as a split second. That's an abstract view of the present. You tend to think of the present as a split second because you're used to looking at a watch, and the watch is marked out with hairlines, and the idea of watchmakers is to

make those lines as thin as possible consistent with visibility. And therefore, as the hand sweeps across the hairline, you've hardly time to say "now." And we begin to think that the present is that. Well, of course it isn't. Present time is rather like the field of vision, where you've got, as it were, a fairly clear center: the field of vision is an oval and you can run your fingers 'round it just at the point where they start to become invisible. And you realize that the edge of the field is fuzzy. And so, in the same way, we have a vision of movement in time as having fuzzy edges. Just as when you are listening to music: you don't hear music a single note at a time, you hear it in phrases. You anticipate what's coming and you remember what has been played. And so you have a kind of wide but fuzzy-edged view of what is called the present.

But it's what is always there, you see? And if—in a culture—we are brought up not to see this, we start to living for the future. And we live for the future mainly because our present is inadequate. And it's inadequate because we are not seeing it fully; we're seeing it in terms of abstractions. And if your present is inadequate and is, matter of fact, only an abstract version of life, you're like a person with a non-nutritive diet. You always, therefore, feel hungry, and you keep eating because you want more! So, in the same way: "More life, please!" "More time, please!" More! More! More! More! Because sometime or other, it's gotta be alright; the thing I've been looking for must happen—I hope! But, of course, it never does. Not if you live that way. Because when all your goals in life are attained and you are at the top of your profession, or you've got beautiful children, or you—whatever it was you wanted—you feel the same as you always felt. You're still looking for something in the future. And there isn't any future! Not really. Therefore, I often say that only people who live in a proper relationship to the material present have any use for making any plans at all. Because then the plans work out; then they're capable of enjoying them. The other people aren't.

So people, then—who aren't here, fully, but whose minds are off somewhere else all the time—are always starved and always rushing to get there. And there's nowhere to go—except here. But I qualify this word 'material present' because of the fact that the word 'material' is a very much misunderstood word. It's a word you can use in a lot of different

ways. As generally used, we say the body, the earth, the rocks, the trees, the animals, and all that are material. And we set over, against that, the spiritual or the mental as if that were some kind of vaguely gaseous world permeating the material world. Or perhaps not gaseous, but rather abstract: a world of ideas, a world of principles. But it's so curious that, when people do that, they debase both the material and the spiritual domains of life because these domains of life have vitality only when they're together. When you see the material as the spiritual and the spiritual as the material. And then both of these concepts tend to vanish because what we call the material world in this put-down sense of the word 'material' is only a concept. If you want to conceive the world as material then that means, really, people who do conceive it as material in that sense of the word 'material' haven't got a good relationship to it. But if you have an immediate relationship, if you really are aware of the present, then your vision of the material world is transformed and you see that it isn't material, it isn't spiritual, it's indefinable. It's what there is. And there is no way of saying what that is because you can't put it into a particular category. And you can only define what you can classify.

Now, I know that is perhaps a little bit of a difficult idea to master because of our confusions of language. We could—if I might try to put it in one more way: I would say, probably, that the correct use of the word 'material' is to mean something like 'metered,' 'measured.' When we say something is immaterial, we can mean both that it doesn't matter—that is to say, it doesn't measure up to anything, it doesn't meter—or that it's spiritual, non-material, immaterial. So I would say the correct use of the word 'material' is: "the world as measured:" the world as represented in pounds, miles, decibels, photons, or whatever. And that, of course, is abstract. Because when you measure the world you don't really make any difference to it, just as the equator does not cut the world in two pieces.

So what is the world that is existing upon which our measures are imposed? What is it that underlies the network? The network of measurements, of classifications, of quantification? Well, you can't say. You can point to it, but you can't really say what it is. It's not a what. But that is what's here, I mean, that's the world we're actually living in, you see? What Korzybski called the unspeakable world. And so when I said the 'material present,' I

was using the word 'material' in an incorrect sense. Not the measured present, but the physical present of actual nonverbal being. And people, therefore, who do not relate well to this become incompetent in the practical arts of life. They become bad cooks, bad lovers, bad architects, bad potters, bad clothiers, because they really have no love for anything except abstractions: money, quantities, status, symbols. And people become absolutely bamboozled by symbols, and so want the symbol rather than what is signified by the symbol. But, you see, however, if you want what is signified by the symbol, then you've got the universe by the tail because every thing that is symbolized by a symbol is inseparable from the whole universe. When you, in other words, you catch a fish, it's not just a thing called a 'fish' that you've got, you are being fed by all oceans when you catch a fish. You are being sustained by this colossal life. And everything, of course, that goes with the oceans. It's as if the ocean reached out and fed you. And that's why the real reason for giving thanksgiving at meals that... of course, in the West people thank God, but it's a more concrete expression to thank the fish. But then, of course, you're thanking the ocean and so on.

So this attitude, now, of a new vision of nature: not as something chopped up into bits so that we could look upon the universe as an assemblage of things, as if somehow or other there's all this collection of galaxies and stuff floating around—where would they come from? Well, they've sort of been washed up like flotsam and jetsam, and have come together by some sort of gravity, and here they are, spinning around. As if it was a collection in the sense of something gathered, that formerly hadn't been gathered. Of course, astronomically, this isn't taken seriously. People think, rather, that it all blew up, that all the galaxies expanded from a center and are still going. It's far more likely. Maybe they'll come back together again and then blow up once more. Who know? Maybe they'll all fade out. But then, things will be where they were before it all started. And what happened once can always happen again. Pulsation, you see, is the very nature of life. Big pulses and tiny pulses. Pulses within pulses, forever and ever.

So, this point of view is one which has flourished in the Far East, where the relationship of man to the physical world has been very different from our idea. And this raises some curious problems because the great civilizations of the Far East, particularly the Chinese and the Japanese, did not—until

coming into contact with Europe and the United States—did not evolve a technology. And because they didn't evolve a technology, they had all kinds of problems for which we say that made them backward. They had problems of disease, and famine, and poverty. And we say, "Well, the poor benighted Chinese! We have nothing to learn from them because their civilization didn't do the things we've done!" But what we don't realize so readily is that this technology which we've produced is very recent. It was only in the middle of the 19th century that we really got going with this. And note that, before that date, we permitted as perfectly ordinary procedures judicial torture, slavery, child labor, filth of unspeakable proportions, and plagues, and all that sort of thing was just the way it was anywhere else in the world, in Europe. But we've forgotten it; we have short memories. We could sing in church:

All things bright and beautiful,

All creatures great and small,

All things wise and wonderful,

The Lord God made them all.

The rich man in his castle,

The poor man at his gate,

He made them high and lowly,

And ordered their estate.

Now that verse is, today, eliminated from the hymn. Because it's saying, you see, that the stations of life—fortunes and misfortunes, riches and poverty—are God-given and nothing can be done about it, and people tend to accept states of affairs about which nothing can be done. And nothing could be done about it until the industrial revolution. And then, of course, the minute that starts everybody wants it. The Chinese want it, the Indians want it, the Japanese want it, and so on.

But the Chinese—for some reason or other, you see—did not develop technology. Now, why didn't they? And why did we? There isn't any simple answer to that question, but one thing that we should note: there are various geographical reasons, and this is not the only reason, but when you look at the map of Europe you will notice that it's very wiggly. It's full of inlets, harbors, and all like this, see? China, by contrast, is a great solid landmass. So is India. The Europeans were preeminently sailors, and it is highly possible—to begin with—that all the great early technical discoveries were the work of seafaring people. This is one of Buckminster Fuller's theories. That, in quite ancient times, there were rather independent seagoing people who had their own culture, who knew that the world was round, who had great navigators, and from then we learned such things as the hoist cranes, that the first real houses were overturned boats, and that trade and the cross-fertilization of different civilizations and different cultures was a work of sea travel. With the machinery necessary for sea travel. You're not depending on a horse, you're depending upon something a human being has made, and upon a very high form of technology. Because sailing is a direct exemplification of man and nature in cooperation. Rowing is different. Rowing is a rather unintelligent way of propelling a boat because it requires a great deal of effort. But sailing is so skillful because you are simply using the energy of nature to move the boat. You are flowing through nature, effortlessly, by using the forces around you in a clever way. When you want to go against the wind you tack, you get the wind to blow you into it.

And this is what is called in Chinese wu wei, meaning literally 'non-interference' or 'non-aggression.' Sometimes translated 'non-action,' but that isn't quite correct. Wu wei is acting in accordance with the field of forces in which you find yourself. Therefore, in splitting wood, you split with the grain because that is the way, the course of things, the Tao, is arranged. So any skillful person will therefore always inquire: "What is the nature of the field of forces in which I find myself?" The Chinese would ask, what is its lǐ? And the word lǐ means: what is the organic pattern of this situation? And then, act in accordance with it. Don't ever force it. Suppose, then, you are sawing: you will find that if you push the saw you will make a jagged cut. And you get impatient. When any people saw wood impatiently they always make a mess of it. But the saw has its own weight, and if you get the

sensation that the saw is doing the work, you see—that's not quite true; your muscles are involved—but you get the sensation of the saw doing the work, then you will make a good cut. See that the saw is sharp and let it do the job for you. You will find in all crafts that the same kind of thing happens when anybody develops consummate skill. When you sing well, you get the sensation that the song is singing itself. When you drive well, somehow, the car and the road are carrying you along, but in a very skillful way. This is this thing I was remarking on at first, this new feeling of a relationship to the world. And what you're doing when you do anything skillfully, you see: you are expressing the total power of the field of forces which is expressing itself in the form of skillful action through the agency of you as a human organism. But it requires intelligence to do this.

Now, what is intelligence? Well, I'm going to reserve that question. I just want to go back a bit to the Chinese. Why didn't they evolve technology? Well, they knew an awful lot of things. Joseph Needham is writing a seven-volume history of science and civilization in China. Telling us all about their mathematics, their astronomy, their physics, their husbandry ideas, everything in the way of techniques that the Chinese evolved. But there were two reasons why they didn't go on to technology as we have it. One of them the bad reason—I think—and the other a good reason.

Confucian thought is not interested in nature. It is humanistic—interested in human relations—but very scholastic because it's based on a literature. In other words, the great Confucian classics exercised a rigidifying effect upon Chinese culture even though they were a great principle of order, of social order. But just in the same way as when you get any scripture—the Bible, the Koran, Science and Health with Key to the Scriptures, anything like that—and people say that that's the authority, then you're stuck. And then you get the situation of the theologians who said to Galileo, "We won't look through your telescope because it already says in the Book how the universe is working, and the book can't be wrong. We know!" And people who get stuck on books always think they know. And it's happening today. When somebody advances an absolutely outrageous proposition for science, lots of scientists are so blind they say, "Well, that's impossible. It couldn't be." Because many scientists aren't true scientists. They are rigidly defending a conception of the universe which requires that everything be as

dull as possible. That the universe be absolutely boring, and stupid above all. And therefore, anything that reveals something that science can't account for—all events that science can't account for are simply ignored. And Charles Fort was a man who devoted his life to collecting records of events and occurrences for which there is no reasonable scientific explanation as yet. And the trouble is: all these events are rather unusual because science only studies the usual. And you have to have an event happen several times in order to study it scientifically. [You can] say, "Well, it happened. And we all saw it." And then the scientist comes in. It's like, you know, when you get sick and you call in the doctor, and all the symptoms vanish. And so—or your car goes wrong, and you take it to the mechanic and nobody can make it make that funny noise it was making, and so on. So, in the same way, a scientist comes around and says, "Well, you say you saw this thing happen. Well, I'll observe it." Well, it won't happen!

So, this is the problem, you see: the Confucians got too hung up on books—that is to say, on a theoretical system—in just the same way that we are hung up on our abstract concept of nature, and are operating in terms of an abstract concept of nature which is taught to us in school, and which we are brought up so much so that we are absolutely hypnotized by it, and we can't experience things which our conceptual system doesn't provide for. When the concept system stops working because it no longer fits the constantly changing pattern of reality, we're in trouble. Well that, of course, was the trouble for the Chinese. Their Confucian concept system had very serious limitations.

Now, that was the bad reason. There was another reason why they didn't evolve a technology, which was Taoist. The Taoists were really interested in nature. If you read their writings—in Lao-Tzu and Zhuang Zhou—they are full of natural illustrations. The behavior of water, of insects, of the elements are all used as illustrations of the art of life. Now, the Confucians—in contrast [to] the Taoists—were lexicographers. They believed in what's called the rectification of names. The language, in other words, mustn't get out of hand; there must be very clear and rigid definitions so that we use words the right way. Now, the Taoists had a critique of this. They said, "With what words will you define the words? And with what

words will you define the words that you used the ones to define with?” Obviously, this situation is circular. Every dictionary is really a vicious circle because it’s words defined in terms of other words. And they’re all the words in the dictionary. So that, say, you take a dictionary that has no pictures in it: to someone who doesn’t know the language it’s absolutely a closed system that you can’t penetrate.

I once thought, as a little boy, I was going to write a fundamental book which would contain the necessary fundamentals for knowledge. And the first thing I naturally did, therefore, was to write down the alphabet. Then I wanted to write down how it was pronounced. And I saw that I couldn’t possibly write down how it was pronounced. I needed to know from the living world how to sound “A, B, C, D.” And that could never be written down. So I was stuck at the start. I abandoned the project at once.

So the Taoists laughed at the Confucians on that account. But also, they felt that nature was organic. It was—they saw, so vividly, that it was a single living organism of immense complexity. And thus, they never thought of it as consisting of separate parts. Just as the head goes with the feet, and as a stomach goes with a brain, they arise mutually; together. They are different but not separate. And therefore, they were very cautious about interfering with anything.

Furthermore, their theory of politics was quite different from the Confucian. Confucian politics is based on the idea of rulership. There is the emperor. There is the family, which is strictly hierarchical structure of authority from above which must be followed and obeyed by those below. But the Taoists, when they—the first book, the Tao Te Ching, is a manual of advice to the emperor, among other things. And what it says to the emperor is, “Don’t rule.”

Because the great Tao flows everywhere,

both to the right and to the left.

It loves and nourishes all things,

but does not lord it over them.

And when merits are accomplished

it makes no claim to them.

Therefore, the emperor is to be retiring, to disappear, to be rather more like—in our own local government—the sanitary engineer than the mayor. To have a kind of anonymous quality of being underground, and of being the one who allows a democracy. Because the Taoist feeling is that you get cooperation—people from people best by letting them cooperate rather than compelling them to.

Now, then, contrast this with a Western theory in which the world is seen not as an organism, but as a mechanism. Now, what's the difference? A mechanism has replaceable parts. It is fundamentally an assemblage of parts. An organism isn't. Furthermore, a mechanism has a governor. And an organism apparently doesn't. It may have a network of governors, all working together in a kind of reticulate pattern. But take, for example: does the brain run the body, or does the stomach? Which is the more important? Well, there are two schools of thought (of course). The stomach people say, "Well, stomachs are really fundamental. They were what was there at first. Because an organism... really, eating is the important thing. But the brain helps the stomach find food. That's what it's really doing. It evolved in order to develop eyes and ears to sneak around and find out things to swallow." So that's the stomach theory. Then, the brain theory is that "It's true that the brain is perhaps a later development than the stomach. That means that the stomach was just the forerunner for the really important character to arrive on the scene. And all the stomach does is it gives fuel to the brain. And the operations of the brain, in terms of culture and all that sort of thing, are what life is really all about." Now, actually, both theories are right and both are wrong. The arrangement between the head and the stomach is mutual. They arise together.

Now, in a system which has a boss, it's different. When you've got the mechanism, and the chauffeur or the engineer who puts it together and operates it, then you have a government. You have a monarchical world order. And when you have government, and things can be viewed as happening in a mechanical order, you can say, "Change it! I order you to behave differently. Do it this way instead." And how do we do that? Why,

we apply mechanical techniques: chop off heads, or force people to do this, that, and the other; I mean, just separate these things up and rearrange them. So then, because—in the West—we went through the phase of Newtonian mechanics, which arises out of the theory that the physical world is an artifact, that it was made by an architect or a super-cosmic engineer, and governed from above by law, we thought up the idea of explaining the behavior of things by mechanical causality. And this led to technology. To steam engines. To automobiles. To hydraulic systems. Everything. Electricity.

But when we reached a certain point in that development we started wondering. We started discovering all kinds of processes for which the mechanical analogy was not adequate. It did us well up to a point, but now, in quantum theory and in biology—in these two things in particular—an organic way of looking at things is clearer, is nearer, to the way they're operating than a mechanical way. And therefore, say, the philosophy of Whitehead—he's probably the greatest organicist in the West—reads just like the philosophy of Zhuang Zhou. It's the same view of the world. So that, somehow, just at this moment of the development of technology—when we suddenly see it's a lot more complicated than we thought it was, and that our project to change the universe is not going to be as easy as even H. G. Wells imagined—it's just at this moment that this Chinese wisdom becomes available to the West. And we can understand it because it's now talking our language. It's talking of the language of relativity. The whole Zhuangzi book starts out with an absolutely marvelous chapter on relativity: relativity of the opposites, the interdependence, the mutual interpenetration of everything that happens. And we've discovered it.

So, there is [the possibility], then—isn't there, at this point in history?—of civilizing technology. Let's put it that way. You could almost say naturalizing technology. Technology came in as a barbarian. A very competent barbarian: all steely, all glittering with force of arms. And technology is busy transforming the face of the Earth into its own image, which is the image of a machine. Covering the Earth with concrete. But technologists know that these freeways will be obsolete in the not too distant future. Grass will grow up through the cracks and they will vanish. Because we shall take to the air like insects. And all our wires and cables;

all that terrible stuff will vanish because we shall be able to transmit electric power without using them. We shall abandon telephones. Suddenly, as it were, the whole mechanical structure will vanish because it was only a step; what de Chardin calls a peduncle—that is, you know, when you’ve got an amoeba separating, it goes apart and there’s a thin little—like an hourglass—a neck joining them, and then they separate, and so there are still two little pear-shaped tops facing each other, and gradually withdraw and they’re balls once again. And that little neck, and the two projecting pieces, those are peduncles. And the peduncle disappears in the course of evolution. Like an umbilical cord is a peduncle. And so all this contraption that we’ve devised, technologically, is a peduncle. And it will vanish because, as we really go about it, we’re going to get so that we don’t need houses, practically. We’re going to find ways of, you know, just altering the temperature in the air and living in a grass hut, or an invisible plastic dome. And spread it all so that we don’t concentrate in cities; don’t have to, because you can just sit and you can dial any book in the Library of Congress and read it on a screen in front of you. All sorts of things like that to be done. So that this, also—Toynbee, in the Study of History, pointed out that we will become increasingly independent of tracks, roads, wires, and so on, so that the civilization becomes airborne. Maybe it’ll even go so far—and here I’m getting into science fiction—as abandoning the electronic method of communication; we may get a telepathic one instead. Who knows? Be a funny world, wont it, when there’s no private thoughts. Everybody’s completely transparent to everybody else. Sure have to get along! Although, as a matter of fact, this distribution will facilitate privacy. Because the thing that really militates against privacy is the city. And the controls of huge traffics of human beings going about their business; this is a real problem. This is invasion.

So then, this, however—this technical type of development, in order to go along those lines, requires that people who are responsible for technical development be well-imbued with an ecological philosophy and see the direction of things so they will not keep perpetuating anachronisms. If—for example, the automobile is a hopeless anachronism with a gasoline engine. But it’s going to be very difficult to get rid of it because people want to sell oil. Or because machine tools would have to be completely made over. It would be terribly difficult for the industry to change. Therefore, we get

anachronisms which blind us to ingenuity and ability to see what could be done instead. You may think that sounds communistic. It isn't at all, because nothing is more of an anachronism than a bureaucracy. A collectivist state, in other words, is the most hopeless thing to change because nobody has any responsibility. It is not organic, it's a monolithic machine. That's the pattern that we see in so-called communist countries. And they have just as tough a time producing an innovation as we do. We have to think of new political ideas altogether; ideas that've never been heard of. But the way of thinking about politics, as of thinking about technics, is by an organic model instead of the mechanical model. The world as one body. But a body, you see, is a highly diversified system with all kinds of division of function, and yet, all one. It is not like an anthill. It's much more differentiated. And that is the human image as distinct from, say, the insect image or the machine image.

The problem I was discussing this morning was really the relationship of ecology to technology, but I was discussing it in a historical way: raising the problem of why technology originated in the West and not, for example, in China, and showing—first of all—that those people in China who did make some progress in the study of nature—the Taoists—thought about the world in accordance with a different model than people in the West. A model that did not immediately permit a technological development. The West thought about nature by analogy with mechanics, with machines. The Chinese thought about nature by analogy with organisms. A machine is something which can be taken apart and reordered, something which is the product of an act of engineering, and is therefore an organization with a governor. An organism is not made piecemeal, it grows and doesn't have a governor. All the parts in an organism are in an orderly anarchy—that is to say, they govern themselves. And the Chinese word for nature, *zìrán*, means 'that which is so of itself.' Therefore, that which functions without being pushed around by some external force. It is automatic, but not as we mean the word automatic. We mean a self-governing machine, and there's a certain difference here.

So, the problem then is: if the Chinese—viewing the world as an organism—felt on the whole that it was wiser to restrain one's interference with things—that is to say, there are certain situations in which the human being should simply lay hands off, there are other situations in which the human

being collaborates with nature—but he does so by virtue of having great awareness of the field of forces in which he is situated. This takes us back, of course, to the point that I made right at the beginning: that you really are the field of forces in which your organism is situated. Self-realization is, in fact, realizing—as a sensuous experience—that you are that field of forces; that you are both your outside and your inside. Which, of course, leads us to something that we can experience but cannot define.

And we can't define it for two reasons. One is: it's too complicated. And another reason is—even deeper than that—it leads us to the root and ground of reality, that is to say, (I'm only speaking in analogical terms) the continuum in which all things exist which can't be thought about as an object because it can't be classified. You can't say anything really meaningful about it at all. But it's tremendously important to know that you're it. That's the real you. Because if you don't know that you go crazy. You become dementedly absorbed in details, identifying yourself with a purely temporal—and, indeed, in some respects arbitrary—role which you're playing, and you forget that even if you do lose your shirt in this game, it doesn't matter in this round. Because at that level, there's no winner and no loser. So

So, the question we come to now is: well, how do you go about knowing the field of forces in which you live? How do you know which way the wind is blowing so that you can sail properly? When it isn't as simple a matter as wetting your finger and holding it up, and see which side gets cold first—that's where the wind's coming from. Or is it as simple as that?

We know—or think we know—that nature is extraordinarily complicated, and so, very difficult to understand. And if you can't understand a very complicated situation it's immensely difficult to make decisions about it. But there is a point of view from which nature is not complicated. And that, to an educated Westerner, may sound quite astonishing. When Buddhists speak in their philosophy about the world of form and the world that is formless, these two categories correspond roughly to the world as complicated and the world as simple. What makes the world complicated is not its actual physical structure, but an attempt to understand it in a certain way.

When you ask, “How does it work? Why does it do it?” then you start analyzing a flower, a body, a geological structure, and you are asking the question, really, “How can I reproduce—in words or numbers—what is going on here?” in such a way that I can predict what it will do next. Now, the trouble with words and numbers is that they have some peculiar limitations. It takes time to read. It takes longer, still, to listen to a tape recording. And to scan a mathematical expression—again, it is something strung out in a line, and you have to think carefully to understand the various steps which have been taken.

So these are methods of breaking down the phenomena of nature into a code. These codes can be handled by computers with astonishing speed. But the part of the human mind which we are mainly concerned with, which is the conscious mind, can only handle them very slowly because the conscious mind has to work in terms of symbols—verbal and mathematical—which are really very clumsy. So that by the time we have really thought about something, it’s usually too late to do anything about it. The circumstances have changed. The crisis about which we had to make a decision has already happened, and therefore we have to act without the kind of preparation we think we ought to have and without the kind of knowledge we think we ought to have. Because we cannot comprehend the world in verbal patterns.

As a result of that we always feel frustrated. We think we’re supposed to comprehend the world that way, and manage it that way, and a lot of people are not satisfied until you’ve given them an explanation. But it should be obvious that there never will be an explanation—in those terms, in the terms of words—because you can talk about the simplest object in the world forever and not fully describe its attributes. Words have a use, but they only have that use when they are operating in subordination to a kind of understanding that doesn’t depend on words at all. Words are like claws on the end of an arm, and the claws are no good unless subordinate to the more subtle organization of the arm and the rest of the body. So words are the claws in which we tear life to pieces and arrange it in certain ways, just as you have to bite—and therefore separate—the bits of a piece of meat in order to digest them. So, to make the world digestible in a certain way, you need to claw it apart.

But actually, we do all kinds of acts of understanding along with words which are not contained in the words. A person, to get your point, does many, many nonverbal operations. For example, to read a book requires that I be able to see. And seeing is a nonverbal operation. When you try to put it into words you come up against barriers of all kinds. It is a very difficult thing to describe. But that's only because you are trying to describe it in a difficult way. It's the same problem if you want to unload the bathtub because the drain is stopped, and you take out the water with a fork—it will take forever. But if you bring in a pail it'll be a lot faster. And there is something in trying to describe the world in words that is rather like trying to move water with a fork. It is efficient, in other words, for some purposes. But words—again, I point out: they communicate only to those who already know what you mean. “To him that hath shall be given.” And for that reason they're convenient: because then we can remind each other, in common by words, of things that we already know.

But water, as a word, means nothing to people who haven't experienced water. Once they have experienced it, the word is useful because it's like using money instead of barter. I can discuss water with you without having to bring some into the room and show it to you. So, words provide this kind of a shorthand. And very much, in so many ways, they have the advantages and disadvantages of money. Money helps us to transfer wealth, words help us to organize experience and communicate about it with each other. But beyond that, when we try to put our experience into words and—in terms of words—comprehend experience, then we run into insuperable difficulties.

Not so long ago, a professor at Harvard—in discussing the heresy of certain members of the faculty who were conducting experiments in terms of changed states of consciousness—said that no knowledge is academically respectable knowledge which cannot be put into words. I don't know what became of the department of physical education at that point, but—or, not to mention, fine arts, and things like that, and music—but still, this is what he said. That's what lots of people feel, people who are in the scientific and technological world—but obviously is a type of intelligence that is not verbal or computational intelligence.

The eye, the brain, the organization of a plant are obviously intelligent. What do I mean, “intelligent?” I say they’re obviously intelligent because anyone can see it. I would even go so far as to say they’re not products of intelligence—as if some intelligent fellow had been around and left this as a kind of track of his competence—the growth of a plant is intelligence itself. And intelligence is naturally something that, in words, would always escape definition in the same way as the nervous system, upon which intelligence depends, is incomprehensible even to the neurologist. We know intelligence when we see it because we say, “It’s fascinating. My, isn’t that tricky! How ingenious. What a wonderful organization. How beautiful!” And we recognize in patterns of nature that this has happened. So when you see a human being, and you say, “What a piece of work is man! This is extraordinary! The beauty of the eyes, the marvelous organization and coordination of the limbs.” But then you realize that this is you. But you don’t know how you work it—and you do work it.

So, what it comes to is this: that in your total organization and nervous system, you are expressing a kind of intelligence that is—when looked at from the point of view of conscious analysis—unthinkably complex. And yet, from its own point of view, it’s perfectly simple because you don’t have to make an effort to see. You just see. You don’t have to make an effort to hear, the ear does it for you. You don’t have to make an effort to hold yourself together, the body holds you together. You do have to make an effort to get food, sometimes to keep warm, sometimes to defend yourself. So, some effort is always involved. And in a certain way, the heart, for example—which we don’t think about—it does work and it consumes energy, but you don’t have the sensation of making a decision every time your heart beats. Some, you see, people who are studying music, probably the wrong way, have to make a decision every time they play a note so as to stay on time and to play the right note. And then they get absolutely worn out because it’s decision after decision after decision, and there’s nothing more wearing than that. Because with every decision goes anxiety: was it the right decision?

There’s no way of avoiding that because if you’re going to decide—with the ordinary, responsible way of making decisions that we’re supposed to do—you never know whether you made a right decision or not until the

event about which you've decided is past. Because you never know how much information you need to collect to make the right decision, whether you did indeed collect enough, and whether the information you collected was relevant. And also, you realize that every possible decision can be radically affected by unforeseeable variables such that you've completed a contract with a business corporation and everything is in order, but you had no means of knowing that the president of that corporation upon whom you depended was going to slip on a banana skin and have a serious accident. There would be no way whatsoever of foreseeing that eventuality. Should you have taken an insurance policy on him? How comprehensive can an insurance policy be? Is it worth taking out an insurance policy? What are the chances of unforeseen events occurring of such significance and in such number that this sort of insurance policy is worthwhile and you're not just wasting money on paying the premiums? In the long run, in the long run, all insurance is a swindle. You should read Ambrose Bierce's book *The Devil's Dictionary*: he has the most subtle and extremely logical demolition of insurance. But in the short run, in a kind of chance-y way, you see, it sometimes pays off.

But, you see, this is the problem—the anxiety with which we are faced—in trying to conduct our lives by the exercise of conscious will and control: we realize that it is really beyond our comprehension. We don't understand. We cannot foresee all eventualities. And therefore, this sense of frustration through trying to control things gives us a feeling of existence which, for thousands of years, men have called *The Fall*. And the idea that there has been a fall, that something has been lost, is universal and very ancient. In the Taoist literature of China there are constant references to a sort of Golden Age. Lao-Tzu says, "When the great Tao lost"—in other words, when things did not always and automatically go in accordance with the course of nature—"there arose duty to man and right conduct. When the six family relationships fell apart, there was talk of filial sons and daughters, and faithful wives. When ministers became corrupt, then only did one hear of loyal ministers and wise councilors."

Now, therefore, when things have fallen apart, somebody gets up and starts preaching. And if there is one thing quite clear from history, it is that preaching does no one any good. It makes only hypocrites. Because if I tell

you that you ought to be concerned, and you ought to be unselfish, and you ought to cooperate, and you ought to be responsible—and because I imply to you that you're not—you will, in the first place, be resentful that I've had to tell you that, and you will feel guilty. But now you are under the impression that you really, and indeed, are a separate self with the power to perform all these virtues, and you then go through the motions of doing what you were told to do in the sermon. You are—in this case, then—an egocentric and selfish person pretending that you aren't. And the truth will always out because, in the long run, you will let down the people who are relying on you to be what you're not. And we have the most subtle ways of letting people down while apparently going through the motions of doing exactly what they expect of us.

Yes: we can be so pure, but so cruel. So loving, but so demanding. So wise, but so dull. So that we take it out on others when we feel that we are forced into doing things for them that are against our own nature. And we do that invariably, but we do our very best not to be conscious of the way in which we do it, because that would puncture the whole balloon and show it up for a farce, and we can't afford that.

So, there is, then, this feeling of nostalgia for the Golden Age when we have the feeling that, once upon a time, at some point—and this may refer back to childhood, it may refer back to life in the womb, it may refer back to primitive conditions before the invention of language and writing and numbers—but somehow, there is a feeling that we get, especially from contemplating animals. They don't worry very much. They seem to follow their nature. They don't seem to go through a decision-making process, just as you don't go through a decision-making process when you sneeze, or when you breathe, or when you blink. It just happens. And it's just as well that it does.

So the thought occurs to us: would it not be possible to conduct our life in that way always? And instead of making these pathetic decisions on the basis of utterly incomplete information, wouldn't there be some way in which we could manage to do the right thing—that is to say, to respond appropriately within the field of forces in which we are living and which we are—without these clumsy attempts to do so by force and by will? That, of

course, is what Taoist philosophy is considering all the time. And it is trying to point out that there is, in fact, a way of living like that. Only, nobody will believe it because they're scared out of their wits that it won't work. And, of course, you have to ask all sorts of questions as to what do you mean by 'work?'

But surely it should be obvious that if you are organically intelligent enough to be able to see, isn't there just the faint possibility that the kind of intelligence which enables you to perform the incomprehensible operation of seeing might also be of use if it could be canalized and invoked in solving other problems as well? Isn't there a possibility, in other words, that the human brain is not a muscle, but a fantastic electronic contrivance—like a computer—which does not think in words, but thinks in terms of neurological operations which are never conscious? That is to say, they are never attended to in detail—that's what consciousness is. In other words, that thinking is not... basically—only a small part of thinking is a verbal process. The greater part of thinking is a physical process. But it's a highly organized process and, when thought about inwards, is a very, very complicated one. But we do it, and it's the simplest thing in the world to do it because you don't have to decide. That's what you mean by simple. You don't have to enter into the complexities.

Now, the proposition that this might be so—I have caused a professor to go completely blue in the face with rage at such a suggestion. That it seemed so—to him—anti-intellectual, undermining the whole nature and dignity of the academic professions, and so forth. But, really and truly, if human beings are to adapt themselves to the increasingly troublesome environment which they are creating, isn't it possible that we are not really trusting ourselves or using ourselves to the full to come to an understanding of our problems? You say—a lot of people say, “Oh, well that sounds like the people who simply say, ‘Oh, ask God to help you and he'll do it. He'll think it out. He knows.’” But that's not the case, you see? The case is: it's asking you to do it. But if you have started out with a definition of yourself which really has very little to do with you at all—which is this kind of joke that you are an ego, and that you are some sort of being inside a bag, and that you're in control, and that you're the boss of this bag (or at least, supposed to be) in the same way as the chauffeur in charge of the car or the engineer

who makes the machine. You might possibly be that if you knew how the whole thing was constructed. But the whole point is: you don't. But if you could revise your view of yourself—who you are—and realize that you are the field of forces with their patterning and with their incredible intelligence, and you trust yourself to decide. To respond, in other words, spontaneously to a situation instead of going through this whole thing of “what is the right thing to do?”

But, you see, if you have been brought up in a civilization inured to the doctrine of Original Sin, you cannot possibly trust yourself. In fact, you see, what happens is this: we know that an airline pilot is a fallible being. And when he's driving a jet things are happening much too fast for him to make up his mind if he has to make a decision. And therefore, increasingly, we put in all sorts of automated decision-making machines on a jet plane. Eventually, the pilot loses his confidence in himself more and more, because he doesn't know how the damn thing works—he's just sitting there. And the famous story about the time when we have supersonic rockets, and you get on board, and a tape recorder says, “You are now taking off for London where we will be arriving in half an hour. All facilities on this aircraft are fully automated. There is no chance of human error and, therefore, no need to worry—to worry—to worry—to worry—”

But, you see, we can do a rather good job in eliminating error by use of the computer in rather limited circumstances. Why? Because the computer, as it develops, is more like a nervous system than it is like a linguistic system. In other words, it is able to deal with ever so many operations at once, and to synthesize them. And words can't do that. Words have to go along a single track. Now then, if the brain is still far more sophisticated than any computer we can yet construct, what is the limitation on human skill is that a human being isn't using his brain in the right way. He's not really using it to the full at all, except in some peculiar beings whom we call geniuses. And the funny thing about geniuses is they cannot explain why they are geniuses. They can't teach it. Here is a case in Zhuang Zhou's book of a wheelwright: he makes the most beautiful wheels, and the trick of a wheel is to get it to fit the axle. It mustn't be so loose that it wobbles, and it mustn't be so tight that it sticks. It has to have just the right thing. And he says, “Here I have been doing this for years, but I do not know how I do it.

So I can't teach my son, and so I'm still working when I'm 75 years old." And this is an eternal problem of all fine craftsmen and skilled people. They cannot explain how it is done.

This was my problem as a small boy in school. Because, when I started out in school—around when I was seven, eight, nine years old—I was considered stupid. Because I always failed in examinations and got terrible marks. But at the same time I was absolutely fascinated with the bookish process. I collected books, I loved books, I loved the smell of books, I liked the look of them. But nobody really got across what you were supposed to do with them. I mean, I could read them. I used to think, well—they used to say, "You don't work!" You know, like saying, "This watch doesn't work!" I said to the teachers, "I want to work very badly, but how do you do it?" They had no explanation. So I used to look at exemplars of intelligence, some of the teachers whom I admired, and I thought maybe I can find out how to do it by imitating the way they do their handwriting, or by wearing clothes the way they wear them, or by making the same sort of gestures, or by speaking in that sort of way. That, by some sort of sympathetic magic, I would acquire the mysterious power which I seem to lack.

In the same way, I remember from childhood, again, that our nurses in a hospital, sanitariums, or homes had a very, very peculiar anxiety about constipation. In fact, that was about the criterion of health; was that you were not constipated. Therefore, you had to do your duty—as they called it—every day. And if you didn't, there was a graduated series of punishments. It started with a concoction called California Syrup of Figs. It went next to a thing called senna tea. It went next to cascara. And finally, to castor oil, which is disgusting stuff. The trouble is that, if they resort to that, you get back in a vicious circle because the whole muscular system is upset, and so you begin all over again.

Now, the mistake that they all made was to issue a commandment to the conscious mind to achieve a result which the conscious mind is perfectly incapable of producing. The conscious mind has nothing to do with whether you're constipated or not. That has to do with the unconscious. Or, I prefer to call it the superconscious, because it's a lot more clever than the conscious mind is—and, indeed, a great deal more trustworthy. Only, we

don't believe that because we believe in original sin. And therefore, the unconscious can't be trusted, and if it wants to take a day off or so from going to the bathroom, we think it's sinful; there's something wrong with it. And that attitude, you see, that was reflected in this rather trivial little illustration, ran through everything. You must love us! You must be free! You must make the right decision! It's up to you. You've gotta do it. See?

Well, of course, as a result of that, one of two things happens. Most people simply lose their nerve. They realize "I've got to make the right decision, but I can't!" Therefore, they drop out; they become the sort of people who just say, "The whole thing is just too much. It's absurd." And they become low-grade intelligences, or so we think. Then there's another kind of people who grit their teeth, they pull themselves together, and they resolutely smash into this way of existence, and they get rewarded accordingly—that is to say, they get more and more power. They succeeded in this game of being God, and so society rewards them, you see, by saying, "Well, you be president. You be this. You be that. You be the other thing." Looks fine. Looks great. Everything's going beautifully. But we've only seen the beginning of it. As it goes on, they say, "Well, hmmm. You've got to control this. Got to control that. You didn't think of that one before, did you? You know, we can avoid a mistake if we get that under control." We get this one fixed, then say, "Now, wait a minute. I can't think about all that. We're going to hand all that problem to this computer which we've got here. We'll keep an eye on that one corner and we'll get that deciding about this."

And so, all these aids to intelligence come along, but at the center of it all is a guy who thinks he's in charge with his conscious intellect. And so, soon, he begins to feel more and more responsible. And because he's making a mess anyhow—I mean, just imagine being the president of the United States! You don't know where you're going, you've got all these decisions to make, you haven't got any private life at all because there's a telephone here and a Secret Service man there and a secretary there, and a this, and a that. And here it goes. But whatever you do, it doesn't make the slightest difference. Everybody's objecting; everybody's saying, "You mustn't do it that way! You forgot this! You are a so-and-so!" And they call you names and everything. The only way of insulating yourself to that is to plug your

ears. But then you can't get any information at all. Cut off the phone, you know? But then you're stuck.

Because, you see, this is the fate that comes to anybody who tries to be God in the wrong way. Everybody is God, actually, so there's no need to try to be. But the moment somebody tries to be, that means he wants to be God from the standpoint of the very limited faculty of conscious thinking and deciding, which is a very clumsy agency for controlling what happens in the world. You're never going to be God that way. Because if God—just figure it out—if God had to think about every motion that a gnat made with its wings in order to see that it happened, boy would he be tired! What a nervous breakdown that would be. Well, you can say, "Only God can do it," but it's a way of saying the whole conception is nonsense. Things like that aren't handled that way. Things like that are handled the way you and your body handle things: which is that they organize themselves without thinking about it. That is to say, they have an intelligence, but it's not verbal intelligence, it's not linear intelligence. It's multi-dimensional, multi-variable intelligence wherein everything altogether everywhere is happening all at once. And if we don't reacquaint ourselves, shall I say, with that kind of intelligence, we're going to be in trouble.

Now, you see, the point is: we have it. It's all there. But we don't give it a chance. Let's take in social intercourse, see? We're very, very controlled. When somebody—you see, conversation goes on in a linear pattern. And it's a game. Somebody suddenly changes the subject. Now, that creates a small social crisis because they say, "Wait a minute, we weren't talking about that. You interrupted." So, in order to protect ourselves against that you, say, you wait for a slight pause and say "Ahem, excuse me for changing the subject, but..." And that indicates that you know—that they are not to take you for a madman who thinks associatively instead of logically, in a linear development. Now, what happens if you change the rules and you put a group of people together for conversation and say, "Say anything comes into your head." Well, that sounds like free association in psychoanalysis, doesn't it? And what about saying to somebody, "free associate?" It blocks them, because they suddenly go blank. Which is a warning: don't move because you can't trust yourself. Don't move. Go blank. So, to help you along, the analyst says, "Did you dream anything last

night?” Oh, that’s alright. “Yes, I did have a dream.” I tell the story of my dream, which is a way of kidding yourself. You are making a statement through a dream for which you’re not held responsible—because it was only a dream. You can, through that, say something about yourself without admitting that you’re saying anything about yourself. And without your—you did the free associating in the dream, you see? The dream was an associative process of thinking rather than a logical one, and you can describe it because it’s safely passed; it’s not happening now.

Then he can, perhaps, draw you out a little further and say, “Now, what do you think about that dream?” Well, if the analyst is a Freudian, you know what to think about the dream. All long things are one thing, and all round things are another, and it’s as simple as that. If you’re a Jungian it’s not so easy; if the analyst is a Jungian it’s much more complicated. But [???] to help you out, saying, “Well, it’s up to you. I don’t know what these things mean in your dream.” But when you think of a particular image that occurred in the dream—which was a certain friend of yours, say—what does that fellow mean to you? And he tries to get you to see that the person you dreamed about actually represents an aspect of yourself. You didn’t have a dream about that actual, objective person out there, but he stands for something in you which you associate with him. So, gradually, associative thinking is drawn out from you.

Then, another thing to do is draw pictures. That’s pretty safe. Just draw anything. Well, you draw a lot of meaningless stuff, you know, and bloo-loo-loo-loo for a while, and then gradually use it as a Rorschach blot. And things begin to come out. But all this is coaxing people, you see? But in a situation where you are directly verbalizing spontaneously, it’s very embarrassing because words are tremendously powerful in a social scene. People can be blown to pieces with words in just nothing flat. Say the wrong word and everybody blushes, just like that. I’ve produced a complete neurological-physiological reaction with nothing but words! So it’s dangerous to get away from the order of words and communicate with people in an unstructured way. Because that’s, to some extent, what happens in tea groups where—or things like the Synanon game—where people are somehow encouraged to say anything they like. But it would get way out indeed if, instead of saying to somebody, “After all, when I look at

you, you really annoy me. Something about the expression in your face which I can't stand." You know? That can become a stereotype; you can go on with that kind of argument. Kind of mutually embarrassing game until it merely becomes a ritual.

But let's suppose that, instead of that, we just started talking nonsense. Or anything goes. It might suddenly stop being nonsense, or at any minute change into nonsense. So that we would immediately withdraw, you see? Say, "Oh, that can't go on." But, on the other hand, if we don't withdraw, we say "Well, all this is going to be words anyway, and there's nothing much that they can do to us. So let's see what happens." Then, if we don't withdraw, people begin to feel at ease. That, after all, I can trust myself to behave in a non-egocentric way without harming others, without creating murder and mayhem and bloodshed, without stealing people's things. And suddenly, when a group discovers that it can have that kind of lulling, pentecostal, glossolalia bit with each other, there's some possibility they might love each other. That's why this has been done in certain spiritual circles for a long time.

And this is why, in Zen Buddhism, there is this game of challenge and response, where you are put in a situation where, if you stop to think what to do, you've lost and you're out. And you have to try again. But you never really know what the situation you're going to have to respond to is going to be. So, once upon a time, there was a master who posed a kōan to one of his students. And a student gave a certain answer, and the master accepted it. The master's assistant, after this student had left, said to the master, "I'm doubtful about whether he really understood the point there." The master said, "Oh, really?" He said, "Why don't you try him again?" The master said, "Yes, I will." So the student came back the following day and he put the same problem to him. And the student responded the same way. The master said, "No, no! That's wrong." But the student said, "But you said yesterday that it was right." He said, "I know. Yesterday it's right, today it's wrong."

Because, you see, every situation is different. It's always changing. And the point is to respond in a way that is appropriate to the field of forces as it is now. And you cannot tell intellectually, you can't tell by analysis, you can't

tell by a process of conscious criticism what the structure of the field of forces is. Your body knows, your brain can find out. But not through conscious attention and formulation in words. But if you don't trust your brain to be able to find out, you will fumble and you will do silly things. And since you have been habitually brought up not to trust your brain to find out, to get into a pattern of trying to behave spontaneously is, of course, to run the danger of making a great fool of yourself. And that, of course, is indeed what happens in a great many experiments in the arts where people think they're going to paint spontaneously, they're going to make spontaneous noises with a musical instrument, they're going to dance spontaneously, they're going to have non-plays on the stage—or happenings—where anything goes. By and large, these things are colossal failures and are completely boring. And it's perfectly understandable why: that, namely, they're being done by people who don't really trust themselves and who are doing this in a background of self-mistrust. And who have never, in other words, cultivated—because it is a kind of a discipline to trust yourself and let it happen.

But, you see, when you get a great comedian working, you can't really train to be a great comedian. I mean, how would you go about it? Would you read all available jokes and memorize them? Would you study the great comedians of the past? Remember all their gags, gestures, expressions? The point is: if you did that, everybody would think you were corny. They would say, "Oh, that's just Mark Twain again." Or whatever. W. C. Fields; it's his gag. The whole point of a comedian is the element of surprise, the unforeseen joke that nobody expected. The thing that really has people laughing is what they just didn't quite expect.

Now, the ability to put this over is something that you either—apparently, you either have it or you don't. And you—also—you have to do it in a situation where you don't know what's coming up yourself. You could be a comedian, in the terms that you've got a script and you've learned your lines, and the script was written by a genius, and you're a good actor and it's very funny. But if you're in a real comedian situation where people in the audience are interacting with you and, in other words, the situation is unstructured, the real genius is the one who can pull the gags just like that,

as if, indeed, they are ad-libbed. That man has got his genuine intelligence working for him.

But so, we come back to the point, then, that the genius is unable to say how he manages to do it. He can say, “Oh, well, yes. I do a lot of hard work.” All geniuses do. But that’s not the cause of it. It goes along with it; it’s a kind of necessary accompaniment of the art rather than the cause of the art. Because one uses work to polish something which was a gem in the first place, you see? When you write poetry, it’s a lot of work to get it; exact melody and beauty of words takes hours. But you had to have something there in the first place that wasn’t simply the polishing, it was the gem. So that the coming forth of such gems, in the same way as a cure for constipation, is something that requires trust in one’s own inherent and original intelligence.

This was what the Zen master Bankei calls your unborn mind. That is a way of saying the mind that you have, that is not individualized, that is not personalized, that is not the ego. And he would say to people, “When you hear something go caw, you know immediately it’s a crow. When you hear something go ding, you know at once it is a bell.” And when he was once heckled by one of those Nichiren priests—you know, they are very fanatical Buddhists; they run the Sōka Gakkai movement—this priest said (standing right at the back of the audience) he said, “I don’t understand a word you’re saying.” And Bankei said, “Come closer and I’ll explain it to you.” And he moved in. And he said, “Closer, still. Still, closer.” The man came forward. And he got right up to the platform. Bankei said, “How well you understand me!”

So, in the same way, once a military man was with a Zen master and he said to the master, “I’ve heard this story that there was a man who kept a goose in a bottle, and it grew so large that he couldn’t get it out. Now, he didn’t want to hurt the goose and he didn’t want to break the bottle, so how does he get it out?” And the Zen master changed the subject. So, finally, the military man—the officer—got up to leave. And just as he got his hand on the screen to go out, the master said, “Oh, officer?” And he turned and said, “Yes?” The master: “There! It’s out!”

Of course, if I say to you, “Hello!” or “I say!” you say, “Yes, what is it?” See? You don’t stop, you don’t hesitate. You don’t think, “What mischief is up here? What could he be planning?” You just respond. And the response is, in this case, perfectly appropriate. Now, you could say this is just habit. True, there is habit. And there are responses that are conditioned, fed into people. But we saw that that doesn’t work for the comedian. He needs something more than habit. And you’ve often had the experience of finding yourself in a crisis where you somehow managed to act intelligently though there was no time to decide. Driving a car, or something, you know? Suddenly, your own being comes to your aid. Well, that—of course—is the whole thing.

But the basis of it is to realize not that this is something sort of rather heroic, which one really ought to try to do—as if there were some other possibility, as if it would be safer not to do that, as if we could sit back here and say, “Oh, now, let’s not get mixed up with that adventure! Let’s be safe and rational, and believe in original sin and mistrust ourselves.” If we do that, we are finished. We go straight—by that method, with the kind of technology we have—we go straight into the totalitarian state and all that goes with it. The total police state: everything’s gotta be controlled. Somebody’s going to win at the God-game. And the end of that—of course, as everybody knows—is: every great totalitarian state destroys itself because it becomes too rigid, and it consumes itself with its own fury and frustration; it has to take itself, it’s hostility, out on itself.

So, actually, it isn’t a question that this is something that we really ought to do, or that to have faith in one’s self is virtuous, or something—you know—like psychologically integrated, and you hope you can be more psychologically integrated than the other people you know. It isn’t like that at all. It’s something that you really cannot avoid. That you, actually—although one, you know, sort of doesn’t believe it—you do do it all the time. Only, when it comes to your attention, then you think you should. But when it doesn’t come to your attention you are functioning intelligently without thinking. When it does come to your attention you say, “I’d better not do that.” It’s like, you know, we work for certain bosses. And, you know, one thing you mustn’t do, if you could possibly get away with it, is never ask their advice. Go ahead and do your job. But if you take it to them

and say, “Should I do it this way or that?” then, suddenly, everything is held up while they think about it. And then they can’t make up their minds. They go this way and they go that way, and they say, “No.” Don’t ask. Just go ahead and do it. And it’ll save the boss so much time, and it’ll stop him worrying, and prevent him from having ulcers.

So, in the same way, there are a certain kind of people want to know whether something’s legal. And the best advice is usually: don’t ask. Because there’s a saying in Zen: “Officially, not even a needle is permitted to pass. Unofficially, a carriage and six horses can get through.” So if the law is not challenged and asked to make a decision on this—forget it! You can probably get away with it. So, in the same way, again, if you realize that trusting in your own organic skill and intelligence is something you can’t really avoid. You can try to avoid it and get mixed up. You can get so mixed up that, if you cannot—if you say, if you think you can’t trust yourself, then it follows that that idea itself is untrustworthy because it’s one of your ideas. If you think you can’t trust your brain, how can you trust the logic which your brain makes possible? And this logic is so simple and, therefore, so clumsy in dealing with the subtle complexity of our world and of the field of forces in which we live.

So, you cannot let go, you know? You say, “Now I’m going to let go,” see? “Today I’m going to let go,” see? Don’t do it that way. You remember that you can’t hold on. That’s the only way to let go. You can’t hold on; there’s nothing to hold on to, no one to hold it. It’s all one system, one energy.

The Universe

The Power of Space

You may think it rather nervy of me to devote this whole seminar to talking about nothing. But it's about space. And in most people's minds space is just nothing unless it's filled with air. But once you get outside the air, space maybe in some way crossed. By floating bodies, by various kinds of electrical vibrations, light waves, cosmic rays etc. But since the Michelson-Morley experiment, which seemed to prove conclusively that there wasn't any such thing as ether, some kind of attenuated fluid through which light was propagated, space just isn't there. It's the way we have, in other words, of talking about distances between bodies. In other words when we say the distance between them increased, as if the distance were a substantive, that does something. Like the man walked, the distance increased. But I suppose what we're actually saying is that the two bodies we're talking about increased the distance between themselves. They did it. But then you suddenly find that you've got distance as an object. To increase the distance, the distance now being the object of, whereas before it was the subject. And so at once one begins to see: there's something fishy about space. And after all it is the background against which we see everything. And even a blind person has a sense of space in that which does not obstruct motion. And yet, funny thing about space is, it in a way doesn't end where a solid begins. You can shift a solid around in space without apparently altering it in any way. And after all there is space between the two sides, shall we say, or ends of the solid. We can think of that in terms of space and measure it in terms of space.

But it is against space that we experience everything that we experience. And, by the way, also we experience everything not only in the dimension of space but also in the dimension of time. Now the fascination about space and time is that while they are basic to all possible experiences that we have, you just can't put your finger on them. Space seems to be completely immaterial. And when St Augustine was asked "What his time?", he said "I

know what it is, but when you ask me I don't." So these two basic dimensions of our physical world are uncommonly elusive. We could perhaps say that they are pure abstractions. There is no such thing as space and there is no such thing as time. They are merely our way of measuring and thinking about the behavior of the physical universe as a pattern, a system of patterns, energy patterns. And if you measure the movement of these patterns, the line along which you measure motion is called the timeline. If you measure their positions, the line along which you measure their positions you would call the spaceline. And these two lines would be as abstract as the equator in relation to longitude zero. These things don't exist on the physical face of the of the world. They are imaginary lines and are only to be found on maps. Could you also say that the same thing was true of time and space? We think for example that there are three coordinates of space and one of time. The three coordinates of space being length, breadth and depth. And through that runs one of time. But come to think of it it's rather artificial. It is making us think of space as having a sort of grain to it. As if it were a crystalline substance and however transparent the crystal it does have a grain. And space has the grain of up, across and through. Those are the three ways in which we think of space. And we can't think of any more, not with our senses. we can mathematically conceive spaces with infinitely many dimensions. That is to say you can write it down as if it were so but you can't conceive it in your imagination. You can draw, it's great fun to draw, a four dimensional cube having four spatial dimensions. That's called a tesseract. And tesseract is a good word to apply to a person who is ultimately a square. A four dimensional square. But the tesseract, you see, the minute you draw it, that obviously you can't have more than he three right angular dimensions of space or the coordinate in any kind of solid figure that you know. And so you can think about it in terms of mathematics, but you can't conceive more than these three coordinates sensuously. And so it's basic common sense to us that space has this structure. But of course the question is: "Is this a structure of space or is it a structure of the human nervous system, the human brain and human thought, which is projected onto the external world as a tool for measuring it?" This is one way of approaching the problem. But there's another way altogether. Which is to consider space as anything but nothing. If space is basic to all that we experience, as time is. You might say then that space is as near as we can imagine to being the ground of the world, or what some

people have called God. The texts of the Hindus, Buddhists and Taoists are full of ways in which the symbol of space is used to mean the ultimate reality. Space is used in India in basic Indian philosophy. In Vedanta it is called akasha. And akasha is for them the fundamental element. There are five elements. Earth, water, air and fire and Akash.

And so space contains all the other elements. In Buddhist philosophy, where the ultimate reality is called Shunyata, are the void. The Chinese will translate the Sanskrit with their characters it means sky or space. And the Taoists would say, quoting Lao Tze: The usefulness of the window is not so much in the frame as in the empty space through which something can be seen. The usefulness of a vase is is not so much in the sides made of clay as in the hollow inside into which something can be put. And of course that is a startling metaphor for a westerner because we think the other way around, you see. As I started out to say, we really think commonsensically that space is nothing at all. And we are much more sympathetic to the idea that it's pure abstraction than to the Oriental idea that space has some kind of basic reality. It bothers us, too, when astronomers talk about curved space. How can nothing be curved? Or properties of space, or expanding space? How can it do that? And then when architects begin to talk about the functions of spaces, the commonsensical Westerner thinks: why don't they talk about the functions of walls? Of course the walls enclose spaces, but the spaces of themselves have no function and they're bothered about this. Painters also are very aware of space because, especially if you paint in oils, you have to paint your background. And therefore, in filling it in, you begin to realize, that it has its own shape. It is the obverse of the foreground. And when you play with photographic negatives or anything that switches foreground to background, foreground to background, you begin to become aware of spaces as having a shape. The interval between all sorts of objects becomes new something significant. Even though it's constantly flowing and changing, as indeed are the objects within that space. So it is a kind of the bit of a shock to our common sense, which in most cases has not caught up with twentieth century physics or astronomy, to hear space considered as something effective. As something definitely THERE, so that you could say it has properties. Take another case of space, which is rather startling. There, are different kinds of space. Space is a basically, isn't it, an interval. There is an interval between each one of the sitting here. If we didn't have

that we would suffocate, because we've been packed together like sardines. We need space in order to function of the human being. We need a kind of area in which to just move and walk about and breathe and express ourselves. Now. You can have intervals not only in space but in time. Pauses are intervals. You can also have intervals in sound, the intervals between tones on notes. And the interesting thing about the intervals between tones is that they are that, upon which the hearing of melody depends. To hear melody is to hear intervals.

Now if you will simply visualize melody in terms of something graphic. Supposing you represent a simple, say, an introduction of a fugue. Or whatever, you know, you can see that in terms of the dancing line or a series of points, read at different levels, representing like musical notation the high ones and the low ones. And you recognize a pattern. But you see at once that the pattern depends on the way the critical dots in it are spaced. And it doesn't matter much whether the space is a big space or whether it's a little one. Because it will always be relative to the size of the dots. You can magnify it or minify it, but you will see it is the way they are spaced, that makes the difference, and here once again we are using spaced as a transitive verb now. We've talked about spaces or distances increasing. Or people increasing the distance. And now we can talk about space as a verb. To space. To be spaced. And so once again the language is either playing tricks on us, or else expressing a profound intuition. Language does both and you have to watch out for which it is. Of course it may be both, that is a possibility. But here at once you see, especially in that illustration of music, of it being necessary to hear intervals in order to hear a melody. You see that the way things are spaced is really another way of talking about the way things are related. So you begin to realize that space is relationship. Go further now. There is another idea about space, which is connected with the Oriental uses of space. It is quite fundamental to Indian and a great deal of Chinese thinking, that space equals consciousness. In other words, what actually we are experiencing as the all-inclusive space in which things happen, is your mind. And. Your mind of course is not something inside your head, that is a great mistake to make. Your head is something in your mind. We can define a person's mind in many ways. But beginning with something rather simple, mind is occupied with thinking. Most people think in words. And you didn't get words out of your head. You got them from

the community in which you live and were brought up. So when you think in a language which your community gave you you are not really thinking your own thoughts. It is very difficult indeed to have private thoughts. Because when the very materials with which you think are public property, it shows what a vast influence the public has on you, in you the deepest recesses of your mind. It's therefore very difficult also to think freely, independently, because we are pushed around with the symbolic systems of words or of numbers in which we think. But since, you see, the functioning of the mind in the process of thinking depends upon an outside community, you begin to see that your mind is a network. A network of relationships. You think only in the context of an environment of people and of natural processes. So that you could say that your mind is at the very least a most complex network of present and past relationships, stretching out to the very limits of the universe. And this, as I've often said, explains such truth as there may be in astrology. That, when you want to draw a map of a person's soul, you draw a map of the universe as it was when he was born. We say that is your chart. That expresses you in a special way. Now, the astrologers' maps are very crude. They're based on a rather primitive view of the universe. But the truth of it is there, you see, that who you really are, your soul, your mind is the total universe as focused upon you. And this connects with what in Mahayana Buddhism is called the doctrine of mutual interpenetration. Namely that every thing-event in the world, anything, in other words, supposing the whole world is a moving pattern. And then you want to identify the wiggles in the pattern. It's very difficult to determine how much of a wiggle makes one wiggle. But by a sort of calculus in which we chew the thing up we say: "All this wiggly world consists of so many wiggles and each individual wiggle is a thing event." What is called in Japanese, *G*, means a thing-event. And so the idea of the doctrine of mutual interpenetration is that every thing-event in the universe implies all the others. It goes with it. Doesn't matter how long it lasts or how short it lasts. The fact that it is, or the fact that it was, implies the existence of everything else. To put it in another way, the fact that there is a moth lying around me, it's very small and it will soon run into a candle and extinguish itself. That little incident would not be possible at all except in the context of all these galaxies. Because their existence goes-with the possibility of there being such a minute little life flatteringly around. What is not so easy to see, is the picture in the opposite direction. That in the same measure all these galaxies

depend upon and go-with this little moth. As the poet Suso, Henry Suso, once said. No it wasn't Suso. Someone like him, lived about the same time. I'll think of it the minute. Anyways. That I know that without me God could not live for one moment. And this is the other aspect of it. And this is the difficult one to understand and we shall be able to approach this in the course of the seminar. In fact if you realize that, then you've really got it, you've got the point of your own existence. But to get the reverse picture, you have first of all to get, clearly, its opposite one, namely that the existence of any one minute little thing is intimately related to everything. And then what happens when you clearly understand that and you've really got that, your mind does a flip. Bliblip, like that. You know, it's like when you squeeze the air into a sausage balloon and you get all the squeezed up, you think, into one end of the balloon and suddenly it goes Bliblip and it comes out the other entries. Well, it's sort of like that. And you have to be very careful at that point not to go crazy. Because, you see, when you find out that all this universe depends on you, some people get frightened, others get cocky and from both things disasters can follow. You have to discover that and then be natural. Act as if nothing happened.

So then, this Buddhist idea, Mahayana Buddhist idea of mutual interpenetration is expressed by the great simile of the net of jewels. In which you have a multidimensional spider's web in the morning dew. And on inspecting one dewdrop you see the reflections of all the others. And in each reflection, in turn, reflections of all the others and again and again. And so of course one discovers this to be no mere philosophical fancy, no mere metaphor when you start working with laser beams and find out that you can reconstruct a whole photograph from a tiny snippet out of the negative. Because the crystalline structure of the whole photographic field, the chemicals spread over the acetate or whatever, when it's exposed to light, all those crystals change in harmony with each other. See, suppose we all touch each other. And then somebody says boo. We'll all jump a little bit together. And if you examine any one jump carefully enough, any one individual jumping, you will see, if you can find out enough about it, that the way he did it was in response to the ones next to him and they did it in response the ones next to them and they jump so far because they couldn't push any further and some were a little bit pulled in that jump and so on. And by seeing exactly what one of them did you could reconstruct what all

of them were doing. Only usually we don't bother to think about things like that, because it takes too long. And this is one of our great difficulties as human beings. That the mode of thinking upon which we largely rely for our practical calculations is unbelievably clumsy. Because it can only deal with one thing at a time. And that doesn't get you anywhere. That's in a way why a great deal of scientific work is apt to be trivial. They are all very well if I had all that time to think it out. But I don't. I have to make practical decisions in a hurry, and no time. But on the other hand here is nature, here is your body. Not merely your body it by itself as a something bounded by the skin, but your body in relationship to a whole community of people and animals and bugs and vegetables, functioning in this astonishing way. Doing myriads of things altogether everywhere at once and not thinking about it at all and. It is astonishing, you know, how we overlook that. Because of course this is the faculty which everybody possesses. And therefore we say "Well that sort of cleverness is a dime a dozen." What we like to distinguish is special cleverness, people who can do strange tricks. Like great feats of thinking and talking and intellectual and cerebral performance. But we mustn't forget that there are also people who do absolutely astonishing things without thinking at all. There are jugglers. There are very beautiful people. That's a pretty astonishing when you pick out someone and say: Gee, isn't she a goddess." And that's done without thinking and it embarrasses many women to be told that they're beautiful. Because they want to be admired for their intellectual achievement rather than for the bodies which their parents provided for them. And so we are a little bit on the defensive about the things that we achieve without our egos being in charge. But we do the most beautiful things that we do, really, by that means. Because all that thought and intellectuality can do is it can embellish your natural talents. A lot of people who are incredibly good at thinking never do anything creative because they have no talent available. They may have it but they don't know it, they don't trust it, they don't know how to make use of it. And therefore that intellect works to little purpose. Because the function of the intellect is to be the servant of the organic intelligence. You see? Only what we're doing, is we're trying to make the intellect the master. The intellect is a wonderful servant just so long as it knows its place. But once it becomes saying to nature: "Look. You submit. I know how you ought to be run. Now I'm going to take charge." That is the moment of hybris where Adam eats the fruit of the Tree of Knowledge, that

is to say of technical knowledge, and tries to be God to the world. And God says: "OK baby. You try." And then, you see, you've got to work. That's why the curse of eating the fruit of the Tree of Knowledge was work. Everything became work. Cats, you know, dogs and birds, they don't do any work. They, true, they scurry around getting food, but that's that that's what there is to do. That's fun, that's life, that's living. It's not work. Besides you don't have to think about it. Your brain tells you where to look for it, your nose tells you where to find it. You do what comes naturally. And there it is. And if God so clothed the grass of the field which today is and tomorrow is cast into the oven, how much more would he clothe you, faithless ones? But I never met a minister, never, who would not comment upon that, that that is a very impractical passage which we can't live up to. But to get back to space. All I was showing in this sort of digression was that our mind, our self, is not inside our heads. But extends. And so, you see, you have, as the great vehicle of this extension of the universe, you have space. And you see immediately that you cannot pin space down. You cannot really conceive space at all. Look at the wonder a child has when it ask questions and begins "What's up there? What's beyond? What's after that? what's after that?" The child is absolutely fascinated by thinking about that. Do you know all children of fascinated with infinity? Don't you remember seeing, say, a child's book. And on the cover of this book is a little girl sitting, reading the same book with the same little girl on the cover and so naturally there is another little girl on the cover of the book she's looking at in the picture. And so the child begins to wonder: "How small can it get? How far can it go?" Or they get in the opposing mirrors and look and say "That's wonderful, why can't you line them up so that it doesn't just disappear around the corner always? Couldn't you get in straight on this?? Seems so difficult. "Mummy, what did God do before he started the World?" Think back. "What would it be like to be in heaven and live forever and ever and ever and ever?", and immediately this somehow stretches the skull and children love doing this because children are always trying out experiments on themselves. You know, they prod themselves, they pull themselves, they love to spin in circles and make themselves feel dizzy, because that's a great thing, you know, that feeling. They're always fascinated with the limits of experience. So what's out beyond that? Because now when a sophisticated astronomer tries to tell you that space is finite, we're still, we resent this. And say "All right space is finite but

what's outside it?" "Well," the astronomer says, "you see you can only talk about an outside inside space. Outside space there is no outside." You see, the mind won't take it. The sense, you see, infinity. So. This space fascinates us. Going on forever. Expanding. It seems to be actually going on forever, you see, if the universe is a huge explosion. But you can see, can't you, I think this: Space, although you cannot pin it down, and has the quality of infinity. There's no way of talking about space, because it has no color. It has no weight. You can't cut it. You can't possibly chop it into pieces. And yet at the same time you cannot differentiate it from solids. We come to another important point here, you see? That solid and space are in a secret conspiracy with each other. Actually there's very little solid in the world. Most of what appears to be solid appears so by virtue of the speed at which it's jiggling. It's like an electric fan, which, when put in rotation, the blades appear to form a solid disk and this chair is solid for rather the same reasons. You can't put your finger through it, it's moving too fast. But actually, whatever it is that is dancing in space, is increasingly difficult to define. The more you think about energy, you see. and you can make a calculus of energy like you make a calculus of wiggles in the world, and you can say there are various waves, or wavicles, or particle of energy, which we give all sorts of different names to. But the more we pursue it, the more it all seems to disappear. Like space, the more you try to think what it is, the more difficult it is. So in the same way the more you try to say "Now come on. Let's sit down. What is this here?" It's alright if you stop at a certain point. Then you say "Well now we know, that's practical. Let's not ask anymore questions." Think. If you keep on asking questions everything falls apart. You notice this in the scholarly world. Scholars spend far more time debunking than they do creating. Because everything that has ever happened has been debunked, practically. You can show that there is no evidence, you know, that Julius Caesar existed not really. Certainly there is no evidence that Jesus existed, that Socrates existed. There was a great deal of doubt about Plato probably the approach Shoko was a myth and so on. You know you can go on in that indefinitely. Finding out that there really is no evidence. I don't know, probably the same sort of thing is happening with the Warren Commission. I don't know. Although it's something that it didn't happen anyway. Because that is the work of the analytical intellect you see. When you finally try to be God, that's to say, define it exactly. Now just where is it and let's get perfectly clear, so that "plop", it's fixed,

see? It all becomes slippery. Because in order to handle the world, you see, you have to touch it rather gently. You mustn't try to pin things down. As they say in Zen, you do not try to drive a nail into the sky. Because that's the beauty of space, you see, there's nothing in it to hang on. It hasn't a hook to put your hat on somewhere in space. And yet it hasn't got a floor to fall onto. See, if space had a concrete floor on the bottom, it'd be pretty dangerous stuff but it doesn't. There's nowhere in space to collide with space. You can run into somebody or something else, yes. But not with space. Figure, then, on this. Work on this hypothesis, you see, it's only a hypothesis at the moment, nothing more. That space is you. Because you are equally inaccessible to inspection. When you look to find out who you are, somebody like a Zen master will interrupt you and say "Excuse me, but who is it that wants to know? And who is it that's looking?" Find out that. So, you know, you're soon chasing your own tail like a little dog. And you never catch up with it. All this, you see. So space is like you. Only we turned in the ordinary way to think of ourselves when we make the gesture like this. I'm here. We go this way. I can feel this. I'm inside it, it's me. But always when you get a certain feeling about things, examine the opposite possibility. That you are this. Now we're going to look in due course at the neurology of this. But you do see that what you see outside you. And feel outside you. Is the way you feel inside just skin. Since all the optical images, shapes and colors and everything are neurological states in the brain. So what appears to you as outside is the most intimate feeling you have of the inside of your head. Because, you know, it's difficult to feel inside of your head unless you have a headache or a tumor or something. But in the ordinary way, the inside of your head is unconscious and the surgeon can open up your skull and put instruments in the brain and you won't feel them at all. The brain is very anesthetized. So, in order to feel the brain, you have to look out there. And that's how it feels in the brain. So I'm just trying to give an indication of how to get the feeling of reciprocity. Of: you, on the one hand it's easy to see, as I said, you depend on the whole show.

Now I want you to see the opposite and equal truth that the whole show depends on you. So that you don't anymore put yourself down as this wretched little bacterium, living on this obscure planet, that evolves around a minor star on the outer fringes of one of the lesser galaxies. This is the

great nineteenth century putdown of man. How nice to be all unimportant. Watch out for this. Watch out for the political consequences of “everybody is equally inferior.” The political consequences emerging in becoming clear as day goes by: barbarism is the answer to that. Untrammelled violence, police states and shocking disregard for human existence. Because they’re only wretched little bacteria. See? Let’s get rid of a whole lot of them. Zip. Burn them up. And this is not unrelated, you see, to this feeling of the individual as someone who doesn’t matter at all. Which can be the reaction against the philosophy of life in which an individual matter too much in the wrong way. In the Christian tradition, we have made the individual matter too much in the wrong way. That is to say, you as an ego are infinitely precious. God has made each one of you separately and each one of you as a separate ego will last forever. And therefore you are all-important in the eyes of God. But you better know your place, baby, because you’re subjects of the King. On the other hand, the other way of looking at the individual as an incarnation of the divine, as God him- or her- or itself, coming on at God everywhere. Did you realize how fascinating that is? That if you were God, would it be fascinating to see myriads, to know yourself in terms of myriads of reproductions of yourself all different. And really different. Like other peoples need to be different from you. And they’ve got a secret in them, you don’t know what they’re going to do next, you see? So they are ALIVE. If I push you and you just go “blargh”, I say “It’s only plastic.” If you jump a little, I say “Ah, that’s someone else! I don’t know what she’s going to do next!’ That’s what I’m looking for that’s what we’re all looking for in personal relationships. And that’s, you see, you can imagine. If you simplified. Here is a kind of ball of light, which is the Divine Being. But it’s fascinating, you see, it’s fascinated with itself. And so, in order to find out its own possibilities, “Bliblip”, it puts another one out there and they bounce together, and “Flop”, there comes another, you see? And they go all over the place and so you get this idea of ever so many echoes of one sound and they’re all chattering back but they’re not just plain uniform, you see. As soon you introduce into this the element of differentiation, so that each one looks as different as possible from the other. But it’s all one. Because there can’t be the sense of I am I, without the sense of “ Oh, there is someone else.” Something else, there is other. I And other imply each other as much as solid implies space. Well, we we will have an intermission. Last night I began by revealing two possible concepts of the nature of

space. One that it is simply an abstraction and projected upon the physical world in rather the same way that we project measurements. Lines of latitude and longitude or the cutting-up of another abstraction called time into divisions like hours, minutes and seconds. Which are there only on the dial of the clock. The earth in its rotation doesn't tick. And time is of course seen thus, simply a measure of change, of the rate of change as between two changing processes. The changing process of the clock and the changing process of, say, a person's running around. It is out of that relationship, in other words, that you get a concept of time. And similarly through being able to measure distances in a similar way you get a concept of space. You see this is one point of view, that it's the an abstraction because force would be lent to this point of view by the fact that space itself isn't really there. Space is there just as absence and you must be very careful not, as Whitehead would have said, to reify, that is to make a thing out of something that is isn't there at all. Like saying have an absinth. Oh boy. Gary Snyder invented a corporation. It was called "the null and void guarantee and Trust Company". And its slogan was "register your absence with us." And so I had some business cards made up for him. Which put at the bottom "Gary Snyder, non-representative". But this is of course Zen humor. Because Zen people are always joking about things not really being there at all. The the general feeling of this being nobody at all, as distinct from being important and somebody, has a kind of inverse human to it. One becomes a sort of bag of wind and there's something about that. The Zen masters call each other wind bags and rice bags and things like that. Because the whole idea of taking nothingness for real is somehow funny. The other point of view, that I was trying to contrast with this, was rather different. And that is that just because they are so imponderable and so un-get-at-able, space is you. Space is your consciousness. And your consciousness is not something located in your head, although your head is a way in which it's focused. And therefore consciousness can be altered by a surgeon putting instruments into the brain. But the full range of consciousness, or the full range of the mind, is the entirety of space as the continuum in which the universe exists in rather much the same way as images exist in a mirror. Only here, there seems to be no solid mirror. There is an infinitely permeable continuum of space. In a Chinese text called the Tanjing or the Platform Sutra, attributed to the sixth patriarch of Zen

Buddhism Huineng. He has the passage where he says that the mind. is like the emptiness of space.

Now he says if you want to realize this don't exclude everything from your mind, because if your mind is like space, space contains the earth and the stars and the sun the moon and the mountains and forests good men and bad men, enlightened men and man and unenlightened men, everything is in it. And so if a person wants to attain an understanding of the mind merely by emptying his mind, he's making his mind small instead of a great. So. You cannot therefore separate space from what it contains. Because without the content there is no container. Without the container no content. And when you see that kind of relationship. When you seem two apparently very different things going together inseparably, always find them together, you can smell a rat. For example, nobody has seen any stuff that had no shape. And nobody has ever seen a shape that had no stuff. There is a suspicion here then that stuff and shape are the same. And likewise, improbable as it may seem, you can realize that space and solid are the same. Only they are, as it were, the same energy, showing itself under two different aspects to a being who always must see things two sidedly, which is man. Man is symmetrical, almost, you see, right down this dividing line. Two sides to his brain, two eyes, two nostrils, a symmetrical mouth, two arms, two nipples, hips, legs, you see, all balancing except the heart is a little bit over to one side. But here he is, you see, this two-wayed thing. Man is like a Rorschach blot. He's some mess that was squeezed, folded and then you unfold it, and by Jove it's symmetrical. And it's a very strange thing about that, you could make order out of almost any mess by symmetrising it. In various ways, you know, there's a gadget called a telidoscope, which is a marriage between a kaleidoscope and a telescope. And you can look at things through it and because it's got mirrors inside of the forty five degree angle, they will balance the reflection in a circle, which is very elegant. And the more messy that you think you look at, the more interesting it is with the teleidoscope. Because it is through this balancing process of some sort of symmetry that order comes about. Repetition. Regularity. So the human being, being thus two sided, is always wanting to ask "Is you is or is you ain't?", "Is it this or is it that?" Answer yes or no. True or false. Black or White. And has very different great difficulties, the more simple minded the person is the more difficulty they have in using their conscious attention to

do anything but estimate these very simple contrasts between the good guys and bad guys. Are you man or a woman? There can be no doubt, there maybe nothing vaguely in between, no grays, no way no washes. Because a simple mind wants this great precision, which of course you can't have. But as poles, you see, one of the greatest dualities in the world is the duality of something and nothing. Of being and nonbeing. and of course in our thinking the solid world represents existence and the space world represents nonexistence. The conquest of space, therefore, will be the conquest of nonexistent, perhaps. See, this is the great attempt to survive by being able to leave this increasingly plundered planet go somewhere else and plunder that. That's the difference between mining and farming. Hunting and farming, too. Well. So there's this great contrast. Of reality considered a what's in the space. That's what's there. And the space is simply what's not there but you can't make it that simple because you only got to think about one step to realize that you can't have the recognition, or perhaps even the existence of what is there. Unless there is also what is not. In other words. I wouldn't be able to see you as moving human entities if you were all densely packed. In some sort of material medium like, say, jello, or milk or whatever because then there would be no intervals between you to bring you out. You see.

Now actually, space must in this connection for a moment be considered from the point of view of optics. The eye is receptive to a certain spectrum of vibrations of light. And therefore, where such vibrations are not being transmitted, the nerve ends are not stimulated and therefore don't report. And that failure to report is space. We call it darkness. Where there is no visible light. But actually there is nowhere in the universe where there is not some kind of vibration going on. So that if you had instrument that responded to it, you would see that space was full of impulses. And if you saw it all, you wouldn't be able to make out the individual outlines which require these nonbeing intervals in order that their being can be realized. That is to say outlined, distinguished, delineated. Discriminated. So to see the outline of the being, you must have the intervening space of the nonbeing. But nonbeing means simply in this connection the lack of stimulation of whatever perceptive or perceiving instrument you are using. Now for example, when you print a book, we say: there is empty paper underneath the print. But of course it isn't nothing under the print. It's

nothing so far as print is concerned, but something very much so far as white paper is concerned. Now, do you see, in the same way, perhaps it isn't nothing in which we are living in moving. It's only nothing so far as our visible shapes of concern. But you could say this: that space is a something of a quite different order than ordinary something. Ordinary something being the things and events which we say occupies space. As does the print occupies the paper. But the philosophers, especially modern philosophers have a great deal of trouble thinking about this. And the reason is that they are too one sided in the kind of instruments they use for understanding the world. And the instrument they use principally is words and thought.e thought. Now, they have just as much trouble in thinking about the universe in terms of their words and thoughts and logical categories as you would have in a printed book, writing some words down, which pointed directly to the paper underneath them. Supposing I say: there is paper underneath every word on this page.

Now, The Philosopher, the type of logical positivist person who dominates American and British academic philosophy today. He would think that could only mean something if I wrote the sentence "there is paper under every word on this page" and then under each one of those words I wrote the word Paper Paper Paper Paper. Then he would say "yes that's true." But you see, that isn't the way it is. The difficulty is, you see, there is an incongruence in between the print and the paper. If we can stand outside that because we are diverse enough to realize, that print is one process and paper is another and they can be put together. But if you are immersed in the print you can't see the paper. And so if you're immersed in the kind of consciousness which simply discriminates things, you cannot realize the background. That is to say then, you cannot realize the nature of space, when you use only your analytical consciousness. The consciousness which looks at things bit by bit by bit by bit by nit, which I call the spotlight consciousness. If you use that alone then you can't think anything about the continuum, the ground in which all this flourishes. But you may then go on to make a mistake. If you're not following me correctly. And this is the mistake of course that these kind of philosophers fall into. If I say now underneath all distinct things, space constitutes the ground in which they live and move and have their being, this is not quite correct. Because, if I speak of space in that way, it makes it just another thing of the same kind

and nature as all the things it contains. If, in other words, I can think about space, and I can only think about it by analogy, by likening it to paper, to a mirror, to a basis, a background... Well, if I can think about it that makes it a think, which is to say a thing. All things are thinks. They're as much of life as you can catch hold of in one thought. That means a think. So likewise in German. Denken, to think, Ding, thing. In Latin, reor, to think, res, thing. So if I make space into a think, I've somehow missed it. That's why we have to say it's a no think. Why they in Buddhism it is said "the real nature of mind is no mind". And you realize this in daily life by the fact that when you see clearly, you see everything except your eyes. Except if there's something wrong with your eyes and you see spots in front, you know, that interferes with seeing. If you hear clearly, you don't hear your ears. But if you have trouble, you get buzzing in your ears. The same way if you're very healthy, physically, you hardly notice your body. Except as a kind of blissful vagueness, which is exhilarating. And if your clothes are comfortable, you don't notice them. So this is connected with the nature of a beautifully functioning mind. That it doesn't get its own way. It doesn't think itself. If it thinks itself, it gets in its own way because it's a no think. No thinks is the background for thinks.

So that's why every attempt to conceptualize the ground of being, whether it's space or God, is an idolatrous, and that's why sages of all was condemned idolatry. To understand the nature of the the ground of being correctly, you must not have an image of it. Now, we don't need to be compulsive about that. Compulsive iconoclasm is a terrible thing. The Islamic people suffered from it from time to time, and when they got to India they knocked down all the Buddhas and beautiful images and banged off their noses. And the Puritans did the same sort of thing to Roman Catholic and Anglican Churches in England. They hated images. That meant, you see, they were terribly attached to them. They hadn't there was still hung up by the images and therefore had to smash them. Either way, if you say: you must not, like as it is in very strict orthodox Islamic culture, you must not make any image of any living creature. And so their art, very interestingly, one must admit, went off into abstract patterning. But what one is saying here is not that it is somehow just wrong to make an image. The point is much deeper than that. It is this. That in order to realize in order to experience the ground of being, you need to be free from images.

That is to say, you need to suspend the activity called thinking. Now most people imagine that if they stop thinking, that's what's sort of the end. The life of the mind instantly curls up and dies. But this isn't the case, because there's a lot more to the mind than thinking. There is this direct apprehension of the world, unmediated through core concepts or thoughts. And that's the kind of apprehension of the world you need to understand space. It's interesting how to some extent this sort of thing enters even into the sciences. Because scientists operate with certain, shall we say, it's hard to say concept, with certain tools that are not concepts, really. We always feel about a concept that you have to know what it is. But for example the basis of algebra is operating with patterns and you don't know what they are. They're called unknowns, X. That is the unknown. You can say X plus Y equals Y plus X. And you made a perfectly clear statement. But you don't have to know what X is or what Y is. Could mean anything at all. So in the same way in in modern geometry, You don't define what you mean by a point. They've abandoned as a sort of a nonsense definition. Euclid's idea that a point is that which has position but no magnitude. You mean it has position. What has position? And so now, a point, everybody knows what a point is. But you don't explain it. Because, you see, there must be a starting point in anything that anybody does and anything they think about, in any system of ideas, any conception of the good life, where you don't explain it. Because everybody knows what it is. And yet, when you ask them about it, they don't. And you see, we get time and space. If you turn back on your starting point and say I will not go anywhere. I will not proceed with my geometry, with my investigation, with my business plans, until I am quite sure of my starting point. You will never begin. Because you can go back into your starting point forever. And that's manifests itself in people, who, for example have certain kinds of hypochondria. Their starting point is the body. "My goodness. Ought I to go out? Would I catch cold? Would I get into an accident? Should I go to a foreign country? Would I get the great Siberian itch, or heebie jeebies, or trots or whatever. So, always worrying about the starting point forever. Now are you quite sure that your premises are right? it's always good to look at your premises. But you can very quickly come to the conclusion that if you don't have some premises, you won't go anywhere at all. So as a general once said: A poor plan of attack carried out with zest and determination is much better than an excellent plan carried out in a wobbling way. So in this way, for

example, in Japan I have no idea really about talking Japanese. I know lots of words and no grammar. Therefore I have no compunction whatsoever about talking because I know it's mistakes all over the place. And if I were nervous about it, as they get nervous about talking English, because they do desperately want to be correct, I have absolutely no desire to be correct. Because I know that in my whole lifetime, I will never be able to speak correct Japanese. So I just plunge in and I get understood. That's the way you have to do it in life. You muddle through. So if you keep turning back, you see, on the initial beginning point and trying to be sure of it, nothing will ever happen. So then, whatever is the point, whatever is the ground that we are and that we take our stand upon, appears to ourselves space. As not being there. To give us transparency. You see, if God were visible, nobody could see anything but God. It would blot out everything else, but by virtue of becoming invisible, the world is created. Because God gets out of the way, so that the world can appear. And the world is a selection, as I explained, the eyes select what they see, because they are only noticing what goes on in a certain spectrum of light. If you could change the eyes' spectrum altogether, you would see a different world of creatures. Flip, flip, flip, you could have to thing like a radio tuner, going from performance to performance, all on different bands of a spectrum. To see them all at once though, would be for our kind of intellect like taking your hands like this across the piano and going slap. See you just go to the chaos of sound. So that there being realized objects in space is partly dependent upon our using an attentive and selective type of consciousness. You see they're the same thing? If you have a selective consciousness you have a selective world. So putting down the five fingers on the piano, instead of the full, flat arm, selects a certain pattern of sound. And you can say it's a chord, it's a melody and so on. So when the Angels play their harps in heaven, they are selecting. They're the fingers of God selecting what kind of patterns are appearing in the world, you see, that's really what that image is about. So then to see this, you go back to no thinking. The suspension of thought is, for modern man in particular, a tremendously important undertaking. When in about 1921, the Ludwig Wittgenstein published a book called the tractatus logico philosophicus, it was the end of Western philosophy. Because where he finished, he said, you know, philosophy is really a method for getting rid of meaningless concepts. And. So he practically got rid of all metaphysical concepts and ended up by saying "whereof one

cannot speak of that one should be silent". And this was the great moment for philosophy departments all over the western world to lapse into silence. And practice meditation. But instead, they had to go on talking. Because they couldn't prove that they were an academic discipline unless they did some talking and a specialist in publishing.

So they began then to chatter nauseatingly about trivialities. They became grim grammarians. Mathematical logicians and things and everybody forgot about philosophy because it got so dull. It wasn't expressing any more man's fascination and wonder at the improbable situation of living in the universe. So. But fortunately things are at last getting through to people. And you would not be entirely laughed out of court in academic surroundings today if you suggested that some non-verbal research be carried on. You would have to put it rather carefully. You would have to refrain from calling it yoga or Buddhism or meditation, but it would be the sort of research in non-verbal sensory awareness or something, you know, something out of academic gobbledygook. But it's coming. And this presents problems to people who are compulsive thinkers. Because when they try to reach this completely non-verbal level, they think about doing it. They think I'm trying to reach the nonverbal level, I'm trying to empty my mind of thoughts, I'm trying to think not thinking. And you feel so sorry for those people. But it is an awful problem if you have it. And to get rid of it, then, one uses gimmicks. One uses methods of absorbing the individual in non-conceptual experiences. Such as, you can play a single loud musical tone. And get that going and it really shatters thinking. It has you, just, turns you into this, your whole body becomes this one tone. And you get the person concentrated on that one point to see it go go go go and zip, you cut it off. Then where are you? Haven't had time to collect your thoughts. You are blown by this tone. And all those techniques that are used in yoga when they chant, when they do some kind of physical exercises, when they have a nonsense proposition like Koan, to concentrate on: all these things work in the same essential way. To suspend the analytical thinking. To suspend the spotlight mind for a while. So that you get back to what is called original mind, where you act without thinking. That's why in the whole interchange between a Zen teacher and his students. The Zen teacher is constantly challenging, challenging the student to respond intelligently to a given situation without thinking, without stopping to think. Just as in, say, using

Judo, you mustn't stop to think, you're lost if you do. You must learn to respond without thinking. So creative skill in so many things depends upon the opposite of thinking, when you examine what people say, what inventors say, what artists say, what mathematicians say about the discovery of new ideas, very few of them arrived at those ideas by a purely thought, thinking, verbal or numerical process. And the reason is of course that the structures which we have arrived at and we do understand by analytical thinking. Once you see them they tend to stay put. They become habits. And there's nothing more difficult to cure in an individual than a habit of thought. You know, I've argued for hours and hours and hours sometimes with people who simply can't understand knowing without a knower. Because they are so trapped by sentence structure. The verb has to have that subject. Therefore you can have a state of affairs in which there is just the verb, that is to say knowing. They say, well who is who is knowing. And it's as bad as arguing with a flat earthist or a Jehovah's witness. Impossible. Because of the ruts of thought and such a person can never be inventive. Why? Because he will never see a new pattern a new structure. And he won't see one, because he's thinking all the time. He's not open to the variations of the actual world. And so, he can only see what he's been taught to see. That's why academic psychology is always in a position of bafflement about learning theory. Because if learning is a process of converting new experience into the terms of what you've already learned, you never really learned all. It's like according to kind of a narrow minded aerodynamics, Bees cannot fly. There is no way of explaining the aerodynamics of that vibration. But it flies. And you often come up against this when an inventor has an idea and all his colleagues say to him: "Oh don't be silly, you can't do that, it just wouldn't work." Well, he says "I've tried it and it does work." Well, they say, "Come on." And very often they won't even try. They'll just say it can't be done. You can get them fantastic dogmatism in the scientific world. And you have to be terribly careful not to upset certain absolutely fundamental, strictly prejudices, which are the result of thinking too much. And of getting accustomed to the warm ruts of thought. And so you never could see the new. So this is the real meaning of an open mind. Not merely that you're a liberal sort of guy, but that you can turn off thought. And thus be turned on to reality. THoughts, you see, belong to the world of symbols. What we experience with our senses is of course the physical world, the real world. You may ask me: "Well isn't

there also a spiritual world?" But you must understand that the spiritual world is the same thing as the physical, when the physical is not confused with the symbolic. There is no real difference between the spiritual and the physical. It's all one energy. All in one space. Now, you see though, the difficulty is, that in saying something like "It's all one energy", this is the really the point, I mean if you understand that this whole universe is one energy and you're it, you don't really have any much in the way of further problems. I mean you have some few practical problems like how to make a good table or a beautiful dress or whatever it is that you're after. But you don't have any more metaphysical problems when you see that. But a person who thinks a lot can't understand that at all because he says well it doesn't make any difference. If everything is all one energy, let's begin again. I mean, what have you said? Of course we haven't said anything. Logically, the statement is pure nonsense. Everything is one energy. So What? But that's only because the person who has received this communication has had it only as a thought. And as a thought it's again like saying: there is paper under every word on this page. And thinking that that means that "paper, paper, paper, paper, paper". But when this is something that emerges from not thinking, and when you see that you've been bamboozled. All your life long you've been bugged by everybody else into thinking that you are some kind of a freak that came into this world. And you don't really belong here because all you are, probably your parents didn't really want you, and that your brothers, older brothers and sisters didn't want you around, you were eating up more and in school they tell you, you know, you've got to learn that you're not the only pebble on the beach and that therefore the best way of teaching you that is that you're really rather insufferable around here and you're on probation until you are acceptable. Well, babies, they will grow up, you see, with this treatment, feeling strangers. Feeling that the earth is something alien. And so we all have this feeling of being alone. Of being impotent little puppets of a huge system going on. And so we are progressively fooled out of, really, with our own cooperation, fooled out of this sense that you can get if you suspend all these identifications that that one does with the thinking process. This is this, this is that, I'm me, what's me is different from so on. You suspend that. And you see not simply that all those problems and all those definitions of who you are aren't real. There's something else, you see, there is the feeling, beyond having dissipated the illusion, of the sheer joy

and delight of this one energy now realizing itself as you. And how nice that it won't always be doing that, because that would get boring. You'll go "Bliblip", like this you see? And it will be a different situation altogether. You know, you'll run into a brick wall and "Bliblip", before you know where you are, you're going "peep, peep" out of an eggshell. The whole thing is flipped and you're doing it on another track. But there's only one you, you see. It's all the one energy. But this is, as I say, difficult to understand logically if you don't understand it experimentally. If you understand it experimentally, it's perfectly clear when somebody says everything is one energy. Of course. But the person who's stuck with the concepts and has nothing more than the concept simply can't make any sense of it at all. And he says, well you're suffering from a hallucination. And will proceed to prove, according to his ideas, that what you've achieved in that has made no difference to you or do anything else. And of course he can prove it. Because his proof is set up to give just that result. Well then. I got into that at some length, the question of no thinking. Because of trying to point out how one must avoid trying to understand space in such a way as to make it a thing. Like a box, you see, which contains all the objects in it. But a no-thing like space is at the same time in cahoots with things. They're two aspects, two poles, two terms of the same energy. Don't make space at the same pole of the one energy as the things, it's the opposite pole. It is then, because of our treatment of space as nothing, you see, that we are afraid of death. We are afraid of that pole of experience, which is one consciousness. That corresponds to space, surrounding the world. And because we think that reality, that our life, that our identity is entirely in the domain of consciousness and thingness and thinkableness the other pole seems completely threatening whereas of cost it is that on which it all depends. Because the two poles depend on each other. They energize each other.

So when you are scared of the nonbeing side of things, you are, as it were, frightened of your own mother. Now of course you may have reason to be, because there are such things as devouring mothers. But the devouring mother represent the original horror felt for the unknown. And in practice in human relationships the devouring type of mother is that precisely the person who cannot come to terms with her own unknown. Therefore she wants to control everything. She wants to see that all the children remain

perpetually under her dominance. Because she can't let go. Because if she let go, you know, she would become un-corseted and flop all over the place as it were. She becomes the devourer. But you always conquer the devourer by dropping into it. By faith, in other words. Faith in the sense of trust, I don't mean belief. Trust. Drop into space and you float. See, this is only begins to be understood by rocket people as they get out there. And we're going to have, I don't know how the psychology of this is proceeding, but we're going to have an awful lot of people getting out in space and not wanting to come back. Because when you're in orbit, then you float. Very interesting sensation. And they have to follow very strict rules. The same way will you do with the skin diving. When you get to a certain level of pressure, you start floating and you feel no body weight. And you have to absolutely keep your will going. When the watch says a certain thing, up you'll go. Orders is orders, see? otherwise you'll drown. In great delight and bliss. So. The point is though that we are at the moment looking at space as something to be entered by the tremendous thrust of a rocket. Because that is the attitude of attacking the unknown. And that causes us not to realize that we are already on the most magnificently equipped spaceship. Which could hardly be improved upon. It just got a source of temperature and energy just at the right distance from it. It is beautifully equipped with oxygen, with food supplies, with all kinds of delightful things to do while on the journey. And it's traveling through the space at a colossal speed. And it's called a planet earth. The art of exploring from the planet earth depends not on conquering space with rockets and bombs. But on developing greater sensitivity in the place where we are. Lao Tze said "without going out of my house, I know the whole universe". Clumsy beginnings of this sensitivity are seen in radio astronomy. Which instead of trying to leap out of the world, it stays here and gets more sensitive. And eventually, I feel, that we should discover each one of us have inside our heads a radio astronomical contraption of great subtlety. And we shall eventually, the more we use instruments, we shall begin to watch a process which I will call etherealization. What a present we call miniaturization is connected with this. Miniaturization means that electronic equipment becomes smaller and smaller and smaller until what was originally a great box like this becomes a tiny, tiny little thing. Little tiny cell. And so in the same way, as certain techniques advance, all kinds of joining lines like wires begin to vanish. See, when radio substitutes for the telephone, all the

wires vanish. When the airplane substitutes for road and railway, all the roads and rails are going to vanish, See. And more and more we'll find means of getting rid of the clumsiness of primitive technology. And then as all this apparatus disappears, we find that we are moving in the direction of having it all in our own operatus. Just like Dolphins have sonar, homing pigeons have built-in radar, I think it's all in us but we had to exteriorize it technologically in order to discover it within.

It's curious, how, past the middle of the twentieth century, there's a very strong evidence of a revival in western philosophy, of what used to be called idealism. Not in the moral sense, but in the metaphysical sense. That is to say, of the feeling that the external world is in some way a creation of the mind. Only we come to this point of view with very different assumptions than were held by people like Hegel or Berkeley or Radley, the great idealists of European metaphysical tradition. And probably rather more akin to similar trends in Buddhist philosophy emerging from India about 400 A.D. The difference of approach, the difference of the way in which today this thing arises and the way in which it arose in the thought of a man like Bishop Berkeley is that the new idealism has a kind of curiously physical basis. When one would argue: everything you know is in your mind. And the distance, the feeling of externality between you and other objects and people is also the content of consciousness. And therefore it's all your consciousness. This of course created all sorts of weird feelings. Are things there when I'm not witnessing them? Or, is there anybody else there? Or are you all my personal dream? And one has only to imagine a conference of such people of solipsists, those who believe that they alone exist, arguing as to which one of them is really there to make the whole idea rather laughable. And furthermore there seem to be no clarity in such philosophical thinking as to what the mind or consciousness meant. It had long associations with the miasmatic and the gaseous by way of images. Mind and Soul and Spirit were always vague and formless. And matter, by contrast, was very rugged. Craggly. And how these two ever influenced each other, nobody ever could decide. Because all properly behaved ghosts walk straight through brick walls without disturbing either the bricks or the ghost. And so, how can a mind incarnate in a material body move that body in any way? This was always a puzzle.

So people began to think that the differentiation between mind and matter was of no use. Because actually what happens in making such a differentiation, is that you impoverish both sides of it. When you try to think of matter as mindless, or mind as immaterial, you get a kind of a mess on both sides. It's the same way when you get a mystic who is not a bit of a sensualist, and a sensualist who has no whit of a mystic. Such a sensualist is boring, such a mystic is a fanatic. To spiritual. It's the same. When we divide the medical profession from the priesthood, both are loses. Not just because they lose their so-called opposite half. But the problem is, when you separate a doctor from a priest, you do more than create a specialization out of what was originally one field, to create two specializations. Because a priest-physician is more than a priest plus a physician. By having, as it were, the binocular vision from medicine and from religion, he just doesn't see two added areas. He sees the area in three dimensions as a result of this combination. Well in a similar way, when we have the concepts of mind and matter working separately, both are impoverished. Mind becomes vague kind of gas, psychic gas. And matter becomes mere stuff. But, you see, what has enabled us to make a transition is, first of all, above all I would say, two sciences. Biology and neurology. Because through biology, and to some extent physics, the method of physics has shown us, that the idea, that man can be an objective observer of an external world, that is not himself, so that, as it were, he can stand back from it and look at it and say what is out there, we see that this cannot be done. We can approximately do it. But we cannot really and fully do it for two reasons. One, the most important reason is that the biologist will show us very clearly that there is no way of definitively separating a human organism from its external environment. The two are a single field of behavior. And then, furthermore, to observe something, either simply by looking at it, or more so by making experiment, by doing science on it, you alter what you're looking at. You cannot carry out an observation without in some way interfering with what you observe. It is this that we try when we're watching, say, the habits of birds. To be sure that the birds don't notice us that we're watching. To watch something it must not know you are looking. And of course what you ultimately want to do is to be able to watch yourself without knowing that you're looking. Then you can really catch yourself. Not on your best behavior. And see yourself as you really are. But this can never be done. And likewise the physicist cannot simultaneously establish the position and the velocity of

very minute particles or wavicles. And this is in part because the experiment of observing nuclear behavior alters and affects what you're looking at. This is one side of it. The inseparability of man and his world. Which deflates the myth of the object of observer standing aside and observing a world that is merely mechanical, a thing that operates like a machine out there. The second is from the science of neurology. Where we understand so clearly now, that the kind of world we see is relative to the structure of the sense organ. That, in other words, what we used to be called the qualities of the external world, it's qualities of weight or color, texture and so on, are possessed by it only in relation to a perceiving organism. The very structure of our optical system confers light and color upon outside energy. And in this sense then, especially if you want to read a very easily digestible account of this thing you get the book by J.Z. Young called "doubt and certainty in science". But you see, here from a new basis altogether we have a new answer to the old riddle, if a tree falls in the forest when nobody is listening, does it make a noise? The answer in terms of modern science is perfectly clear. That the falling tree creates vibrations in the air. And these become noise if and only if they relate to an eardrum and to an auditory nervous system. Just as in ordinary drum, however hard you hit, the drum will make no sound if it has no skin. Because sound is not something that exists in the external world. Sound is a relationship between vibrating air and certain kinds of biological organisms. And therefore it is these organisms which confer what we call sound upon a vibration, which in an earless world would make no noise. Now you see, that is perfectly clear and straightforward. But now dare we take certain steps from that? Could we say for example that before any organisms existed, there was no world. And what we're talking about when we talk about a world prior to the existence of organisms is what is called an extrapolation. Let me explain extrapolation for a moment. Supposing you have a map of Kansas. And you want from the evidence contained in the map to guess at what kind of territory lies beyond its edges. Well naturally you will extend those straight line roads off and off and off, that's the only basis you've got to go on. Nothing in the map of Kansas would warn you that a little way west you will encounter the Rocky Mountains and the roads will have to wiggle. And still less will warn you that you're going to encounter the Pacific Ocean way out beyond, where you can't build any roads. So naturally you see, we extrapolate from what we know to the unknown. And so one might say

then, is the existence of a universe before there were any living organism an extrapolation? All we are saying is, this is how things would have been if we had been around. But we weren't so it wasn't. That is a possible argument, although in the climate of opinion today it is one that is not fashionable. You must watch out above all for fashion in philosophy. Fashion in science. There are completely irrational functions that govern what is or what is not a respectable scientific opinion. And although there is very careful work done, very valuable and thoughtful experimentation, always in the background of this work there are these irrational fashions of what is believable and what is not. Many things that we accept today were completely unbelievable. We are always coming across this. Authoritative pronouncements that no one will ever reach the moon because of incontrovertible evidence about this that and the other. But nowadays we have swung over perhaps to being a little bit too uncritical. And as Norbert Wiener warned in his book "the human use of human beings", we must not take science as a sort of fairy godmother, and say, well we have all these problems of overpopulation and lack of water and so on but science will solve it, don't worry. See, that's the other extreme. But there are these fashions. And so the idea that the world is in some way, you see, therefore. The one moment you let this little idealism thing in under the door, and I remind you, I'm using idealism not in a moral sense but in a metaphysical sense, as opposed to some sort of materialism. Now, the moment you let that in under the door, if I can possibly realize that the way the world is, is evoked by the structure of my organism, it is that way. All mountains and suns and moons and stars are the inhabitants of a strictly human world. Perhaps insects with their different sense organs have a very different universe and that is an insect universe. This is again, it seems, to be a recrudescence of what used to be called the prophetic fallacy. Which was the attribution of human qualities and emotions to natural phenomena. The wind sighs in the trees. My heart is sad. And somebody comes along and says: "It isn't the wind that sighing, it's you." True and not true. Because you wouldn't be able to sigh if there were no wind. And you sighing and wind blowing go with each other. I've invented this new word, gowith, G O W I T H, or goes with. It is to replace the idea of causality. Certain things go with each other and sighing wind goes-with a sane world in which there are human hearts and human emotions.. And if there were not a world with human hearts and emotions there would be no wind and if there were no

wind there would be no human hearts and emotions. It's a transaction, it's reciprocity. So in the same way every event, then, in the external world is dependent on the observer for its happening. As for example is a rainbow. You can say: The sun is shining. And there's moisture in the atmosphere. And the sun being at the right angle to the moisture makes a rainbow. And if somebody is there they see the rainbow. That is a mythology, a way of putting things that is acceptable to us in the current climate of philosophical and scientific fashion.

But I want to put it in another way. The sun is shining and there is a person standing. If there were moisture in the atmosphere, there would be a rainbow but there is. So there is no rainbow. If you want to be fair there is no rainbow if nobody is watching it, you see? Because you must have one of the three components sun, moisture, observer to have the thing called rainbow. And what applies to the tenuous, filmy, luminescent rainbow, applies equally well to the hardest rocks, the solidest mountains and the hottest fires. Because all existence is a relationship. It's like the skin of the drum. If it's not there, no amount of hitting a nonexistent skin will produce any noise. So you see energy, we can see this, energy is relationship. We can see the falling fist on the skin of the drum. Boing, like that. And if there isn't both the falling fist and the skin: no noise, no existence. But existence is not only the impact of rocks on each other. Existence requires always as its third, you can get the rocks knocking, the sun and the moisture, the tree crashing to the ground, the sun pouring out electrical energy. But none of these things constitute existence until related with. The neurological complex. But then you have to look backwards, and say at the same time: the neurological complex belongs to the same world as the sun. It's a physical pattern, physical behavior, physical energy. But it takes this complexity of pattern to evoke the world. You see, this idea is unfamiliar and that's the difficulty of understanding it, that's all. It's a very simple idea, but it's an unfamiliar one and it's an unfashionable one. Although as I say, this sort of thinking is coming back to us at this time. Very largely as result of people's experiments with psychedelics. Where one gets the perfectly uncanny feeling of the world and oneself as simply two phases of a single process. Well, as the rainbow metaphor illustrated, we arbitrarily favor an explanation of the triangle. The impact of energies in the external world and an observer of this impact, which, as it were, energizes all

realizes, makes them real. The difficulty that we have in our prejudice, that it's the two forces out there that are real, and the observer is irrelevant to the reality of the situation. It's what we're really saying. Goes back to the whole notion that man himself is irrelevant. Man is conceived as something, therefore, that is irrelevant in various ways. He could be said to be irrelevant because he is a spiritual visitor from another world altogether. He could be said to be irrelevant because he's unimportant. He makes very little difference to the total universe. He's very small. But when you get this kind of thinking, you want to go back and ask: "Why do people want to believe that man is irrelevant?" In all theory of this kind look for some sort of, well ask the question: "What do these people want to achieve by their theory, by holding this stance?" And it was fashionable in the nineteenth century to look upon man as irrelevant. For some very sound political reasons. I may sound a little bit like a Marxist in saying this, but it's when you're on the rampage, you have to believe either that you're the representative of God Almighty and doing everything at his bidding. Or that what you're doing isn't really very important. Either position will give you an alibi for behaving like a barbarian. So the great put-down on man, that our little affairs sort of no concern to God. Thank heaven he's not watching any more. Then we can get away with murder, which is what we wanted to do. In the colonization doings, especially of the nineteenth century, and the outrages of the two world wars, there is no God watching anymore. You know, the teacher is gone out, boys let's raise hell. That was a way of getting rid of teacher. You know, God is dead, let's have a drink. And as a result of this, you see, it became so fashionable to think of man as merely unimportant. Little victim of the cosmic trap. That, for a while, Western man lost his sense of the dependence of the, well what the Hebrews used to call, he lost his sense of man's position as the head of nature. And when you hear today, people's comments on that old myth, that man is the head of nature. They come back in a very funny way. They say "Oh that's the most conceited point of view. Man is part of nature." Yes, but why is it that the naturalists, who think that man is part of nature, are always fighting nature. Because they don't understand what it means to be the head of nature. Every creature is the head of nature in its turn. And we all take turns because it's taking turns that makes the world go round. Every creature in its turn is the head of nature, because each creature creates the world in its own image. And so each creature, as a creator of the world, is man. Man

simply means the middle position. This is the whole idea of man. The middle. The middle way. The mean. And so. Wherever is the central point that is the point called man, just as you are the center of your universe. And as the astrologers explained, that when you wanted to draw the map of the soul you took the center point occupied by the individual organism. In other words the date and the time, and that gave you a latitude and longitude. And so in relation to that date and time, how was the universe arranged, shows the map of the individual soul. Because the individual is the whole universe considered from this point of view. Or focused at this point of view. So in like way, the cosmic situation of a bee or a mouse, puts that mouse in the position of man when the mouse is considered the center of the universe. Now, every point in a curved space-time continuum is the center of the universe. You can see it, although this is only a metaphor and is not quite the right mathematical and physical description. But when you consider the surface of a ball of a sphere, any point on that surface can be the center. Just rotate it to what appears to be the front as you look at it and it's the center of the surface of the sphere. Any point. So if our space is curved like the surface of the sphere, then any point on it may legitimately be considered the center. And so considered as the center, that is the point called Man. Although, as I say, it may be mouse, it may be ant, it maybe insect, anything. But this becomes inconceivable and unimaginable to individuals who have no experience of themselves as center. And people who insist on the idea of being an objective observer, of standing outside and watching the individual, the world as a kind of television screen or movie screen upon which there is a distant panorama of passing events. That person, by adopting that position, has excluded himself from the feeling of centrality. In fact he rather looks down on the feeling of centrality. He says that is the egotistic situation, you see. You are the center of everything. But, you know, you may call it all sorts of bad names, you may call it the egocentric predicament, but that's the way it is. And it's much less egocentric to accept it than to say well I'll go off and play my own eccentric game as an objectively observer, who is a sort of controller outside the world in that qualitative sense in which the monotheistic God is said to be outside the world. The boss.

So then, if you take this to a very far extent, see how far we can go with it. Is it, then, that in the measure, that you are the behavior of the universe, is

the universe the behavior of you? I was talking in the beginning, you see, about the ease of understanding one way of looking at this and the difficulty of understanding the other. Even though one implies the other. When we see, that the degree to which individual behavior is a factor of the whole environmental scene, we tend to try and understand that in terms of determinism. That the individual organism is helplessly pushed around by and responding to environmental forces. But on the other hand, if the relationship between the organism and its environment is transactional, it won't be that one sided. If the relationship is transactional, it will be true simultaneously, that the individual organism behaves in accordance with the environment and the environment behaves in accordance with the individual organism. So if we put that in startling practical terms. If you got into a mess, that was what you wanted. Well, you say "I didn't know I wanted it. I certainly didn't think I wanted it." No, because that will be true, you didn't want it, so long as you refer to yourself only in terms of the conscious spotlight which scans experience bit by bit, and which thinks about it. To the degree you identify your own functioning with that alone, then you will say of what happens, "Well I didn't ask for this. It has nothing to do with me, I wasn't responsible." But as soon as you extend your way of looking at things, and are not that myopic about it, you'll begin to see what is, I think, clumsily foreshadowed by Freud and Jung, especially Freud, in his idea of self-punitiveness, death wishes and all these things. Where he is trying to say of the functioning of the unconscious, that when you get into a catastrophe, you are accident-prone, because you want to punish yourself. Now, actually Groddeck is much better at this than Freud. Very few people know Groddeck. Groddeck really was behind lot of Freud's ideas, and he wrote a thing called "The Book of the it", "Das Buch vom Es" And in this he explains the most extraordinary theory of the unconscious. Which, he doesn't, like Freud, Freud basically didn't trust the unconscious. That's why he felt, that the reality principle was in irreconcilable conflict with the pleasure principle and that this conflict would destroy human civilization. Groddeck, who looked like a goblin, with enormous ears. A little man, really looked like a goblin. and he ran a Sanitarium at Baden-Baden, where people who came for massage got psychoanalysis and people who came for psychoanalysis got a massage.

Well he wrote this book in the form of letters from a goblin to a young girl. And it's the most, it's much more sexy than Freud. But through the whole thing he has this complete faith in the unconscious and its wisdom. And a friend to whom I once lent this book years ago said "After reading that I will never be afraid of getting sick again". Because he pointed out about all sickness, that sickness really not a disease, but a symptom of the the It, the unconscious trying to cure you. And therefore, just as one does not simply knock down a fever with quinine, because that would stop the work of the fever, so perhaps one should not knock down all sorts of diseases. Because for purposes which we do not as yet understand, the unconscious is using them for a constructive purpose. But now so you see. This was something Freud was fumbling after. The notion of an intelligence in us, greater than the intelligence of consciousness. And operating in an unconscious way. Note the choice of words. Why didn't he say super conscious? Because the climate of opinion at the time in which he was alive wanted to insist that everything below human conscious reason was stupid. That mere matter, up blind energy, had displaced God upon the throne of heaven. But it comes back, you see, with with Freud. That you cannot eliminate the unconscious as part of your essential operation, yourself. Because you are an inseparable part of the world, you cannot divvy up responsibility and say: "You should praise me for that, I should blame you for that. It's your fault!", "No, it wasn't, it's your fault." you know? All this is a perfectly silly argument. And if we think it dignifies human beings and gives them a sense of, and theologians are always talking a lot of nonsense about this kind of thing, they're saying that the dignity of man depends upon each individual assuming his responsibility. And as soon as they start doing this, nyanyana, it is, it is, it isn't, you know, and arranging who's to be clobbered, who's the fall guy who gets the blame for the situation. It's usually somebody who was just happen to be standing by when it happened. So. If then you understand that you are an integral, functioning part of this whole cosmos, what price do you pay for stopping this yak yak about your fault, my fault et cetera? The price you pay is, you have to admit your own complicity in the catastrophes that occur to you. You have to see, that everything that comes to you, is what went out of you. Everything that comes to you is a return to you of what went out of you. You asked for it. But it's not the conscious you that asked for it. Not the you that is just the

spotlight consciousness, because that's unconscious of most of the things that go on in you.

So you get a curious, fascinating picture of how things are operating underneath the surface. This is what's so valuable about studying some science. Take a very so-called simple science, like elementary botany. Or best of all a kind of elementary course in ecology. Plant, microbe, organism relationships. And what you see is this. You see a developing pattern in which everything that happens gets integrated into the whole thing that's going on. That what is from one point of view, say, the disease of a certain plant, is the method of reproduction are some other species. If we get, say, malaria from anopheles mosquitoes, that is because anopheles mosquitoes have an extraordinary reproduction cycle, that involves their being parasitic to us. Now if you take the anomalies point of view, it becomes man. You see? So that, as you study these systems, you see, what is going on is, we need a little bit this way. And then someone says "Oh no that's going too far!" And then they say, they pull it and it comes back, you see, and now a little bit this way. You get it going over here, and then they say "Oh no no no, that's too much, too much!" They feel a strain or something that said "too much" so there's constant adjustment going on. And if you would examine, for example, the sharp edge of a leaf. You put it down under a huge microscope and there's a churning, churning, churning, going along. And there are certain little elements, cells in that leaf, you see, that want to go weeee, way out there. And if they do, you know, the leaf is disintegrating into gas, and weee. But then some police come along, along that line and say "Hey get back inside. Keep in, keep in." and the other thing: "No, you're destroying our liberty. We want to go out." "Go on, get in!" And this whole thing, this clamor goes along the edge of the leaf. From our point of view it's a perfectly stable, clean edge. We're not looking closely enough. So our turmoil, our problems, our walls and calamities and atomic explosions mean, if the planet blows up, that's going to be like. Morganroth once showed me a great plant covered in green fly. They were succulent and fat and having a ball. Came by the next day, the whole thing was grey dust. They'd eaten up the plant and disintegrated. As a fact of nature around here we say thank heavens for that. These green flies just ate the wheat up and both of them were pests anyway. It works out in the balancing system of nature.

So we are doubtless in the same situation. And only we have a kind of blinkers on, whereby we only see half the picture. We get the end of it, that it can push us around, but we don't get the end of it, that being pushed around is what we asked for. We evoke it all by the very fact that we're here. Children don't think that they are responsible for being born. They blame their parents, not realizing, that they can't really separate themselves from their patterns, that in the measure that, for example, I have sexual desires, I can really understand my father's predicament. And I couldn't possibly blame him, because actually I was the evil gleam in his eye, when he approached my mother. You know, I asked for it. Now you can see in this, that your relationship to the world as being responsible for everything that happens to you, is not the same as an ordinary boss. Who would be a magician and say that all sorts of improbable things should happen. Rather it is this. If you think of yourself only as the consciousness then, if you get some ideas for me about being in control of everything that happens to you, you will act stupidly, as if you were the boss of the whole thing, like a kind of a lunatic thinking he's god. But if, on the other hand, you understand that your real self is the wisdom, that is expressed in the intelligent form of your organism, then you won't fall into the error of thinking your relationship to the world of being that of its governor.

This morning I want to talk about space in relation to what is ordinarily is called reincarnation. Because this is one of the most fascinating applications of the sense that space constitutes something significant. Now, the subject of reincarnation is one around which is ringed an incredible amount of hocus pocus. And yet there is something in it. And there seems to be something in it not mainly because there is a lot of alleged evidence for it in the form of stories of children who remember their former lives and so on. I want to approach the subject much in the way that Erwin Schrödinger, the physicist does. Because he has a view of this, that does not involve any hocus pocus at all. It is perfectly simple, and all the evidence for it is already before us. So it involves no claim to special insight [or] psychic knowledge, but merely to grasping a principle that is staring us in the face.

And this principle is difficult to understand, not because there's any inherent intellectual complexity to it. But simply because it requires getting across something that's just unfamiliar. There is obviously some sort of analogy, which I've already drawn your attention to, between space and

unconsciousness. Between stars, there is darkness. Between stars, there is not the energy, which constitutes a so-called body. In some modern physical theory, that is purely hypothetical not really tested, bodies in space are thought of as points at which space is intensified. But, at any rate, there are these gaps, these intervals. And obviously the unconscious state must appear always to the conscious state as a gap or interval. So when we go to sleep at night, we wake up in the morning almost instantly. In other words, there appears to have happened nothing except something quite vague between going to sleep and waking, unless you had dreams. And so, you can conceive, or barely conceive, going to sleep, but not waking up. Or the reverse of it, waking up without ever having gone to sleep. Which appears to be the nearest we can imagine to death and birth, respectively. To go to sleep and never wake up, when we die. When we were born, to wake up, but not to remember ever having gone to sleep. And of course, this bugs our imagination, because it's inconceivable in terms of consciousness. People are afraid. Some people are afraid, of the possibility of eternal annihilation. And I suppose one of the most eloquent expressions of that is John Betjeman's poem "Before the Anesthetic". Where he would prefer rather even the dismal hells than that this I should cease to be. And other people, perhaps of a more rational bent, say "well that's no problem". Because if you simply cease to be, there's nobody to be disturbed by it. You can't experience not being there forever. And what most people do is, they project upon the prospect of annihilation the imagination of being shut up in a dark prison. An, as it were, supersensory deprivation chamber, forever.

But of course, the notion of eternal annihilation really has no meaning. It is an attempt to conceive nothingness, non-experience, and so far as our imaginations are concerned, nature abhors a vacuum. We have to project something into that. Because psychologically, as well as logically, it is a void. However, you see, just as we've been discussing the notion that all creatures whatsoever, not to mention all people, feel themselves in the middle. They feel central to their experience. And being central to experience is the nearest thing I can conceive as a meaning for the word I. Not an ego, because that is a social structure, a social institution, which has been kind of implanted upon our psychological behavior. Upon, shall we say, experience. Because experience is the thing that we are taught. We are taught what experiences are permissible and what are not. Just in the same

way as we are taught what speech is permissible and what is not, and what gestures are permissible, what actions are permissible and what are not. So our experience is trained, and we are trained to experience ourselves as egos. But still, underneath the implantation of the ego experience, there is this sensation of centrality. You may feel that your center is isolated, as in the ego thing, or you may feel that your center is simply the center of a being, which is you, which extends to the ultimate limits. But in every case, there is the sense of centrality in every being that exists.

And therefore, every being is I just as you are. And there are always "I"s, in this sense. So long as the planet endures and there are living creatures on it, this is a planet with eyes. And so long as there is the possibility, that anywhere in the galaxies there should be such a planet, or creatures, who focus the centrality feeling of the universe, there is I. And that I is always you. We know, that, when people die, other people are born after them. And that is all the evidence we need for the notion of a reincarnation. Or it could be explained in various ways, discussed in various ways and elaborated. But fundamentally, people die. And then people are born. And that is only the simplest way of saying it, because people are born while others are living. And the whole collection of I centers can sit around in a ring in this room. And I would explain, according to my feeling, that we are all a cycle of reincarnations sitting round here in a circle. Because reincarnation is the reincarnation of I. If you wanted to be the reincarnation of a particular i, then you will have to do something else altogether, which we shall go on to talk about. But one thing seems to me to be perfectly clear. There was a time when your I woke up. It emerged from the biological continuum, from what de Chardin calls the biosphere of this planet. And you don't remember having been here before, least not in the ordinary way. That is as surprising and as inconceivable an event as ceasing to be and, without any apparent prospect of being again. But, you see, after this event called life, if you go back to unconsciousness, you go back to where you were before you started. And since there can't be any experience of non-experience. Obviously any next I that comes up, and all in fact the next eyes that come up, are you. Only since I is an experience of centrality, you don't experience yourself as multicentered. You experience yourself as a particular center. Because the universe, although it is multi-centered, each center is experienced uniquely.

So what you might roughly expect is this: that after you die, the next thing you know is that you are without the slightest memory of what ever happened before. You repeat the same sort of experiences that you had when you were born. Because it's somebody else being born. There has to be someone around. I'm merely saying that the experience of being I goes on. Even if there's an interval of several billion years, it makes no difference whatsoever. Supposing the human race was wiped off the planet and it took that much time for it to reappear, or any living creature. That would make no difference to this phenomenon. So let me repeat. Since there is no possibility of a non-experience, there are always experiences coming up, and each one of them is you. Because it's I. Now I know there's a difficulty in this. Because it arises from the fact, that we identify I with the ego. And a part of ego is the memory system. You know who you are in the sense that you remember who you are. You identify yourself with a series of events, that you remember. And these are, like, strung-out in a line, they're like a certain tune. And therefore you identify yourself with that tune. So we repeat ourselves, we have consistent characters. Just in the same way as a tune is always constructed to repeat itself in a certain way with variations, so that we recognize the tune, and the name of the piece, by hearing even one part of it. So here is a tune, you see, that is being played. And it is attached to a center called I. Only the I is much more than this particular tune, this particular series of memories. Even though we are persuaded and kind of hoaxed into identifying the whole I with that series of memories. But, you know, supposing somebody plays a Chopin Etude. And then he stops. Then, later on, somebody else plays it. Is it the same tune? Why, in one sense yes, in another sense no. So it is possible, isn't it, that, even though your tune was wiped out, because the memory system goes with death, the same sort of tune could be played again with its characteristics themes. And that will be in another sense you. In a more particular sense than the you of centrality. In Buddhism, there has never been the idea, that rebirth or reincarnation involves the transmigration of a specific soul. Because all schools of Buddhism are agreed on the idea that the individual self, or soul, is an illusion. A Maya. And they liken the process of rebirth to the motion of a wave across the surface of water. Actually, the motion is illusory. The water simply goes up and down. Now, there is an optical impression of a wave moving out. No wave moves, and yet there is the seeming of movement.

So the Buddhist would say: no soul reincarnates and yet there is the illusion of reincarnation. Buddhists think of reincarnation as an illusion. And yet believe in it. Westerners think of it as something that might be a fact and find it difficult to believe in it. Westerners adopt the idea of reincarnation as a comforting idea. Buddhists are trying to get out of being reincarnated. It's very funny. But at any rate, the Buddhist doctrine of reincarnation says, that what passes problem life to life, is karma. Is doing, action, that's what karma means. Process. And that something like wave. Not soul, not entity, that doesn't pass. You can look at it in another way. There is an institution like the University of California. This university keeps going on and on and on and yet all the buildings change, certainly all the students change, all the faculty changes, all the administrative offices change as the years go by, and yet it's still the University of California. What is the University of California? Why, it is does a process. It is a doing. It is a pattern of behavior. Your body is in the same situation. There is not one scrap of you that was with you ten years ago. It has all been rebuilt, reorganized, completely repaired and renewed. Then who are you? You are a pattern, you see, you're a process, that is identifiable and recognizable. You face in a certain way, you hair in a certain way, you are in a certain way and you behave in a certain way, so we recognise you. But it's all inconstant. It's like a whirlpool in water. The water flows through and the whirlpool retains the shape. Until it doesn't. But then it can always whirlpool again somewhere else. So now, what do we do? If that's clear so far, what do we do to give any credence at all to the notion, that there is some connection between some lives of a peculiar character? That we could take a life lived between the years of 1500 and 1580, and look at that. And then see another life lived between 1700 and 1792, and say, you gods, there's no getting away from it, but that the latter is a continuation of the former. Now. How could you do that? Well, very simply. Let us consider that we are looking at an enormous number of biographies, scattered over a very great period of years. But to visualize them, we've got to think of them as different colored spots. Now, as you look at this great mosaic, you see, of spots of all sorts of different colors, you will very soon begin to pick out patterns in it, as you do with a Rorschach blot. And you will see continuities running across. And you will therefore have projected a particular, even personal, reincarnation pattern running between these different biographies. It is highly conceivable, that one of these blots may, at a certain point, there may
