Tao of Philosophy

Not What Should Be

I wonder what you mean, when you use the word 'I?' I've been very interested in this problem for a long long time, and I've come to the conclusion, that what most civilized people mean by that word, is a hallucination. That is to say, a false sense of personal identity, that is at complete variance with the facts of nature. And as a result of having a false sense of identity we act in a way that is inappropriate to our natural environment. And when that inappropriate way of action is magnified by a very powerful technology, we swiftly begin to see the results of a profound discord between man and nature. As is well known we are now in the process of destroying our environment, as a result, of an attempt to conquer it and master it. And we have not realized, therefore, that our environment is not something other than ourselves. In assuming that it is we have made a great mistake. And are now paying the price for it.

But most people would agree with the lines of the poet who said "I, a stranger and afraid, in a world I never made," because we have the strong sensation that our own being inside our skin is extremely different from the world outside our skin. That while there may be intelligence inside human skins. And while there may be values and loving feelings. Outside the skin is a world of mechanical process which does not give a damn about any individual, and which is basically unintelligent. Being gyrations of blind force, and so far as the merely biological world is concerned gyrations of libido, which is Freud's word for blind lust. It should be obvious, that the human being goes with the rest of the universe. Even though we say in popular speech "I came into this world."

Now it is not true that you came into this world. You came out of it. In the same way as a flower comes out of a plant or fruit comes out of a tree. And as an apple tree apples. The solar system in which we live and therefore the galaxy in which we live and therefore the system of galaxies in which we

live. That system peoples. And therefore people are an expression of its energy and of its nature. If people are intelligent. And I suppose we have to grant that. If. Then the energy which people express must also be intelligent because one does not gather. Figs from thistles and grapes from thorns. But it does not occur you see to the ordinary civilized person to regard himself or herself. As an expression of the whole universe. It should be obvious that we cannot exist except in an environment of Earth, Air, Water, and solar temperature. That all these things go with us. And are as important to us albeit outside our skins as our internal or organs heart stomach brain and so forth.

Now if then we cannot describe the behavior of organisms without at the same time describing the behavior of their environments we should realize that we have a new entity of description. Not the individual organism alone but what would now be called a field of behavior which we must call rather clumsily the organism environment. You go with your environment in the same way as your head goes with the rest of your body. You do not find in nature faces arriving in the world sui generis. They go with a body that also bodies do not arrive in a world. Which would be for example a plain ball of scrubbed rock floating without an atmosphere far away from a star. That will not grow bodies there is no soil for bodies. There is no complexity of environment which is body producing.

So bodies go with a very complicated natural environment and if the head goes with the body and the body goes with the environment the body is as much an integral part of the environment as the head is part of the body. It is deceptive of course because the human being is not rooted to the ground like a tree. A human being moves about and therefore can shift from one environment to another but the shifts are superficial the basic environment of the planet remains a constant and if the human being leaves the planet he has to take with him and a canned version of the planetary environment. Now we are not really aware of this upon taking thought and due consideration it does occur to us, yes indeed, we do need that environment but in the ordinary way we don't feel it. That is to say we don't have a vivid sensation of belonging to our environment in the same way that we have a vivid sensation of being an ego inside a bag of skin located mostly in the skull about halfway between the ears and a little way behind the eyes. And

it issues in these disastrous results of the ego which according to one thousand century commonsense feels that it is a fluke in nature. And that if it does not fight nature it will not be able to maintain its status as intelligent fluke.

So the geneticists are now saying and many others are now saying that man must take the course of his evolution into his own hands. He can no longer trust the wiggly random and unintelligible processes of nature to develop him any further but he must interfere with his own intelligence. And through genetic alterations breed the kind of people who will be viable for human society and that sort of thing. Now this I submit is a ghastly era. Because human intelligence has a very serious limitation. That limitation is. That it is a scanning system, of conscious attention, which is linear. That is to say, it examines the world, in lines. Rather as you would pass the beam of a flashlight across a room or a spotlight. That's why our education takes so long. It takes so long because we have to scan miles of lines of print. And we regard that you see as basic information.

Now the universe does not come at us in lines. It comes at us. In a multidimensional continuum in which everything is happening all together everywhere at once. And it comes at us much too quickly, to be translated into lines of print. Or of other information, however fast they may be scanned. And that is our limitation so far as the intellectual life and the scientific life is concerned. The computer will greatly speed up the linear scanning. But it's still linear scanning. And so long as we are stuck with that form of wisdom we cannot deal with more than a few variables at once. Now what do I mean by that. What is a variable? A variable is any one linear process let's take music when you play a bar few. And there are four parts to it you have four variables you have four moving lines and you can take care of that with two hands. An organist using two feet can put into more variables and have six going and you may realize if you've ever tried to play the organ that it's quite difficult to make six independent motions go at once. The average person cannot do that without training the average person cannot deal with more than three variables at once without using a pencil. Now when we study physics we are dealing with processes in which there are millions of variables. This however we handle by statistics in the same way as insurance companies use actuarial tables to predict when most

people will die. If the average age of death is sixty five however, this prediction does not apply to any given individual. Any given individual will live to plus or minus sixty five years. And the range of difference may be very wide indeed of course. But this is all right the sixty five guesses all right when you're doing large scale gambling. And that's the way the physicist works in predicting the behavior of nuclear wavicles. But the practical problems of human life deal with variables in the hundreds of thousands. Here statistical methods are very poor. And thinking it out by linear consideration is impossible. With that equipment then we are proposing to interfere with our genes. And with that equipment also be it said we are trying to solve our political economic and social problems. And naturally everybody has the sense of total frustration. And the individual feels 'what what on earth can I do? '

We do not seem to know a way of calling upon our brains. Because our brains can handle an enormous number of variables that are not accessible to the process of conscious attention your brain is now handling your total nervous system to be more accurate. Your blood chemistry; the secretions from your glands. The behavior of millions of cells. It is doing all that without thinking about it. That is to say, without translating the processes it is handling into consciously reviewed words, symbols or numbers. Now when I use the word thinking I mean precisely that process: translating. What is going on in nature in two words symbols. Or numbers because both words and numbers are kinds of symbols. Symbols bear the same relation to the real world that money bears to wealth. You cannot quench anybody's thirst with the word water, just as you cannot eat a dollar bill and derive nutrition from it. But using symbols and using conscious intelligence; scanning, has proved very useful to us. It has given us such technology as we have. But at the same time it has proved too much of a good thing. At the same time, we've become so fascinated with it that we confuse the world as it is with the world as it is thought about talked about and figured about. That is to say, with the world as it is described.

And the difference between these two is vast. And when we are not aware of ourselves except in a symbolic way. We are not related to ourselves at all we are like people eating menus instead of dinners. And that's why we all feel psychologically frustrated. So then we get back to the question of,

“What do we mean by I? ” Well first of all obviously we mean our symbol of ourselves. Now ourselves in this case is the whole psycho physical organism conscious and unconscious, plus its environment. That’s your real self. Your real self. In other words, is the universe as centered on your organism. That’s you.

Let me just clarify that a little for one reason. What you do is also a doing of your environment. Your behavior is its behavior as much as it’s behavior is your behavior. It’s mutual. We could say it is transactional. You are not a puppet which your environment pushes around. Nor is the environment a puppet which you push around. They go together they act together. In the same way for example if I have a wheel one side of it going down is the same as the other side of it going up. When you handle the steering wheel of a car, are you pulling it or are you pushing it? No, you’re doing both, aren’t you? When you pull it down the side you are pushing it up that side. It’s all one so there’s a push pull between organism and environment. We are only rarely aware of this as when in curious alterations of consciousness which we call mystical experience, cosmic consciousness, an individual gets the feeling that everything that is happening is his own doing. Or the opposite of that feeling that he isn’t doing anything, but that all his doings his decisions and so forth are happenings of nature. You can feel it either way. You can describe it in these two completely opposite ways but you’re talking about the same experience you’re talking about experiencing your own activity and the activity of nature as one single process. And you can describe it as if you were omnipotent like God or as if it were completely deterministic and you hardly existed at all. But remember both points of view are right. And we’ll see where that gets us.

But we don’t feel that do we, ordinarily? What we feel instead is an identification of ourselves with our idea of ourselves or I would rather say with our image of ourselves? And that’s the person. Or the ego. You play a role, you identify with that role. I play a role, it’s called Alan Watts and I know very well that that’s a big act. I can play some other roles besides Alan Watts, if necessary. But I find this one is better for making a living. But I assure you it’s a mask and I don’t take it seriously. The idea of my being a kind of messiah or guru or savior of the world just breaks me up. Because I know me. You know it’s very difficult to be holy. In the ordinary

sense. So I know I'm not that but most of us are taught to think that we are whom we are called. And, when you are a little child and you begin to learn a role and your parents and your peers approve of your be. In that they know who you are. You're predictable, so you can be controlled. But when you act out of role and you imitate some other child's behavior everybody points the finger and says you're not being true to yourself. "Johnny, that's not you, that's Peter." And so you learn to stay Peter. Or to stay Johnny. But of course you're not either. Because this is just the image of you it's as much of you as you can get into your conscious attention, which is precious little. Your image of yourself contains no information about how you structure your nervous system. It contains no information about your blood chemistry it contains almost no information about the subtle influences of society upon your behavior. It does not include the basic assumptions of your culture which are all taken for granted and unconscious. And you can't find them out unless you study other cultures to see how their basic assumptions differ. It includes all kinds of illusions that you're completely unaware of as for example that time is real.

And that there is such a thing as a past. Which is pure hokum. But there are nevertheless all these things that are unconscious in us and they are not included in our image of ourselves, nor of course included in our image of ourselves is there any information about our inseparable relationships with the whole natural universe. So this is a very impoverished image. When you ask a person "what did you do yesterday?" They'll give you a historical account of a certain number of events in which they participated in, the certain number of things which they saw, used or were clubbed by. But realize at once that this history leaves out most of what happened. I in trying to describe what happens to me this evening will never be able to describe because there are so many people here that if I were to talk about everyone whom I've seen what they were wearing what color there was what sort of expressions they had on their faces I would have to talk to doomsday. So instead of this rich physical experience, which is very rich indeed I have to attenuate it in memory and description to saying "Oh I met a lot of people in Philadelphia. And they were men and the women a lot of them were young and some of them were old." You know, it's an utterly impoverished account of what went on. So therefore in thinking of ourselves in this way what I did yesterday what I did the day before in

terms of this stringing mangy account all I have is a caricature of myself. And you know the caricaturist doesn't draw you all in he just put certain salient features whereby people will recognize you. As sort of a skeleton. So we can see we are as it were conceiving ourselves as a bunch of skeletons and they've got no flesh on, just a bunch of bones. And no wonder we all feel inadequate. We're all looking for something, to the future, to bring us the goodie. We know we ought to have. There's a golden goodie at the end of the line somewhere there's a good time coming. Be it ever so way far away that one far off divine event which all creation moves we hope. And therefore we say of something that's no good it has no future. I would say it has no present. But everybody says it has no future.

Now, here we are, as it were, psychically starved. And always there for looking for looking seeking seeking seeking. And this confused seeking is going on everywhere we don't know what we want. Nobody knows what they want. We say yes we think we think of what we want in vague terms: pleasure, money, wealth, love. Fulfillment personal development. But we don't know what we mean by all that. The person really sits down to figure out write out, I say twenty pages, on your idea of heaven. It will be a sorry production. You can see it already in Medieval art whether it'd pictures of heaven and hell. Hell is always much better than Heaven. Although it's uncomfortable it's a sadomasochistic orgy. Wowie, you know hell is really a rip roaring, whereas all the saints in heaven are sitting, of the with you know, very very smug and demure like they were in church. And you see also the multitudes of the saved instead of this writhing wormy thing you can see all their heads which the artist is drawn to abbreviate them just the tops of their heads in masses they look like cobblestone street. Flattened out. So what has happened then is this. That I. Is an illusion it's an image and it is no more ourself than an idol is the god. But we say it can't be so, because I feel I really exist, it isn't just an idea in my head, it's a feeling, I feel me! Well what is it that you feel when you feel I?

What is it that you feel when you feel I? I'll tell you. What do you do when somebody says "Pay attention!" What is the difference between looking at something and taking a hard look at it? And between hearing something and listening intently? What's the difference? What's the difference between waiting while something goes on and enduring it. Why? The difference is this that when you pay attention instead of just looking you screw up your

face you frown. And stare that is a muscular activity around here. When you will, you grit your teeth or clench or this when you endure or control yourself you pull yourself together, physically, and therefore you get uptight. You hold your breath, you do all kinds of muscular things to control the functioning of your nervous system and none of them have the slightest effect on the proper operation of the nervous system. If you stare at things, you will rather fuzz the image than see them clearly if you listen intently by concentrating on muscles around the ears you will be so much attending to muscles here that you won't hear things properly and you may get singing in the ears. If you tighten up with your body to pull yourself together, all you do is constrict yourself. I remember in school I sat next to a boy who had great difficulty in learning to read. And what they always say to children is "try!" If you can do something as tries so the boy tries to muddy done when he's trying to get out words he grunts and groans as if he were lifting weights. And the teachers impress the boys really trying gives him B for effort. Has nothing to do with it.

Now we all make this muscular strain, with the thought that it's achieving psychological results. The sort of psychological results it's intended to achieve and all this amounts to is this like you're taking off on a jet plane you've gone a mile down the runway and the thing is not in the air yet, and you get nervous, so you start pulling at your seatbelt. That's what it is. Now that is a chronic feeling we have it us all the time and it corresponds to the word I. That's what you feel when you say I. You feel that chronic tension because when an organ is working properly you don't feel it. If you see your eye you've got cataract. If you hear your ears, you've got singing in the areas you know getting in the way of hearing. When you of fully functioning, you are unaware of the organ. When you are thinking clearly your brain isn't getting in your way. Actually of course you are seeing your eyes in the sense that everything you see out in front of you is a condition in the optic nerves at the back of the skull. That's where you're aware of all this, but you're not aware of the I as the I. I'm talking about the optical eye.

So when we are aware of the ego I we are aware of this chronic tension inside ourselves and that's not us, it's a futile tension. So when we get the illusion the image of ourselves married to a futile tension you've got an illusion married to a futility. And then you wonder why I can't do anything.

Why I feel in the face of all the problems of the world impotent, and why I somehow cannot manage to transform I? Now here we get to the real problem, because we're always telling each other that we should be different. I'm not going to tell you that tonight. Why not, because I know you can't be. Nor can I. That may sound depressing but I'll show you it isn't, it's very heartening. But everybody you see who is at all sensitive, and awake to their own problems and human problems is trying to change himself. We know we can change the world unless we change ourselves if we are all individually selfish we're going to be collectively selfish. If we don't really love people and only pretend to, somehow we've got to find a way to love. After all it's said in the Bible that our shalt love the Lord thy God. And your neighbor as yourself. You must love. We all agree sure. But we don't. In fact one psychologist very smartly asked the patient with whom are you in love against.

And this is particularly becomes appalling when we enter into the realm of higher things by which I mean spiritual development. Everybody these days is interested in spiritual development. And wisely because we want to change our consciousness. Many people are well aware that this egocentric consciousness is a hallucination. And that they presume it's the function of religion to change it because that's what the Zen Buddhists and yogis and all these people in the Orient to doing. They're changing their state of consciousness to get something called Satori, all mystical experience or Nirvana or moksha or what have you and everybody around here has a really enthused about that because you don't get that in church. I mean that has been Christian mystics but the church has been very quiet about them.

Then the average church all you get is talk. There's no meditation, no spiritual discipline, they tell God what to do interminably as if he didn't know. And then they tell the people what to do as if they could or even wanted to. And then they sing religious nursery rhymes. And then to cap it all the Roman Catholic Church, which did at least have an unintelligible service which was... Which was you know it was real mysterious and suggested bad magic was going on there when put the thing into bad English. And they took away incense and they took away they became a bunch of Protestants and there was a terrible So now all these Catholics are at loose ends it's clear booth loosed put it up to be a pun but she said you

know. It's no longer possible to practise contemplative prayer mats. As you're being advised, exhausted, edified all the time.

And it becomes a bore. Think of God listening to all those prayers. We do have I mean talking about grieving the Holy Spirit. It's just awful. People have no consideration for God at all. So. But in pursuing these spiritual disciplines yoga and Zen and so forth and also psychotherapy there comes up a big difficulty. And the big difficulty is this. I want to find a method whereby I can change my consciousness. But the, therefore to improve myself, but then the self that needs to be improved is the one that is doing the improving.

And so I'm rather stuck. I found out the reason that I think I believe say in god, is that I sure hope that somehow God will rescue me. In other words, I want to hang on to my own existence and I feel rather shaky about doing that for myself but I just hope there's a God who'll take care of it. Or if I could be loving. I would have a better opinion of myself. I feel better about it I could face myself as people say. If I were more loving so the unloving me somehow by some gimmickry has to turn itself into a loving me and this is just like trying to lift yourself off the ground with your own bootstraps. It can't be done. And that's why religion in practice mainly produces hypocrisy. And guilt. Because of the constant failure of these enterprises. People go and study Zen. And they come back and say wow getting rid of your ego is a superhuman task. I assure you it's going to be very very difficult to get rid of your ego you have to sit for a long time and you're going to get the sorest legs. It's hard work and all you wretched kids you think you're getting rid of your ego on part or something or other and easy yoga you don't know what you're in for when it really comes down to the nitty gritty.

But you know the biggest ego trip going is getting rid of your ego. And the joke of it all is your ego doesn't exist. There's nothing to get rid of. It's an illusion as I tried to explain. But you still want to ask how to stop the illusion. And who's asking? I mean, do you think in the ordinary sense in which you use the word 'I', how can I stop identify myself with the wrong me? But the answer is simply you can't. The Christians put this in their way when they say that mystical experience is a Gift of Divine Grace. Man as

such cannot achieve this experience it is a gift of God and if God doesn't give it to you there's no way of getting it. Now that is solidly true. You can't do anything about it because you don't exist. Well you say that's pretty depressing news.

But the whole point is it isn't depressing news, it is the joyous news! There's a Zen poem which puts it like this talking about it, it means the mystical experience the Satori, the realisation that you are the eternal energy of the universe like Jesus did. It says like this you cannot catch hold of it nor can you get rid of it. In not being able to get it you get it. When you speak, it is silent, when you are silent it speaks. Now in not being able to get it you get it because this whole feeling what Krishnamurthi is trying to explain to people, for example, when he says why do you ask for a method there is no method all methods are simply gimmicks for strengthening your ego.

So how do we not do that this is you're still asking for a method there is no method if you really understand what your 'I' is you will see there is no method. This is so so sad. But it's not this is the gospel the good news. Because if you cannot achieve it if you cannot transform yourself. That means that the main obstacle to mystical vision has collapsed. That was you. What happens you can't do anything about. You're at your wit's end. What are you going to do, commit suicide? But supposing you just put that off for a little while. Wait and see what happens. You can't control your thoughts, you can't control your feelings. Because there is no control. You are your thoughts and your feelings and they're running along running along running along to sit and watch them. There they go you're still breathing aren't you. Still growing your hair. Still seeing and hearing. Are you doing that? I mean is breathing something that you do? Do you see I mean do you organize the operations of your eyes and know exactly how to work those rods and cones in the retina? Do you do that? It's a happening. It happens so you can feel all this happening. You are breathing it's happening, your thinking is happening, you're feeling is happening you're hearing you're seeing the clouds are happening across the sky the sky is happening blue the sun is happening shining.

There it is. All this happening. And may I introduce you, this is yourself. This begins to be a vision of who you really are. And that's the way you function you function by happening that is to say by spontaneous occurrence. And this is not a state of affairs that you should realise. I cannot possibly preach it to you because the minute you start thinking I should understand that this is the stupid notion again that I should bring it about when there is no you to bring it about so that's why I'm not preaching you can only preach to egoss.

All I can do is to talk about what is. It amuses me to talk about what it is because it's wonderful. I love it and therefore I like to talk if I get paid for it. And I make my living and sensible people get paid for doing what they enjoy doing. So this is not an easy this is the whole approach is not to convert you not to make you over not to improve you but for you to discover if you really knew the way you are, things would be would be sane. But you see you can't do that. You can't make that discovery because you're in your own way. So long as you think "I'm I." So long as that hallucination knocks it. And the hallucination disappears only in the realisation of its own futility. When at last you see you can't do it. You cannot make yourself over, you cannot really control your own mind. See, when we try to control the mind. A lot of yoga teachers try to get you to control your own mind mainly to prove to you that you can't do it. There's nothing, you know a fool who persists in his folly will become wise, so they what they do is they speed up the folly. And so you get concentrating. And you can have a certain amount of superficial and initial success by a process commonly called self-hypnosis. And you can think you're making progress. And a good teacher will let you go along that way for a while until he really throws you with one. Why are you concentrating?

Buddhism works this way, Buddha said if you suffer you suffer because you desire and your desires are either unattainable or always being disappointed or something. So cut out desire. So those disciples went away and they stamped on desire jumped on desire cut the throat of desire and threw out desire but then they came back and but as said but you are still desiring not to desire. It. I wonder how to get rid of that so when you see that that's nonsense they are naturally comes over you a quietness. In seeing that you cannot control your mind, you realize there is no control. What you took to

be the thinker of thoughts is just one of the thoughts what you took to be the feeler of the feelings which was that chronic muscular strain was just one of the feelings. What you took to be the experience of experience is just part of the experience.

So there isn't any thinker of thoughts feel or feelings we get into that bind because we have a grammatical rule that verbs have to have subjects. And the funny thing about that is that verbs are processes and subjects and nouns which are supposed to be things how does a noun start a verb. How does the thing put a process into action. Obviously it can't. But we always insist that there is this subject called the knower. And without a knower there can't be knowing. Well that's just a grammatical rule it isn't the rule of nature. In nature there's just knowing like you're feeling it and how to say you are feeling it as if you were somehow different from the feeling when I say I am feeling I what I mean is there is feeling here. When I say you are feeling I mean there is feeling there. I have to say even "There is feeling. What a cumbersome language we have. Chinese is easier you don't have to put all that in writing that why you can say things twice as fast in Chinese as you can in any other language.

Well anyway. When you come to see that you can do nothing that the play of thought of feeling etc just goes on by itself as a happening. Then you are in a state which we will call meditation. And slowly. Without being pushed your thoughts will come to silence that is to say all the verbal symbolic chatter going on in the skull. Don't try and get rid of it. Because that will again produce the illusion that there's a controller. Just, it goes on it goes on it goes on finally it gets tired of itself and bored and stops. And so then there's a silence. And this is a deeper level of meditation. And in that silence. You suddenly begin to see the world as it is. And you don't see any past. And you don't see any future. You don't see any difference between yourself and the rest of it that's just an idea you can put your hand on the difference between myself and you. You know you can't blow it, you can't bounce it, you can't pull it. It's just an idea. You can't find any material body. Because material body is an idea, so is spiritual body, somebody is philosophical notions see reality isn't material. That's an idea reality isn't spiritual That's an idea reality is [claps].

So we find, if I've got to put it back into words that we live in an eternal now. You've got all the time in the world because you've got all the time there is which is now. And you are this universe. And you feel this strange feeling when when when ideas don't define the differences you feel that other people's doings or your doings. And that makes it very difficult to blame other people. If you're not sophisticated theologically You may of course run screaming in the streets and say that you're God.

In a way that's what happened to Jesus because he wasn't sophisticated theologically he only had Old Testament Biblical theology behind him. If he'd had Hindu theology he could have put it more subtly. But it was only that rather primitive theology of the Old Testament. And that was a conception of God as a monarchical boss. And you can't go around sandboxes son. If you're going to say "I'm God," you must allow it for everyone else too. But this was a heretical idea from the point of view of Hebrew theology and so what they did with Jesus was they pedestaled him, I mean they kicked him upstairs so that he wouldn't be able to influence anyone else and only you maybe god. And that stopped the Gospel cold right at the beginning. It couldn't spread.

Well anyway. This is therefore to say that the transformation of human consciousness through meditation is frustrated so long as we think of it in terms of something that I myself can bring about. By some kind of wangled, by some sort of gimmick. Because you see that leads to endless games of spiritual one upmanship. And of guru competitions, of my guru is more effective than your guru, my yoga faster than your yoga, I'm more aware of myself than you are I'm humbler than you are I'm sorry for my sins than you are I love you more than you love me it is interminable goings on about which people fight and wonder whether they're a little bit more evolved than somebody else and so on all that can just fall away. And then. We get this strange feeling that we have never had to see in our lives except occasionally by accident some people get a glimpse. That we are no longer. This poor little stranger and afraid in a world it never made. But that you are this universe and you are creating it at every moment because YOU SEE IT STARTS NOW. It didn't begin in the past there was no past so if the universe began in the past when that happened it was now, see. But it's still now and the universe is still beginning now and it's trailing off like the

wake of a ship from now in the wake of the ship fades out so does the past. You can look back there to explain things but the explanation disappears, you never find things are not explained by the past or explained by what happens now. That creates the past and it begins here. That's the birth of responsibility. Because otherwise you can always look over your shoulder and say well I'm the way I am because my mother dropped me and she dropped me because she was neurotic because a mother dropped her, and away we go back to Adam and Eve, to disappearing monkey or something and we never get at it. But in this way you're faced with it you're doing all this. And it's an extraordinary shock. So. Cheer up. You can't blame anyone else for the kind of world you're in. And if you know you see that I, in the sense of the person, the front, the ego really doesn't exist. Then it won't go to your head too badly if you wake up and discover that your god.

Sense of Nonsense

It's very commonly said that the root of most human unhappiness is the sense that one's life has no meaning. This is, I suppose most frequently said in circles interested in psychotherapy because the feeling of meaninglessness is often equated with the existence of neurosis. And so many activities into which one is encouraged to enter, philosophies one is encouraged to believe and religions one is encouraged to join, are commended on the basis of the fact that they give life a meaning. And, I think it's very fascinating to think out what this idea itself means, or what it – is intended when it is said that life has to have a purpose. I remember so well as a child listening to sermons in church in which the preacher would constantly refer to God's purpose "for you and for me." And, I could never make out what it was because when questioned about this, the reverend gentleman seemed to be evasive: "What is the purpose of God for the world?" We used to sing a hymn too: "God is working His purpose out as the year succeeds the year," and the nearest clue one got to it was in the (sort of) refrain of the hymn: "Nearer and nearer draws the time, the time that shall surely be, when the earth shall be filled with the glory of God, as the waters cover the sea." And of course, that raises the question, "What is the glory of God?"

Well, now, it's pretty obvious, I think, that when we talk about life having or not having a meaning, we are not using quite the ordinary sense of the word "meaning" as the attribute of a sign. We are not saying – are we? – that we expect this natural universe to behave as if it were a collection of words, signifying something other than themselves. It isn't a point of view which would reduce our lives in the world merely to the status of signs. And, it's obviously in some different sense than that, that Goethe wrote his famous lines at the end of Faust: "Alles Vergängliche ist nur ein Gleichnis" – forgive my pronunciation of German. "All that is mortal, or all that is perishable, is but a symbol." And so, a symbol of what? What do we want to feel, what would satisfy us as being the meaning behind this world? It's so often, you know, that we don't follow our ideas and our desires through. Most of the things that we want very fervently are things that we have only half-glimpsed. Our ideals are very often suggestions – hints – and we don't know really exactly what we mean when we think about it. But there is this obscure sense in which we feel that life ought to have significance, and be a symbol in at least that sense if not just so arid a symbol as a mere sign.

Or it also may mean that life is meaningful. An individual feels that his life amounts to something when he belongs and fits in with the execution of some group enterprise; he feels he belongs in a plan. And this too seems to give people a sense of great satisfaction, but we have to pursue that question further too. Why is it that a plan – why is it that fellowship with other people gives the sense of meaning? Does it come down perhaps to another sense of meaning that life is felt to be meaningful when one is fully satisfying one's biological urges, including the sense of hunger, the sense of love, the sense of self-expression in activity, and so on? But then again, we have to push that inquiry further. What do our biological urges really point towards? Are they just, however, things always projected towards a future? Is biology and its processes nothing but "going on towards going on towards going on"?

Or there's a fourth and more theological sense of the meaning of life. In all theistic religions at any rate, the meaning of life is God himself. In other words, all this world means a person, it means a heart, it means an intelligence, and the relationship of love between God and man is the

meaning of the world. The sight of God is the glory of God, and so on, but again here, there's something to be further pursued.

What is it that we want in love with a person, and even a person in the sense of the Lord God? What is the content of it? What is it that we are really yearning after? Well, now, if we go back to the first point, taking Goethe's words that all that is transitory is but a symbol and that we want to feel that all things have significance, it does seem to me that there is a sense in which we often use the word "significance" where the word seems to be chosen quite naturally, and yet at the same time it is not quite the right word. We say, for example, often, of music, that we feel it to be significant, when just at the same time, we don't mean that it expresses some particular kind of concretely realizable emotion, and certainly it is not imitating the noises of nature. A program music, you know, which simply imitates something else, and it deliberately sets out to express sadness or joy (or whatever) is not the kind of thing I mean. So often when one listens to the beautiful arabesque character of the Baroque composers, Bach or Vivaldi, it is felt to be significant not because it means something other than itself, but because it is so satisfying as it is. And we use, then, this word, "significance," so often in those moments when our impetuous seeking for fulfillment cools down, and we give ourselves a little space to watch things, as if they were worth watching – ordinary things.

And in those moments when our inner turmoil has really quietened, we find significance in things that we would not expect to find significant at all. I mean, this is, after all, the art of those photographers who have such genius in turning the camera towards such things as peeling paint on an old door, or mud and sand and stones on a dirt road, and showing us there that if we look at it in a certain way those things are significant. But we cannot say significant "of what" so much as significant "of themselves." Or perhaps significance then is the quality of a state of mind in which we notice that we are overlooking the significance of the world by our constant quest for it later.

All this language is of course quite naturally vague and imprecise because, I think, the wrong word is used. And yet not entirely the wrong word because as I said, it comes so naturally to us.

It was Clive Bell, the great aesthete, who wanted to say that all the characteristic of art, especially the characteristic of aesthetic success in painting, was the creation of significant form. Again, a very vague, imprecise expression. But it certainly is an attribute not only of those moments in which we are tranquil inside, but also of moments of deep, spiritual experience of what would be called moksha, or “release,” in Hinduism or satori in Zen. In those moments the significance of the world seems to be the world – seems to be what is going on now. And we don’t look any further – the scheme of things seems to justify itself at every moment of its unfoldment. I pointed out that this was particularly a characteristic of music- it’s also a characteristic of dancing, and in the sensation of belonging with one’s fellow man, in the carrying out of some significant pattern of life which I mentioned as a second sense of the world being meaningful. Again, the character of this feeling is again something that is fulfilled in itself: to dance is not to be going anywhere. When we dance in the ballroom, we don’t have a destination – we’re just going around a room. And it’s in doing this – it’s in executing the pattern, in singing the music with other people, that even though this does not point to anything else outside itself we again get the sense of meaning, and this is also obviously the case so often in the satisfaction of the biological urges. Does one live to eat or eat to live? I am not at all sure about this. I’m sure I very often live to eat because, sitting around a table with people – I don’t like eating alone – and enjoying food is absolutely delightful. And we’re not thinking when we do this – at least certainly I’m not – that we have to eat because it is good for us, and that we have to “throw something down the hatch,” as Henry Miller said, and swallow a dozen vitamins just because our system needs nourishment.

I remember, quite recently, there was an article in the Consumer Reports about bread. It seems there had been some correspondence and protest, saying that the bread one bought –the white bread one buys in the stores –is perfectly inedible and lacking in nutrition, and that it was much better to eat peasant-type breads – rough pumpnickel and things of that kind. And the experts replied that our white bread is perfectly full of good nutrients and there is nothing really the matter with it at all. Well, I felt like saying it is not a matter perhaps of the bread being deficient in the essential vitamins. Bread is not medicine, it is food, and one’s complaint against it is that it is

bad cookery. It tastes of nothing. And we do tend – don't we? – to look upon food, so often, for what it will do for us, rather than the delight of eating it. But if the satisfaction of biological urges is to mean anything, surely the point of these urges is not the fatuous one of mere survival. We might say that the point of the individual is simply that he contributes to the welfare of the race, and the point of the race is that it “reproduces itself to reproduce itself” and keep going. But of course that is not really a point at all; that is just fatuous. Surely the race keeps going because going is great – because it's fun. If it is not and never will be, then there is no point, obviously, in going, I mean, looking at it from the most hedonistic standpoint. But then when we come to the question, “What is fun?” – “What is the joy of it?” again we come to something that cannot very well be explained in the ordinary language of meaning of leading to something else. And this, I think, becomes preeminently true if we think of it in theological language – that the meaning of life is God. In any of the theistic religions what is God doing? What is the meaning of God? Why does He create the universe? What is the content of the love of God for His creation? Well, there's the frank answer of the Hindus that the godhead manifests the world because of lila, which is Sanskrit for “play.”

And this is likewise said in the Hebrew scriptures or the Christian Old Testament in the Book of Proverbs where there is a marvelous speech by the divine wisdom, Sophia, which in describing the function of the divine wisdom in the creation of the world – the world, in other words, is a manifestation of the wisdom of God. The wisdom uses the phrase that in producing men and animals and all the creatures of the earth, wisdom is playing, and it was the delight of wisdom to play before the presence of God. And when it is likewise said in the scriptures that the Lord God created the world for His pleasure, this again means, in a sense, for play. And certainly this seems to be what the angels in Heaven are doing according to the traditional symbolic descriptions of Heaven: they are ringed around the presence of the Almighty, calling out “Alleluia! Alleluia! Alleluia!” through all eternity. Well, “alleluia” may have meant something originally, but as it is used now it does not mean anything, except, well, in our own slang, “whoopie!” It is an exclamation of nonsensical delight, and it was Dante in *The Paradiso* who described the song of the angels as the laughter of the universe.

Now this sense of nonsense as the theme of the divine activity comes out also very strongly in the Book of Job. I always think that the Book of Job is the most profound book in the whole Bible, Old Testament and New Testament. Because here is the problem of the man – the righteous man – who has suffered and all his friends try to rationalize it and say, “Well, you must have suffered because you really had a secret sin after all, and you deserve the punishment of God,” or because... rationalize it somehow. And when they’ve had their say, the Lord God appears on the scene and says, “Who is this that darkeneth counsel with words without knowledge?” and then proceeds to ask Job and his friends a series of absolutely unanswerable conundrums, pointing out all the apparent irrationality and nonsense of His creation. “Why,” for example, He said, “do I send rain upon the desert where no man is?”

Most commentators on the Book of Job end with the remark that, “This poses the problem of suffering and the problem of evil, but doesn’t really answer it.” And yet in the end Job himself seems to be satisfied. He somehow surrenders to the apparent unreasonableness of the Lord God, and this is not, I think, because Job is beaten down and becomes unduly impressed with the royal, monarchical, and paternalistic authority of the deity and does not dare to answer back. He realizes that somehow these very questions are the answer. I think of all the commentators on the Book of Job, the person who came closest to this point was (old) G. K. Chesterton. He once made the glorious remark that it is one thing to look with amazement at a gorgon or a griffin, a creature who does not exist, but it is quite another thing to look at a hippopotamus, a creature who does exist, and looks as if he does not. In other words, that all this strange world with its weird forms like hippopotami – and when you look at them from a certain point of view – , stones and trees and water and clouds and stars – when you look at them from a certain point of view and don’t take them for granted – they are as weird as any hippopotamus, or any imagination of fabulous beasts of gorgons and griffins and things like that. They are just plain improbable, and it is in this sense, I think, that they are the “alleluia,” as it were, the nonsense song.

Why do we love nonsense? Why do we love Lewis Carroll with his “’Twas brillig, and the slithy toves did gyre and gimble in the wabe, all mimsy were

the borogroves, and the mome raths outgrabe. . . .”? Why is it that all those old English songs are full of “Fal-de-riddle-eye-do” and “Hey nonny-nonny” and all those babbling choruses? Why is it that when we get “hep” with jazz we just go “Boody-boody-boop-de-boo” and so on, and enjoy ourselves swinging it? It is this participation in the essential glorious nonsense that is at the heart of the world, that isn’t going anywhere – that is a dance. It seems that only in moments of unusual insight and illumination that we get the point of this, and find that thus the true meaning of life is no meaning, that its purpose is no purpose, and that its sense is non-sense. But still, we want to use about it the word “significant.” Is this significant nonsense? Is this a kind of nonsense that is not just chaos, that is not just blathering balderdash, but that has in it rhythm, fascinating complexity, a kind of artistry? It is in this kind of meaninglessness that we come to the profoundest meaning.

Coincidence of Opposites

It is really a very unorthodox and unacademic thing to do to start a discussion with a group of psychologists on the subject of metaphysics, but we have to do that because a lot of people say that their approach to life is scientific, as distinct from metaphysical, and that metaphysics is bosh anyway. But everybody, by virtue of being a human being, is willy-nilly a metaphysician. That is to say, everybody starts from certain fundamental assumptions as to what is the good life, what he wants, [or] what are his, shall we say, axioms for living. And I find that psychologists generally tend to be blind to these fundamental assumptions. Maybe it is truer of psychiatrists than of psychologists, but they tend to feel that they are scientists. They’re rather bending over backwards to have a scientific status because that is fashionable in our age. But, you know, it’s so amusing that when, say – let’s take psychoanalysis for example – as pointed out to many philosophers that their philosophical ideas are capable of being shown to have a psychoanalytic reference. For example, John Wisdom wrote a book about the philosophy of Berkeley, in which he attributed a great deal of his point of view to his experiences at toilet training as a child. The philosopher is very grateful to the psychoanalyst for revealing to him his unconscious and its emotional contents, but the psychoanalyst must in turn await a

revelation from the philosopher as to his philosophical unconscious and the unexamined assumptions which lie in it.

So if I may start by insulting your intelligence with what is called the most elementary lesson – the thing that we should have learned before we learned “1 – 2 – 3” and “A – B – C,” but somehow was overlooked. Now, this lesson is quite simply this, that any experience that we have through our senses, whether of sound, or of light, or of touch, is a vibration. And a vibration has two aspects: one called “on,” and the other called “off.” Vibration seems to be propagated in waves, and every wave system has crests and it has troughs.

And so life is a system of now you see it, now you don't, and these two aspects always go together. For example, sound is not pure sound; it is a rapid alternation of sound and silence, and that is simply the way things are. Only, you must remember that the crest and the trough of a wave are inseparable. Nobody ever saw crests without troughs or troughs without crests. Just as you do not encounter in life people with fronts but no backs, just as you do not encounter a coin that has heads but no tails. And although the heads and the tails, the fronts and the backs, the positives and the negatives are different, they are at the same time one. And one has to get used, fundamentally, to the notion that different things can be inseparable, and that what is explicitly two can at the same time be implicitly one. If you forget that, very funny things happen. If therefore we forget, you see, that black and white are inseparable, and that existence is constituted equivalently by being and non-being, then we get scared, and we have to play a game called “Uh-oh, Black Might Win.” And once we get into the fear that black – the negative side – might win, we are compelled to play the game, “But White Must Win,” and from that start all our troubles.

Because, you see, the human awareness is a very odd mechanism. I do not think “mechanism” is quite the right word, but it will do for the moment. That is to say, we have as a species specialized in a certain kind of awareness which we call conscious attention, and by this we have the faculty of examining the details of life very closely. We can restrict our gaze, and it corresponds somewhat to [peripheral field] – the central field of vision in the eyes. We have central vision and we have peripheral vision.

Central vision is that which we use for reading and for all sorts of close work, and it's like using a spotlight. Whereas peripheral vision is more like using a floodlight. Now, civilization and civilized human beings, for maybe 5,000 years, maybe much longer, have learned to specialize in concentrated attention. Even if a person's attention span is short, he is, as it were, wavering his spotlight over many fields. The price which we pay for specialization in conscious attention is ignorance of everything outside its field. I would rather say "ignore-ance," than ignorance, because if you concentrate on a figure, you tend to ignore the background and you tend, therefore, to see the world in a disintegrated aspect. You take separate things and events seriously, imagining that these really do exist, when actually they have the same kind of existence as an individual's interpretation of a Rorschach blot; they are what you make out of it.

In fact our physical world is a system of inseparable differences. Everything exists with everything else, but we contrive not to notice that because what we notice is

what is noteworthy, and we notice it in terms of notations: numbers, words, images. What is notable, noteworthy, notated, and noticed is what appears to us to be significant, and the rest is ignored as insignificant. And as a result of that we select from the total input that goes to our senses only a very small fraction, and this causes us to believe that we are separate beings, isolated by the boundary of the epidermis from the rest of the world. You see, this is also the mechanism involved in not noticing that black and white go together – not noticing that every inside has an outside. That the inside, what's inside – what goes on inside your skin, is inseparable from what goes on outside your skin. You see that, for example, in the science of ecology one learns that a human being is not an organism in an environment, but is an organism-environment, that is to say, a unified field of behavior. If you describe carefully the behavior of any organism you cannot do so without at the same time describing the behavior of the environment, and by that you know that you've got a new entity of study: you are describing the behavior of a unified field. But you must be very careful indeed not to fall into old Newtonian assumptions about the billiard ball nature of the universe. The organism is not the puppet of the environment being pushed around by it, nor on the other hand is the

environment the puppet of the organism being pushed around by the organism. The relationship between them is, to use John Dewey's word, "transactional," a transaction being a situation like buying and selling in which there is no buying unless somebody sells, and no selling unless somebody buys. So that fundamental relationship between ourselves and the world, which is, in an old-fashioned way, by people such as [B. F.] Skinner, who has not updated his philosophy – interpreted in terms of Newtonian mechanics – he interprets the organism as something determined by the total environment. He doesn't see that in a more modern way of talking about it we're simply describing a unified field of behavior, which is nothing more than what any mystic ever said. That's a dirty word in the modern, academic scientific environment, but if a mystic is one who is sensibly or even sensuously aware of his inseparability as an individual from the total existing universe, he is simply a person who has become sensible – aware through his senses – of the way ecologists see the world. So when I am in academic circles I do not talk about mystical experiences, I talk about ecological awareness. Same thing.

And so the next aspect of our metaphysical introduction must be about games. You know, I think there are really four questions that all philosophers have discussed from the beginning of recorded time. The first is: Who started it? The second is: Are we going to make it? The third is: Where are we going to put it? And the fourth is: Who is going to clean up?

When you think these over it poses a fifth question: Is it serious? And that is the one I want to discuss. Is existence serious, like you say, "Doctor," after he has looked at your X-ray picture, "is it serious?" What does that mean? It means, "Am I in danger of not continuing to survive?" The question is "Ought I to continue to survive?" In other words, "Must I survive?" If life is serious, then of course I must survive. If it is not serious, it really does not matter whether I do or I don't. Now, in Western culture it is practically a basic assumption that existence is serious, and this is particularly true among people who call themselves existentialists. When they talk about a person who exists authentically they mean that he takes his life seriously and other people's lives seriously. But the poet and essayist, G. K. Chesterton, once observed that the "angels fly because they take themselves lightly." And if I may venture into mythology, if the angels take

themselves lightly, how much more so the lord of the angels? But you see, we have been brought up in a mythological context where the Lord God definitely does take Himself seriously and is indeed, the serious person. So, that when we go into church, laughter is discouraged in the same way as it is discouraged in court. This is a serious matter and everybody has to have the right expression on their faces because this is the great, great authority figure. This is Grandpa, [imitates old man] and we do not realize that he has a twinkle in his eye. But the basis of it all is this: If we say, “You must survive” or “I must survive,” and “Life is earnest and I have got to go on,” then your life is a drag and not a game.

Now it is my contention and my personal opinion – this is my basic metaphysical axiom, shall we put it that way – that existence – the physical universe – is basically playful.

There is no necessity for it whatsoever. It is not going anywhere; that is to say, it does not have some destination that it ought to arrive at. But it is best understood by analogy with music because music as an art form is essentially playful. We say, “You play the piano.” You do not work the piano. Why? Music differs from, say, travel: when you travel you are trying to get somewhere and, of course, we, because of being a compulsive and purposive culture, are busy getting everywhere faster and faster till we eliminate the distance between places. I mean, with modern jet travel you can arrive almost instantaneously, and what happens as a result of that is that the two ends of your journey become the same place. So you eliminate the distance and you eliminate the journey. Because the fun of the journey is to travel, not to obliterate travel. So the, in music, though, one does not make the end of a composition the point of the composition. If that were so, the best conductors would be those who played fastest, and there would be composers who wrote only finales. People would go to a concert just to hear one crashing chord because that is the end. Say you went dancing – you don’t aim at a particular spot in the room – that’s where you should arrive – the point of dancing is the dance.

Now, but, we don’t see that as something brought by our education into our everyday conduct. We have got a system of schooling which gives it a completely different impression. It’s all graded, and what we do is we put

the child into the corridor of this grade system, with a kind of “Come on, kitty – kitty – kitty.” And you go to kindergarten, and that is a great thing, because when you finish that you will get into first grade; and then “Come on!” First grade leads to second grade, and so on. And then you get out of grade school, you go on to high school, and it’s “revving up,” the thing is coming, and then you go on to college, and by Jove, you get into graduate school, and when you are through with graduate school you go out to join the world. And then you get into some racket where you are selling insurance and they’ve got their quota to make, and you’ve gotta make that. And all the time that thing is coming, it’s coming, it’s coming – that great thing –the success you are working for. Then when you wake up one day, about forty years old, you say, “My God, I have arrived! I am there.” And you do not feel very different from what you always felt, and there is a slight let-down because you feel there’s a hoax. And there was a hoax, a dreadful hoax: they made you miss everything by expectation. Look at the people who live to retire and they put those savings away, and then when they are sixty-five they do not have any energy left, they’re more or less impotent, and they go on and rot in an old people’s – senior citizen’s community.

Because we simply cheated ourselves the whole way down the line. We thought of life by analogy with a journey, with a pilgrimage – which had a serious purpose at the

end. The thing was to get to that end, success, or whatever it is, or maybe Heaven after you are dead, but we missed the point the whole way along. It was a musical thing, and you were supposed to sing or dance while the music was being played. But you had to do “that thing” and you did not let it happen. So this is why the human being sometimes becomes an organism for self-frustration. Let’s take – Korzybski called man a “time binder.” That means that he is the animal peculiarly aware of the time sequence. And as a result of this he is able to do some very remarkable things. He can predict: he studies what has happened in the past and he says the chances are so-and-so of that happening again, and so he predicts. Well, it’s very useful, to be able to predict, because that has survival value, but at the same time it creates anxiety. You pay for this increased survivability involved in prediction by knowing that in the end you will not succeed. You’re all going

to fall apart by one way or another; it might happen tomorrow, it might happen fifty years from now, but it all comes apart in the end. And people get worried about that – they get anxious, so what they gained on the roundabout, they lost on the swings.

So then, if you see on the other hand, that existence – this is, as I said, my basic metaphysical assumption, which I won't conceal from you – that existence is musical in nature, that is to say that it is not serious – it is a play of all kinds of patterns and we can look upon different creatures as we look at different games, as we look at chess, checkers, backgammon, tennis. There is the, the tree game, the beetle game, the grass game. Or you can look at them as different styles of music – mazurkas, waltzes, sonata, etc. All down the line there are all these different things doing their stuff. They're going, "do-do-do-do-do..." in different rhythms. And we're doing that. If you were in a flying saucer from Mars, or somewhere, and you came and looked, tried to make out what was living on this world from about ten thousand feet late at night, or early morning, you would see these great ganglia with tentacles going out all over the place. And early in the morning you would see little blobs of luminous particles going into the middle of them. Then in the late afternoon or early evening it would spit them all out again. And they'd say, "Well, this thing breathes, and it does it in a special rhythm. It goes in – and – out, in – and – out, and in – and – out, once every twenty – four hours. But then it rests a day and doesn't spit so much, it just spits in a different way. There is a kind of irregularity, and then it starts spitting all over again the same way." They would say, "Well, that is very interesting, but that is just the kind of thing we have. This is something that goes this way, and then goes that way."

Now, existence, you see is something that is spontaneous. The Chinese word for nature is tzu-jan. It means that which happens of itself. Your hair grows by itself, your heart beats by itself. You breathe – pretty much by itself. Your glands secrete their essences by themselves – you do not have voluntary control over these things, and so we say it happens spontaneously. So, when you go to sleep and you try to go to sleep you interfere with the spontaneous process of going to sleep. If you try to breathe real hard you will find you get balled-up in your breathing. So if you are to – if you gotta be human, you just have to trust yourself to have bowel movements and go

to sleep, and digest your food. Of course if something goes seriously wrong and you need a surgeon that is another matter, but by and large the healthy human being does not right from the start of life need surgical interference. And he lets it happen by itself, and so with the whole picture that is fundamental to it. You have to let go and let it happen, because if you don't, you're going to be all clutched up.

Then you gotta be constantly trying to do what can happen healthily only if you do not try. And when people – when you think a bit about what people really want to do with their time, what they do when they are not being pushed around and somebody is telling them what to do, they like to go – they like to make rhythms. They listen to music and they dance or they sing, or perhaps they do something of a rhythmic nature like playing cards, bowling, or raising their elbows. Everybody wants to spend their time swinging. That's the nature of this whole thing we're in. You see, he likes the swings. That's why he does it.

Seeing Through the Net

Now, what I want to do is have a mutual brain-picking session and I'm going to start the ball rolling by saying why I, as a philosopher, am interested in many things that you are all probably interested in professionally. Basically, what we are going to talk about I suppose, is the problem of control, as exemplified in the ancient Latin question *Quis custodiet custodiet ipsos?* – “Who guards the guards?”

Now, we know that we are living in an age when there has been an enormous proliferation of techniques for subjecting every kind of natural process outside the human skin, and now increasingly inside the human skin, to some form of rational control. And as we succeed in doing this, it also becomes apparent that we are failing, that the process becomes of such a high degree of complexity that we begin to feel that we are standing in our own way. That everybody complains, the state of affairs in the modern world, in the technological world is so complicated that nobody can understand it, and nobody really knows what to do. That for example, you want to run a small business and you find you run in to such enormous legal hassles that you need so many secretaries to do the paperwork that you can

hardly do the business. That you're trying to run a hospital, but that you have to spend so much time making records and writing things down on paper that you don't have much time to practice medicine. That you're trying to run a university and the requirements, the recording, the endless red tape of the registrar's office in the administration building is such that the actual work of research and teaching is seriously hampered.

So individuals increasingly feel themselves obstructed by their own cautiousness. This is basically what it is. Now, to explain myself first of all, because most of you are strangers to me, I am a philosopher who has for many years been interested in the mutual fructification of Eastern cultures and Western cultures, studying Oriental ideas, not in the spirit of saying to the West, "You ought to be converted to Oriental ideas," but in the spirit of saying, "You don't understand the basic assumptions of your own culture if your own culture is the only culture you know." Everybody operates on certain basic assumptions, but very few people know what they are. You can say, very often encounter the sort of character who is an American businessman, and he says, "Well, I'm a practical businessman. I believe in getting results and getting things done, and all this high-falutin' logic and nonsense is of no concern to me." Now I know that the practical basic assumptions, the metaphysics of that man, can be defined as pragmatism, as a school of philosophy. But it's bad pragmatism because he has never thought it through. And so, it is very difficult, you see, to get down to what are your basic assumptions? What do you mean by the good life? What do you mean by consistency? What do you mean by rationality? The only way of finding out what you mean by these things is by contrasting the way you look at something to the way it is looked at in another culture.

Therefore, we have to find cultures which are in some ways as sophisticated as our own but as different from our own as possible. And of course for this purpose I always thought that the Chinese were optimal, and the Indians, the East Indians and that, by studying the ideas of these people, and by studying their life goals, we could become more aware of our own. It's the old principle of triangulation, you don't establish the situation of a particular object unless you observe it from two different points of view, and thereby calculate its actual distance from you.

So, by looking at what we are pleased to call the reality of the physical world from these basic standpoints of different cultures, I think we are in a better position to know where we are than if we only have one single line of sight. Therefore, this has been my interest and my background, and arising out of this there has come a further question which I would call “the problems of human ecology.” How is man to be best related to his environment, especially in circumstances where we are in possession of an extremely powerful technology and have therefore the capacity to change our environment far more than anyone else has ever been able to do so? Are we going to end up not by civilizing the world but by Los-Angelezing it? In other words, are we going to foul our own nest as a result of technology? But all of this gets down to the basic question is, really: “What are you going to do if you are God?” If, in other words, you find yourself in charge of the world through technological powers, and instead of leaving evolution to what we used to call in the nineteenth century “the blind processes of nature” – that was begging the question, to call them blind – but at any rate, we say we are not going to leave evolution anymore to the blind forces of nature. But now we are going to direct it ourselves, because we are increasingly developing, to say, control over genetic systems, control over the nervous system, control over all kinds of systems. Then, simply, “What do you want to do with it?” But most people do not know what they want, and they have never even seriously confronted the question of what they want. You ask a group of students to sit down and write a solid paper of twenty pages on “What is Your Idea of Heaven”, what would you really like to happen, if you could make it happen. And that’s the first thing that starts people really thinking because you soon realize that a lot of the things you think you would want are not things they want at all. Supposing, just for the sake of illustration, you had the power to dream every night any dream you wanted to dream. And you could, of course, arrange for one night of dreams to be seventy-five years of subjective time, or any number of years of subjective time. What would you do? Well, of course you would start out by fulfilling every wish. You would have routs and orgies, and all the most magnificent food and sexual partners and everything you could possibly imagine in that direction. When you got tired of that after several nights, you would switch a bit and you would soon find yourself involved in adventures, and contemplating great works of art, fantastic mathematical conceptions, you would soon be rescuing princesses from a dragons and all

sorts of things like that, and now you would say, “Now, tonight what we are going to do is we are going to forget this dream is a dream, and we are going to be really shocked.” And when you woke up from that one you would say, “uuu, wasn’t that an adventure!” Then you would think more and more far of ways to get involved and let go of control, knowing that you would always come back to “center” in the end. But while you were involved in the dream you would not know you were going to come back to center, be in control, and so eventually you would be dreaming a dream in which you found yourselves sitting around in this room listening to me talking or involved with the particular life problems which you have. And maybe that’s what you are doing.

But there is a difficulty, you see, the difficulty of control. Are you wise enough to play at being God? And to understand what that question means. We’ve to go back to metaphysical assumptions underlying Western common sense. And whether you are a Jew, or a Christian, or an agnostic, or an atheist you are not uninfluenced by the whole tradition of Western culture. The models of the universe, which it is employed, which influence our very language, the structure of our thought, the very constitution of logic, which are going into, say computers. The Western model of the universe is political, and engineering or architectural. It’s natural for child to ask his mother “How was I made?” It would be inconceivable for a Chinese child to ask, “How was I made?” It might ask “How was I grown?” or “How did I grow?” but not “How was I made?” as if I were an artifact, something put together, something which is a construct.

But all Western thought is based on the idea that the universe is a construct, and even when we got rid of the idea of the constructor, the personal God we continue to think of the world in terms of a machine, in terms of Newtonian mechanics, and later in terms of what we call quantum mechanics, although I find it rather difficult to understand how quantum theory is in any sense “mechanics.” It is much more like “organics,” which is to me a different concept. However that may be, it is percolated, you see, into the roots of our common sense. That the world is a construct, it is an artifact. And therefore as one understands the operations of a machine by analysis of its parts, by separating them into their original bits, we have “bitted” the cosmos, and see everything going on in terms of bits, bits of

information. And I have found that this is an extremely fruitful enabling us to control what is happening. After all, the whole of Western technology is the result of “bitting.” That’s suppose, you know, you want to eat a chicken you cannot eat the whole chicken at once. You have to bite it, you have to reduce it to bits, which you do not get a cut-up fryer out of an egg, it does not come that way. So what is happen is this, that we don’t know the origins of all this, it may be go back a thousands of years. The way we develop the art of thinking, which is essentially calculus is this: the universe as it comes in nature, the physical universe, is something like a Rorschach blot; it’s all wiggles. We who live in cities are not really used to this because we build everything in straight lines, and rectangles, and so on. Wherever you see this sort of things, you know human beings have been around because they are always trying to straighten things out.

But nature itself is clouds, is water, is the outlines of continents, is mountains, is a biological existences, and all of them wiggle. And wiggly things are to human consciousness a little bit of a nuisance because we want to figure them out. And it is as if therefore, some ancient fisherman one day held up his net and looked at the world through the net, he said: “My, just think of that. There I can see the view, and the peak of that mountain is one – two – three – four – five – six holes across, and the base is one – two – three – four – five holes down. I’ve got its number.” See? So the lines of latitude and longitude, lines of celestial and terrestrial, latitude and longitude, the whole idea of a matrix – of looking at things through graph paper printed on cellophane – is the basic idea of measurement. This is the way we calculate. We break down the wiggleness of the world into comprehensible, countable, geometrical units, and thereby figure it and construct it in those terms. And this is so successful up to a point that we can of course come to imagine that this is the way the physical world really is – discreet, discontinuous, full of points, and in fact a mechanism.

But I want to just put into your mind the notion that this may the prejudice of a certain personality type. You see, in the history of philosophy, and poetry, and art we always find the interchanges of two personality types which I call “prickles” and “goo.” The prickly people are advocates of intellectual porcupinism. They want a rigor, they want precise statistics and they have a certain clipped attitude in their voices, and you know, very well

known in academic circles where there are the people who are always edgy like that. And they accuse other people of being disgustingly vague, miasmic, and mystical. But the vague, miasmic, and mystical people accuse the prickly people of being mere skeletons with no flesh on their bones. They say, "You just rattle. You are not really a human being. You know the words but you don't know the music." So therefore, if you belong to the prickly type, you hope that the ultimate constituent of matter is particles. If you belong to the gooey type you hope it is waves. If you are prickly you are a classicist; and if you are gooey you are a romanticist. Going back into medieval philosophy, if you are prickly you are a nominalist; if you are gooey you are a realist, and so it goes.

But we know very well that this natural universe is neither prickles nor goo exclusively. It is gooey prickles and prickly goo. You see, all depends on your level of magnification. If you have got your magnification on something so that the focus is clear, you have got a prickly point of view, you've got structure and shape clearly outlined and sharply defined. You go a little out of focus and it goes blaa, and you've got goo. But we are always playing with the two because, it's like the question is "Is the world basically stuff, like matter, or is it basically structure?" We find out, of course today that in science we don't consider the idea of matter of being some sort of stuff because, supposing you wanted to describe "stuff", what terms would you use to describe it? You always have to describe it in terms of structure, something countable, something that can be designated as a pattern. So we never get to any basic stuff. It seems to me that this way of thinking is based on a form of consciousness which we could best call "scanning." The capacity to divide experiences into bits is somehow related to a physical facility which corresponds to the sweeping of a radar beam, or a spotlight, over the environment. The advantage of the spotlight is it gives you intensely concentrated light on restricted areas. A floodlight, by comparison, has less intensity. But if you examine, say this room were in total darkness, and you used the spotlight with a very thin beam and you scanned the room with it, you would have to retain in memory all the areas over which it passed and then, by an additive process, you would make out the contours of the room.

Now it seems to me that this is something in which civilized man, both in the East and in the West, has specialized. In a method of paying attention to things which we call “noticing,” and therefore it is highly selective. It picks out, features in the environment which we say are noteworthy and which we therefore register with a notation, be it the notation of words, the notation of numbers, or such a notation as algebra or music. We notice those things, only those things, for which we have notation. When very often child will point at something and say to its parents, “What is that?” and they are not clear what the child is pointing, the child has pointed to something which we consider that is not a “thing.” The child has pointed to, say an areas of funny pattern on a dirty wall, and has noticed a figure on it. But the child does not have a word for it and says, “What’s that?” The adult says, “Oh, that’s just a mess,” because that does not count for us as a thing. When you come through this understanding: “What do you mean by a thing?”, it is very fascinating to ask children: “What do you mean by the thing?” and they do not know because it is one of the unexamined suppositions of the culture. “What do you mean by an event?” Well, everybody knows what an event is but nobody can say, because a thing is a “think.” It is a unit of thought, like an inch is a unit of measurement. So we “thing” the world, which is to say that in order to measure a curve you have to reduce it to point instance, and apply the calculus, so in exactly the same way, in order to discuss or talk about the universe you have to reduce it to things. But each thing, or “think,” is, as it were, one grasp of that spotlight, going yeh-yeh-yeh, like this, you see. So, we reduce the infinite wiggleness of the world to grasps, or bits, we are getting back to biting, you see, the idea of teeth, to grasp of thoughts. So we thereby describe the world in terms of things, just as that fisherman could describe his view by the number of net-hole over and through which the view was showing, and this has been the immensely and apparently successful enterprise of all technological culture, superbly emphasized by ourselves.

The Western model of the universe is political, and engineering or architectural. And therefore as one understands the operations of a machine by analysis of its parts, by separating them into their original bits, we have “bitted” the cosmos, and see everything going on in terms of bits, bits of information. And I have found that this is an extremely fruitful enabling us

to control what is happening. After all, the whole of Western technology is the result of “bitting.” And so we “thing” the world, that is to say that in order to measure a curve you have to reduce it to point instance, and apply the calculus, so in exactly the same way, in order to discuss or talk about the universe you have to reduce it to things. But each thing, or “think,” is, as it work, one grasp of that spotlight, going (yeh-yeh-yeh) like this, you see. So, we reduce the infinite wiggleness of the world to grasps, or bits, we are getting back to biting, you see, the idea of teeth, to grasp of thoughts. So we thereby describe the world in terms of things, just as that fisherman could describe his view by the number of net-hole over through which the view was showing.

But the problem that arises is this: first of all, very obviously, everybody knows , I hardly need to mention it, go to the science of medicine. You’ve got a specialist who really understands the function of the gallbladder and has studied gallbladders ad infinitum, and he really thinks he knows all about it. But whenever he looks at a human being he sees them in terms of gallbladder. So, if he operates on the gallbladder, he may do so very knowledgeably about that particular area of your organism but he does not foresee the unpredictable effects of this operation in other connected areas, because the human being’s gallbladder is not a “thing” in the same way as a spark plug in a car can be extracted and a new one replaced. Because the system isn’t the same. There is a fundamental difference between a mechanism and an organism, which can be described operationally. A mechanism is assembled; you add this bit to that bit, to that bit, to that bit. But an organism grows, that is to say, when you watch in a microscope a solution in which crystals are forming, you do not see this thing of little bits coming, coming, coming and drawing each other, and finally making up a shape. You see a solution where, it is more like watching a photographic plate developing. Suddenly the whole area which you are watching seems to organize itself, to develop, to make sense, moving from the relatively simple and gooey to the relatively structured and prickly. But not by addition.

So then, if we are trying to control and understand the world through conscious attention which is a scanning system, which takes in everything bit, bit, bit, bit, bit, what we are going to run into is, if that’s the only

method we rely on, everything is going to appear increasingly to complicated to manage. So that you get for example, let us take the problem of the electronics industry. The catalogs of products that are being produced over the world by the electronic industry. Who has read all the catalogs? How do you know whether something you are working on is patented or not? Who else has taken out a patent? Has anybody had time to read all the catalogs? Well nobody has, they are just voluminous, and it is exactly the same in almost any other field. There is an information explosion like the population explosion, how on earth are you going to scan all that information? Yes, of course, you can get computers to help you in this direction but by Parkinson's Law the sooner you become more efficient in doing this, the more the thing is going to develop, so that you will have to have more efficient computers still to assimilate all the information. You may get ahead, but only for a short time.

So you see there's this problem of the sort of competition of consciousness, of it's—how fast can you go doo-te-doo doo-te-doo de doo-te-doo de doo-te-doo de doo-te-doo and keep track of it, you see? You say, 'I've got a good memory, I can keep track of that.' And you say to you, 'I'll bet you you can't, I'll go more complicated than you.' Musicians do this, drummers you know? And they get things going, and they start—so long as they can count, and lots of musicians do count, it's crazy, but they do—and they count count count and they out-complicate each other to the point where, you can't retain it any longer in memory. So you say, 'OK, if I can't retain it we've got this gadget here that can, and we've got these um marvelous mechanical memories and they'll retain it. They'll go much more fancy, they'll go de doo-te-doo at a colossal speed zwwiiip like that, you see? But it's the same old problem. Because you'll get something that can outdo that.

So we end up asking that, yes. But supposing if there were some other way of understanding things. Let us go back from the spotlight to the floodlight, to the extraordinary capacity of the human nervous system to comprehend situations instantaneously without analysis, that is to say without verbal or numerical symbolism of the situation in order to understand it. I hope you understand what I mean. We – we do do that. We have this curious ability of pattern recognition, which the mechanical systems have only in a very primitive way. Xerox have put out a machine which recognizes figures

written in almost anyone's handwriting provided their handwriting is a fairly grade-school and normal. But a computer has a terrible time trying to recognize the letter "A" when it is printed in say, san serif, gothic, longhand, or whatever kind of "A" you may write. The human recognizes instantly this pattern but the computer is at a disadvantage here. It seems to lack a kind of capacity I would call "field organization" because it is all punctive, it's digital, dut dut dut dut, like a newspaper photograph which, when you look at it under a microscope, is all dots. So the problem is this: in developing technology, are we leaving out of consideration our strongest suit, which is the brain itself. See, we are in a situation where the brain is still not really worked out by even the most competent neurologists. It puzzles them, they cannot give a model of the brain in numerical or verbal language. Now, you are that, you see? You are this thing, you yourself are these things which you yourself cannot figure out. In the same way that I cannot touch the tip of this finger with the tip of this finger, I can't bite my own teeth. But I who is attempting to touch the tip of this finger with this finger am by the sheer complexity of my structure far more evolved than any system which I can imagine. This is, in a way, slightly akin to the "girdle theorem", that you cannot have a system of logic, which defines its own axioms. The axioms of any given system must always be defined in terms of a higher system. So you are the most complex thing that has yet been encountered in the cosmos, and you can't figure you out.

Now let us suppose that we are going to try to do that and become, as it were, completely transparent to ourselves so that we could entirely understand the organization or the mechanics of our own brains. What happens when we do that? Well, you are back in the situation of God, and when you are God what are you going to do? When you're God, what you're going to do: you are going to say to yourself, "Man, get lost." Because what you want is a surprise, and when you have figured everything out there will be no more surprises, you will be completely bored. But on the other hand, a person, I would say, who is really functioning completely is basically a person who trusts his own brains and permits his brain to operate at a more optimal level. In other words, he knows how to think things out but he makes his best discoveries without thinking. In other words, you all know very well the processes of creative invention, you've got a problem you think it over but you can't find any answer to it because

the digital system of thinking is too simple, too clumsy to deal with it. It's more complex, there're more variables than can be kept in mind at one time, so you say, "I will sleep on it." Or you go to the Institute of Advanced Studies at Princeton, or of Behavioral Sciences at Stanford, where they paying to goof off, which is an excellent idea. And you moon around and you've got a blackboard and you look out and pick your nose and so on, and your brain eventually hands you the solution to the problem. And you immediately, because you have the technical knowledge, you recognize that's a solution. Then naturally you go back and check it and you work it out in the bit-by-bit form of thinking on it and see if does it come out in those terms. And if it does, everybody will agree with you, "Yes, that is the answer." But if it doesn't come out in those terms they will not agree with you because you have not subjected it to the socially acceptable traditional form of analyzing knowledge.

But here is the problem. It takes an awfully long time to check these things out, it takes an awfully long time to arrive at the solution which you've got, like that, by a purely calculated process. Most of the situations in life are such that they do not wait for us to make up our minds. So an enormous amount of carefully worked-out scientific knowledge is trivial. It is all very well, very finely worked out, but much too late because life presents you, life comes at you from all sides, all over everywhere at once. And the only thing you've got to deal with that is the thing inside here, in the skull.

Now, I am not saying this, to put down all this marvelous work of calculation, brought to immense sophistication electronically and so on. No at all, because actually, you people are the first people to understand the limitations of their own kind of knowledge, and you are going to have to tell the politicians about this, they don't understand. They think that this kind of knowledge is the answer to everything and I think most of us know it is not. Which is not something, I repeat, against technology. I'm only saying, when you walk you put your right foot forward, and that is fine, but then you must put your left foot forward. So that's say, the great technological enterprise has been putting the right foot forward but you must bring up the left foot, that is to say, bring up reevaluation, a new respect for the organic type of organization which is incomprehensible to technological thinking but which always underlies it. That by itself doesn't

work because after you bring the left foot up you have again got to bring up the right foot, the analytic, after goo comes prickles, and after prickles comes goo. We have to keep these things up.

I think our danger at the present time is that we are so heady, so delighted with the results of prickles, that we have to allow a little bit of goo back into the system. Well now, what we have to try and do is, I think, to work out a way of making the brain itself more efficient, and this is the thing that civilized education has neglected. Lynn White, I have to quote him again, used to say that, the academic world today only values three kinds of intelligence: verbal intelligence, mnemonic intelligence, in other words remembering, and computational intelligence. He said it entirely neglects kinesthetic intelligence, social intelligence, and at least seven other kinds of intelligence. But it is the extraordinary capacity of the neural organization say, to engage in pattern recognition and in solving instantly certain complex problems without knowing how it does it. The trouble is, when you do something you do not know how to do, you've got a non-repeatable experiment, in a certain sense. In other words, you cannot explain to someone else how to put it together, but you can do it like you can open and close your hand without any knowledge of physiology. You do it every time. Oops, I don't know how you do it, I just do it, you see? So we have an enormous potential of intelligence, of knowing how to do all sorts of things, which to the extent that we are academically minded people, we will not allow ourselves to do because we cannot explain it. For example, there is a way of cooling a blazing furnace, very simple, but engineers say it is theoretically impossible, it cannot happen, it's like bees that cannot fly by the laws of aerodynamics but they do. So, the rather practical issue I come to is this: that technology, if it relies exclusively on linear thinking, is going to destroy the environment. It is going to become too complicated to handle, man is going to be like the dinosaur which had to have a brain in its head and a brain in its rump because it was so big. You know, the caveman kept a dinosaur, and when he went to bed at night he'd clump it on the tail with a club, and it would scream at eight o'clock in the morning, wake him up. It seems to me we are getting into that kind of saurian situation with our technology, which it is going to lead us to extinction.

So the question is: are we going to foul things up by insisting on using linear input, information and controlling it, as the dominant tool of controlling the world? Or can we master all that as we have done and still use the linear input and analysis but with a fundamental trust in our power to assimilate multiple inputs, although we really do not know how we do it? My point is that you cannot find an absolute which you can pin down, you see, so there always remains in any human operation the basic central thing which you cannot pin down because it is you, just as teeth cannot bite themselves. Now, the assumption of Judeo-Christian culture is that man in his nature is sinful, and therefore cannot be trusted. The assumption of at least ancient Chinese culture is that man in his essential nature is good, and therefore has to be trusted. Because they say to us, "If you cannot trust your own basic nature you cannot really rely on the idea that you are untrustworthy, therefore you are hopelessly fouled up." So this has an amazing political and other consequences, this different assumption. If we say, "No, we human beings are fallible, and basically selfish, and really, really fundamentally evil, therefore we need law and order and a control system to put us in order." We thereby project these control systems onto the church or the police, or onto somebody who is really ourselves disguised. They are like daylight saving time. Everybody could simply get up an hour earlier, but instead of doing that we alter the clock because a clock is a kind of authority, and we say "Well, the clock says it is time for you to get up." The Indians, the Amer Indians laugh at the "palefaces" because they say, "The paleface, he doesn't know when he is hungry until he looks at his watch." So in this way we become clock-dominated, and the abstract system takes over from the physical, organic situation. And this is my big pitch, if I'm gonna make a big pitch, is that we run into a cultural situation where we have confused the symbol with the physical reality, the money with the wealth, and the menu with the dinner, and we are starving on eating menus.

Myth of Myself

I believe that if we are honest with ourselves, that the most fascinating problem in the world is "Who am I?" What do you mean, what do you feel when you say the word "I", "I, Myself"? I do not think there can be any more fascinating preoccupation than that because it is so mysterious, it's so

elusive. Because what you are in your inmost being escapes your examination in rather the same way that you can not look directly into your own eyes without using a mirror, you can't bite your own teeth, you can't taste your own tongue and you can't touch the tip of this finger with the tip of this finger. And that is why there is always an element of profound mystery in the problem of who we are. This problem has fascinated me for many years and I have made many enquiries "What do you mean by the word I?" And there is a certain consensus about this, a certain agreement, especially among people who live in Western civilization.

Most of us feel "I" – ego, myself, my source of consciousness – to be a center of awareness and of a source of action that resides in the middle of a bag of skin and so we have what I have called the conception of ourselves as a skin-encapsulated ego. It is very funny how we use the word "I", if we just refer to common speech, we are not accustomed to say, "I am a body." We rather say, "I have a body." We do not say, "I beat my heart" in the same way as we say, "I walk, I think, I talk." We feel that our heart beats itself, and that has nothing very much to do with "I." In other words, we do not regard "I, myself" as identical with our whole physical organism. We regard it as something inside it, and most Western people locate their ego inside their heads. You are somewhere between your eyes and between your ears, and the rest of you dangles from that point of reference. It is not so in other cultures. When a Chinese or Japanese person wants to locate the center of himself, he points (here, not here, here) to what Japanese call the kokoro or the Chinese call shin, the heart-mind. Some people also locate themselves in the solar plexus, but by and large we locate ourselves behind the eyes and somewhere between the ears. As if within the dome of the skull there was some sort of arrangement such as there is at the SAC (Air Force) headquarters in Denver where there are men in great rooms surrounded with radar screens and all sorts of things, and earphones on, watching all the movements of planes all over the world. So, in the same way, we have really the idea of ourselves as a little men inside our heads who has earphones on which bring messages from the ears, and who has a television set in front of him which brings messages from the eyes, and all sorts of electrode things all over his body giving him signals from the hands, and so on. He has a panel in front of him with buttons and dials and things, and so he more or less controls the body. But he is not the same as the body

because “I” am in charge of what are called the voluntary actions, and what are called the involuntary actions of the body they happen to me. I am pushed around by them, but to some extent also I can push my body around. This, I have concluded, is the ordinary, average conception of what is one’s self.

Look at the way children, influenced by our cultural environment, ask questions. “Mommy, who would I have been if my father had been someone else?” You see, the child gets the idea from our culture that the father and mother gave him a body into which he was popped at some moment; whether it was conception or whether it was parturition is a little bit vague, but there is in our whole way of thinking the idea that we are a soul, a spiritual essence of some kind, imprisoned inside a body. And that we look out upon a world that is foreign to us, in the words of the poet Housman: “I, a stranger and afraid, in a world I never made.” So therefore we speak of confronting reality, facing the facts. We speak of coming into this world, and this whole sensation that we are brought up to have of being an island of consciousness locked up in a bag of skin, facing outside us, a world that is profoundly alien to us in the sense that what is outside “me” is not me, this sets up a fundamental sensation of hostility and estrangement between ourselves and the so-called external world. Therefore we go on to talk about the conquest of nature, the conquest of space, and view ourselves in a kind of battle array towards the world outside us. I shall have much more to say about that in the second lecture, but in the first now I want to examine the strange feeling of being an isolated self.

Now actually it is absolutely absurd to say that we came into this world. We did not: we came out of it! What do you think you are? Supposing this world is a tree. Are you leaves on its branches or are you a bunch of birds that settled on a dead old tree from somewhere else? Surely everything that we know about living organisms – from the standpoint of the sciences – shows us that we grow out of this world, that we, each one of us, are what you might call a symptoms of the state of the universe as a whole. But you see, that is not part of our common sense.

Western man has, for many centuries, been under the influence of two great myths. When I use the word “myth” I don’t necessarily mean falsehood. To

me the word myth signifies a great idea in terms of which man tries to make sense with the world; it may be an idea, it may be an image. Now the two images which have most profoundly influenced Western man are: number one – the image of the world as an artifact, like a carpenter’s table or a jar made by a potter. Indeed, in the Book of Genesis there comes the idea that man was originally a clay figurine made out of the Earth by the Lord God who then breathed into this clay figurine and gave it life. The whole of Western thought is profoundly influenced through and through by the idea that all things – all events, all people, all mountains, all stars, all flowers, all grasshoppers, all worms, everything – are artifacts; they have been made. And it is therefore natural for a Western child to say to its mother, “How was I made?” That would be quite an unnatural question for a Chinese child, because the Chinese do not think of nature as something made. They look upon it as something that grows, and the two processes are quite different. When you make something you put it together: you assemble parts, or you carve an image out of wood or stone, working from the outside to the inside. But when you watch something grow, it works in an entirely different way. It doesn’t assemble parts. It expands from within and gradually complicates itself, expanding outwards, like a bud blossoming, like a seed turning into a plant.

But behind our whole thought in the West is the idea that the world is an artifact, that it is put together by a celestial architect, carpenter, and artist, who therefore knows how it was done. When I was a little boy and I asked many questions which my mother could not answer, she used to resort in desperation to saying, “My dear, there are some things that we are not meant to know,” and I would say, “Well, will we ever find out?” And she said, “Yes, when we die and we go to Heaven it will all be made clear.” And I used to think that on wet afternoons in Heaven we would all sit around the throne of grace and say to the Lord God, “Now, just why did you do it this way, and how did you manage at that?” and He would explain it and make it all very clear. All questions would be answered because, as we have in popular theology understood the Lord God, He is the mastermind who knows everything. And if you ask the Lord God exactly how high is Mount Whitney to the nearest millimeter, He would know exactly like that, and would tell you. Any question, because He is like the Encyclopedia Britannica. Unfortunately, this particular image, or myth, became too much

for Western man because it was oppressive to feel that you are known through and through, and watched all the time by an infinitely just judge.

I have a friend, a very enlightened woman, she is a Catholic convert, but very enlightened Catholic, and in her bathroom she has on the pipe that connects the tank with the toilet seat a little framed picture of an eye. And underneath in Gothic letters is written "Thou God seest me." Everywhere is this eye – watching, watching, watching – watching and judging you, so that you always feel you are never really by yourself. The old gentleman is observing you and writing notes in his black book, and this became too much for the West, became oppressive. They had to get rid of it, and so instead we got another myth, the myth of the purely mechanical universe. This was invented at the end of the eighteenth century, became increasingly fashionable throughout the course of the nineteenth century and well into the twentieth century, so that today it is common sense. Very few people today really believe in God in the old sense. They say they do, but they really hope there is a God, they don't really have faith in God. They fervently wish that there was one, and feel that they ought to believe that there is, but the idea of the universe being ruled by that marvelous old gentleman is no longer plausible. It isn't that anybody has disproved it, but it just somehow does not go with the vast infinitude of galaxies and of the immense light-year distances between them, and so on.

Instead, it has become fashionable, and it is nothing more than a fashion, to believe that the universe is dumb, stupid, that intelligence, values, love, and fine feelings reside only within the bag of the human epidermis, and outside that it is simply a kind of a chaotic, stupid interaction of blind forces. Courtesy of Dr. Freud, for example, biological life is based on something called "libido," which was a very, very loaded word. Blind, ruthless, uncomprehending lust, that's the foundation of the human unconscious, and similarly to thinkers of the nineteenth century like Ernst Hegel, even Darwin, and T.H. Huxley and so on, there was this notion that at the root of being is an energy, and this energy is blind. This energy is just energy, and it is utterly and totally stupid, and our intelligence is an unfortunate accident. By some weird freak of evolution we came to be these feeling and rational beings, more or less rational, and this is a ghastly mistake because here we

are in a universe that has nothing in common with us. It does not share our feelings, has no real interest in us, we are just a sort of cosmic fluke.

And therefore, the only hope for mankind is to beat this irrational universe into submission, and conquer it, master it. Now all of this is perfectly idiotic. If you would think that the idea of the universe has been the creation of a benevolent old gentleman, although He is not so benevolent, He takes sort of “this hurts me more than it is going to hurt you”, sort of attitude to things. You can have that on the one hand, and if that becomes uncomfortable you can exchange it for its opposite, the idea that the ultimate reality does not have any intelligence at all, at least that would get rid of the old bogey in the sky in exchange for a picture of the world that is completely stupid.

Now, these ideas don't make any sense, especially the last one, because you cannot get an intelligent organism, such as a human being, out of an unintelligent universe. The same in the New Testament, that figs do not grow on thistles nor grapes on thorns – applies equally to the world. You do not find an intelligent organism living in an unintelligent environment. Look, here is a tree in the garden, and every summer it produces apples; and we call it an apple tree because the tree “apples” – that's what it does. All right? Now, here is a solar system inside a galaxy, and one of the peculiarities of this solar system is that, at least on the planet earth, it “peoples” in just the same way that an apple tree “apples.” Now, maybe two million years ago, somebody came from another galaxy in a flying saucer and had a look at this solar system, and they looked it over and shrugged their shoulders and said, “Just a bunch of rocks,” and they went away. Later on, maybe two million years later, they came around and they looked at it again and they said, “Excuse me, we thought it was a bunch of rocks but it is peopling, and it is alive after all; it has done something intelligent.” Because you see, we grow out of this world in exactly the same way that the apples grow on the apple tree. If evolution means anything, it means that. But you see, we curiously twist it. We say, “Well, first of all in the beginning there was nothing but gas and rock. And then intelligence happened to arise in it like a sort of fungus or slime on the top of the whole thing.” And we are thinking in a way that disconnects the intelligence from the rocks. Where there are rocks, watch out, watch out! because the rocks

are going eventually to come alive and they are going to have people crawling over them. It is only a matter of time, just in the same way as the seed, the acorn is eventually going to turn into the oak because it has the potentiality of that within it. Rocks are not dead.

You see, it depends on what kind of attitude you want to take to the world. If you want to put the world down, you say, "Oh well, fundamentally it is only just a lot of geology, it's a stupidity, and it so happens that a kind of a freak comes up in it which we call consciousness." That is an attitude that you take when you want to prove to people that you are a tough guy, that you are realistic, that you face facts, and that you don't indulge in wishful thinking. It's just a matter of role-playing, and you must be aware of these things; they're fashions in the intellectual world. On the other hand, if you feel warmhearted towards the universe, you put it up, instead of putting it down, and you say about rocks, "They are really conscious, but a very primitive form of consciousness." Because, after all, when I take even this crystal here, which is glass, and go (I tap on it), well it makes a noise. And that response, that resonance is an extremely primitive form of consciousness. Our consciousness is much more subtle than that, but when you hit a bell and it rings, you touch a crystal and it responds, inside itself it has a very simple reaction. It goes "jangle" inside, whereas we go "jangle" with all sorts of colors and lights and intelligence, ideas, and thoughts, it is more complicated. But both are equally conscious, but conscious in different degrees. That is a perfectly acceptable idea. It's just the opposite of the idea, you see, all I am saying is that minerals are a rudimentary form of consciousness, whereas the other people are saying that consciousness is a complicated form of minerals. You see? What they want to do is to say everything is kind of bleh, whereas what I want to say is "Hooray! Let's a life is a good show!"

As we study man or any other living organism and try to describe him accurately and scientifically, we find that our normal sensation of ourselves as isolated egos inside a bag of skin is a hallucination. It really is it's absolutely nutty, because when you describe human behavior, or the behavior of a mouse or a rat or a chicken or anything you want to describe, you find that as you try to describe its behavior accurately, you must also describe the behavior of its environment. Supposing I walk and you want to describe the action of walking, you cannot talk about my walking without

also describing the floor, because if you do not describe the floor and the space in which I am moving all you will be describing is somebody swinging his legs in empty space. So as to describe my walking, you must describe the space in which you find me. You know, you couldn't see me unless you could also see my background, what stands behind me. See, if I myself, if the boundaries of my skin were coterminous with your whole field of vision you would not see me at all. You would see my bright, red vest instead. That's why put it on this evening and to demonstrate this point. And that would be the thing that filled your field of vision, that was the thing standing there, you would not see me, because in order to see me you have to see not only what is inside the boundary of my skin, but you have to see what is outside it too.

Now, that is terribly important. Really, the fundamental, ultimate mystery – the only thing you need to know to understand the deepest metaphysical secrets – is this: that for every outside there is an inside and for every inside there is an outside, and although they are different, they go together. There is, in other words, a secret conspiracy between all insides and all outsides, and the conspiracy is this: to look as different as possible, and yet underneath to be identical. Because you do not find one without the other. Like Tweedledum and Tweedledee agreed to have a battle. Note that – agreed. So there is a secret: what is esoteric, what is profound, and what is deep is what we will call the “implicit.” What is obvious and in the open is what we will call the “explicit.” And I and my environment, you and your environment are explicitly as different as different could be, but implicitly you go together. And this is discovered by the scientist, when he tries, with the whole art of sciences describe what happens exactly, when he describe exactly what you do, he finds out that you, your behavior, is not something that can be separated from the behavior of the world around you. He realizes then that you are something that the whole world is doing, just as when the sea has waves on it, all right, you see is the ocean is waving. So each one of us is a “waving” of the whole cosmos, the entire works, all there is, and with each one of us it is waving and saying, “Yoo-hoo! Here I am!”, only does it differently each time, because variety is the spice of life.

But you see, the funny thing is we have not been brought up to feel that way. Instead of feeling that we, each one of us, are something that the

whole realm of being is doing, we feel that we are something that has come into the whole realm of being as a stranger. When we were born we do not really know where we came from because we do not remember, and we think when we die that is just going to be that. Some people console themselves with the idea that they are going to Heaven, or that they are going to be reincarnated, summer land or something you know, but people don't really believe that. For most people it is implausible, and the real thing that haunts them is that when they die they will go to sleep and are never going to wake up. They are going to be locked up in the safe deposit box of darkness forever. But that all depends, you see, upon a false notion of what is one's self. Now, the reason why we have this false notion of ourselves is, as far as I can understand it, that we have specialized in one particular kind of consciousness. Being very general, rough, we have two kinds of consciousness. One I will call the "spotlight," and the other the "floodlight." The spotlight is what we call conscious attention, and that is trained into us from childhood as the most valuable form of consciousness. When the teacher in class says, "Pay attention!" everybody stares, and looks right at the teacher (like that). That is spotlight consciousness; fixing your mind on one thing at a time. Concentrate, and even though you may not be able to have a very long attention span, nevertheless you concentrate, you use your spotlight: one thing after another, one thing after another, flip, flip, flip, flip, flip, like that. But we also have another kind of consciousness which I call the floodlight. For example, you can drive your car for several miles with a friend sitting next to you, and your spotlight consciousness will be completely absorbed in talking to your friend. Nevertheless, your floodlight consciousness will manage the driving of the car, will notice all the stoplights, the other idiots on the road, and so on, and you will get there safely without even thinking about it.

But our culture has taught us to specialize in spotlight consciousness, and to identify ourselves with that form of consciousness alone. "I am my spotlight consciousness, my conscious attention; that is my ego; that is me." And very largely we ignore the floodlight. The floodlight consciousness is working all the time, every nerve end that we have is its instrument. You know, you can go out to a luncheon or something, and you sit next to Mrs. So-and-So, and you go home and your wife says to you,

“Was Mrs. So-and-So there?”

“Yes, I sat next to her.”

“Well, what was she wearing?”

“I haven’t the faintest idea.”

You saw, but you did not notice. Now, because we have been brought up to identify ourselves with the spotlight consciousness, and the floodlight consciousness is undervalued, we have the sensation of ourselves as being just the spotlight, just the ego that looks and attends to this and that and the other. And so we ignore and are unaware of the vast, vast extent of our being. People, who by various methods become fully aware of their floodlight consciousness, have what is called “a mystical experience” or a cosmic consciousness or what the Buddhists call bodhi, awakening. The Hindus call it moksha, liberation, because they discover that the real deep, deep self, that which you really are, fundamentally and forever, is the whole of being – all that there is, the works, that is you. Only that universal self that is you has a capacity to focus itself at ever so many different here-and-nows. So, when you use the word “I”, as William James said “is really a word of position like ‘this,’ or ‘here’.” Just as a sun or star has many rays, so the whole cosmos expresses itself in you and you and you, in all the different variations. It plays games: it plays the John Doe game, the Mary Smith game. It plays the beetle game, the butterfly game, the bird game, the pigeon game, the fish game, the star game. Just like these are games that differ from each other just like backgammon, whist, bridge, poker, pinochle; or like the waltz, mazurka, minuet, and so on. It dances with infinite variety, but every single dance that it does, that is to say – you – is what the whole thing is doing. But you see, we forget it, we do not know. We are brought up in a special way so that we are unaware of the connection, unaware that each one of us is the works, playing it this way for a while. So we have been taught to treat death as if that were the end of the show, that won’t happen any more. And therefore to be afraid of all the things that might bring about death: pain, sickness, suffering. And if you don’t know this, if you are not really vividly aware of the fact that you are basically “the works,” you have no real joy in life, you are just a bundle of

anxiety mixed up with guilt, because, you see, when we bring children into the world, we play awful games with them.

Instead of saying, “How do you do? Welcome to the human race. Now my dear, we are playing some very complicated games, and these are the rules of the game we are playing. I want you to understand them, and when you learn them when you get a little bit older you might be able to think up some better rules.” Instead of being quite direct with our children, we say, “You are here on probation, and you must understand that. Maybe when you grow up a bit you will be acceptable, but until then you should be seen and not heard. You are a mess, and you have to be educated and schooled and whipped until you are human.” So these attitudes which are inculcated into us from infancy go on into old age, the way you start out is liable to be the way you finish. So people are going around feeling fundamentally that they do not belong because their parents said to them in the first place, “Look, you don’t really belong here, you are here on sufferance. You are on probation. You are not a human being yet.” And people feel this right on into old age and so they figure that the universe is presided over by this kind of awful God-the-Father parent who has our best interest at heart, he’s loving, but “Who spares the rod, spoils the child. Whom the Lord loveth, He chasteneth.” So, where is it going to hit next? You do not feel that you belong, and so we get this ghastly, what I call, “Christian ego,” and a little bit Jewish, too, who really feels that he is homeless, that he is orphan. Even the Christians say we are sons of God by adoption, grace; not real sons but only by adoption, grace, and sufferance. So there comes a sensation so characteristic of Western man and, indeed, of all highly civilized people, of being a stranger on the earth, a momentary flash of consciousness between two eternal blacknesses.

And so therefore we speak of confronting reality, facing the facts. We speak of coming into this world, and this whole sensation that we are brought up to have of being an island of consciousness locked up in a bag of skin, facing outside us, a world that is profoundly alien to us in the sense that what is outside “me” is not me, this sets up a fundamental sensation of hostility and estrangement between ourselves and the so-called external world.

So, my main point last night was then, that we need a new kind of consciousness in which every individual becomes aware that his real self is not just his conscious ego. You know, let's take a headlight of a car. The headlight shines on the road in front, the headline does not shine on the wire which connects it with its own battery. So, in a way, the headlight is unaware of how it shines, and in the same way we are unaware of the sources of our consciousness. We do not know how we know. There was a young man who said, "Though it seems that I know that I know, what I would like to see is the I that knows me, when I know that I know that I know." And so, we are ignorant of, we ignore, it does not come within the scope of our attention how it is that we manage to be conscious, how it is that we manage to grow our hair, to shape our bones, to beat our heart, and to secrete all the necessary fluids that we need from our glands. We do it, but we do not know how we do it. Because you see, underneath the superficial self, which pays attention to this and that, there is another self more really "us" than "I." And if you become aware of the unknown self – the more you become aware of it – the more you realize that it is inseparably connected with everything else that there is. That you are a function of this total galaxy, bounded by the Milky Way, and that farther more this galaxy is a function of all other galaxies. And that vast thing that you see far off, far off with great telescopes, and you look and look, and one day you are going to wake up and say, "Why, that is me!" and in knowing that you know that you'll never die. You are the eternal thing that comes and goes, that appears now as John Jones, now as Mary Smith, now as Betty Brown; and so it goes, forever and ever and ever.

Most of us are brought up to feel that what we see out in front of us is something that is, that lies beyond our eyes out here. That the colors and the shapes that you see in this room, are out there. Now, in fact that is not so, in fact all that you see is a stated affairs inside your head. All these colors, all these lights are conditions of the optical nervous system. There are outside the eyes quanta, electronic phenomenon, vibrations but these things are not light, there are not color until there are translated into states of the human nervous system. So if you want to know how the inside of your head feels, open your eyes and look, that is how the inside of your head feels. But we are normally unaware of that and project it out.

Man and Nature

In my talk last night I was discussing the disparity between the way in which most human beings experience their own existence, and the way man's being and nature is described in the sciences. I was pointing out that in such sciences as ecology and biology, ecology for example describes and studies the relationship between all organisms and their environments. The way in which they describe human, animal, and insect behavior is in flat contradiction with the way in which most of us experience our thinking, our action, and our existence. We have been brought up to experience ourselves as isolated centers of awareness and action, placed in a world that is not us, that is foreign, alien, other, which we confront. Whereas, in fact, the way an ecologist describes human behavior is as an action. What you do is what the whole universe is doing at the place you call "here and now". You are something the whole universe is doing in the same way that a wave is something that the whole ocean is doing.

This is not what you might call a fatalistic or deterministic idea. You see, you might be a fatalist if you think that you are a sort of puppet which life pushes around. You are separate from life, but life dominates you. That's fatalism. But in the point of view I am expressing, the real you is not a puppet which life pushes around. The real deep down you is the whole universe, and it is doing your living organism and all of its behavior, it's expressing it as a singer sings a song. We have been hoodwinked into the feeling that we exist only inside our skins, and I was showing last night that that is a hallucination. It is just as nutty as anybody could be, like a fruitcake, you know, who thinks he is Napoleon or something another, thinks he is a poached egg and goes around finding a piece of toast to sit on. It is just like that, a hallucination. And I was showing how we need to experience ourselves in such a way that we could say that our real body is not just what is inside the skin but our whole total external environment. Because, if we do not experience ourselves that way, we mistreat our environment. We treat it as an enemy. We try to beat it into submission, and if we do that, comes disaster. We exploit the world we live in, we do not treat it with love and gentleness and respect. We cut down millions of acres of forests to turn it into newspaper, of all things. Lovely trees turned into information about nothing, and we do not replace them properly. We kick

the world around in revenge for feeling that really we are puppets which the world kicks around.

So, my main point last night was then that we need a new kind of consciousness in which every individual becomes aware that his real self is not just his conscious ego. You know, let's take a headlight of a car. The headlight shines on the road in front, the headline does not shine on the wire which connects it with its own battery. So, in a way, the headlight is unaware of how it shines, and in the same way we are unaware of the sources of our consciousness. We do not know how we know. There was a young man who said, "Though it seems that I know that I know, what I would like to see is the I that knows me, when I know that I know that I know." And so, we are ignorant of, we ignore, it does not come within the scope of our attention how it is that we manage to be conscious, how it is that we manage to grow our hair, to shape our bones, to beat our heart, and to secrete all the necessary fluids that we need from our glands. We do it, but we do not know how we do it. Because you see, underneath the superficial self, which pays attention to this and that, there is another self more really "us" than "I." And if you become aware of that unknown self – the more you become aware of it – the more you realize that it is inseparably connected with everything else that there is. That you are a function of this total galaxy, bounded by the Milky Way, and that furthermore this galaxy is a function of all other galaxies. And that vast thing that you see far off, far off with telescopes, and you look and look, one day you are going to wake up and say, "Why, that's me!" and in knowing that you know, you see, that you never die. You are the eternal thing that comes and goes, that appears now as John Jones, now as Mary Smith, now as Betty Brown; so it goes, forever and ever and ever.

Now then, why I made this point as an introduction to what I want to say tonight is the problem of the relationship of man and nature. You know, in the history of philosophy there are really three theories of nature. Incidentally, what do you mean when you use the word "nature"? What is nature study, natural history, the Museum of Natural History, what do you expect to find there? Well, for many people nature means the birds, the bees, and the flowers. It means everything that is not artificial. People think, for example, a building like this is not natural; it is artificial. The natural

state of the human being is to be naked, but we wear clothes, and that's artificial. We build houses. Is there any difference between a human house and a wasp's nest or a bird's nest? Not really, but we do have in our minds, you see, the idea that nature is somehow outside us. We have got some nature in us, and we say there is a thing called human nature, that's mostly bad. Human nature, according to Dr. Freud, is motivated by the libido, and you know what that is and you cannot trust it. In the old days they used to beat it with whips, but Freud said, "Don't do it that way! You have to treat it as a good horse trainer trains a horse by giving it a lump of sugar every now and then, and get it control that way. Be kind to it and respect it, even though it is really very, very disrespectful."

Well now, there are, as I said, in the history of the mankind, three theories of nature. The first theory is the Western theory, which is that nature is a machine, or an artifact. We inherit this from the Hebrews who believed that nature was made by God in somewhat the same way as a potter makes a pot out of clay or a carpenter makes a table out of wood. It is not insignificant that Jesus is the son of a carpenter. Our tradition has been to look upon the world as a construct and somebody knows how it was put together. Somebody understands and that is the constructor, the architect, the Lord God. But it so happens that in the eighteenth century Western thought began to change. They became increasingly doubtful as to whether there was a maker – whether there was a God – but they continued to look upon the creation as an artifact, as a machine. And by the time of Newton, people were explaining the world in terms of mechanism and we are still under the influence of that idea because after all, things like life magazines and so on, when they give you an article on human physiology, they usually make drawings which show the human being as a kind of mechanism, as a sort of factory. And they show how the peristaltic action carries the food in and how it is processed by this organ and that organ, as just as if a certain product is fed into a factory, a cow at one end and comes out canned corned beef at the other. Just in such a way the human is illustrated and so in some kinds of rather degraded medicine, that is now practiced, when you go to the hospital for a medical examination, you are treated as a machine, they process you. You are not a person, you are putted in a wheelchair immediately even if you are perfectly healthy and can walk, nevertheless they have to have you in this wheelchair. And they put you through a

process and the heart specialist looks only at your heart, because he can't understand anything else. The otorhinolaryngologist, which means an ear, nose, and throat man, looks at that section of you, and he does not know about anything else. Then maybe a psychiatrist takes a look at you and goodness knows what happens there; and so on, and so on. Everybody looks at you from their specialized point of view as if they were a bunch of mechanics examining your automobile. Because as I said last night, we just ask for this because most of us consider ourselves as chauffeurs inside our bodies, which we own in the same way as we own a car. And when it goes wrong we take it to the mechanic to fix it. You don't really identify with our body, just as we do not really identify with your car. So here is this whole theory of nature which has grown up in the West, as an artifact, something made.

Now let me take a second theory of nature. This is an Indian theory, East Indian. Nature not as an artifact but as drama. Basic to all Hindu thought is the idea that the world is Maya. That is a Sanskrit word which means many things. It means magic, illusion, art, play. All the world is a stage, and in the Hindu idea of nature there is, the ultimate reality of the universe is the self which they call brahman, or atman. That is what there is; the Self – universal, eternal, boundless, indescribable – and everything that happens, happens on the Self, like you say “It's on me, the drinks tonight are on me,” or like we say when you hear the radio, “It's on the speaker.” You see, everything you hear on the radio, flutes, drums, human voices, traffic noises, any imaginable sound, all those sounds are vibrations of the diaphragm in the speaker. But the radio does not tell you that. The announcer does not come on and say every morning “Good morning, ladies and gentlemen, this is KQED. The following sounds that you are going to hear are vibrations of the diaphragm in your speaker, and they are not really human voices or musical instruments, but just that.” They never let you in on that, and in exactly the same way, the universe does not let you in on the truth that all sense experiences are vibrations of the self; not just your self, but the Self, and all of us share this Self in common because it is pretending to be all of us. Brahman, the ultimate principle, plays hide and seek eternally, and he does it for unspeakably long periods of time. The Hindus measure time in what is called a kalpa; K A L P A, that is 4,320,000 years. Don't take this seriously, this not meant to be taken literally, but just for an

unspeakably long time. The brahman, the self, pretends that it is lost, and is us. And all of our adventures and all our troubles, and all our agonies, tragedies, it gets mixed up in. Then, after the period of 4,320,000 years has elapsed, there is a catastrophe. The universe is destroyed in fire, and after that the Brahman wakes up and says, "Well, good, crazy! What an adventure that was!" He wipes the sweat off his brow and says, "Shwooo, let's rest a while." So, for another 4,320,000 years the Divine Self rests, and knows who It is. It's me. Then It says, "Well, this is rather boring. Let's get going again; let's get mixed up." And it does this in a very strange way because the way the Hindus time it, the first period of getting mixed up, getting lost is beautiful. That is the longest period. Everything is right, just life is glorious. Then there is the next period in which things get a little wonky. Something is vaguely out of order, that doesn't last so long. Then the next period, the third, is when good and evil are equally balanced, and that is still not so long. Finally comes the shortest period when everything bad triumphs, and the whole thing blows up and we begin all over again. We are supposed to be living in that now. It is called the Kali Yuga, the Age of Darkness, and it began on Friday, February the 23rd, 3123 B.C., and it has 5,000 years to run. But as it goes on, time gets faster, so do not worry. So you see, that's the theory of nature as a drama, it's a play.

Now, there is a third theory of nature which is Chinese, and this is very interesting. The Chinese word for nature they call tzu-jan, and this expression means "of itself, so", what happens of itself. Or we might say "spontaneity," it almost means "automatic," because automatic is what is self-moving, only we associate the word "automatic" with machinery. But tzu-jan, what-is-so-of-itself, is associated in the Chinese mind not with machinery but with biology. Your hair grows by itself; you do not have to think how to grow it. Your heart beats by itself; you do not have to make up your mind how to beat it. This is what they mean by nature. A poem says, "Sitting quietly, doing nothing, spring comes, and grass grows of itself." So there are principle of nature called the Tao, T A O, pronounced "dow" in the Mandarin dialect, "tow" in the Shanghai dialect, "toe" in the Cantonese dialect, take your choice.

Tao means the course of nature, and Lao-tzu, who was a philosopher who lived a little later than 400 B.C., wrote a book about the Tao. And he said,

“The Tao which can be spoken is not the eternal Tao.” You cannot describe it. He said the principle of the Tao is spontaneity, he said “the Great Tao flows everywhere, both to the left and to the right. It loves and nourishes all things but does not lord it over them. It accomplishes merits and lays no claim to them.” So there is a very great difference between the Chinese idea of Tao, as the informing principle of nature, and the Judeo-Christian idea of God as nature’s lord and master, because the Tao does not act as a boss. In the Chinese philosophy of nature, nature has no boss. There is no principle that forces things to behave the way they do, it is a completely democratic theory of nature. Correspondingly you see, most Westerners, whether they be Christians or non-Christians, do not trust nature. Of all things nature is the thing least to be trusted. You must manage it. You must watch out for it, it will always go wrong if you do not watch out, you know the goblins will get you if you do not watch out. So, we are always feeling that you can’t trust it. See, we are absolutely instilled with the idea of original sin. You cannot trust nature because it comes out with weeds and insects, and above all, you cannot trust human nature, because if you don’t hold a club over yourself, you go out and rape your grandmother.

Now, the Chinese would say, “If you cannot trust yourself you cannot trust anything, because if you cannot trust yourself can you trust your mistrust of yourself? Is that well-founded?” You see? If you can’t trust yourself, you are totally mixed up. You haven’t a leg to stand on, and you have no point of departure for anything. And in this respect, the Taoist philosophy and the Confucian philosophy are in agreement. In Confucius philosophy, the fundamental virtue of a human being is called jen, spelled J E N, for reasons best known to Chinese scholars. I don’t know what they are, but it is pronounced jen. It is a Chinese character that Confucius placed as the highest of all virtues, higher than righteousness, higher than benevolence, and it means approximately human-heartedness. Now, Confucius once said that “goody-goodies are the thieves of virtue.” Virtue in Chinese is teh, we Romanize it as T E H, and it means virtue not in the sense of moral propriety, but virtue in the sense of magic, as when we speak of the healing virtues of a certain plant. A man of true virtue is therefore a human-hearted man, and the meaning of this is that one should, above all, trust human nature in the full recognition that it is both good and bad, that it’s both loving and selfish.

Now, let me give an illustration of the wisdom of this. When people fight wars, I trust them. If the reason for which they fight a war is to expropriate somebody else's possessions and women, because they will fight a merciful war they will not destroy the possessions and the women that they want to capture. They want to enjoy them. And that's a war based on simple, ordinary, everyday human greed. The most awful wars that are waged, are the wars waged for moral principles. You are a lousy communist, you have a philosophy that is destructive to religion and to everything that we love, and value, and reverence, and therefore we will exterminate you to the last man unless you surrender unconditionally. Such wars are ruthless beyond belief. We can blow up whole cities, wipe people out because we are not greedy, we are righteous. That is why the goody-goodies are the thieves of virtue. If you are going to do something evil, do it for a plain, honest selfish motive. Don't do it in the name of God. Because if you do, it turns you into a monster who is no longer human. A sadist, a pure destroyer. So an inflexibly righteous person is not human. And that is why in Chinese ideas of justice a good judge is not somebody who abides by the book. Their idea of justice is for God's sake keep the case out of court. Let us have a concentration behind the scenes. And let's arrange a compromise. Because we know our opponent is a rascal, I know I am a rascal, and therefore, there can be a mutual arrangement between thieves. So we talk about it, we call the judge in, in an unofficial capacity. And the judge hums and haws and if he is a good judge, he has a sense of what is called Li. I'm going to talk you about another meaning of the word pronounced li later on, but it's quite a different word.

Li is justice, but you cannot write it down. There is another word for justice, or law, in Chinese tzu. And this word represents, in its Chinese character form, a cauldron for cooking sacrifices and a knife. In the high and far-off times of Chinese history there was an emperor who, when the people brought their sacrifices of meat and so on to be put in the cauldrons, he also scratched with a knife on the side of the cauldrons the laws of the state so all the people could read them and understand what they were. But the sages who advised this emperor said that was a very bad thing to do because the moment people see the law written down, they develop a litigious spirit. That is to say, they think out ways of wangling around it, and that's what we do all the time, don't we? The moment Congress passes

a law, a tax law especially, all the lawyers get together and they fill it full of holes. They say, “Well, it did not define this and it did not say that.” And some of those Confucians wanted to put the language in order and to make all the words mean just so. But the Taoists laughed at them and said, “If you define the words, with what words are you going to define the words that define the words?” So they said, therefore, that the emperor should not have written the laws down because a sense of justice is not something you can put in words. It is what our lawyers call “equity,” and if you talk to any lawyer and in discussing various judges around town he will say, “Well, Judge so-and-so is pretty much a stickler for the letter of the law, but on the other hand Judge so-and-so has a sense of equity. He knows when the law, the letter of the law just doesn’t apply to this particular case. And he just has an innate sense of fair play, that is the man to be trusted as a judge.” This is what the Chinese mean by a judge who has the sense of li, of real justice. It cannot be written down, it cannot be explained because every case is individual. But what such a man has fundamentally in his heart, he trusts the good and bad of human nature.

Human beings are complex, we don’t know ourselves at all, really. Consider your nervous system. Neurologists haven’t even begun to figure it out, and yet all of your conscious decisions are based on this thing that you do not understand. You are unbelievably more wise in your nature than you ever will be in your conscious thoughts, because behind your conscious thoughts lies your nervous system. And if you say, “Well, my nervous system is unreliable. It is just a bunch of strange, weird, biological chances that have become mixed up somehow,” then this very opinion that you are expressing, you see, is a function of that nervous system. So you are saying that you are a total hoax, you cannot trust yourself at all. So that is a set of game rules that don’t lead anywhere. It’s totally self-frustrating.

So you see, what the Chinese have developed here is a theory of nature, I said there are three theories – the western mechanical theory, nature as an artifact; the Hindu dramatic theory and the Chinese organic theory. Nature, human nature included, is an organism; and an organism is a system of orderly anarchy. There is no boss in it but it gets along by being left alone and being allowed to do its stuff. That is what the Chinese Taoist

philosophy calls wu-wei, which means not doing nothing but not interfering with the course of events, not acting against the grain.

Now this is the time to introduce the second word li in Chinese. The first li meant justice, the second li is a character which had the original meaning of the markings in jade, the grain in wood, and the fiber in muscle. And it's usually translated 'reason' or the 'principle of things', these are not very good translations. The best translation of li is organic pattern. Now look here. When you look at the clouds they aren't symmetrical. They do not form fours and they do not come along in cubes, but you know at once that they are not a mess. A dirty old ashtray full of junk may be a mess but clouds do not look like that. When you look at the patterns of foam on water they never make an artistic mistake and they are not a mess. They are wiggly but in a way, orderly, and it is difficult for us to describe that kind of order.

Now, take a look at yourselves. You are all wiggly. We think that we are pretty ordinary because there are a lot of us who look approximately the same. So when we see a human being we think, "Well, that is pretty much in order" and regular, and it's okay, we don't realize how wiggly we are. We are just like clouds, rocks, and stars. Look at the way the stars are arranged. Do you criticize the way the stars are arranged? Would you like them to form fours? Would you like them to be sort of set out like needlepoint on the canvas of the skies? There were somebody in the eighteenth century, in the days when they built formal gardens of clipped hedges and made all the tulips stand together like soldiers, who criticized the stars for being irregularly arranged, but today we don't feel that way. We love the way the stars are scattered, and they never make a mistake in their arrangement. What about mountain ranges? Do you criticize the valleys for being low, and praise the peaks for being high? You just say, "It is great, it's the way it is." Now, that kind of order the artist pays a tribute by painting a landscape. In every national park there is a place called "Inspiration Point," and people go there and say, "Oh! It's just like a picture!" And nobody knew this four hundred years ago. It took the artists to paint landscapes and then people realized how beautiful it is. Nowadays artists are painting pictures of damp, stained walls and floors where people have dropped a lot of paint. One day people will walk into a room where there is a lot of paint scattered on the

floor and they will say, “My goodness, it is just like a Jackson Pollock. Isn’t it just like a picture?” You see? It always takes the artist to show us the vision, but of course in the meantime, it is difficult. You go to an exhibition of contemporary, nonobjective painting, and a kind of square fellow walks in there and says, “That’s not what I call a picture”, because it is against his prejudices. But I say to people, “Now, excuse me, wait a minute. Take a look at that again. I’m going to tell you something. That painting is a colored photograph...of guess what?” Then they look at it in astonishment with entirely new eyes. What could that be a photograph of? They begins to see that it might be a photograph from a microscope, of globules of germs floating in liquid. It might be anything, very easy it suddenly comes over them. Goodness knows whether that was what the artist intended, but that’s a method of giving people a shock, of seeing things in a new way.

You know, a GI visited Picasso in Paris during the war and said, “I cannot understand your paintings. They are absurd. Life does not look like that.” Picasso said, “Do you have a girlfriend?” He said, “Yes.” “Have you a picture?” He said, “Yes.” “Show it to me.” So he drew out his billfold, and there was a little colored photograph of his girlfriend, and Picasso looked at it and said, “Is she so small as that?”

Now then, the idea of li, the idea of natural order, is like this patterns on foam, patterns in jade, the shapes of the clouds, the shapes of trees and mountains. They are orderly, but we cannot put our finger on the order. We know it is orderly but we do not know why. And we know it’s completely different from a mess. The order of nature is in that way indefinable. When Saint Augustine was asked, “What is time?” he said, “I know what it is, but when you ask me I don’t.” So in the same way the Chinese would say, “We know what the order of nature is, but if you ask us, we don’t.” The poet says, “Picking chrysanthemums along the eastern fence, gazing in silence at the southern hills, the birds fly home through the soft mountain air of dusk.” In all these things there is a deep meaning, but when we are about to express it, we suddenly forget the words. That’s li. Nature as a self-ordering principle, but it does not really know how it does it. Another poem says, “If you want to know where the flowers come from even the God of Spring doesn’t know.” This is a very remarkable attitude to nature. Politically you see, if you translate this into politics it is high philosophical anarchy, and

there is a lot to be said for this as a political point of view. That in other words, government is always a mess because the state opposes itself to the people. We live under a constitution where we are supposed to be governed by ourselves, somebody once said, “Down with democracy, when we get it.” Because the state, the government always creates itself as a business in competition with all the other businesses, and it wins because it is the biggest one of the bunch. The Taoists said of the state that it should be as anonymous and as unobtrusive as possible. That is to say that the emperor instead of going around in processions and being heralded with waving flags, should be as unobtrusive as the head of the sanitation department. You know, he’s a man, a guy who goes around in a plain ordinary suit and really attends to his job. The head of sanitation of the city of Dallas goes around, you don’t have a police escort and sirens blowing and flags waving. He simply does his job. And the feeling of Lao-tzu is that the president or the emperor should have the same kind of attitude. That he should simply help the people and retire, and not claim any merits for it, always withdraw himself, always be behind the scenes. Not striving for power, but simply to help things along. “Govern a great state,” he said “as you would cook a small fish.” Now, you know, when you have a small fish in the frying pan do not keep tossing it around and fidgeting with a spatula, otherwise it will fall apart. Do it gently, softly, softly, catchee monkey.

So then, here is a conception of nature as something you must trust; outside nature – the birds, the bees, the flowers, the mountains, the clouds, and inside nature, human nature. Now nature isn’t trustworthy, completely. It will sometimes let you down with a wallop, but that’s the risk you take, that’s the risk of life. What is the alternative? “I do not trust nature at all. It has got to be watched.” You know what that leads to? It leads to 1984 and Big Brother, it leads to the totalitarian state where everybody is his brother’s policeman, where everybody is watching everybody else to report them to the authorities. Where you can’t trust your own motivations, where you have to have a psychoanalyst in charge of you all the time to think, to be sure that you do not think dangerous thoughts or peculiar thoughts. And you report all peculiar thoughts to your analyst and your analyst would keep a record of them and report them to the government. And everybody is busy in keeping records of everything. It’s much more important to record what

happens than what happens. This is already eating us up, it's much more important that you have your books right than that you conduct your business in a good way. In universities it is much more important that the registrar's records be in order than the library be well-stocked. After all, you know, your grades are all locked up in safes, and protected from thievery and pilfering, and they are the most valuable property that the university has; the library can go hang.

Then further more, the main functioning of a university is, as a sensible person would imagine, to teach students and to do research. So the faculty should be the most important thing in the university, on the contrary, the administration is the most important thing. The people who keep the records, who make the game rules up. So the faculty are always being obstructed by the administration and forced into irrelevant meetings, and to do everything but scholarship. Do you know what scholarship means, or what a school means? The original meaning of schola is leisure. We talk of a "scholar and a gentleman" because a gentleman was a person who had a private income and he could afford to be a scholar. He did not have to earn a living and therefore he could study the classics and poetry and things like that. Today nothing is more busy than a school. They make you work, work, work because you have to get through on schedule. There are expedited courses, and you go to school so as to get a union card, to get a Ph.D. or something you could earn on living. So, on the whole, it's a contradiction of scholarship. Scholarship is to study everything that is unimportant, not necessary for survival, all the charming irrelevancies of life. So you see, the thing is this, if you do not have room in your life for the playful, life is not worth living. All work and no play makes Jack a dull boy, but if the only reason for which Jack plays is that he can work better afterwards, he is not really playing. He is playing because it is good for him, he is not playing at all. You have to be able to be a true scholars, you have to cultivate an attitude to life in which you are not trying to get anything out of it.

You pick up a pebble on the beach: look at it, beautiful, don't try to get a sermon out of it. Sermons-in-stones and God-in-everything be damned – just enjoy it! Do not feel that you have got to salve your conscience by saying that this is for the advancement of your aesthetic understanding. Enjoy the pebble. If you do that, you become healthy. You become able to

be a loving, helpful human being. But if you can't do that, if you can only do things because they're somehow, you are going to get something out of it, you are a vulture.

So, we have to learn, you don't have, you know, you don't have to do anything, but it is a great idea, it is a great thing if you can learn what the Chinese call "purposelessness." They think nature is purposeless. When we say something is purposeless, it is a put-down. There is no future in it, it is a washout. When they hear the word purposeless they think that's just great. It is like the waves washing against the shore, going on and on, forever, with no meaning. A great Zen master said, as his death poem, just before he died, "From the bathtub, to the bathtub, I have uttered stuff and nonsense." The bathtub in which the baby is washed at birth, the bathtub in which the corpse is washed before burial, all this time I have said many nonsenses. Like the birds in the trees go twee, twee, twee. What is it all about? Everybody tries to say, "Ah, yes, it is a mating call – purposeful. They are trying to get their mates, you know, by attracting them with a song." That's why they have colors, and why butterflies have eye-like designs on them for self-protection, an engineering view of the universe. Why do we do that? We say, "Well, it is because they need to survive." But why survive? What is that for? Well, to survive. See, human beings really are a lot of tubes, and all living creatures are just tubes. These tubes have to put things in one end and let them go out at the other. Then they get clever about it and they develop nerve ganglia on one end of the tube – the eating end called a head. And that has got eyes and ears, and it has little organs and antennae, thing like this, and that help you define things to put in one end so that you can let them out the other. Well, while you are doing this, you see, the stuff going through wears the tube out and so, the show can go on, the tubes have complicated ways of making other tubes which will go on doing the same thing, in at one end, out the other. And they say, "Well, that is terribly serious. That is awfully important. We have got to keep on doing this."

Then when the Chinese say nature is purposeless this is a compliment. It is like the idea of the Japanese word yugen. They describe yugen as watching wild geese fly and be hidden in the clouds; as watching a ship vanish behind the distant island; as wandering on and on in a great forest with no thought of return. Haven't you done this? Haven't you gone on a walk with

no particular purpose in mind? You carry a stick with you and you occasionally hit it at old stumps, wander along and sometimes twiddle your thumbs. It is at that moment that you are a perfectly rational human being; you have learned purposelessness. All music is purposeless. Is music getting somewhere? If it were, I mean, if the aim of music or the symphony were to get to the final bar, the best conductor would be the one who got there fastest. See, dancing, when you dance do you aim to arrive at a particular place on the floor? Is that the idea of dancing? The aim of dancing is to dance. Is the present. This is exactly the same in our life. We think life has a purpose. I remember the preachers who used to say, when I was a small boy, I've always heard it, we must follow the God's purpose, his purpose for you and his purpose for me. When I asked these cats what the purpose was, they never knew! They never knew what it was, they had a hymn "God is working his purpose out as year succeeds to year. God is working his purpose out and the time is drawing near. The time on the earth should be full of the glory of God as the waters cover the sea." What's the glory of God? Well, they weren't quite sure. I'll tell you what it is. In heaven all those angels are gathered around the glory of God. That is to say the which than which there's no whicher. Catholics call it the beatific vision, the Jews call it the shekhinah. There all are angels standing around and saying hallelujah, hallelujah, hallelujah. It means nothing. They're just having a ball. See, that's what happened in the beginning. When the God created the universe it was created like all star, all planets, all galaxies, they are vaguely spherical. He created this and said have a ball. But before he said that, he said you must draw the line somewhere. That was the real thing he said first, before 'let there be light' that came later. First thing was you must draw the line somewhere. Otherwise nothing would happen. You've got to have the good guys, the bad guys, you've got to have this, you've got to have that, the black and white, light and darkness. You must draw the line somewhere.

Now, here is the choice. Are you going to trust it or not? If you do trust it you may get let down, and this it is yourself, your own nature and all nature around you. There are going to be mistakes, but if you don't trust it at all, you are going to strangle yourself. You are going to fence yourself around with rules and regulations and laws and prescriptions and policemen and guards – and who's going to guard the guards. And who's going to look

after Big Brother to be sure he doesn't do something stupid. No-go. Supposing I get annoyed with somebody in the audience and I'm going to throw this ashtray at them but I don't want to hit my friend sitting next to that person. I want to be absolutely sure this ashtray hits that individual. And so I don't trust myself to throw it. I have to carry it along and be sure I hit that person on a head. See, I don't throw it because I can't let go of it. To throw it I must let go of it. To live I must have faith. I must trust myself to the totally unknown, I must trust myself, to a nature which does not have a boss. Because a boss is a system of mistrust. That is why Lao-tzu's Tao loves and nourishes all things, but does not lord it over them.

Limits of Language

Tonight at any rate we've got to go through some theoretical material so we're on a head-trip. I don't know where the trip will end up, it depends on you. But in order to lay the foundation for this, we have to examine ideas that are basic to our common sense. Ideas are very powerful. It is not only emotions that are powerful in human life. Psychoanalysis has, of course, examined the emotional bases of human opinions and beliefs, but one should also examine the intellectual bases of psychological principles, theories, or therapies. Because everybody who speaks any language at all has, has underneath the surface of the language or the figuring that he uses, certain basic assumptions which are usually unexamined, and these unexamined systems of belief are extremely powerful in their influence over our lives.

We will begin with one very common idea that is built into our common sense, which is that the physical world consists of two aspects: respectively, form and matter. This was foisted on us by Aristotle and also by the Bible. Because it is said that God created man out of the dust of the earth, and as it were made a figurine in His own image, and then breathed the breath of life into its nostrils so that this form of clay became a living being. So, underneath that lies the notion that everything material is made of some sort of basic stuff, like clay is the basis of pots. For centuries, scientists, philosophers wanted to know, "What is that stuff? What are we made of?" Now look here, a carpenter makes tables out of wood, and a potter makes pots out of clay, but I ask you: is a tree made of wood? Obviously not. A

tree is wood, it is not made of it. Is a mountain made of rock? Obviously not, it is rock. See, our language contains innumerable ghosts. Supposing I say, "The lightning flashes." Surely the flashing is the same as the lightning. There is not one thing called "lightning" and another called "flashing." The lightning is the flashing. It is raining. What is this it that is raining? The raining. I can make a noun out of a verb anytime by turning it into a gerund. So, we populate the world with ghosts which arise out of the structure of our language, and thus therefore of the structure of our thinking because we think in language, or in figuring, and numbers. So it is intensely fascinating investigation to find out what are the hidden assumptions that underlie language and figuring, in other words language and mathematics, and here is this basic assumption, you see, that almost all of us have, that, and it comes again and again into our everyday speech, that form, pattern, organization, organisms are made of something. As if there were some inert primordial and, of course, stupid stuff which had to be put into shape by an energy and an intelligence other than the stuff like the intelligence of the potter shapes the clay.

So therefore we have a basic picture of the world in which everything is being pushed around. There's a boss, there is somebody in charge who is different from what that somebody is in charge of, and puts everything into shape, because our common sense does not allow that things shape themselves. Very odd. In Chinese the word for nature is tzy-jan which is that which is so of itself, the spontaneous. The Chinese have no difficulty in thinking about nature as self-shaping. A Chinese child would not ask its mother 'how was I made?' It would ask its mother 'how did I grow?' which would be quite different, you see? So to be made is to be commanded and therefore every good being obeys, whether you obey god or whether you obey the laws of nature, you obey. And in an analog therefore of the world that has been putted into our common sense is one of military command, note that. Because the image of god, I would go further and say the idolatrous image of god, which has been handed down to us, is one of the beneficent tyrant – the boss, big papa.

So then, when our physicists started to find out what stuff was, they went into it and into it, and examined it with ever more minute instruments. First they started cutting up things with knives, and they cut them into smaller

and smaller and smaller until the particle that they wanted to dissect was exactly the same width as the edge of the knife, and so they got the atom. And that word in Greek atomas means the “non-cuttable.” A: non; tomas: cuttable. Thus, the basic atom, what you cannot cut anymore because you have come down to the end. Well, they were not satisfied with that, so they got an atomas – in other words a particle of something or other that was just the same width as the blade of the knife edge – and they looked at it under a microscope. They saw that it seemed to be composed of more small particles, so they found out means of working those out, and then they found extraordinary means of investigating the properties of matter, then they reached a point where they couldn’t decide whether was particles or weather was waves, so they called them “wavicles”, they thought they had come to certain ultimate wavicles called electrons. But then, unfortunately, everything fell apart, and they found protons, mesons, and many other extraordinary things. Because of course, what they did not realize was that as you make more and more powerful microscopic instruments, the universe has to get smaller and smaller in order to escape the investigation. Just as, when the telescopes become more and more powerful the galaxies have to recede in order to get away from the telescopes because what is happening in all these investigations is, through us and through our eyes and senses, the universe is looking at itself. And when you try to turn around to see your own head, what happens? You see? It runs away! You will never get at it. You cannot bite your own teeth, you can’t touch the tip of this finger with the tip of this finger. This is the principle. Shankara explained this beautifully in his commentary on the Kena Upanishad where he says, “That which is the knower – the ground of all knowledge – is never itself an object of knowledge, just as fire does not burn itself.” So there is always that profound mystery that you are never going to be in absolute control of what goes on, because if you were, to be like making love to a plastic woman. Who wants that? There’s always the mystery. The thing we don’t know, as Van der Leeuw put it, “The mystery of life is not a problem to be solved, but a reality to be experienced.” If there were not that, you see, there would be no life.

The reason why certain people turned to philosophy, well I became a philosopher was that ever since I was a little boy I always felt that existence, as such, was weird. I mean here we are, and isn’t that odd? Of

course it is odd, but what do you mean by odd? Well, it is what is different from even, and what is odd stands out. What is even lies flat, but you cannot see the outstanding without the flat background. Is the thing standing out? It's odd. Each one of you is odd: strange, unique, particular, different. How do we know what we mean by that, except against the background of something even that is not differentiated, like space? So, you get this philosophical itch, you begin to scratch your head and think about why is that so. Well after awhile you may realize that "Why?" is a meaningless question, and so you may ask: "How is it so?" Well, that leads you into science and other investigations. So you want to know, "What is it?" I mean, what is this happening, this thing called existence, "what is it"? You ask that question long enough, and it suddenly hits you that if you could answer it, you would not know what terms to put the answer in. I mean, when we investigate the properties of nature, and we do get some answers, all the answers are in terms of particular structures, forms, patterns. And these can be measured, and their behavior can be predicted. But when I want to ask the question "What are the forms made of?", I mean "What is it really?", we cannot think of any way in which we could answer the question, because we would have to have a class of all classes.

When you ask the question "What?" it is like saying: "Is you is or is you ain't?" Is you animal, is you vegetable, is you mineral? Are you a Republican or a Democrat? Are you male or female? Are you a Christian or a Jew or a Hindu, or a what have you? We classify, always, to give an answer to the question "What is it?" And when you classify you distinguish an inside group from an outside group. So what we want to know is what is the group of all groups. But we can't imagine what the outside would be. So we can't answer the question, "what is it"?

So, the physicists finally abandoned the quest for stuff, and they gave us a description of the universe entirely in terms of form: the pattern, not the stuff. People ask, "What is the work?", but you can't do that! "What is the pattern made of? Surely, there must be an answer to that?" See, what happens is, when you turn up the microscope all stuff turns into form, it becomes articulate. You know, the carpet looks like some sort of stuff, but when you look at it under a microscope you will see the crystalline structure of the nylon, or whatever it is made of. See? Then they want to know,

“What are the crystals made of?” All right? Turn up the volume and you will find molecules. Turn up the volume, you will find wavicles. Then, “But the wavicles must be of something!” Of course they are not, we find substance, or stuff, totally vanishes, and we are left with form. Sanskrit does not really have a word for “matter.” It has nama-rupa which means “named form,” it’s the form that matters. Or let us put it in another way: everything is a matter of form, and let’s go into this, it’s fascinating.

You see, “Does it matter? What does that mean? Does it matter? Is it important?” In other words, does it measure up to anything? Now let’s go back to the Indo-European roots of the language, matter comes from a Sanskrit root matra, which means “to measure”. Lay out the foundation, you say, for a building. So from this root matra if we go on into Sanskrit, we get the word maya, and maya is generally translated as illusion, although it also means magic, creative power. The word illusion comes from the Latin ludere, to play. “Let us pretend that we matter.” Also from the root matra we have “meter,” and that is also “to measure;” metere in Greek, mater in Latin, which means “mama”, “mother.” The mother of Buddha was called Maya, and Mary, ma again, is the mother of Jesus – ma, ma, ma, ma, ma. But ma, you see, is a matter of form, pattern. The Chinese call the basic principle of nature li, and the character for li means the markings in jade, the fiber in muscle, the grain in wood. So Joseph Needham translates it “organic pattern”. That’s what’s going on. There isn’t any stuff involved. What stuff is, is a pattern seen out of focus, where it becomes fuzzy, like kapok you see? We say, kapok is the stuffing of the cushion. And that’s stuff. You see, some kind of goop. But when we examine the kapok closely, we find structure. That’s what you will find, and there will be anything else. Crazy. Because it completely flouts our common sense. We say ...but surely, philosophers beat tables that are in front of them and you know, they say, “It is there, because ...bang!, you know. There must be something that is stuff, that is substantial.” But the only reason why you cannot pass your hand through a table is the table is moving too fast. It is like trying to put your finger through an electric fan, only it is going much faster than an electric fan. Anything solid is going so fast that there is no way to get this through it, that’s all. So you say, “What is it that is going so fast?”

Well, that question is based on a grammatical illusion. The grammatical illusion is that all verbs have to have subjects, can you imagine anything more weird than the idea that a verb, or action, or event must be set into motion by a noun? That is to say, a non-event or thing. Now what is the difference between a thing and an event? I can't, for the life of me, tell. We say, "This is a fist," that's a noun. Now, what happens to it when I open my hand? This thing has unaccountably disappeared, so I should have called this a "fisting," and this is a "handing." It may also be a "pointing." So, we could devise a language such as that of the Nootka Indians, where there are no nouns and there are only verbs. Chinese is very close to that, I think the superimposition of the idea of noun and verb on the Chinese language is a Western invention. I can't think of any Chinese word for a noun. But all those languages of Indo-European origin have nouns and verbs in them; they have agents and operations. That's one of the basic snags: when we divide the world into operations and agents, doings and doers, then we ask such silly questions as, "Who knows?" "Who does it?" "What does it?" When the "what" that is supposed to do it is the same as "the doing," you could very easily see that the whole process of the universe may be understood as "process." Nobody is doing it. Because when you go back to doing it, you go back to the military analogy, the chain of command, the boss who goes bang! and the object obeys. That's a very crude idea, very unsophisticated.

So, if you can bear it, we have suddenly eliminated a "spook," and the spook was called "stuff." So, we are now more at ease with ourselves in a world of form, nama-rupa, named forms. We can, of course, get rid of the names. We can now go further and try the experiment with not calling the forms by any names, but just observing the forms, although when we have got rid of the names we cannot even call them "forms," because that is a name. And, there is the bizazz going on, which Buddhists called tathata, and that means "suchness" or "thusness." Actually tathata is "da – da – da," because when a baby first talks it says "da": "Da, da, da, da." And fathers flatter themselves thinking that it is saying "dada", "daddy," it isn't, it is saying "da." So the Upanishads say, Tatvam asi: you are it. The basic "da" does not mean anything. Da is like everything else, you see, the world is a musical phenomenon, good music never refers to anything except the music itself. You do not ask Mr. Bach, Mr. Ravi Shankar, "What do you mean by

this music? What is it intended to express?” Bad music always expresses something other than itself, like the 1812 Overture or the Sunken Cathedral. Good music never talks about anything other than the music. If you ask Bach, “What is your meaning?” he say “Listen! That is the meaning.” Giraffes are giraffing, trees are treeing, stars are starring, clouds are clouding, rain is raining. And if you don’t understand, look at it again. And people are peopling. Wow.

We notice that all these suchnesses appear and disappear; they keep changing, they come and they go. But if you get hung up on your particular form, I’ll have to alter the language a little bit, because you see, your form makes a duality, whereas you are your form, you’re what you’re doing. Now, you think, “Hmm, for some strange reason I must make that go on as long as possible,” and therefore you think you have an instinct to survive. So the only thing anybody can agree about today, so far as the discussion of ethical and moral problems are concerned, is that we ought to survive. Therefore certain forms of conduct have survival value and certain forms do not. But when you say to yourself, “You must go on living,” you put yourself in a double bind because you’ve said [yes] to a process which is essentially spontaneous and it must happen. The basic form of the double bind which is imposed upon all children is you are required to do that which will be acceptable only if you do it voluntarily. So, when we say to ourselves, “You must go on,” the reason is, you see, that we are not living in the eternal now, where the reality is. We are always thinking that the satisfaction of life will be coming later. “There’s a good time coming be it ever so far away, that one far off divinely sent to which all creation moves.” Don’t kid yourself. As the Hindus have taught us, in the course of time everything gets worse and eventually falls apart, comes the Kali-Yuga and Shiva at the end, which is to say, only suckers put hope in the future.

You see? I tell you, there are three classes of people in the Western world: the aristocracy, the proletariat, and the bourgeoisie. The aristocrats live on the past because they come of noble family, and they are like potatoes, because the best part is underground. The proletarians live in the present because they have nothing else. And the poor bourgeoisie live for the future, they are the eternal suckers, they can always open to a con game. So

when they find out that there really isn't much of a future, you are going to die, they transpose the future into a spiritual dimension. They figure, "This material world is not the real world, but the spiritual world is the real world; and there will be somewhere, somehow, an eternal life for me." "A charge to keep I have, a God to glorify, a never-dying soul to save and fit it for the sky." So when they say, "What are you going to do there?" Well, they do not have the faintest idea. You know that? If you ask theologians about what they think is going to happen in Heaven, they just dry up. "Why, we are going to play harps!" I mean this is a symbolic meaning of that which I could go into, but the average person's idea of Heaven is an absolute bore, I mean it's like being in church forever. Children see this immediately, when they hear a hymn like "Weary of earth and laden with my sin I look to Heaven and long to enter in," they, "Oh, God! Heaven is to be in church for always." And they think "Hell is preferable", at least some excitement is going on. You see it in medieval art, if you go to the Metropolitan Museum in New York you can see Jan Van Eyck's painting of The Last Judgment, Heaven on top and Hell below. In Heaven everybody is looking like the cat that swallowed the canary, sitting in rows and very smug. God the Father is president and, oh dear, beneath this there is a winged skull like a bat and squirming bodies, all nude, all being eaten by snakes. There is fantastic thing going on; but you see, Van Eyck had a ball painting that, because in medieval way, it was the only way you could get away with painting nudes and sexy scenes, sadomasochistic. So that's naturally why hell became much more interesting than Heaven.

So therefore, this hope for the future is a hoax, it's a perfect hoax. That maybe we will make spiritual progress, everybody puts it off. "Maybe if I work at yoga for ten years, twenty years and do this thing, I will eventually make it to moksha to nirvana", whatever. That is nothing more than a postponement, it's this business off, because if you are not fully alive now, you think maybe someday you will be. Look, supposing I ask you, "What did you do yesterday?" No, "What did I do yesterday? In fact, I have forgotten." But mostly we say, "Well, let me see now; let me get out my notebook. I got up at 7:30 and I brushed my teeth, and I read the newspaper over a cup of coffee, and then I looked at the clock and dressed, and got in the car and drove downtown. I did this and that in the office and so on." You go on and on and suddenly you discover that what you have described

has absolutely nothing to do with what happened. You have described a scraggly, skeletal, fleshless list of abstractions whereas, if you were actually aware of what went on, you could never describe it. Because nature is multidimensional, language is linear, language is scrawny. And therefore, if you identify the world as it is with the way the world is described, it is as if you were trying to eat dollar bills and expect a nutritious diet. Or eat numbers. A lot of people eat numbers. People play the stock market and they are doing nothing but eating numbers. They are always unhappy, absolutely miserable, because they never get anything. So therefore, they always hope more is coming because they believe that if they eat enough dollar bills eventually something satisfactory will happen. So eating the abstractions all the time we want more and more and more time.

Confucius very wisely said, “A man who understands the Tao in the morning may die with content in the evening.” Because when you understand, you do not put your hope in time, time will not solve a thing. So when we enter into the practice of meditation, of yoga, we are doing something radically unlike other human activities. Of course, the way yoga is sold in the United States, like everything else, is that it is supposed to be good for you. It is not. It has nothing to do with anything that is good for you. It is the one activity which you do for its own sake and not because it’s good for you, not because it will lead anywhere, because you cannot go to the place where you are now. Obviously. The Yoga is to be completely here and now. Why the word yoke means “join,” to get with it, to be completely here and now. This is the real meaning of concentration, to be in your center. And the Christian word for “sinning” in Greek is amatanene, which means “to miss the point.” And the point is eternal life which is here and now. Come to your senses.

So yoga is defined in Sanskrit in the Yoga Sutra: yoga chitra briti derota. Difficult to translate, but roughly yoga is the stopping of..., briti is turning like a wheel, and chitra is consciousness: “turnings in consciousness.” It is the attempt of the mind to catch hold of itself, which is what we call thinking, worrying, so you could say loosely: yoga is the cessation of thinking. It is not the cessation of awareness, but of symbolizing, trying to catch, clutch reality in terms of thoughts, symbols, descriptions, definitions. Give it up. It’s not easy because we do it habitually. But until there is

silence of the mind, it is almost impossible to understand eternal life, that is to say, eternal now. If you could, come to the place where you suspend conceptions. Conceptions in Sanskrit are called vikalpa. And so the stage is called nirvikalpa, “not conceptual.” And this will be basic to everything I’m going to talk about. To understand nonverbal reality, non-conceived reality, what I call “suchness”, ta ta ta, it is really very easy, it’s too easy, that’s why it is difficult. But then when you are fully aware and not thinking, you will notice some amazing absences: there is no past. Can you hear anything past incidentally? Can you hear anything future? They are just not there to the plain sense of one’s ears, ears are easiest to begin with. Can you hear anyone listening to something else other than sound? Can you hear the listener? No, well then presumably it’s not there. Then you become again as a child and simply forget all that you were ever told and contemplate on what is. All these ghosts go away. Weird, but they just go. And then you enter into the eternal state where there is no problem. When you’ll go back and you collect your opinions again, you think: “Well, that will not do. How can I be practical and be in that sort of state?”

Well, I remember in the Sermon on the Mount that Jesus said a lot of things about this. “Consider the lilies of the field, how they grow. They toil not, neither do they spin, and yet Solomon in all his glory was not clothed like one of these.” “And if God so clothed the grass or the field which today is, and tomorrow is cast into the oven, shall He not much more clothe you faceless ones? Wow. So do not worry about tomorrow saying, ‘What shall we eat? What shall we drink? Or how shall we clothe ourselves?’ All the rabble seek after these things, sufficient to the day is the worry of it.” Nobody ever preaches a sermon on that text, never. I have heard lots of sermons but never one on that, because people say, “Look, that’s all very well because Jesus was the boss’s son, and he knew that he was really in charge of the universe and had nothing to worry about. But we have to be practical.” Ooo, what do you suppose the Gospel was? The good news, but it never got out? You, too, are the boss’s son: that was the gospel.

If Jesus had lived in India they would not have put him to death, because everybody in India knows that we are all God in disguise. So if he had said, “I and the Father are one,” in India they would have said, “Hooray!”, you know? Lots of people in India know that perfectly well, but here? Uh! uh!

That is a no – no! “Who do you think you are? You own the place? You keep your position! You are just a creature, a critter.” It’s in the family system, it’s in everything. Because they have their own way of doing it in India, because they have a delayed action on it. When you get to be a certain age, and after you have studied long enough with a certain guru, then and only then may you realize this. But until then it is still a no – no. But if you have put in the time they finally let you in. Here you have to wait, until you are dead.

Well, the only place to begin is now, because here is where we are. So why put it off? A lot of people say, “Well, I am not ready.” What do you mean you are not ready? What do you have to do to be ready? Well, “I am not good enough because I am neurotic, I am perhaps not old enough, not mature enough for such knowledge. I am still frightened of pain, and of course I would have to overcome that. I am still dependent on material things. I have to eat a lot, drink a lot, have sex around, and all that kind of thing, and I think I had better get all that under control first.” Oh? You mean you have a case of spiritual pride. You want to be able to congratulate yourself for having gone through the discipline which is rewarded with realization. That is trying to quench fire with fire. Another words: “Wouldn’t it be great to be a mystic?” Look at it this way, I mean c-crazy, to have no fear, no attachments, no hang-ups, to be as free as the air so that you could just wander out in the streets, give away all your clothes to the beggars, and let go of the whole thing, let it all hang-up. Wouldn’t it be crazy to have that courage? But if you look into yourself honestly you will find that inside you are actually a quaking mess of sensitivity. This desire to be the great mystic is nothing more than a symptom of your quaking mess; it is self-defense.

You may think, “Wow! We will do yoga and get real tough.” That only means you are going to be increasingly insensitive, running away from the quaking mess, escaping. You never can, you are stuck with it. There is nothing you can actually do to transform your own nature into unattached selflessness because you have a selfish reason for wanting to do it. Well, that is pretty depressing, isn’t it? “You mean to tell me that the only people who really get enlightened and liberated are those whom the grace of God somehow hits in an arbitrary way? And all I can do is sit around and wait?”

Well, let us begin with that supposition. Let us suppose there is nothing we can do to change ourselves. No psychotherapy, religion all of this is absolutely in vain; there is nothing, nothing, nothing you can do about it. It is like trying, I said, to bite your own teeth, or to lift yourself up by your own bootstraps. Incidentally it struck me as funny, a lot of people are using that phrase in the wrong way. They say when something very difficult has to be done “we have to lift ourselves up by your own bootstraps”. You can’t! It’s impossible.

Now one might say, “That is terribly depressing. You mean, Alan Watts, you come here simply to tell us that there is nothing we can do? I mean, here we are all presumably assembled in a cultural milieu, spiritual milieu, psychotherapeutic milieu where we are supposed to get better.” And I tell you there is nothing you can do about it. Well, give us our money back! Go to somebody else who will be more encouraging! But; what does it mean that you cannot do anything about it? It is singing loud and clear: The reason you cannot do anything about it is that you do not exist, that is, as an ego, as a soul, as a separate will. It just is not there. When you understand that, you are liberated. As they say in Zen, “You cannot take hold of it nor can you get rid of it. In not being able to get it, you get it. When you are silent it speaks. When you speak it is silent.” But do not misunderstand me, this is not any kind of fatalism when I say “you” as you conceive yourself to be, that is your ego, your image of yourself is not there, it does not exist. It is an abstraction. It is like “three.” Did you ever see three? Just plain, ordinary three? No, nobody ever saw it. So it is a concept, it’s a vilkalpa.

So in the same way is oneself. There is the happening, the suchness, but it is not pushing you around because there is no you to be pushed around, like a billiard ball stuck on the end of the cue. There is the cue, and it goes this way and goes that way. They call a Buddha a tathagata, one who comes or goes thus, this way and that way. So this illusion of the persecuted ego who is pushed around by fate has altogether disappeared, and likewise the illusion of the ego who pushes fate around has also disappeared. There is a happening. So in this do you see what has happened? By dying to yourself, by having become completely incompetent and finding that you do not exist, you are reborn, you become everything. In the words of Sir Edwin Arnold, “Forgoing self, the universe grows I.”

Philosophies of Asia

Relevance of Oriental Philosophy

Theology has not, as a matter of fact, had a very distinguished record in promoting the study of other than the Christian religion. And this is rather puzzling. Most study of comparative religions that goes on in theological schools has historically been missionary oriented. To find out the weird ideas of the prospects so as to be able to undermine them. Because you see, if you know in the first place that you have the true religion, there really is no point in studying any other one and you can very quickly find reasons for showing them to be inferior, because that was a foregone conclusion. They had to be. And therefore, all arguments about the respective merits of various religions, especially where Christianity is involved, and often where Judaism is involved, and sometimes Islam too, all of which are essentially imperialistic religions. In all such discussions the judge and the advocate are usually the same person, because if for example you get into discussions as to whether Buddha was a more profound and spiritual character than Jesus Christ, you arrive at your decision on the basis of a scale of values which is of course Christian. And in this sense the judge and the advocate of the same.

And I really do marvel at this Christian Imperialism because it prevails even among theological liberals. And it reaches its final absurdity in religion-less Christianity, the doctrine that there is no God and Jesus Christ is His only Son. Because you see, there's some anxiety here that even though we don't believe in God anymore, somehow we've still got to be Christians and obviously because we have a very curious organization which must be understood. The inner meaning of the church as it works in fact. A society of the saved, you see, necessarily requires outside it a society of the not saved because if there is not that contrast, you don't know that you belong to the in-group. And in this way all social groups with claims to some kind of special status must necessarily create aliens and foreigners. And Sir Thomas Aquinas let the cat out of the bag one day when

he said that the Saints in Heaven would occasionally appear over the battlements into Hell and praise God for the just punishment visited upon the evil-doers.

Now, as you know I'm not being very fair and very kind to Modern Theology, but there is this strange persistence of insisting that our group is the best group. And I feel that there is in this something peculiarly irreligious, and furthermore it exhibits a very strange lack of faith. Because I believe that there is a strong distinction between faith on the one hand, and belief on the other. Because belief is as a matter of fact, quite contrary to faith. Because belief is really wishing. It's from the Anglo-Saxon root belief, "to wish", and belief stated say in the creed is a fervent hope that the universe will turn out to be thus and so. And in this sense therefore belief precludes the possibility of faith because faith is openness to truth to reality whatever it may turn out to be. I want to know the truth. That is the attitude of faith. And therefore to use ideas about the universe and about God as something to hang onto, in the spirit of Rock of Ages cleft for me, you know, hymnal imagery is full of rocks and mighty fortresses are God. "In vain the surges anguish shock, in vain the drifting sand, unharmed upon the eternal rock the eternal city stands." And there's something very rigid about this rock. And we are finding our rock getting rather worn out in an age where it becomes more and more obvious that our world is a floating world. It's a world floating in space where all positions are relative and any point may be regarded as the center. A world, which doesn't float on anything, and therefore the religious attitude appropriate to our time is not one of clinging to rocks but of learning to swim. And you know that if you get in the water and you have nothing to hold on to and you try to behave as you would on dry land you will drown. But if on the other hand you trust yourself to the water and let go you will float.

And this is exactly the situation of faith. This is surely all implied in the New Testament. When for example, Jesus began to foretell his own death, his disciples were very disturbed because it is written in our law that the Messiah does not die, and he replied "Unless a grain of corn fall into the ground and die, it remains isolated and brings forth no fruit. Or rather, if it die, it brings forth much fruit." And on another occasion he said to the disciples "It is expedient for you that I go away, but if I go not away from

the paraclete, the Holy Spirit cannot come to you.” But we have reversed all this. Jesus with me it was one of those rare and remarkable individuals who had a particular kind of spiritual experience which in terms of Hebrew theology he found most difficult to express without blasphemy. I am the Father are one. In other words I am God. And that is something of course if you are a Hindu. That is a rather natural statement to make. You see in our culture which has Hebrew theology in its background anyone who says I am God is either blasphemous or insane because our image of God and the image, don't forget, has far more emotional power than any amount of theology and abstraction. It is our Father which really influences us as a conception of God, not necessarily being ought to Luke's decontaminated name for God the ground of being. Or Professor Northrop's undifferentiated aesthetic continuum. These aren't very moving, even though subtle theologians prefer this kind of thing and will tell us that when we call God the Father, we don't have to believe literally that there is a cosmic male parent and still less that he has a white beard and sits on a golden throne above the stars. Nobody, no serious theologian ever believed in such a God.

But nevertheless, the imagery affects us, because the image of the monotheistic god of the West is political. The title King of Kings and a Lord of Lords is the title of the Emperors of ancient Persia. The image of God is based on the Pharaohs, the great rulers of the Chaldeans, and the kings of Persia. And so this is the political government and Lord of the universe who keeps order and who rules it from, metaphorically speaking, above. So anyone who would say I am God is therefore implying that he's in charge of everything that he knows all about it and therefore everybody else ought to bow down and worship him. But in India if you say I am God they say “Congratulations, at last you found out.” Because the image is quite different. See our image of the world is that the world is a construct and it's very natural for a child to say to its mother how was I made. As if you know you are somehow put together but that goes back to the imagery of Genesis where God creates Adam and makes a clay figurine and then he breathes the breath of life into this to the nostrils of this figurine and it comes to life. So that is the fundamental supposition which even underlies the development of Western science. That everything has been made and then someone knows how it was made. And you can find out the cause behind the universe there is an architect. This could be called the ceramic

model of the universe. Because there is a basic feeling that there are two things in existence one is stuff material and the other is form. Now material like clay by itself is stupid it has no life. It has no intelligence and therefore for matter to assume orderly forms it requires that the next turn all intelligence be introduced to shape it. And therefore with that deeply embedded in our common sense it's very difficult for people to realize that this image is not necessarily for description of the world at all. Indeed the whole idea of stuff is completely absent from modern physics which studies the physical universe purely in terms of pattern and structure. But the Hindu model of the world and I'm speaking of Hindu mythology, the popular imagery I'm talking about, the popular imagery on both sides I'm not at the moment getting into theological technicalities. The Hindu model of the universe is a drama. The world is not made it has acted. And so behind every face human animal plant mineral there is the face on face of the central self the up man. Which is Brahman, the final reality which is not defined. Because obviously that which is the center cannot be made an object of knowledge anymore than you bite your own teeth. Or lift itself up by own bootstraps. It's what there is it's the basis and you are it, which is a colloquial translation of the Sanskrit adage tat tvam asi, that art thou. The idea being you see that the nature of reality is a game of hide and seek. Because that's really the only game there is now you see it now you don't all nature is vibrating it's a wave like motion of Crest and trough. Pulse and interval pulse and interval. Only we don't always notice that because our senses respond slowly say to light and light appears to be a continuous energy without interval.

So there's the idea, goes like this that for endless cycles of time this is a premier reality the self plays hide and seek with itself. That for a period of a Kalpa, which is four million, three hundred twenty thousand years, the Self is awake to Itself. And knows that it's it but for another Kalpa it gets lost it says to itself man get lost and pretends. That it is a vast multiplicity. That's exactly what you would do if you had the privilege of dreaming any dream you wanted when you went to bed at night. This would enable you of course in one night to dream seventy-five years of clock time. And what you would do first of all, you would have marvelous adventures you would have every conceivable delight and satisfy every wish. And then as time went on that would get a little boring and you would get more daring. You

would have adventures, you would rescue princesses from dragons, and then you would get even more daring, then you would dream that you weren't dreaming. And then you'd get into really serious messes, because wouldn't it be a surprise when you woke up. And eventually you would be dreaming that you were sitting here in this auditorium listening to me. You would eventually get around to that, for your sins. Well maybe that's what's happening anyhow, you see. And in Sanskrit this dream is called Maya, but it's a word that means more than dream or illusion, it means creative power magic. Skill, art, and measurement. Laying down the foundations is making a minor. So then the world is a big act. It's play not in the sense of something trivial but in the sense of a stage play. Hamlet is a play. You play the organ in church. That's not trivial. And so the actor of this play being the best of all possible actors takes himself in totally. Almost but everybody knows in the back of their mind that the something funny about being itself. So you see when you go to the theater you know of course that the proceeding arch tells you that what's going on behind this arch is not for real. But somehow the actor almost persuades you that it is real. He wants to get you sitting on the edge of your chair, he wants you laughing crying, he wants you in a state of anxiety so that he almost persuades you. But you see if the actor is as good as the supreme Self. The audience is taken in that really and they believe the play is really, what skill, how marvelous. But you see in all acting. It's there is behind the stage a green room. Out on the stage with a law does not come on as the Lord. Becomes on as you and I. Heroes and Villains. But off-scene, he assumes his true nature and duffs his mask, which in Latin is his persona. In classical drama the persona was the megaphone mouth masked one for the open air theater and by a curious degradation of words the word person has come to mean the real individual and when Harry Emerson Fosdick wrote How to Be a Real Person, the real title of his book should have been How to Be a Genuine Fake. Well now this image this model of the universe is disturbing to Christians, what is particularly disturbing is the element in it of what's the very special theological chaos work, or pantheism. The feeling that if every part is being played by the supreme law then all the real distinctions between good and evil are obliterated. Now that is the biggest nonsense ever uttered. Distinctions between good and evil do not have to be eternal distinctions to be real distinctions. It is really to say that a distinction which is not eternal is not real is a highly un-Christian thing to say and certainly a very u-

Jewish thing because one of the fundamental principles of the Hebrew attitude is that all finite things that have been created by God are good. And therefore a thing that doesn't have to be infinite to be good or finite things come to an end. Furthermore to invoke the author already of heaven in matters of moral regulation is like putting a two million current through our electric shaver. It ended in the final asininity of the notion that if you went against the will of God, since evil is eternal, you would fry in hell forever and ever and ever and as the Chinese say, do not swat a fly on a friend's head with a hatchet. Like all kinds of judicial torture and harsh justice such ideas bring law into disrespect. And such a fierce God and such an unbending attitude resulted in the fact of people disbelieving in God altogether and shall we say throwing out the baby with the bathwater.

So this is among many reasons why people are saying God is dead it's very inconvenient to have the kind of god. Who is this authoritarian boss of the world, prying down over your shoulder all the time and knowing your inmost thoughts and judging you. It's a very uncomfortable feeling and everybody's happy to be rid of it. It has never significantly improved anybody's behavior in the so-called ages of faith. People were just as immoral, if not more so than they are today. Because you see all this fixed notion of god is idolatry. If thou shalt not make to die self any graven image of anything that is in the heaven above etc. The most dangerous and pernicious images are not those that made of wood or stone, nobody takes those seriously. They are the images made of imagination and conception and thought. And that is why in the fundamental approach to the Godhead, both the Christian, I mean both the Hindu and the Buddhist and for that matter the Taoist take what is called the negative approach which used to be known long ago in the Middle Ages as Apophatic theology. As and Thomas Aquinas said "To proceed to the knowledge of God, It is necessary to go by the way of remotion. Of saying what God is not, since God by his immensity exceeds every conception to which our intellect can attain."

So then when of the Godhead the Hindu says all that can truly be said is neti neti, "not this, not this," and when the Buddhist uses such a term for the final reality as Sunyata, which means voidness, or emptiness. Then textbook after textbook on comparative religion that I read by various theologians say this is terrible negativism this is nihilism. But he doesn't

realize that it's nothing of the kind. If for example, you have a window on which there's a fine painting of the sun, your act of faith in the real sun will be to scrape that off so that you can let the real sunlight in.

And so in the same way pictures of God on the window of the mind need scraping up, because otherwise they become idolatrous they become substitutes for the reality. Now I'm hoping that this sort of understanding will issue from God is a dead theology. I'm not quite sure whether it's going to. Because as a matter of fact there are precedents within the Christian tradition for an intelligent God is dead theology for what I would call atheism in the name of God. Or agnosticism in the name of God The word agnostic has a curious history. It's based on the Greek word agnosia. Which we used to translate into English as 'unknowing'. And there's a very interesting mystical treatise of the fourteenth century called the Cloud of Unknowing, showing how the highest form of prayer, contemplative prayer, as that in which all concept of God had been left behind. Where in other words, one completely lets go of clinging to God and this was the supreme act of faith. So that you don't any longer need an image. Because this gets in the way of the reality. But the moment you insist on an image then you have the church as a huge imperialistic vested interest organization. After all if the charge is the Body of Christ isn't it through the breaking of the Body of Christ that life is given to the world. But the church doesn't want to be broken up by Jove no, it goes around canvassing for new members see the difference between a physician and a clergyman is that. The physician wants to get rid of his patients and he gives them medicine and he hopes they won't get hooked on the medicine. Whereas the clergyman is usually forced to make his patients become addicts. So that they'll pay their dues. The doctor has faith in turnover. He knows that there'll always be sick people, and the clergy also need faith in turnover get rid of your congregations say now you've heard all I've got to tell you go away. If you want to get together for making celestial whoopee, which is worship, All right. But I don't I used to when I was a chaplain in the university, I used to tell the students that if they came to church out of a sense of duty they weren't wanted. They would be skeletons at the feast. It would be much better if they went swimming or stayed in bed. Because they were going to celebrate the Holy Communion and I meant celebrate. But somehow or other you see we take religion in a kind of dead earnest. I remember when I

was a boy at school how wicked it was to laugh in church. We don't realise, it's G.K. Chesterton said that the angels fly because they take themselves lightly. And asked Dante said in the parody, so when he heard the song of the angels, It sounded like the laughter of the universe. Why what are those angels doing? They're saying I don't know you Alleluia, Alleluia, Alleluia, which doesn't really mean anything. It's sublime nonsense. And so in the same way there are Buddhist texts and Hindu texts which are the chants of the Buddhas or Divine Beings which don't mean anything at all and never did mean anything they are just glorious lolling, glossolalia. So the point that I wish to make most strong is that behind a vital religious life for the West there has to be faith which is not expressed in things to which you cling. In ideas, opinions to which you cling in a kind of desperation. Faith is the act of letting go, and that must begin with Letting Go of God. Let God Go.

The point that I wish to make most strongly, is that behind a vital religious life, for the West, there has to be faith which is not expressed in things to which you cling. In ideas, opinions, to which you cling in a kind of desperation. Faith is the act of letting go, and that must begin with Letting Go of God. Let God go.

But you see, this is not atheism in the ordinary sense. Atheism in the ordinary sense is further hoping that there isn't a god. It has become extremely plausible that this trip between the maternity ward and the crematorium is what there is to life. And we still have going into our common sense the nineteenth century myth which succeeded the ceramic myth in Western history, I call it the myth of the fully automatic model of the universe. Namely, that it's stupid. It's blind force. Hekels. Gyration. Fortuitous Congress of Atoms, is of the same vintage as Freud's libido. The blind surge of lust at the basis of human psychology.

But when you consider this attitude, you know, what is the poetic counterpart of it? Man is a little germ that lives on an unimportant rock ball that revolves about an insignificant star on the outer edges of one of the smaller galaxies. What a put down that was. But on the other hand, if you think about that for a few minutes, I am absolutely amazed to discover myself on this rock ball rotating around us of the spherical file. It's a very odd situation. And the more I look at things I cannot get it rid of the feeling

that existence is quite weird. A philosopher is a sort of intellectual Yokel who gawks at things that sensible people take for granted. And sensible people who claim that existence is nothing at all I mean just basic and go on and do something. This is the kind of movement in philosophy logical analysis says you mustn't think about existence. It's a meaningless concept, and therefore philosophy has become a discussion of trivia and philosophical journals is now satisfactorily dull as any other kind of purely technical inquiry. No good philosopher lies awake nights worrying about the destiny of man and the nature of God and all that sort of thing because a philosopher of today is a practical fellow who comes to the university with a briefcase at nine and leaves at five. He does philosophy during the day, which is discussing whether certain sentences have meaning and if so what and then he would as William Earl said in a very funny essay, he would come to work in a white coat if he thought he could get away with it. The problem is he's lost his sense of wonder.

Wonder is like a in modern philosophy something you mustn't have. It's like enthusiasm in eighteenth century England, it's very bad form. But you see I don't know what question to ask when I wonder about the universe. It isn't a question that I'm wondering about it's a feeling that I have. Imagine if you had an interview with God, everybody was going to have an interview with God, and you were allowed to ask one question what would you ask. And don't don't rush into it. You will soon find that you have no idea what to ask. Because I cannot formulate the question that is my wonder the moment my mouth opens to utter it I suddenly find I'm talking nonsense. But that should not prevent wonder from being the foundation of philosophy. Well, as Aristotle said wonder is the beginning of philosophy. Because it strikes you that existence is very very strange. And then moreso when this so-called insignificant little creature has inside his skull a neurological contraption that is able to center itself in the midst of these incredible expanse of galaxies and start measuring the whole thing. That is quite extraordinary. And then furthermore when you realize, that in a world where there are no eyes the sun would not be light. And that in a world where there were no soft skins rocks would not be hard, nor in a world where there were no muscles would they be heavy. Existence is relationship and you are smack in the middle of it.

So there is obviously a place in life for a religious attitude in the sense of awe. Astonishment at existence. And that is also a basis of respect for existence. We don't have very much of it in this culture even though we call it materialistic. A materialist as a person who loves material. And I suppose in the Christian tradition and in the Jewish one would say that the lord God is the greatest materialist because you know as William Temple once said "God is interested in many other things than religion". Well God only interested in religion the world would consist of nothing but church buildings and Bibles and clergyman. And that would be pretty boring.

So in the culture that we call materialistic today we are of course bent on the total destruction of material and it's going to version into junk and poisonous gas as quickly as possible. This is not a materialistic culture because it has no respect for material. And respect is in turn based on Wonder, on feeling the marble of just an ordinary pebble in your fingers. So I'm afraid you see for the God is dead theology, that it will sort of drift off into secular do-goodery in the name of Jesus. And this is I think where we can be strongly religious side and stimulated by the introduction into our spiritual life of certain things that are Oriental.

Now you see,, it must be understood that the crux of the Hindu and Buddhist disciplines is an experience not a theory. Not a belief. If we say that religion is a combination of creed, code, and cult, in other words, this is true of Judaism, Islam, and Christianity and if they are religions, Buddhism is not. Because the creed is a revelation they revealed the symbolism of, what the universe is about, and you are commanded to believe in it on the divine authority. The code is the revealed will of God for man which you are commanded to obey, and the cult is the divinely revealed form of worship which you must practice commandment because God is boss. He's ruler. King of Kings and Lord of Lords.

But the disciplines say of yoga in Hinduism or of the various forms of Buddhist meditation do not require you to believe anything. And they have no commandments in them, they do indeed have precepts, but they are really vows which you undertake on your own responsibility, not in obedience to anybody. They are experimental techniques for changing consciousness. And the thing they are mainly concerned with is helping

human beings to get rid of the hallucination that each one of us is a skin encapsulated ego. You know, a little source, a little man inside your head, located between the ears and behind the eyes who is the source of conscious attention and voluntary behavior.

Most people, you know, don't think, don't really think that they are anything but that and that the body is a thing you have. Mummy, who would have been if my father had been someone else? See the parents give you the body and you pop the soul into it at some period, conception or partition nobody could ever decide, and this attitude stays with us, that we are something in a body, that we have a body, and we are not it, so we experience the beating of the heart as something that happens to me, when I was talking or walking, is something that I do, don't you be charged for language won't allow you to think that it's not customary to say so. How do you think? How do you manage to be conscious? You don't know. How do you open and close your hand? Do you know? If you're a physiologist, you may be able to say, but that doesn't help you to open and close your hand any better than I do.

So, you know how to do it but I can't put it into words in the same way the Hindu god knows how he creates this whole universe because he does it but he wouldn't explain it that would be stupid you might as well try to drink the Pacific Ocean with a fork. So when a Hindu gets enlightened and he recovers from the hallucination of being a skin encapsulated ego and finds out that central to his own self is the eternal Self of the universe. And you go up to him and say "Well how do you do all this?" he says "Well, just like you open and close your hand." And because we are all it. Whenever a questioner used to come to Sri Ramana, the great Hindu sage who died a few years ago, they said to him Master. What was I living before in a previous incarnation and if so who was I? And he would say who is asking the question? Who are you? And a spiritual teacher in both Hinduism and Buddhism is a kind of, well, what he does to awaken you, to get you over the hallucination of being the skin encapsulated ego, he bugs you in a certain way. He has a funny look in his eyes as if to say "Come off it Shiva. I know what you are doing." And you say "What, me?" Here he looks at you in a funny way. And there, finally you get the feeling that he sees all the way through you, and therefore that all your selfish and evil thoughts

and nastiness is transparent to this gaze and then you have to try and alter them he suggests, you see, that you practice the control of the mind. That you become desireless. You give up selfish desires so as to cease to be a skin encapsulated self. And then you may have some success in quieting your mind, in concentrating, but then after that you throw a curve at you. Which is, but aren't you still desiring not to desire? Why are you trying to be unselfish?

Well the answer is I want to be on the side of the Big Battalions.. I think it's going to pay better to be unselfish than to be selfish. Well Luther saw that. Augustan saw that. But there it is. Because what he's done, you see, he's beginning to make you see the unreality, the hallucinatory quality of a separate self. This has merely conventional reality in the same sense as lines of latitude and longitude, the measurements of the clock, that's why one of the meanings of Maya, illusion, is measurement. Things for example, are measurements, they are units of thought, like inches are units of measurement. There are no things in physical nature. How many things are a thing? It is any number you want. Because a thing is a think or unit of thought as much of reality as you can catch hold of in one idea.

So when this realisation of the hallucination of a separate self comes about it comes about through discovering that your alleged separate self can't do anything. It can't improve itself either by doing something about it all by doing nothing about it. Both ways are based on illusion. You see this is what you have to do to get people out of hallucinations you make them act consistently on the suppositions of the hallucination. People who believe that the earth is flat cannot possibly be talked into seeing that it's round because they know it's flat. Because can't you see? So what you do is this you say let's go and look over the edge, wouldn't that be fun? But you see to be sure that we do get to the edge we must be very careful not to walk in circles. So you perform a discipline, you go steadily and rigorously westwards along latitude forty or something and then when you get back to the place where you started. He is convinced that the world is at least cylindrical. By experiment. By reductio ad absurdum of his premises and so in the same way, the guru whether Hindu or Buddhist performs a reductio ad absurdum on the premise of the skin encapsulated ego. Well what happens then? You might imagine from garbled accounts of eastern

mysticism that one thereupon disappears forever into an infinite see a faint glimmer of Jello and become so lost to the world in entranced that you forget your name address, telephone number, and function in life and nothing of the kind happens. In the state of mystical illumination, although it may in its sudden onset be accompanied by a sensation tremendous luminescence and transparency and as you get used to it it's just like everyday life. Here are the things that you formerly thought were separate individuals and the Here it is you who you formerly thought was merely confronting these other people. When the great Dr D.T. Suzuki was asked what is it like to be enlightened he said "It's just like ordinary everyday experience except about two inches off the ground." Because what is altered is not the way your senses perceive. What is altered Is that what you think about. Your definitions of what you see your evaluation of it. So when you don't cling to it when you have no longer a hostile attitude to the world because you know the world is you it is mean to take it from the point of view of biology if I describe the behavior of a living organism I cannot possibly describe that behavior without simultaneously describing the behavior of the environment. So that I discover that I don't describe organisms in environments, I describe a unified field of behavior called an organism-environment. It's an awkward word. But there it is. The environment doesn't push the organism around the organism doesn't push the environment around. They are two aspects, or poles of the same process.

And so you have to understand that this attitude towards nature, seeing the fundamental unity of the self which manifests it all, is not an attitude as the missionaries are apt to suppose which denies the value of differentiation. You must understand the principle of what are called Identical differences. Take a coin, the head side is a different side from the tail side, and yet the two are inseparable. Take the operation of buying and selling, selling is a different operation from buying but you can't buy unless somebody sells at the same time and vice versa. This is what is meant by the underlying unity of opposites what is called in Hinduism Vita, or non-duality. Or when the Chinese use the word Tao to designate The Way of operation of the positive and negative principles the yang and yin. It is not a unity that annihilates differences, but a unity which is manifested by the very differentiations that we perceive. Just as it's all polar. It's like the two poles of a magnet are different but yet one magnet. So when we say oriental monism is a point of

view towards life which merges everything into a kind of sickening goo. This is terribly unfair. It just isn't so. If you argue that the sort of doctrine that everybody is really the Godhead destroys the possibility of real love between individuals because you have to be definitively other than I am to love you, otherwise it's all self-love. Well that argument collapses in view of the doctrine of the Trinity. If the three persons are one God then they can't love each other by the same argument. Hinduism simply uses the idea which is in the Christian Trinity only it makes it a multi-Trinity instead of the three one. That's all. Of course the thorn in the flesh is always in approaching a doctrine which seems to be monistic pantheistic. What about evil? Are we to make the ground of being responsible for evil. And we don't want to do that because we want to keep God skirts clean. In spite of the fact that our own Hebrew Bible says I am the Lord, there is none else. I form the light and create darkness. I make peace and create evil I the law do all these things. And haven't you heard the story about the yetzer hara? That according to Jewish theology the law of God implanted in Adam at the beginning of time I think all the yetzer hara it means the wayward spirit. I call it the element of irreducible rascality. And it's very necessary to have this in order to be human. You see how it was done was this prohibition not to eat of the fruit of the tree of knowledge. That was the one sure way of being a being, of getting it eaten. But of course when the Lord God accused out and said you have been eating of that tree, I told you not to eat. And he passed the buck to Eve said this woman that I gave is me she tempted me and I did eat. He looked at Eve, "Now what about it?" She said "Well it was the serpent." He looked at the serpent, and the serpent didn't say anything. Because he knew too much and he wasn't going to give away the show. Who is it that sits at the left hand of God? We know who sits at the right hand. But it's hushed up, because that's the side where the district attorney sits. And in the Book of Job, of course you know, Satan is the district attorney at the court of heaven, he's the prosecutor, he's a faithful servant of the court.

Because you see, the whole problem is, it would be very bad indeed if God were the author of evil and we were his victims. That is to say, if we keep the model of the King of the universe and the creatures are all subjects of the king, then a God who is responsible for evil is being very unkind to other people. But in this theory God is not another person. There are no

victims of God. He's never anything but his own victim. You are responsible. And if you want to stay in the state of illusion, stay in it. But you can always wake up.

Mythology of Hinduism

I wonder, I wonder, what you would do if you had the power to dream at night, any dream you wanted to dream. And you would of course be able to alter your time-sense and slip, say seventy-five years of subjective time into eight hours of sleep.

You would, I suppose, start out by fulfilling all your wishes. You could design for yourself what would be the most ecstatic life. Love affairs, banquets, dancing girls, wonderful journeys. Gardens, music beyond belief. And then, after a couple of months of this sort of thing at seventy five years a night you'll be getting a little taste for something different and you would move over to an adventurous dimension where there were certain dangers involved and the thrill of dealing with dangers. And you could rescue princesses from dragons. And go on dangerous journeys. Make wonderful explosions and blow them up. And eventually get into contest with enemies. And after you've done that for some time you'd think up a new wrinkle. To forget that you were dreaming so that you would think it was all for real. And to be anxious about it. Because it'd be so great when you wake up. And then you say well like children who dare each other on things, how far out could you get? Or could you take what dimension of being lost, of abandonment, of your power, what dimension of that could you stand you could ask yourself this because you know you would eventually wake up. And I feel gone on doing this you see for some time you would suddenly find yourselves. Sitting around in this room. With all your personal involvements problems that. Talking with me. How do you know that that's not what you're doing? Could be.

Because after all what would you do if you were God. If you were what there is. The Self. In the Upanishads, as the basic text of Hinduism one of them starts out saying in the beginning was the self. And looking around it said "I am." And thus it is that everyone to this day when asked who is there, says it is I, and they are to give whatever particular name you may

have. For if you were God and in the sense that you knew everything and you were completely transparent to yourself through and through. You would be bored. Because, if looking at it from another way, we push technology to its furthest possible development, and we had instead of a dial telephone on one's desk a more complex system of buttons. And one touch beep, would give you anything you wanted. Aladdin's lamp. You would eventually have to introduce a button labeled surprise.

Because all perfectly known futures as I pointed out are past. They have happened, virtually. It is only the true future is a surprise. So if you were God. You would say to yourself Man get lost. And it strange that this idea is obscurely embedded in the Christian tradition when in the epistle to the Philippians, Sir Paul speaks of God the Son the last the Word of God who is incarnate in Christ and says "Let this mind be in you which was also in Christ Jesus, who being in the form of God thought not equality with God a thing to be clung to, but made himself of no reputation, and humbled himself and was found in fashion as a man and became obedient to death." Same idea. Same idea as the idea of the dream. And yet that very far out dream of getting as extreme as you can get.

And so this then is the basis of the Hindu view of the universe and of man. The Hindu looks upon the universe as a drama. The Westerner of course looks upon the universe as a construct, as something made. And it is not therefore insignificant that Jesus was the son of a carpenter. The Chinese looks upon the universe as an organism, as we shall subsequently see. But the dramatic idea is basic to Hinduism. Now you can speak about Hinduism on two levels at least. One I will call the metaphysical level, and the other the mythological level. If you speak on the metaphysical level, you can speak only in negative language. You can say what the Divine, the ultimate reality, is not. If you speak on the mythological level, you may speak of what the Divine is like because myth is not a falsehood as one uses the word in a sophisticated way. A myth is an image, a concrete image in terms of which man makes sense of the world. And thus the idea of God the Father or God the maker is a myth because it's an image. And Christian theologians distinguish equally between two kinds of theological language which are respectively called cataphatic and apophatic. Apophatic language is negative, as when we say God is infinite and eternal. Cataphatic language

is mythological, as when we say God the Father, God is love and all the positive designations. We are not saying God is a cosmic male parent, but is analogous with the Father. So is Hinduism. But what I'm going to speak to you and first of all is the mythological language of Hinduism. The idea of the universe as the big act. The universe is God playing hide and seek. With himself. For God is thought of fundamentally to the Hindu as the self. The Self. The cosmic I. And it is a basic proposition for the Hindu, that only the Self, the Godhead is real. There is nothing other than the Godhead.

So that the appearance, of the feeling that there are other things than the Godhead, is called Maya. Maya. We ordinarily translate that word illusion. But you must be careful about the word illusion. Illusion is related to the Latin ludere. And that means play. And this is why the analogy of the world is dramatic. It's a play-in the sense of a stage play. Now when you go to the theater, you know what you're going to see is not for real. Because what proscenium arch tells you that everything that happens on the far side of that arch is only in play. Not serious. But the actor and you will hope that he will be good at it is going to try and persuade you that it's for real. So that he will so move you that you are crying or sitting in anxiety upon the edge of your chair. And so the audience is almost persuaded to be taken in.

Now what about if this would happen with the very best actor of all. The great actor. The audience would have cost be completely taken in. But in this case of course the actor and the audience are the same. The Self. The Self has thus the capacity to abandon itself, to forget itself, to hide from itself, and thus to make the most completely convincing illusion but in play and so the activity of the creative activity of the Godhead in India is and is called Lila, which means play. Our word lilt is related to it I think. But so also in the Book of Proverbs. You will find a discourse being given by the Divine Wisdom "The Lord possessed me in the beginning of his ways before his works of Old. I think it's the twenty second chapter of Proverbs in the course of wish. The wisdom says that. Its delight was to rejoice the King James Bible says in the presence of God and with the sons of men. But the Hebrew translated rejoice says play. Rejoice is a sort of dignified Elizabethen. But it says play. And Sir Thomas, aware of this, said that the divine wisdom was above all to be compared with games because games are played for their own sake. And not for any sort of ulterior motive. So

also music is a kind of non-purposeful thing because you don't either play music to reach a destination, nor do you dance to reach a particular place on the floor. It is the doing of it itself that is important because after all if the object of music were to gain a certain destination those orchestras that played fastest would be considered the best.

So the idea is that the that dancing and music more than other arts represent the nature of this world. That it is playful. That it is sport. That is maybe sincere but is definitely not serious. And as G.K. Chesterton well put it once "The angels fly because they take themselves lightly." How much more so a lot of the angels. So if a beautiful lady should say to me "I love you." And I were to reply, "Are you serious, or are you just playing with me?" that would be quite the wrong response, because I hope she is not serious and that she will play with me. I should say are you sincere or are you just toying with me because you see the word play has many different senses. A person who is playing the organ in church is certainly not doing something trivial. When you go to see a play called Hamlet you are not saying something trivial. When the concert artists plays Mozart he is suddenly entertaining you but it's not a trivial entertainment. But on the other hand we would use play in a did it quite a different sense when we mean just fooling around. Doing it for kicks.

So it is fundamental, as a matter of fact, to both the Hindu and the Christian traditions that the universe is the play of God. But the Christian thinks of it in the terms of construction play. Like building with blocks. And the Hindu thinks of it as dramatic play of the actual participation of the Godhead in the creation so that every being whatsoever is God in disguise. Hinduism speaks of the Godhead as you use is the word Brahman. This is neuter form in Sanskrit from the root "Bri". Which means to grow. To expand. To swell. The neuter form "Brahman," does not have quite the connotation then you see of kingship that we will find attached to the Western idea of God, but is also referred to as Atman. And this word we translate ordinarily the self so you can have the power are. You put the M. in to connect the particle, Param Atman, which means a part of the supreme self. Or sometimes just the Atman alone, and that means the Self in you.

But the fundamental principle of Indian philosophy is Atman as Brahman and your self is the Supreme Self. Or it is expressed also in the formula tat tvam asi, colloquially translated “you’re IT. Or tat, that, tvam, latin to arm, asi, you are that, that thou art. Tat, of course is the first word uttered by a baby. Da da da da da da. And fathers flatter themselves that it’s saying da-da. It’s not. It’s saying “that,” and so is pointing to that-ness in everything. It’s so important to see this. Because everything is just that. I could say it in a negative way which you won’t appreciate it first perhaps. Everything is meaningless. Only words have meaning. Because they point to something other than themselves. The sound water is undrinkable. But it points to the drink of all reality. But you say though what is that pointing at the water and somebody says water is not being correct because what you are pointing at is not the noise water so it’s not water. It’s that. Does. And what is a kind of jazz, bloop bloop bloop bloop bloop bloop, and it’s just doing that. And you can get to see two people or a kind of jazz. They talk and communicate with each other but what does that mean? Well they get together and they make more people and they do this and they do that and they eat and they go on doing this but it’s just jazz. And you begin to see as you do that, everything is like music you see it’s all these complicated vibrations could get do on all kinds of ways that’s that or that in this that are also called in Sanskrit.

So anyway this is the fundamental notion that you are really what there is. The works. Only you’re playing hide and seek with yourself. And on a stupendous scale. Hindus measure time in units which in Sanskrit are called Kalpa. And a Kalpa is a period of four million three hundred twenty thousand years. And there are two kinds of Kalpa. One is called Manvantara, and the other is called Pralaya. Manvantara is the Kalpa in which the universe is manifested. In other words, in which God puts on his big act. And Pralaya is the Kalpa succeeding Kalpa in which the universe is unmanifested And the Godhead does not dream but is awake to its own nature. So that for these, are called respectively the days and the nights of the Brahman. And this goes on for ever and ever and ever and ever the days, the days and nights adding up into years and centuries and aeons. They speak of Crore, a Sanskrit measure. Crore sort of a word that really I think means umpteen. Crores of kalpas. And this is the in breathing and the out-breathing. As this is the word hangsah. In this word in Sanskrit

hangsah, means a swan or a big water bird like a gander. And there's a myth that there is in the beginning the divine bird which lays the egg of the world and the egg splits and the upper is the heavens and the lower is the earth. Now so when the worlds are manifested, the Lord breathing out says "hung," and when the worlds are withdrawn the breath comes back. But if you say hung. Hungsah becomes a hangsah. That means, sah means that, the truth. I am, I am that. It's like imagine when we get to the final moment in which the world is blown up. You know, imagine the countdown. This is the end. Somebody has pushed the button. Eight, seven, six, five four three two one.

What are you listening to? The sound of the waves. And you can sit and listen to the little waves on the seashore. You get back here into this kind of thinking and you're hearing the ocean of the universe going. And that's your breathing too it's all one rhythm. So it may be that every star was once a planet populated by intelligent people who found out about the fundamental energy of the universe and blew themselves up. And as they blew up, they scattered all kinds of stuff out which became little planets, and in a long time life started all over again. Because the Hindu theory is very odd. Every cow but in a Manvantara period whether the manifested world is divided into four subdivisions of time, each one of which is called a Yugo. That means roughly an epoch or an era. And there are four Yugo's, and they are named after the different throws in the Indian game of dice. That for such throws in the first is called critter. That means. Creta means to do this when we say something is done truly done. It's the perfect throw of four. second is called Threta or which is the throw three. The next is called Vapira which is the throw of two. And the final one is called Kali which means the worst throw which is the throw of one. Now each of these periods of the Kalpa. Are of different lengths creator is the longest and Carly is the shortest and so arranged. So that when the world is first manifested as in those dreams that I were mentioning to you the world is in a golden age to begin with is perfect. And that is the longest period of time. Then when we get a little bit more adventurous you see, treta means that in this era a kind of disharmonious element enters into things it's like a three legged chair isn't so secure as a four legged chair it's just a bit inclined to tip. And as it were there's a fly in the ointment. The snake in the garden. Then comes Vapara in which the forces of Good and Evil are equally

balanced. And finally Kali which is the shortest period where the forces of evil triumph, and the world is destroyed at the end of it. For then the Godhead appears in the form of Shiva who represents the destructive aspect of the divine energy. And is the creative Vishnu, the Preserver, Shiva the Destroyer. But Shiva is always the destroyer in the sense of the liberator, the guy who breaks up the ruts. And he comes on with a blue body and ten arms and a necklace of skulls. Indian gods have many arms because they are cosmic centipedes. They do all things without having to think about it, like the centipede doesn't have to think about how to manipulate its legs. Like you don't have to think how to grow your hair. And as Shiva dances what is called the Tandava, which is the dance of destruction at the end of the cycle, at the end of the Kalpa. You will see that his hands contain clubs and knives and bells but one hand is like that, and that gesture means, don't be afraid, it's a big act. It is all as it were the outflowing of your own consciousness, of your own mind.

Now then, the Hindu life is related to this cosmology. And the object of life is of course in the end to wake up from the dream. When you've had enough. And so the dreaming process is called sometimes Samsara. Samsara is the round. The rat race. And Samsara is divided into six divisions. But I'd better draw a map, I think. This is common cosmology to both the Hindus and the Buddhists.

This is the world of the Deva. And this is the same root from which we get both divine and devil, but Deva means angel. The highest and most successful beings in the universe, and so opposite this is the world of narac, naraka, who are the most unsuccessful. These are the purgatorial worlds of extreme suffering. This is the world of Assura. They are also angels, but they're angry angels representing the wrath potential of energy. This is the world of animals. This is the world of Preta, for which we have no English equivalent, hungry or frustrated spirits who have enormous stomachs but mouths only the size of needles a vast appetite and no means of fulfillment. And this is the manu, the world, that is to say the world of man. You don't have to take this literally. You could say when you are extremely happy or ecstatic you are here. When you are miserable, you are here. When you are dumb, you're here, when you're mad you're here. When you're frustrated you're here, but when you're more or less your normal rational self you are. Now or so you are all life through the period of the Kalpas goes grinding

around this wheel. And if you go up and you succeed and you get to the top you have to come down. They don't look they don't see success in other words in the world as a method of liberation because it implies failure.

So the idea of liberation which is called Moksha. Is the ideal of Hindu life. Wake up, it's a dream. And in time, there is no hope in time. Everything is going to get worse in time, because as you know it does we all fall apart in the end. Everything falls apart, institutions buildings and nations, it all crumbles. And people say well that's an awfully pessimistic philosophy. Well is it? I would rather say that the people who have hope in the future are the miserable people. because they are like donkeys chasing carrots that are dangled before their noses from sticks attached to their collars. And they pursue and they pursue in vain, always hoping that tomorrow will be the great thing and therefore incapable of enjoying themselves today.

People who live for the future never get there. Because when their plans mature they are not there to enjoy them. They're the sort of people who spend their lives saving for their old age. And trying to teach their children to do the same thing. So that when they retire at sixty five, you know there have false teeth and wrinkles and prostate trouble and all that sort of thing. Where were you going what did you think it was all about? Furthermore, the fact that life is transient, is part of its liveliness. The poets, in speaking of the transience of the world, always tell their best poetry. You know, our revels now are ended, and these are actors as I foretold you are all spirits and are melted into air into thin air. And like the baseless fabric of this vision, the Cloud-Cap towers, the goddess palaces, the solemn temples, the great earth itself I always did inherit shall dissolve. And like this insubstantial pageant faded, leave not a rack behind. We are such stuff as dreams are made up, and our little life is rounded with a sleep. And said so well it doesn't seem so bad after all does it. You see there's always in the poetry of Evanescence a kind of funny nostalgia. Moralists will say all those lovely lips which you so delight to kiss today will in a few years of rot and disclose the grinning teeth of the skull.

So what?The skull says lying in the grass chattering Finch in water fly are not merrier than I here among the flowers I lie laughing everlastingly. No, I may not tell the best, surely friends I could have guessed, death was but the

good kings jest, it was hid so carefully. And monks used to keep skulls on their desks. And people nowadays think that was very morbid. But it's only I went and visited the chapel in the Via Vinetto in Rome where there's a crypt bones, where all the altar furnishings are made out of human bones. The altars of piles of skulls there are rib bones arranged across the ceiling like floral patterns with vertebrae representing flowers. And they're all dead cap which in monks. And there's a funny little monk collecting the admissions up at the top and he has one of the funniest grins on his face I see a long time. I said to him you know the Day of Resurrection is going to be an awful lot of scuttling up this narrow staircase, of people trying to reassemble their bones. Father isn't that my fifth metatarsal? So the whole idea you see is that everything's falling apart. So don't try to stop it! When you're falling off a precipice it doesn't do you any good to hang on hang on to rock that's falling with you. But everything is doing that and so again this is another case of a completely wasting our energy in trying to prevent the world from falling apart don't do it. And then you'll be able to do something interesting with the free energy.

So that's Moksha. Because when the Hindu says everything is unreal, the Western reacts and says, "No no you can treat life as a dream. It's serious, it's real, it's for real!" And what do you mean by? OK how really wanted to be. This is in other words. Everything in so far as it's falling apart, if one thing is changing, it is like smoke, and we all feel that smoke has a lesser degree of reality than would. It's is the image of the evanescent, of the ghostly. There's this idea the whole world is this mirage. That doesn't mean it's a bad thing it's only bad if you cling to it if you try to lean on it. But if you don't lean on it it's a grand illusion so the word Maya not means not only illusion but it means art. It means magic and it means creative power. So this is the big act. And it's perhaps easier to feel the world in that way in a tropical country where death is very common and where you just watch things dissolve before your eyes ad yet burst out and grow again. The whole world is changing. Maybe easier to think that way than in our environment although when you're out in California, the human landscape changes so fast, that no town is the same for two years. Any mailing list that you have change one third addresses per annum. Nothing stays put. The hills are shadows and they flow from form to form and nothing stands.

Now this you see is not a pessimistic attitude, therefore, at all, to be able to realize that this world is simply a dream. A dancing play of smoke, fascinating yes, but don't lean on it. Life is a bridge, says one of the Hindu sayings, "Pass over it but build no house upon it." And so immediately you see that this is responsible for the enormous gaiety of certain Hindu sages. This is a thing that often puzzles Westerners. The element of they expected anybody who's an ascetic or a sage or something to be rather miserable with a glum face, but on the contrary. You take this character who's going around these days that Mahashi Mahesh, he's always laughing. Because he sees through it he looks on every side, and there is the face of the beloved of the divinity in everybody in every direction in everything playing at being you. And you can look down into a person's eyes way way in and you see the Self, the Eternal Divine, and what is so funny when it puts on an expression saying "What me?" And the guru, the teacher. When people go to a guru, they get all sorts of funny ideas, they think he's looking right through me. He sees me through and through he knows how awful I am, reads my most secret thoughts because he has a funny look at things. He isn't even interested in your secret thoughts he is looking straight at the god it in you with a funny expression on his face which is saying "Why are you trying to kid me? You can have it Shiva, I know you are." But and therefore you see his his role is to gently humor you into waking up as to your true nature. Now of course as I intimated earlier. The Hindu is therefore saying everybody is God. And this is why when a Hindu greets you he does this. That is the word the act of puja or worship to the Godhead in you. And our theologians get rather worried about that. Because you see the two conceptions of God are different. Our conception is of the boss man the king. Theirs is of the cosmic centipede with the many arms. Who does not have to think, how to make the world or other, to act the world. That would be an insufferable nuisance. You may think it rather wonderful when some Thomas tries to explain that God is fully aware of everything that happens and in every detail is willing each single vibration of any mosquitoes wing.

But when you really begin to think about it, that approach is intellectual elephantitis. Imagine the Lord being aware of all the prayers, and having to listen to the sort of prayers that go on every night. God heard the embattled nation shout. Got star for England, then God Save the King, God this, God that, of God The other thing good God said God I've got my work cut out.

But so therefore when somebody in India suddenly announces that he's God, nobody accuses him of blasphemy or of being insane. They say simply congratulations, at last you found out. And they don't immediately request a miracle. As you see, if we get across someone who says "I'm God" or "I'm a Jesus Christ," they say what they said to Jesus Christ in the first place. Command that this bread, these stones be made bread. And you know, he used to wangle out of it and go out of it by saying "You're wicked and deceitful generation seek it after a sign, in the show no sign be given." The Hindu would say, but there is no point in changing it. It's going the way I want it to anyhow. Only really and truly. There is not this idea of God the technician, but rather the power of omnipotence is not to be able to do anything, but to be doing all things, whatever it is that's going on. And spontaneously without having to think about it which is very clumsy.

Now then, I must say something about how then this relates to the life of the Hindu. Hindus divide life into certain stages what I call the Asharmas. The first is called Brahma Charia. The second Gri Hasta. And the third Vannaprasta. Brahma Charia, means the stage of the student, the apprenticeship. Gri Hasta, to the stage of the householder. And Vanaprasta, the stage of the forest. This is really related to the cultural history of early India. Before we have agrarian communities, we have a hunting culture, which is on the move. In a hunting culture, every male knows the whole culture, there is no division of labor. And the holy man of the hunting culture is of course called a shaman. A shaman is a realized man, a man who knows the in a secret. He's seen through the game and he finds it by going away alone into the forest. And cutting himself off from the tribe. That is to say, from social conditioning. And he goes maybe for a long period into the forest and comes back. He's found out who he is, and he sure isn't who he was told he was. But as hunting culture settle into agrarian patterns of life, what do they do? They build a village. And around the village they set up a stockade, which is known as the pail. And the village is always of course standing at a crossroads. And there you get in an agrarian society a division of labor. And the division of labor comprises four. In medieval Europe we call them lords spiritual. Lords temporal. Commons and serfs. In India they are Brahmins. Chatrya that means fighters. Vichya, merchants or traders. Shudra, laborers. So you've got the priests, the Warriors, the merchants, and the laborers. Division of labor. The four

sections of town. So the four basic costs. So when you are born you are born into a caste. And your duty as a Gri Hasta, to our householder, is to fulfil your cost function, and to bring up a family. When you've done that. You go back to the forest, back to the hunting culture. And you drop your role. And you become nobody. A shaman again. So Hindu calls one who does this, which is of course the same word as Shaman. And the Chinese call him a Shaman. Shaman is an immortal. Why immortal? Because it's only the role that's mortal. The big front, the persona. The one who you really are. The common man, that is to say the man, who is common to us all which you could call the Son of Man. That's the real self that's the guy who's putting on the big act. And of course he has no name. Nobody can put the finger on him. Because you can't touch the tip of the finger with the tip of the finger.

So that means in practice then, that when you hand over your vocation in life which is called Svadarma, that means that's the same as the Latin, one's own karma means function your own function or we would call your vocation. When you've completed it, you drop out and become a nobody. Because you're going to find out now who you really are. You're no longer. Mr. Who is. Trust salesman. You drop that name. And you take on one of the names of God Swami Brahmananda Swami bliss of Brahma. And you're. You may go quite naked like the Shiite holy man. No clothes and they just go out and wander and don't make any provisions or anything they in literally take no thought for the morrow, what you shall eat, what you shall drink or where with all those will be clothed. But you seem people respect them. They say are we going to have those people up there because they are doing what human being is ultimately supposed to do, and we should do it in our turn and so give them some food. Now naturally caste holy men and all that kind of thing can be exploited. Anything can be exploited and abused. And we can look at it all and say. What a mess, why don't you do something for yourselves? Why don't you kill the sacred cows and eat them? Why don't you clean up why do you permit all this disease? Just try and see something from another point of view for a change. I'm not saying that we should do what the Hindus do, but just look at it from another point of view. And they would smile at us and say. "You really think it's as real as all that?" Have you never experienced what's on the inside of this game.

So the trouble with you Westerners is you never experienced bliss. You never got down to the root of reality. You don't know that state of consciousness. And so you're frantically trying to patch everything up and pin it all together and screw the universe up so it's fixed you can never do it or it is going to wildly rushing around and creating trouble. Cos Western educated induce think the same way. They are now rushing around and patching India up. And what's going to happen is they're going to arm all the millions of people in India and they're going to create a lot of trouble in Asia one of these days when they become powerful society. We're here of course.

Yeah that's true you know. Because of the big fight with the devil you see. The war in heaven, you see now the funny thing about that is, when you read Milton's Paradise Lost, long before Lucifer decided to rebel, the whole of Heaven was armed. And he describes the legions of angels with their discussions and gone for lungs and military department, who was looking for trouble? You know there Lucifer was a good guy back there, you see, the bearer of light. So the Hindu looks at our Christianity and sort of thinks, my goodness. Here is the eternal Self, but in the idea of Christianity, the God-head is having a real far one. Because not only is he incarnating himself, say as some wretched beggar, but he's incarnated himself as a Christian soul who believes that in this one short life he will decide his eternal destiny and the possibilities of making a mistake are far greater than the being a lousy beggar. The possibility involved in the Christian gamble is to fry in hell forever and ever and ever and ever. Even the Avici hell at the bottom of the Naraka only goes on for about one Kalpa. But the everlasting damnation. What an idea. So the Hindu says Bravo, you know. God has really done a dare on himself this time to be a Christian soul.

Introduction to Buddhism

The idea of a Yana, of vehicle, comes from the basic notion or image of Buddhism as a raft for crossing a river. This shaw is ordinary everyday consciousness, such as we have, mainly the consciousness of being an ego or a sensitive mind locked up inside a mortal body. A consciousness of being you in particular and nobody else. The other Shaw is release or Nirvana. A word which means literally blow out. As one says when heaving

a sigh of relief. Nirvana is a never, never, never to be interpreted as a state of extinction or a kind of consciousness in which you are absorbed into an infinitely formless luminous ocean which could best be described as purple jello. But luminous, you know, kind of spiritual. It isn't meant to be that at all. Nirvana has certain many senses, but the primary meaning of it is that this everyday life just as we have it now, but seen and understood and felt in a very very different way. Buddhism is called in, general a Dharma, and this word is often mistranslated as the law. It's better translated as the doctrine. And still better translated as the method. And the dharma is formulated originally by the Buddha, who was the son of a north Indian Raja living very close to Nepal who was thriving shortly after six hundred B.C. The word buddha is a title. The proper name of this individual was Guatama Siddhartha. The word Buddha means the Awakened One. From the Sanskrit root Budh, which means to wake. Or to know.

So we could say Buddha means the man who woke up, and the Buddha was a very very skilful psychologist. He is in a way the first psycho-therapist in history. A man of tremendous understanding of the wiles and deviousness of a human mind. What ism it is made to be easily understood. Everything is numbered so you can remember it. And the basis of it is and I want to call the four noble truths. The first one is the truth about suffering. The second the truth about the cause of suffering the third the truth about the ceasing of suffering. And the fourth, the truth about the way of ceasing the suffering. Then let's go back to the beginning: suffering. The Sanskrit word as Dukha D. U. K. H. A. Dukha. In means suffering in the widest possible sense but chronic suffering chronic trust ration is probably as good a translation as any chronic frustration and the blood it does and says the life of mankind and of animals indeed also of angels. If you believe in angels is characterized by chronic frustration. And so that constitutes the problem if if anyone if anyone of you says I have a problem I don't suppose you would be here if you didn't in some way have a problem. Well that's dukha.

Now the next thing is the cause of it., which is called Trishna T R I S H N A, is a Sanskrit word that is the root of our word thirst. Thirst. But more exactly craving or clutching or desiring. Because of craving or of clutching in us, we create suffering, but in turn this second truth includes that behind Trishna there lies another thing called ignorance. Avidya. Non Vision. And

you see video. Vid in Sanskrit is the root of the Latin v Dale and of vision. And in front of the word is none as we say atheist is a non theist so I Vidia is not seeing ignorance or better ignoring because our mind as it functions consciously is a method of attending to different and particular areas of experience, one after another one of time. When you focus your consciousness on a particular area, you ignore everything else. That is why to know is at the same time to ignore. And because of that there arises Trishna craving. Why? Because if you ignore what you really know you come to imagine that you are separate from the rest of the universe. And that you are alone. And therefore you begin to crave. To thirst. You but you develop an anxiety to survive. Because you think if you're separate if you're not the whole works you're going to die actually you're not going to die at all you're simply going to stop doing one thing and start doing something else you know when you die in the ordinary way you just stop doing this thing called Alan Watts. But you do something else, later, later man and I'm like that and you and it is nothing to worry about at all. Only if you are going tally law up in the illusion that you're only this then you begin to be frightened and anxious and that creates thirst. So if you can get rid of ignorance, ignore-ance, and widen your mind out so as to see the other side of the picture, then you can stop craving. That doesn't mean to say you won't enjoy your dinner. And that it won't be nice to make love to girls or anything like that. It doesn't mean that at all it means you enjoying your dinner and making love and generally. Enjoying the senses and all the experience that only becomes an obstacle to you if you cling to that in order to save yourself.

But if you don't need to save yourself you can enjoy life just as much as ever. You don't have to be a Puritan.

So then, that state of letting go instead of clinging to everything. Supposing you're in business, and you have to make money and keep up this family support or something like that you know the thing is do that but don't don't let it get you down. Do it what the Hindus call Nishkama Karma. Karma, Nishkama means passionless karma activity. And that means doing all the things that one would do in life one's business one's occupation and cetera et cetera but doing it without taking it seriously. Do it as a game. And then everybody who depends on you will like it much better, because if you take

it seriously, they'll be feeling guilty because they'll say "Oh dear papa absolutely knocks himself out to work for us," you see, and they all get miserable and they go on. They live their lives out of a sense of duty which is a dreadful thing to do.

So that's Nirvana, to live in a let-go way. Then the Four Noble Truths describes the way the method of realising Nirvana, and that's called the Noble Eightfold Path. And the eightfold path is a series of eight human activities such as understanding of your effort, vocation or occupation, speaking, conduct, etc., and they're all prefaced by the Sanskrit word Samyak, which is very difficult to translate. Most people translate it right, in the sense of correct. But this is an incomplete translation. The word sum, the root sam in Sanskrit is the same as our word sum, through the Latin suma. And of course the sum of things means completion. But it also has the sense of balanced, or middle wayed. Not W E I G H E D, but W A Y as in the middle way, and Buddhism is called the middle way. And we will find out a great deal about that later.

But the thing that you must recognize is this. Buddhism, although when you say right speech in other words, don't tell lies. Well let me put it this way, everybody who belongs to the Theravada school in the south expresses the fact that he is a Buddhist by reciting a certain formula. And it's called Kisarana, and Panchasila. This is I'm talking Pali now, not Sanskrit. And I means the three refuges punch a seal on the five precepts. And they put their hands together like this and say "But the hung on them be done hung on Tom the sun Hung's on me" [sic], that means I take refuge in Buddha, I take refuge in the method, the Dharma, I take refuge in the Sangha, which means the fraternity of the followers of Buddha, and then he goes on and he takes the five precepts [chants]. And this precepts one after another I have promised to abstain from taking from life. Taking life. I do not die now, that I many I have promised to abstain from taking what is not given Kama Summa. God, I promise to abstain from exploiting my passions. Most of out of out on me, I promise to abstain from false speech [chants]. I promise to abstain from getting intoxicated by a list of various boozes. [laughs] Now that this, everybody, Buddhists in the southern school says this.

Mahayanas have a different formula. All this is the method and the method, the dharma, is there for a moral law. Just like the Ten Commandments but it isn't. There's nothing. It's quite different. You see, you don't take the five precepts in obedience to a royal edict. You take them upon yourself. And there is a very special reason for doing so. How can you call fill the precept not to take life? Every day you eat, even if you're a vegetarian, you must take life. And so on.

Now therefore, understand this, and this is absolutely fundamental to an understanding of Buddhism. Buddhism is a method. It is not a doctrine. Buddhism is a dialogue. And what it states at the beginning is not necessarily what it would state at the end. The method of Buddhism is first of all a relationship between a teacher and a student. The student creates the teacher by raising a problem and going to someone about it. Now if he chooses wisely, you see, he'll find that if there's a Buddha around to use as the teacher. And then he says to the Buddha, "My problem is that I suffer, and I want to escape from suffering." So the Buddha replies. "Suffering is caused by desire. By Trishna, by craving. If you can stop desiring, then you will solve your problem. Go away and try to stop desire." And he gives him some methods. How to practice meditation, and to make his mind calm and still to see if he can stop desire. The student goes away and practices this. Then he comes back to the teacher and says, "But I can't stop desiring not to desire. What am I to do about that?" So the teacher says. "Try then to stop desiring not to desire." And now you can see where this is going to land up. Or he might put it in this way. "All right if you can't completely stop desiring, do a middle way." That is to say, stop desiring as much as you can stop desire. And don't desire to stop any more desire than you can stop. See where that's going to go.

Because he keeps coming back. Because what the teacher has done in saying stop desiring he has given his student what in Zen Buddhism is called a koan. This is a Japanese word that means a meditation problem, or more strictly it means the same thing as case means in law. Because koans are usually based on anecdotes and incidents of the old masters, cases, precedents. But a koan, the function of the koan is a challenge for meditation. Well who is it that desires not to desire? Who is it that wants to escape from suffering? And here we get to a methodological difference

between Hindus and Buddhism on the question of who are you. The Hindu says you, yourself, he calls Atman, the self. And he says now strive to know the self. Realize I am not my body because I can be aware of my body. I am not my thoughts because I can be aware of my thoughts, and not my feelings, for the same reason I am not my mind, etc., because I can be aware of it. Therefore I really am other than, above, transcending, all these finite aspects of me. Now that the Buddhist has a critique of that. He says “Why do you try to escape from yourself as a body?” The reason is your body falls apart and you want to escape from it. Why do you want to decide then to fight yourself from your emotion. The reason is your emotions are uncomfortable and you want to escape from. You don’t want to have to be afraid. You don’t want to have to be in grief or anger. And love even is too much, you see, it involves you and suffering because if you love someone you have a hostage to fortune.

So the Buddha says the reason why you believe you are the Atman, the eternal Self, which in turn is the Brahman, the self and the whole universe, is that you don’t want to lose your damn ego. And if you can fix your ego and put it in the safe deposit box of the lot. You’ve still got yourself, you haven’t really let it go. So the Buddha said there isn’t Atman. He taught the doctrine of an non-Atman, non-self. Your ego is unreal. And as a matter of fact, there’s nothing you can cling to. No refuge really. Just let go, man. There’s no salvation, no safety, nothing anywhere, you see how clever that cross. Because he what he was really saying is any Atman, that you could cling to or think about or believe in wouldn’t be the real one. This is the accurate sense of the original documents of the Buddha’s teachings, if you carefully go through it that’s what he’s saying he’s not saying that there isn’t the outline of a Brahman is anyone you could conceive wouldn’t be it. Anyone you believed in would be the wrong one. Because believing is clinging still. There’s no salvation through believing. There’s only salvation through knowledge.

And even then. The highest knowledge is to know is non-knowledge. And he agrees with the Hindus, who say in the opening Upanishads, if you think that you know Brahman, you do not know him. But if you know, that you do not know the Brahman, you truly know. Why? Well that’s very simple. If you really are it, you don’t need to believe in it. And you don’t need to

know it, just as your eyes don't need to look at themselves and see. So that's the the difference of method in Buddhism. Now understand method here. Method as that dialogue. And the so-called teachings of Buddhism are the first opening gambit in the dialogue. And when they say you cannot understand what is an out of books the reason is that the books only give you the opening gambits. Then having read the book you have to go on with the method. Now you can go on with the method without a former teacher, that is to say you can conduct a dialogue with yourself. Or with life. You have to explore and experiment on such things as, could one possibly not desire? Could one possibly concentrate the mind perfectly? Could one possibly do this that and the other and you have to work with it you see so that you understand the later things that come after trying these experiments. These later things are the heart of Buddhism.

So then shortly after the Buddha's time. the practice of Buddhism continued as a tremendous ongoing dialogue among little various followers, and eventually they established the great universities. Such as there was at a place called Nalanda in northern India. This discourse was going on, and if you looked at it superficially, you might think it was nothing but an extremely intellectual bull session where philosophers were outwitting each other. Actually, the process that was going on was this. That the teacher or guru in every case was examining students as to their beliefs and theories, and destroying their beliefs showing that any belief that you would propose any idea about yourself or about the universe which you want to cling to and make something of use for. A crutch, a problem, the security, the teacher demolishes that. This is how the dialogue works, until you are left with not a thing to hang on to. Any religion you might propose, even atheism, they'll tear up. Agnosticism they'll destroy. Any kind of belief. They're experts in demolition, so that they finally get you to the point where you've got nothing left to hang on to. Well then you're free, cause you're it, you see? Once you're hanging on to things, you put it, somewhere else and see, something I can grab. And even when you think that "I'm it," you're still hanging on to, then they're going to knock that one down.

So when you are left without anything at all, you have seen the point. Now that the method of the dialogue essentially. That is the dharma. And all but it's make jokes about. Buddha says in the Diamond Sutra "When I attained

complete perfect unsurpassed awakening I didn't attain anything." Because it's like, to use a metaphor that is used in the scriptures, it's like using an empty fist to deceive a child. So you know, you say to a child, "What have I got here?" The child gets interested immediately, and wants to find out, so you hide it, and the child climbs all over you can't get a give and finally you do let him get it and there's nothing in it.

Many of the problems that are now being discussed by modern logicians are unbeknownst to them already in the ancient Indian books. Problems of semantics, problems of meaning, problems of the nature of time and of memory. All these were discussed with very very meticulous, scholarly sophistication. So that it is my opinion that this was a very very fertile period of human history. And that the philosophy in which it eventually emerged, the philosophy of Mahayana Buddhism is as yet the most mature and really intelligent theory of human life and of the cosmos that man has ever devised. It is characteristic of this point of view. That it adheres to the Middle Way. And the Middle Way doesn't mean moderation, it means the bringing together of opposites. Of what we might call in our world spirit and matter, mind and body. Mysticism and sensuality. Unity and multiplicity. Conformity and individualism. All these things marvelously wedded together in the worldview of Mahayana. And fundamental to Mahayana Buddhism is the idea of what is called the bodhisattva. Bodhisattva means a person who has as his essence Satva, Bodhi, awakening. And it's usually used to mean a potential Buddha. Someone who is as it were, just about to become a Buddha. That was the original sense and so part of the Pali Canon is a book called The Jataka [sic], the tales of the Buddha's previous lives. How he behaved when he was an animal. How he behaved when he was a man, long before he became Buddha. And in all these stories, he is represented as sacrificing himself for the benefit of other beings. But since he had not yet become a fully fledged Buddha he's called in these stories a bodhisattva. That really means a potential Buddha.

But the point is that as a potential Buddha as a Bodhisattva, he is always involved in situations where he is feeding himself for the hungry tigers and so on. Now in the course of time, the term Bodhisattva underwent a transformation. A bodhisattva matures and becomes a Buddha. And what does that mean popularly? It means that whoever is fully awakened to the

way things are is delivered from any necessity to be involved in the world any more. In other words, you can go on to a transcendent level of being, where time is abolished. Where all times are now. Where there are no problems. Where there is perpetual eternal peace. Nirvana, in the sense of the word Pari-Nirvana means beyond Nirvana, super Nirvana. So that, if you are fed up with this thing and you don't want to play the game of hide and seek anymore you can go in the Pari-Nirvana and be in total serenity. However, and again I'm talking the language of popular Buddhism, a person who stands on the threshold of that peace can turn back. And say I won't be a Buddha. I'll be a Bodhisattva. I won't make the final attainment, because I would like to go back into the world of manifestation they call Samsara. Go back into that world and work for their liberation.

So then, when a Mahayana Buddhist does his formula. For Puja. He says, sentient beings are numberless, I take a vow to save them. Diluting passions are inexhaustible, I take a vow to destroy them. The gates of the method of the method, the Dharma, are manifold, I take a vow to enter them. The Buddha Way is supreme, I take a vow to complete it. All this is impossible. And see numberless sent in beings because their numbers can never be delivered. Diluting passions which are inexhaustible can never be eliminated. So the Mahayana say [chants]. That's their formula the Bodhisattva, who returns into the world and becomes involved again is in fact regarded as a superior kind of being to the one who gets out of it. And the person who gets out of the rat race and enters into eternal peace is called Pratyekabuddha, which means private Buddha, a Buddha who does not teach. Who does not help others, and in Mahayana literature that is almost a term of abuse. Pratyekabuddha is a class with unbelievers and heretics and infidels and fools. But the great thing is that Bodhisattva. All beings are thought of in popular Buddhism as constantly reincarnating AGAIN and AGAIN and AGAIN And AGAIN into the round of existence, helplessly, because they still desire. They're therefore drawn back into the cycle. The Bodhisattva goes back into the cycle with his eyes wide open voluntarily. And allows himself to be sucked in, and this is normally interpreted as an act of Supreme compassion and bodhisattvas can assume any guise. They can get furiously angry, if necessary, in order to discourage evil beings. Even could assume the role of a prostitute and live that way so as to deliver beings at that level of life. Could become an animal, become

an insect, become a maggot, anything you know. All deliberately and in full consciousness, to carry on the work of the deliverance of all beings. Now that's the way the popular mind understands it, and therefore the bodhisattvas are all revered and respected and worshiped and looked upon as gods as we look upon God in the West and as saviors as the Christian looked upon Jesus. But underneath this myth there is a profound philosophical idea. And that is this it goes back to the Hindu philosophy of advice and non-duality. Namely, there the apparent dualism of I and thou. Of the knower and the known, the subject and the object is unreal. And so also the apparent duality between. Maya the world illusion and reality is unreal. The apparent deluded duality or difference between the enlightened and the ignorant person is unreal.

So the apparent duality of bondage and deliverance, all liberation is unreal. The wise, the perfectly wise man, is the one who realizes vividly that the ideal place, is the place where you are. This is an impossible thing to put in words. The nearest I could get to it would be to say that if you could see this moment. That you need nothing beyond this moment, now, sitting here, irrespective of anything I might be saying to you, of any ideas you might have rattling around in your brains. That here and now is the absolute, which than which there is no whicher. Only, we prevent ourselves from seeing this, because we are always saying there ought to be something more on, I'm missing it something somehow. And nobody sees it. Now. Then also the most far out form of my own of Buddhism is in is called the Pure Land school Jodo Shinju. Jodo means pure land since you true sect. And. This is based on the. Idea that there was an immeasurably past ages a Great Bodhisattva called Amitava and he made a vow that he would never never become a Buddha unless any being who repeated his name would automatically, at death be born into the pure land over which he presides, over this kind of paradise. He did become a Buddha, and so the vow works. All you have to do is to repeat the name of Amitaba, and this will assure the fact that without any further effort on your part you will be reborn in his paradise when you die and in that Paradise becoming a Buddha is a cinch. There are no problems there. There Western paradise, you see, is a some kind of a level of consciousness, but it's represented as fact, as a glorious place and, see the pictures of it in, sound wonderful pictures where the Buddha Amitabha, who is actually a Persian figure related to a Uhura

Mazda, and he means boundless light, and the statue at Kamakura, that enormous bronze Buddha in the open air is Amitabha. So there he sits surrounded with his court and this court is full of ups silence and absoluteness beautiful girls playing lutes, and as you are born into the Paradise what happens when you die because you discover yourself inside a lotus. And the Lotus goes up and there you find yourself sitting coming out. Of the water. And here on the clouds in front of you are the Absaras, sitting, strumming their Lutes with the most sensuous, beautiful faces, and to get this, all you have to do is say the name of Amitabha. The formula is Namu-Amina-Butz [sic] Now I want to know what's and you get this fast man know what I mean everything I mean about them and I want [chants] I'm set any minute time to see you so you're quite sure it's going to happen. But actually only have to say it once. And you mustn't make any effort to gain this reward because that would be spiritual pride. Your karma you see your bad deeds your awful past is so bad that anything good you try to do is done with a selfish motive and therefore doesn't effect your deliverance. Therefore the only way to get deliverance is to put faith in the power of this I mean Amitabha Buddha. And to accept it as a free gift and to take it by doing the most absurd things, saying no more I mean the books. Don't even worry whether you have to have faith in it, because trying to have faith is also spiritual pride.

It doesn't matter whether you have faith or whether you don't the thing works anyway so to say now I mean the books and that's the most popular form of Buddhism in Asia. The two most vast temples in Kyoto, the Inisha and Higashi Hongaji temples, represent the sect. And everybody loves Amitabha, Amita they call him in Japan. Boundless light, infinite but of compassion. Sitting there with an angelic expression on his face, "It's all right man, all you have to do is say my name." So when we add together, try our wheels number, they call it Nembutsu, that's the means of remembering, but our bookcases and all these things where you just have to put it up, and the the work is done for you. Then wouldn't we Westerners say, especially if we are Protestants, "Oh what a scoundrelly thing that is. What an awful degradation of religion. What an avoidance of challenge and effort and everything that is required." Is this is what the Bodhisattva doctrine of infinite compassion deteriorates into.

Now you see there is a profound aspect to all that. Just as there is the diamond in the ice as we were talking about this morning. Just as there is desperation and despair. Nirvana. Desperation and despair of the horrors. So there are two ways of looking at this. Nothing to do, no effort to make idea. Depending completely on the Savior. For who is Amitabha. Popularly Amitabha is somebody else, he is some great compassionate being who looks after you. Esoterically, Amitabha is your own nature. I mean your real self, the inmost boundless light that is the root and ground of your own consciousness. You don't need to do anything to be that. You are that. And saying Nembutsu is simply a symbolical way of pointing out. That you don't have to become this, you are it. And Nembutsu therefore and its deeper side builds up a special kind of sage which they call mere Miokonin. Miokonin in Japanese means a marvelous fine man. But the Miokonin in is a special type of personality who corresponds in the West to the holy fool in Russian spirituality, or to something like the Franciscan in Catholic spirituality. And you know Miokonin. Well I tell you some Miokonin stories, that's the best way to indicate their character. One day I'm Miokonin was traveling and stopped in a Buddhist temple overnight. And he went up to the sanctuary where they have all these big questions like you know for the priest to sit down and he arranged the questions in a pile on the floor and went to sleep on. In the morning the priest came in and saw this tramp sleeping and said "What are you doing here? Desecrating the sanctuary by sleeping on the cushions, and so on right in front of your order! And the Miokonin looked at him in astonishment and said "Surely you must be a stranger here, you can't belong to the family." In Japanese when you want to say that a thing is just the way it is you call it sonomama. So as a Haiku poem which says "Weeds in the rice field, cut them down. Sonomama, fertilizer." Cut the weeds, leave them exactly where they are, and they become fertilizer sonomama. And so on mama means reality just the way it is just like that now there's an expression of parallel expression konomama, which means I just as I am. Just little me, with no frills no pretense, except that I naturally have some pretense. That's part of konomama. And the Miokononin is the man you see who realizes that he can i just as I am Buddha. Am delivered by Amitabha, because Amitabha is my real nature. If you really know that you see, that makes you a Miokonin. But be aware of the fact that you could entirely miss the point and become a monkey instead by saying, I am all right just as I am, and therefore I'm

going to rub it in, and I'm going to be going around parading my unregenerate nature because this is Buddha too you see. The fellow who does that doesn't really know that it's OK. He's doing too much he's coming on too strong. The other people who are always beating themselves, they're doing the opposite error, you see. The middle way right down the center is where you don't have to do a thing to justify yourself. And you don't have to justify not justifying itself which is the mistake that most beatniks make. They justify not justifying themselves. And go too far.

So you see there's something quite fascinating and tricky in this doctrine of the Great Bodhisattva Amitabha, who saves you just as you are who delivers you from bondage just as you are and you only have to say namu-amina-butz. Fascinating. But that is the principle of Mahayana, and that is, your acceptance of yourself as you are is the same thing as coming to live now as you are, you see now is as you are in the moment. But you can't come to now and you can't accept yourself. On purpose. Because the moment you do that you're doing something unnecessary. You're doing a little bit more that's what they call in Zen legs on a snake. Or a beard on a eunuch. You've overdone it you see. How can you neither do something about it nor do nothing about it as if that was something you had to do? You see? This is the same problem as originally posed in Buddhism. How do you cease from desiring? Because when I try to cease from desiring, I am desiring not to design. All of this is what is called Upaya, or what is called a skillful device to slow you down so that you can really be here. By seeing that there is nowhere else you can be. You don't have to come to now, where else can you be? It isn't a task, it isn't a contest, that the Greeks called argon, agony. A contest. There's nowhere else to be, so they say Nirvana is no other than Samsara. This shore is really the same as the other shore. It's not a, so if you look far in this Langvatara [sic] Sutra says, if you look to try and get Nirvana in order to escape suffering and being reborn, that's not nirvana at all.

Eco Zen

I suppose most of you have heard of Zen. But before going on to explain any details about it I want to make one thing absolutely clear. I am not a Zen Buddhist. I am not advocating Zen Buddhism. I'm not trying to convert

anyone to it. I have nothing to sell. I am an entertainer. That is to say, in the same sense that when you go to a concert and you listen to someone play Mozart, he has nothing to sell except the sound of the music. He doesn't want to convert you to anything. He doesn't want you to join an organization in favor of Mozart's music as opposed to say Beethoven's. And I approach you in the same spirit as a musician with his piano or violinist with his violin. I just want you to enjoy a point of view which I enjoy.

Now then, having then...when that's been said and I hope it's put your minds at rest. Let me give you first of all some simple historical information. Zen is a form of Buddhism. It originated in China about five hundred A.D. and about twelve hundred A.D. it migrated to Japan where it exists today. And it is a form. It's a way of life that has had an immense influence on the arts, and on the culture, the poetry and architecture of the Far East. It has lately become of enormous interest to many people in other parts of the world. Now, normally when one talks about Buddhism and Zen is a form of Buddhism, it is supposed that you're talking about a religion, and people are apt to classify themselves as Buddhists as they might say I am a Catholic, or a Methodist, or a Baptist, or an Episcopalian, or a Jew. But that is rather misleading. Buddhism is not a religion in that sense.

If we want to find an equivalent to Buddhism in our society today in the West, probably the nearest thing to it is psychotherapy. When a person goes to a psychiatry store psychoanalyst to work out a serious personal problem, not because he's just nutty. I mean not necessarily because he has hallucination or excessive ringing in the ears with no clear physical origin but when a person feels that his whole life is somehow disoriented and wrong, and he doesn't go to the preacher, because the preacher only moralizes to him and says, My man you should have more faith in God or something. So he goes instead to a doctor because in our day is a man with a tag of science on him has more prestige than a man who has the tag of religion. And so when psychiatrist goes to work on you, his objective is more or less to change your state of consciousness. That is to say, if your state of consciousness, your state of mind is one of being day after day constantly depressed, the objective of going to a psychiatrist, or a

psychotherapist is to have your state of consciousness changed to one of happiness.

Now in a somewhat similar way, the object of Buddhism in all its forms, is to bring about a fundamental change in a human being's everyday state of consciousness. If I make it yet more specific, it's to bring about a change in your sense of personal identity, that is to say in your sensation of who and what you are. And in this way, Buddhism which I suppose you know, is a method of changing consciousness that was discovered or invented by a man called Guatama, who lived in India shortly after six hundred B.C.. Who was given the title Buddha because the word means the awakened one the man who woke up. And therefore that very title suggests that ordinary people are asleep. I remember a very wise man who used to give lectures like this and when he came in he used to be silent and he'd look at the audience and he had gaze at everybody in the audience particularly, for a long time, and everybody would begin feeling they get embarrassed, and when he gazed at them for a long time he'd say, "Wake up! You're all asleep. And if you don't wake up I won't give any lecture." Now in what sense are we asleep? The Buddhist would say that almost all human beings have a phony sense of identity. A delusion a hallucination as to who they are. I'm terribly interested in this problem of identity and I try and find out what people mean when they say the word I. I think this is one of the most fascinating questions. Who do you think you are? Now what seems to develop is this. Most people think that I is a center of sensitivity somewhere inside their skin. And the majority of people feel that it's in their heads. Civilizations in different periods of history of differed about this. Some people feel that they exist in the solar plexus; other people feel that they exist about here, but in American culture today or in the Western culture in general most people feel that they exist in here [forehad]. And there is as it were a little man sitting inside the center of the skull. And he has a television screen in front of him which gives him all messages from the eyeballs. He has earphones on and that gives him all messages from the ears, and he has in front of him a control panel with various dials and buttons and things which enable him to influence the arms and legs and to get all sorts of information from the nerve ends and that's you.

So we say in popular speech, I have a body. Not, I am a body, but I have one because I am the owner of the body in the same way as I own an automobile. And I can take the automobile to the mechanic and occasionally in the same way, I have to take my body to the mechanic the surgeon the dentist the doctor and have it repaired. But it belongs to me. It goes along with me, I mean it a child for example can ask mother mom who would I have been if my father had been someone else? And that seems a perfectly simple and logical question to a child asked because of the presumption that your parents gave you your body, and you were popped into it, maybe at the moment of conception or maybe at the moment of birth, from a repository of souls in heaven and your parents simply provided the physical vehicle.

So that age long idea that is indigenous, especially to the Western world, is that I am something inside a body. And I am not quite sure whether I am or am not my body. Some doubt about it. I say, I think. I walk, I talk, but I don't say I beat my heart. I don't say, I shake my bones, I don't say I grow my hair. I feel that my heart beating, my hair growing, my bone shaping, is something that happens to me. And I don't know how it's done. But other things I do. And next, I feel quite sure that everything outside my body is quite definitely not me. There are two kinds of things outside my body. Number one is other people. And they're the same sort of thing as I am. But also they are all little men locked up inside their skins. And they're intelligent, they have feelings, and values and are capable of love and virtue. But number two is the world that's non-human that we call nature. And that stupid. It has no mind. It has emotions maybe, and animals. But on the whole it's a pretty grim business, dog eat dog. And when it gets to the geological level it's as dumb as dumb can be. It's a mechanism and there's an awful lot of it. And that's what we live in the middle of and the purpose of being human is, we feel, to subjugate nature. To make it obey our will and we arrived here, we don't feel that we belong in this world. It's foreign to us. In the words of the poet Housman." I a stranger and afraid in a world I never made."

And so all around us today we see the signs of man's battle with nature. I'm living in the moment in a marvelous house in the Hollywood Hills. And we're overlooking a lake. And on the other side of the lake the whole hill

has suddenly been interrupted with a ghastly gash where they have made level lots for building tract homes of the kind you would build on a flat plane. This is called the conquest of nature. These houses will eventually fall down the hill. Because they are causing soil erosion and they're being maximally stupid. The proper way to build a house on a hillside, is to do it in such a way as to effect the minimum interference with the nature of the hill. After all, the whole point of living in the hills is to live in the hills. There's no point in converting the hills into something flat and then going and living there. You can do that already on the ground. So people the more people live in the hills the more they spoil the hills and they're just the same as people living on the flat ground. How stupid can you get? Well anyway that this is one of the symptoms of a phoney sense of identity. Of our phony feeling, that we are something lonely locked up in a bag of skin and confronted with the world and external, alien, foreign world that is not me. Now according to certain of these great ancient philosophy is like Buddhism, this sensation of being a separate lonely individual is a hallucination. It's a hallucination brought about by various causes the way we are brought up, being the chief of them of course. I remember as a child, and you probably have very similar memories to mine that all our parents were desperately interested in identifying us. Don't you remember that sometimes you went out and played with other children and there was someone in the group of other children you admired and look up to and you came home imitating the mannerisms of that other child. And your mother said to you Johnny, that's not you, that's Peter. And you felt a little bit ashamed, because somehow you let her down. She wanted you to be you her child and not Mrs Jones's child Peter. And so in many ways we are all taught this. For example, the main thing that we're all taught in childhood is that you must do that which will only be appreciated if you do it voluntarily. Now darling, a dutiful child must love its mother, but now I don't want you to do it because I say so but because you really want to. Or, you must be free. See, this comes into politics. Everybody must vote. You see, imagine. You are members of a democracy. And you must be members of a democracy, you're ordered to. Crazy. Also, Thou shalt love the Lord thy God. Is that a commandment or a joke? You know, if you suggest that the Lord is joking, most people in our culture are offended, because they have a very moronically conception of God as a person totally devoid of humor.

But the Lord is highly capable of joking because joking is one of the most constructive things you can do.

So when you are told who you are and that you must be free; furthermore, that you must survive, and you must go on living, and that becomes a kind of compulsion, you get mixed up. It's very simple, of course you get mixed up if you think you must do something which will only be the thing required of you if you do it freely. These are the sort of influences then that cause human beings all over the world to feel isolated. To feel that they are centers of awareness locked up in bags of skin.

Now this sensation of our identity can be shown and demonstrated to be false by some of the disciplines of our own science. When we describe a human being or any other living organism from a scientific point of view, all that means is that we're describing it carefully. We're going to describe very carefully what a human being is and what a human being does. All right. And we find that as we go on with that description, we can't describe the human being without describing the environment. We can't say what a human being is doing without also saying what the world around him is doing. Just imagine for a moment that you couldn't see anything up here except me. You couldn't see behind me, you couldn't see the stage you couldn't see the microphone, you could only see me. That was all you could see. What would you be looking at? You wouldn't see me at all. Because you wouldn't see my edges, and my edges are rather important for seeing me. My edges would be identical with the edge of your eyesight, with that vague oval curve which is the field of vision, and what you would be looking at would be my necktie, my nose, my eyes and so on but you wouldn't see my edges. So you'd be confronted with a very strange monster. And you wouldn't know it was a human being. Because to see me you need to see my background. And therein lies a clue of which we are mostly ignorant. In Buddhist theory, because of our phony sense of identity is called Avidya, and that means ignorance, although it's better to pronounce it ignore-ance. Having a deluded sense of identity is the result of ignoring certain things.

So when you look at me and I manage by behaving up here in a kind of a more or less interesting way, I cause you to ignore my background because

I concentrate attention on me. Just like a conjurer stage magician in order to perform his tricks misdirects your attention. He talks to you about something he's doing here, and he talks to you about his fingers and how empty they are and he can pull something out of his pocket in plain sight and you don't notice it. And so a magic happens. That's ignoring. Selective attention focusing your consciousness on one thing to the exclusion of many other things. So in this way we concentrate on the things the figures. And we ignore what we don't concentrate on the background and so we come to think that the figure exists independently of the background. But actually they go together, and they go together just as inseparably as backs go with fronts, as positives go with negatives, as ups go with downs. And as life goes with death. You can't separate it. So there's a sort of secret conspiracy between the figure and the background. They are really one, but they looked different. They need each other. Just as male needs female. And vice versa. But we are ordinarily completely unaware of this. So then when the scientist starts paying attention to behavior of people and things carefully, he discovers that they go together. That the behavior of the organism is inseparable from the behavior of its environment.

So you see if I am to describe what I am doing what am I doing. Am I just waving my legs back and forth? No. I'm walking. And in order to speak about walking you have to speak about the space in which I am walking about the floor. About the direction left or right in relation to what kind of room, what kind of stage, what kind of situation. Because if obviously if there isn't a ground underneath me I can't very well walk. So the description of what I am doing involves the description of the world. And so, the biologist comes to say that what he is describing is no longer merely the organism and its behavior. He is describing a field which he now calls the organism hyphen environment. And that field is what the individual actually is. Now this is very clearly recognised in all sorts of sciences, but the average individual and indeed the average scientist does not feel in a way that corresponds to his theory. He still feels as if he were a center of sensitivity locked up inside a bag of skin. The object of Buddhist discipline or methods of psychological training is as it were, to turn that feeling inside out. To bring about a state of affairs in which the individual feels himself to be everything that there is. The whole cosmos. Focused, expressing itself here. And you as the whole cosmos expressing itself there and there and

there. And so on. That what, in other words, the reality of myself fundamentally is, not something inside my skin but everything, and I mean everything outside my skin, but doing what is my skin and inside. I mean, imagine that every one of us...look, in the same way that the sea when the ocean has a wave on it. The wave is not separate from the ocean is it. Every wave on the ocean is the whole ocean wave in the ocean waves and it says you I'm here. But I do I can wave all over the place I can wave in many different ways I can wave this way or that way. So the Ocean of being waves every one of us. And we are its waves, but the wave is fundamentally the ocean.

Now in that way, your sense of identity would be turned inside out. You wouldn't forget who you were, you wouldn't forget your name and address, your telephone number, your social security number and what sort of role you are supposed to occupy in society. But you would know, that this particular role that you play, this particular personality that you are, is superficial and the real you, is all that there is.

The object of Buddhist discipline or methods of psychological training is as it were, to bring about a state of affairs in which the individual feels himself to be everything that there is. The whole cosmos, focused, expressing itself here. Now, in that way, your sense of identity would be turned inside out. You wouldn't forget who you were. You wouldn't forget your name and address, your telephone number, your social security number and what sort of role you are supposed to occupy in society. But you would know that this particular role that you play. This particular personality that you are, is superficial and the real you is all that there is.

And that inversion, turning upside down of the sense of identity, of the state of consciousness which the average person has, is the objective of Buddhistic disciplines. The method of teaching something in Buddhism is rather different from methods of teaching which we use in the Western world. In the Western world, a good teacher is regarded as someone who makes the subject matter easy for the student. A person who explains things cleverly and clearly so you can take a course in mathematics without tears.

In the Oriental world, they have an almost exactly opposite conception, and that is that a good teacher is a person who makes you find out something for

yourself. In other words, learn to swim by throwing the baby into the water. There's a story used in Zen about how a burglar taught his child to burgle. He took him one night on a burgling expedition and locked him up in a chest in the house that he was burgling and left him. And the poor little boy was all alone locked up in the chest and he began to think, how on earth am I going to get out? So he suddenly called out fire, fire, and everybody began running all over the place and they heard the shriek coming from inside the chest and they unlocked it and he rushed out and shot out into the garden. And just then, everybody was in hot pursuit calling out thief thief and he went by a well he picked up a rock and dropped it in the well. And everybody thought the poor fellow has jumped into the well and committed suicide. And he got away. And got home and his father said Congratulations you have learned the art. So do you see? William Blake once said a fool who persists in his folly will become wise.

And so, the method of teaching used by these great eastern teachers is to make fools persist in their folly, but very rigorously and very consistently and very hard. So then, if I may now having given you the analogy, the image let's go to the specific situation. Supposing you want to study Buddhism under a Zen master, what will happen to you. Well first of all, let's ask the question why would you want to do this anyway? I mean I can make the situation fairly universal it might not be as an master that you go to it might be a Methodist minister. It might be a Catholic priest it might be a psychoanalyst but what's the matter with you. Why do you go? And surely the reason that we all would be seekers is that we feel some disquiet about ourselves. Many of us want to get rid of ourselves. We can't stand ourselves and so we watch television and go to the movies and read mystery stories and join churches in order to forget ourselves. In order to merge with something greater than ourselves. We want to get away from this ridiculous thing locked up in a bag of skin. So I have a problem. I hurt. I suffer. I'm neurotic, or whatever it is, and one goes to the teacher and say my problem's me, change me. Now if you go to a zen teacher. He'll say. Well I have nothing to teach. There is no problem, everything's perfectly clear. And you think that one over. And you say he's probably being cagey. But he's testing me out to see if I really want to be a student. So I know, according to everybody else who's been through this, that in order to get this man to take me on I must persist. Do you know our saying, anybody

who goes to a psychologist ought to have his head examined. That's a very there's a double take in that saying. So in the same way anybody who goes with a spiritual problem to a zen master defines himself as a nut, and the teacher does everything possible to make him as nutty as possible. But the teacher says quite honestly I haven't anything to tell you. I don't teach anything. I have no doctrine as I said to you in the beginning of this talk, I have nothing whatsoever to sell you. So the student thinks, this is very deep, because this nothing that he's talking about this nothing that he teaches, is what they call in Buddhism Sunyata, is Sanskrit for nothingness. But, and it's supposed to be the ultimate reality but as you know if you know anything about these doctrines This doesn't mean real no-thingness, not kind of just nothing there at all not just blank but it means no thing. It's the transcendental reality behind all separate and individual things and that's something very deep and profound so he knows that when the teacher said I have nothing to teach he meant this very esoteric no thing. Well he might also say then if you have nothing to teach what are all these students doing around here? And the teacher says they are not doing anything they're just, they're just a lot of stupid people who live here. And he knows again you see, this stupid doesn't mean just straight stupid but the higher stupidity of being, people who are humble and don't have intellectual pride.

So finally the student having gone out of his way to define himself as a damn fool in need of help has absolutely worked himself into the situation. He's defined himself as a nut and then the teacher accepts him, and the teacher says now, I'm going to ask you a question. I want to know who you are before your father and mother conceived you. That is to say, you come to me with a problem and you said I have a problem I want to get one up on this universe. Who is it that wants to get one up? Who are you who is this thing called your ego your soul, your eye, or identity for whom your parents provided the body? Show me that and, he says Father I'm from Missouri and I don't want any words I want to be shown. So the student may open his mouth to make an answer but the teacher says. You're not ready. And he takes him back and introduces him to the chief student, all those so-called Zen monks who live together. And the chief student says now what we do here is so and so, we have this discipline, but the main part of the discipline is meditation. And we all sit crosslegged in a row and then we do that, and you sit cross-legged and you learn how to breathe and be still. In other

words to do nothing. But you mustn't go to sleep, and you mustn't get into a trance. You have to stay wide awake, not thinking anything, but perfectly doing nothing. And there's a monk walking down all the time with a flat stick rather long about so long and if you go to sleep or if you get into a trance or if you get dreamy he hits you on the back. So that you'll stay quite clear and wide awake but still doing nothing. And the idea is that out of the state of profoundly doing nothing you will be able to tell the teacher who you really are. And in other words, the question Who are you before your father and mother conceived you is a request for an act of perfect sincerity and spontaneity, as if I were to say to you, will you be absolutely genuine with me? No deception please, I want you to do something that expresses you without the slightest deception no more role acting, no more playing games with me I want to see you.

Now imagine. Could you really be that honest with somebody else? Especially a spiritual teacher. And you know, he looks right through you. He sees all your secret thoughts. And he knows the very second when you've been a little bit phony. And that bugs you. Just like a psychiatrist. You're sitting in there discussing your problems with him and you start picking your nose. And the psychiatrist suddenly says to you is your finger comfortable there, do you like that? And you know you know your Freudian slip is showing. What do fingers symbolize, what do nostrils symbolize? And then use it quickly to put your hand sort of. And you say, oh no it's nothing it's nothing I was just picking my nose. And the analyst says Oh really? Then why are you justifying it? Why are you trying to explain it away? He has you everywhere you turn. But that's the whole art of psychoanalysis and it's then it's the same thing.

In other words, when you are challenged to be perfectly genuine. It's like saying to a child, now darling come out here and play, don't be self-conscious. Or it's like I would say to you now look if you come here tonight at exactly midnight and put your hands on the stage you can wish and have granted any wish you want provided you don't think of a green elephant. So everybody will come there put their hands here and they will be very careful not to think about a green elephant. Well now do you see the point, that everybody if we transfer this to the dimension of spirituality where the highest ideal is to be unselfish, to let go of oneself. When you are trying to

be unselfish, you are doing it for selfish reasons. You can't be unselfish by a decision of the will, any more than you can decide not to think of a green elephant. There is a story about Confucius, who one day met Lao Tzu, who was a great Chinese philosopher. And Lao Tzu said so what is your system and Confucius said it is charity and love of one's neighbor and elimination of self interest. Lao Tzu said, [that's] stuff and nonsense. Your elimination of self is a positive manifestation of self. Look at the universe. The stars keep their order. The trees and plants grow up words without exception the waters flow. Be like this. All your nonsense about elimination of self is like beating a drum in search of a fugitive. So in this way these are all examples of the thing, that trickery the master is playing on you. You came to him with the idea in your mind that you are a separate, independent, isolated individual, and what he is simply saying to you is show me this individual. I had a friend who was studying Zen in Japan and he got pretty desperate to produce the answer of who he really is and on his way to an interview with the master to give an answer to the problem he noticed a very common sight in Japan, a big bullfrog sitting around in the garden, and he swooped this bull frog up in his hand dropped it in the sleeve of his. And then he went into the master. And to give the answer of who he was, he suddenly produced the bull frog. And the Master said, too intellectual. In other words, this answer is too contrived. It's too much like Zen. You've been reading too many books. It's not the genuine thing.

So after a while what happens is this. When the student finds that there is absolutely no way of being his true self. Not only is there no way of doing it, there is also no way of doing it by not doing it. You can't do it by doing something you can't do it by not doing something. Let me make this clear or put it into Christian terms. Thou shalt love the Lord thy God. Now what are you going to do about that? If you try very hard to love God and you ask yourself Why am I doing this? You find out you're doing it because you want to be on the side of the big battalions. You want to be right. After all the Lord is the master of the universe isn't he? And if you don't love him you're going to be in a pretty sad state. So you realize I'm loving him just because I'm afraid of what will happen to me if I don't, then you think that's pretty lousy love isn't it. And you think I am that's a bad motivation. I wish I could change that I wish I could love the Lord. Out of a genuine heart. But why do you want to change? I realize that the reason I want to

have a different kind of motive is that I've got the same mode. So I say, oh heaven sakes God I'm a mess. Will you help me out? And then he reminds you, why are you doing that? Now you're you're just giving up, aren't you, you're asking someone else to take over your problem.

So you suddenly find you see you're stuck. So in this way, what is called the Zen problem or koan is likened to a person who swallowed a ball of red iron. He can't gulp it down and he can't spit it out. Or it's like a mosquito biting an iron bull. It's the nature of a mosquito to bite and it's the nature of an eye and the bull to be unbiteable and both go on doing their thing that is their nature. And so nothing can happen. You are absolutely up against it. Absolutely no answer to this problem. No way out.

Now what does that mean? If I can't do the right thing by doing and if I can't do the right thing by not doing what does it mean it means of course. That I do is say to do all this am a hallucination. There is no independent self to be produced. There is no way at all of showing it because it isn't there. So you recover from the illusion and you suddenly wake up and think what a relief. And they call that Satori, that's awakening, the first step in awakening. Let me try and translate this. When this kind of experience happens you discover that what you are is no longer this sort of isolated center of action and experience locked up in your skin. That by being, the teacher has asked you to produce that thing. To show it to him genuine and naked and you couldn't find it. So it isn't there. And when you see clearly that it isn't there, you have a new sense of identity. And you realize that what you are is as I said the whole world of nature doing this.

Now that's a difficult thing for many Western people, because it suggests to them a kind of fatalism. It suggests that the individual is nothing more than the puppet of cosmic forces. So in the same way, when your own inner sense of identity changes, from being the separate individual to being what the entire cosmos is doing at this place, you become not a puppet, but more truly and more expressively an individual than ever. This is the same paradox which the Christian knows in the form whosoever would save his soul shall lose it. Now I think that this is something of very great importance to the western world today, because we have developed an immensely powerful technology. We have stronger means of changing the

physical universe than has ever existed before. How are we going to use it? There is a Chinese proverb that if the wrong man uses the right means, the right means work in the wrong way. Let us assume that our technological knowledge is the right means. What kind of people are going to use this knowledge? Are they going to be people who hate nature and feel alienated from it or people who love the physical world and feel that the physical world is their own personal body? And extension the whole physical universe right out of the galaxies is simply one's extended body. Now at the moment, the general attitude of our technologists who are exploring space is represented in the term "the conquest of space". And they are building enormous shell like phallic objects to go into the sky. And this is downright ridiculous because who is going to get anywhere in a rocket. You know it takes a terrible long time even to get to the moon, and it's going to take longer than anybody can live to get outside the solar system just to begin with.

The proper way to study space is not with rockets, but with radio astronomy. Instead of going bang, you know, with tough fist at the sky. Become more sensitive. Develop subtler senses, that's radio astronomy and everything will come to you be more open be more receptive and eventually you will develop an instrument that will examine a piece of rock on Mars with greater care than you could if you were holding it in your own hand. Let it come to you. But you see this whole attitude of using technology as a method of fighting the world will succeed only in destroying the world as we are doing with uninformed and shortsighted methods of getting rid of insect pests of forcing our fruit and tomatoes to grow of stripping our hills of trees, and so on and so on, thinking with all this is some kind of progress when actually it is turning everything into a junk heap.

It is said you know that Americans who are in the forefront of technological progress are materialists. Nothing is further from the truth. American culture is dedicated to the hatred of material and to its transformation into junk. Look at Los Angeles. Does it look as if it was made by people who love the material? It's all made out of ticky-tacky, which is a combination of plaster of Paris, paper maché, and plastic glue and comes in any flavor. The important lesson in other words is technology and its power must be handled by true materialists and true materialists are people who love

material. Who cherish wood and stone and wheat and eggs and animals. And above all they treat it with a reverence that is due to one's own body.

Taoist Way

The philosophy of the Tao is one of the two great principal components of Chinese thought. There are of course quite a number of forms of Chinese philosophy, but there are two great currents which have fairly molded the culture of China and they are Taoism and Confucianism. And they play a curious game with each other. Let me start by saying something about Confucianism originating with confluence of Confucius who lived approximately a little after six hundred thirty B.C.. He's often supposed to have been a contemporary of Lao Tzu, who is the supposed founder of the Taoist way, but it seems more likely that Lao Tzu lived later than four hundred, according to most modern scholars. Confucianism is not a religion. It's a social ritual. And a way of ordering society. So much so that the first great Catholic missionary to China Matteo Ricci was a Jesuit found it perfectly consistent with his Catholicism to participate in Confucian rituals because he saw them as something of a kind of national character as one might pay respect to the flag or something of that kind in our own times. But he found that Confucianism involved no conflict with Catholicism no commitment to any belief or dogma that would be at variance with the Catholic faith.

So Confucianism is an order of society and involves ideas of human relations including the government and the family based on the principle of what is called in Chinese *ren*, although Joshua will notice that I never get my tones right. Which is an extraordinarily interesting word. I'm going to put some of these things on the whiteboard. This is the word *ren* in Chinese, and it's often translated benevolence, but that's not a good translation at all. This word means human heartedness. That's the nearest we can get to it in English. And it was regarded by Confucius as the highest of all virtues but one that he always refused to define. It's above righteousness and justice and propriety and other great Confucian virtues and it involves the principle that human nature is a fundamentally good arrangement. Including not only our virtuous side, but also our passionate side also our appetites in our way witness. The Hebrews have over a term which they call the *yetzer hara* Y E

T Z E R H A R A. Which means the wayward inclination, or what I like to call the element of irreducible rascality, that God put into all human beings. And put it there because it was a good thing it was good for humans to have these two elements in them and so a truly human hearted person is a gentleman with a slight touch of rascality just as one has to have salt in a stew. Confucius said the goody good is other thieves of virtue. And Meaning that to try to be wholly righteous is to go beyond humanity. To try to be something that isn't human. So this gives Confucian approach to life and justice and all those sort of things a kind of queer humor. Sort of boys will be boys attitude which is nevertheless a very mature way of handling human problems. It was of course for this reason that the Japanese Buddhist priests who visited China to study Buddhism especially as zen priests, introduced Confucianism into Japan, because despite certain limitations that Confucianism as and it needs it always needs the Tao philosophy as a counterbalance. Confucianism has been one of the most successful philosophers in all history for the regulation of governmental and family relationships. But of course it is concerned with formality. Confucianism prescribes all kinds of formal relationships; linguistic, ceremonial, musical, in education, in all the spheres of morals, and for this reason has always been treated by the Tao for being unnatural. You need these two components, you see and they play against each other beautifully in Chinese society. Roughly speaking mostly they confusion in the way of life is for people involved in the world. The Taoist way is to a of life is for people who get disentangled.

Now as we know in our own modern times there are various ways of getting disentangled from the regular lifestyle say of the United States. If you want to go through the regular lifestyle of the United States you go to high school and college and then you go into a profession or a business and you own a standard house and you raise a family and you have a car or two cars and do all that jazz. But a lot of people don't want to live that way and there are lots of other ways of living besides that. So you could say that those of us who go along with the pattern correspond to the Confucians, and those who are Bohemians or bums or beatniks or whatever and don't correspond with the pattern they are more like the Taoists. Because the Tao is really, actually in Chinese history, Taoism is a way of life for older people in. Lao Tzu, the name given to the founder of the Tao and means the old

boy, and the legend is that he when he was born he was already had a white beard.

So, it's sort of like this that when you have contributed to society when you've contributed children and brought them up, and you have assumed a certain role in social life. You then say Now it's time for me to find out what it's all about, who am I ultimately behind my outward personality. What is the secret source of things? And the latter half of life is the preeminently excellent time to find this out it's something to do when you are finished with the family business. I am not saying that that is sort of unavoidable strict rule of course one can study the Tao when very young. Because it contains all kinds of secrets in it as to the performance of every kind of art or craft or business or any occupation whatsoever. But it does in in in China in a way it plays that role of a kind of safety valve. For the more restricted way of life that Confucianism prescribes. And there is a sort of type in China who is known as the old rogue. He's a sort of intellectual bum, often found among scholars who is admired very much and who had a type of character which had an influence on the development of the ideals of Zen Buddhist life. He is one who goes with nature rather than against nature.

Well now, first of all I'm going to talk about ideas which come strictly out of Lao Tzu's book the Tao Te Ching And of course the basic thing in the whole philosophy is the conception of Tao. This word has many meanings and the book of Lao Tzu starts out by saying that the Tao which can be spoken is not the eternal Tao. Or you can, there's a pun in there, but you can't quite put into English. You can't give all the meanings because the word Tao means both. The way for course of nature. Or of everything. It also means to speak.

So the actual opening phrase of the book. Following this word Tao is this. And the character is repeated again. You see and this this character means can be or can, able, something like that. So the way which can be then give it its second meaning spoken. Described out of. But it also means the way that can be weighed not W E I G H But W A Y E D. You know, you'd have to invent that word. The way that can be traveled perhaps is not the eternal way. In other words there is no. Way in which the Tao or following the Tao,

there's no recipe for it. I can't give you any do it yourself instructions A.B.C. D. as to how it's done. It is like when Louis Armstrong was asked What is jazz? he said "If you have to ask you don't know." Now that's awkward, isn't it. But we can gather what it is by absorbing sudden atmospheres and attitudes connected with those who follow it and from the art and the poetry and all the expressions and the anecdotes and stories. That illustrate the philosophy of the way. So this word, then, the way or the course of things is not you must understand there's some Christian missionaries translate as the logos. Taking as their point of departure the opening passage of some John's Gospel in the beginning was the word. Now if you look up the Chinese translation of the Bible it says in the beginning was the Tao. And the Tao was with God and the Tao was God. The same as in the beginning with God all things were made by it and without it was not anything made that was made.

So they have substituted Tao there, now that mimic a very funny effect on a Chinese philosopher, because the idea of things being made by the Tao is absurd but the Tao is not a manufacturer and it's not a governor. It doesn't rule as it were in the position of a king. Although the book without it being is written for many purposes, but one of its important purposes is as a manual of guidance for a ruler. And what it tells him is essentially ruled by not ruling. Don't lauded over the people and so he says the great Tao flows everywhere both to the left and to the right. It loves and nourishes all things but does not lord it over them. And when good things are accomplished. It lays no claim to them. In other words, the Tao doesn't stand up and say I have made all of you, I have filled this earth with its beauty and glory, fall down before me and worship. The Tao, having done anything you know always escapes. And is not around to receive any thanks or acknowledgement. Because it loves obscurity. And Lao Tzu said the Tao is like water. It's always seeks the low level which human beings abhor. So it's a very mysterious idea. Tao then is not really equivalent with any Western or Hindu idea of God because God is always associated with being the Lord. Even in India, the Brahman is often called the supreme lord although that with the term are strictly applicable to ishtar, the manifestation of Brahman in the form of a personal god. But rather than the Lord Krishna as his his son is the Bhagavad-Gita the song of the Lord of

there's always the idea of the king and the ruler attached but not in the Chinese Tao philosophy.

The Tao is not something different from nature, from ourselves, from our surrounding trees and waters and air. The Tao is the way all that behaves. And so the Chinese, the basic Chinese idea of the universe is really that it's an organism. And as we shall see when we get on to Huang Tzu, or who is the sort of elaborator on Lao Tzu. He sees everything operating together. So that nowhere can you find the controlling center there isn't any. The world is a system of interrelated components none of which can survive without each other. Just as in the case of bees and flowers. You will never find these around in a place where there aren't flowers and you will never find flowers around in a place where there aren't bees or insects that do the equivalent job. And what that tells us secretly is that although bees and flowers look different from each other they're inseparable. They, to use a very important Taoist expression, they arise mutually. This is one of the great phrases from the second chapter of Lao Tzu's book where, he says this character means to have or to be, and this next one is a very important character in Taoist philosophy it means no negative will in Chinese not to be, and then this curious expression for which we don't have a really good corresponding idea in traditional Western thought. So, to be and not to be, mutually arise. This character is based on the picture of a plant. Something that grows out of the ground. So you could say, positive and negative, to be and not to be, yes and no. Light and dark arise mutually come into being. There's no cause and effect, it's not that relationship at all, it's like the egg and the hen. So as the bees and the flowers co-exist, in the same way as high and low back and front and long and short, loud and soft. All those experiences are experience of all only in terms of their polar experience. So the Chinese idea of nature is that all of areas species arise mutually because they into depend and this total system of interdependence is the Tao. It involves certain other things that go along with Tao but this is this is this mutual arising is the key idea toe whole thing and it is, if you want to understand Chinese and Oriental thought in general it is the most important thing. To grasp. Because you see we think so much in terms of. Cause and effect we think of the universe today. In Aristotelian and Newtonian ways, and in that philosophy the world is all separated. It's like a huge amount of nation of billiard balls. And they don't move until struck

by another or by a cue. And so everything is going to talk talk talk talk talk talk talk talk talk talk talk all over the place one thing starting up another in a mechanical way. But of course from the standpoint of twentieth century science we know perfectly well now that that's not the way it works. We know enough about relationships to see that that mechanical model which Newton devised was all right for certain purposes. But it breaks down now because we understand relativity, and we see how things go together in a kind of connected net, rather than in a chain of billiard balls banging each other around.

So, in in the philosophy of the Tao, it is said, it's always being said this is, you read this in every art book about Chinese art, that in Chinese painting, man is always seen as in nature, rather than dominating it. You'll get a painting entitled, poet drinking by moonlight. And you see a great landscape and after some search with a magnifying glass at last you see the poet, stuck in a corner somewhere drinking wine. Whereas if we painted the subject poet drinking by moonlight the poet would be the most obvious thing in the picture there he would be dominating the whole thing the landscape of somewhere behind it, but of all the Chinese painters put man, I mean the painters of the great classical tradition. There are Chinese painters who specialize in family portraits and do these very formal paintings of someone's ancestor sitting on a throne it's quite a different category but the Taoist inspired painters, Zen inspired painters, have this view of man as an integral part of nature. Something in it just as everything else is in it flowers and birds. And not they're sent into this world commissioned by some sort of supernatural being to come into this world and find it dominated it.

So then, the whole conception of nature is as a self regulating, self-governing, indeed democratic organism. But it has a totality, it all goes together and this totality is the Tao. So then we move to a second term that is extremely important. That the, expression. *Tsu-ran*, is the Bickley the term that we translate nature. When we translate Chinese. But this term expresses this whole point of view it doesn't say nature, *natura*, which means in a way, class of things. It means literally self-so. What is so obvious itself what happens of itself and the spontaneity. And in the doubt edging early on Lao Tzu says the Taoist method is to be so of itself. Now we might translate that automatic where it not that the word automatic has a

mechanical flavor. Tsu-ran, or [shizen?] as is called or she's an in Japanese means spontaneous. Yes, it happens as your heart beats, you don't do anything about it you don't force your heart to beat you don't make it beat it does it by itself. Now figure out a world in which everything happens by itself it doesn't have to be controlled it's allowed. The whereas you might say the idea of God involves the control of everything going on. The idea of the Taoist, is the ruler who abdicates and lets all the people trust all the people to conduct their own affairs to let it all happen. So this doesn't mean you see that there isn't a unified organism and everything is in chaos it means that the more liberty you give the more love you give the more you allow things in yourself and in your surroundings to take place, the more order you will have.

It is believed generally in India that when a person sets out on the way of liberation, his first problem, is to become free from his past karma. The popular theory of Karma, of the word that literally means action or doing in Sanskrit, so that when we say that something that happens to you is your karma It's like saying in English it's your own doing. But in popular Indian belief, karma is a sort of built in moral law or a law of retribution. Such that all the bad things you do and all the good things you do have consequences which you have to inherit and so long as karmic energy remains stored up you have to work it out. And what the sage endeavors to do is a kind of action which in Sanskrit is called Nish karma Karma. Nish karma means without passion or without attachment karma, action. And so, in whatever action he does he renounces the fruits of the action so that he acts in a way that doesn't generate future karma because future karma continues you in the wheel of becoming, Samsara, the round, and keeps you being reincarnated. Now then, in that case, when the time comes that you start to get out of the chain of Karma. All the creditors that you have start presenting themselves for payment, in other words, does a person who begins say to study yoga this felt that he will suddenly get sick or that his children will die he loses money all sorts of catastrophes will occur because. The karmic debt is being cleared up. And it is in no hurry to be cleared up if you're just living along like anybody but if you embark on the spiritual life a certain hurry occurs and therefore since this is known. It's rather discouraging to start these things. The Christian way of saying the same thing is that if you plan to bet, or change your life, shall we say to turn over a new leaf, you mustn't let the devil know, because he will oppose you

with all his might if he suddenly discovers that you're going to escape from his power. So for example, if you have a bad habit say you drink too much and you make a New Year's resolution that during this coming year you'll stop drinking that's a very very dangerous thing to do because the devil will immediately know about it. And what will happen will be this. See he will confront you with the prospect of three hundred sixty five drinkless days, and that will be awful, you know, just overwhelming and you won't be able to make much more than three days on the wagon.

So in that case you compromise with the devil and say just today I'm not going to drink you see but tomorrow maybe you know we'll go back. Then when tomorrow comes you say Oh just another day and it's trial that's all and the next day you say one more day won't make much difference so you only do it for the moment and you don't let the devil know that you have a secret intention of going on day after day after day after day.

But of course there's something still better than that. And that is not to let the devil know anything. And that means of course not to let yourself know. One of the many meanings of that saying Let not your left hand though watch or write and do it is just this. And that was why in the Zen discipline, the great deal of it centers around. Acting without premeditation, as those of you know who read Harry Gold's book, Zen in the art of archery it was necessary to release the bowstring without first saying now. There's a wonderful story it may also have read by a German writer Von Kleist, about a boxing match with a bear. The man can never defeat this bear because the bear always knows his plans in advance. And is ready to deal with any situation. The only way to get through to the bear would be to hit the bear without having first intended to do so. That would catch him. And so this is one of the great great problems in the spiritual life or whatever you want to call it, is to be able to have intention and act simultaneous. By this means you escape karma and you escape the devil. So you might say that the Taoist is exemplary in this respect. That this is getting free from karma without making any previous announcement of simply; supposing we have a train and we want to unload the train of its freight cars. You can go to the back end and you can unload them one by one and shunt them into the siding, but the simplest of all ways of unloading is to uncouple between the engine in the first car and that gets rid of the whole bunch at once. And it is

in that sort of way you see that the Taoist gets rid of karma without challenging it. And so it has the reputation, you see, of being the easy way. There are all kinds of yogas and ways for people who want to be difficult. And one of the great gambits of a man like Gurdjieff, was to make it all seem as difficult as possible, because that challenged the vanity of his students. If some teacher Some guru says really this isn't difficult at all it's perfectly easy. Some people will say oh he's not really that the real thing. We want something tough and difficult when when we see somebody starts out giving you a discipline they're a very weird and rigid people think there is a thing that that man means business, see and so they flatter themselves by going to such a guy that they are serious students, whereas the other people are only dabblers and so on. All right if you have to do that way that's the way you have to do it, but the Taoist is the kind of person who shows you the shortcut, and shows you how to do it by intelligence rather than effort, because that's what it is. Taoism is in that sense what everybody is looking for. The easy way in the shortcut. Using cleverness instead of muscle. So the question naturally arises isn't it cheating. When in any game, somebody really starts using his intelligence he will very likely be accused of cheating. And to draw the line between skill and cheating is a very difficult thing to do. You see the the inferior intelligence will always accuse a superior intelligence of cheating. That's its way of saving face. You beat me by means that weren't fair. We were originally having a contest to find out who had the strongest muscles and you know we were pushing against it like this does this that this. And this would prove who have the strongest muscles, but then you introduce some gimmick into it, some judo trick or something like that we see and you're not playing fair. So in the whole domain of ways of liberation. There are roots for the stupid people and roots for the intelligent people. And the latter are faster. This with perfectly clearly explained by Wua Nung, the six patriarch of Zen in China. And it's sutra where he says the difference between the gradual school and the Sudden School is they both arrive at the same point but the gradual is for slow-witted people and the suddenness for fast witted people, can you in other words find a way that sees into your own nature but sees into the doll. Immediately, and at the end of this morning's talk I pointed out to you the immediate way, the way through now. When you know that, this moment is that all. And this moment is by it's considered by itself. That without past and without future eternal. Neither coming into being or going

out of being. There is nirvana. And there is a whole Chinese Philosophy of time based on this. It hasn't, to my knowledge been very much discussed by Taoist writers. It's been much discussed by zen writers, but it's all based on the same thing. Dogan the great thirteenth century Japanese Zen Buddhist started in China, and he wrote a book called Shobo Genzo. A roshi recently said to me in Japan, that's a terrible book. Because it tells you everything. It gives the whole secret away. But in the course of this book he says, you don't there is no such thing as a progression in time. The spring does not become the summer. There is first spring and then there is summer. So in the same way, you now do not become you later. This is T.S. Eliot's idea, in Four Quartets, where he says that the person who has settled down in the train to read the newspaper, is not the same person who stepped onto the train from the platform. And therefore, also you who sit here and not the same people who came in at the door. These states are separate, each in its own place. There was the coming in the door person. That there is actually only the here and now sitting person. And the person sitting here and now is not the person who will die. Because we are all a constant flux, and the continuity of the person from past through present to future is as illusory, in its own way, as the upward movement of the red lines on a revolving barber pole. You know, it goes round and round and round and the whole thing seems to be going up or going down. But actually nothing is going up or down. So when you throw a pebble into the pond and you make a con centric rings of waves, there is an illusion that the water is flowing upwards, and no water is flowing outwards at all. Water is only going up and down what appears to move outward is the wave not the water. So this kind of philosophical argument says that our seeming to go along in a course of time. It doesn't really happen. The Buddhists say suffering exists but no one who suffers. Deeds exist but no doers are found. A path there is, but no one who follows it and Nirvana is but no one who attains it. So, in this way they look upon the continuity of life, as the same sort of illusion that is produced when you take a cigarette and in the dark wallet, it and the illusion of a circle is created whereas there is only the one point of fire.

The argument then is, so long as you're in the present, there aren't any problems. The problems exist only when you allow presence to amalgamate. There's a way of putting this in Chinese, it is rather interesting

they have a very interesting sign. This. It's pronounced nyin. And Japanes, nin. And the top part of the character means now, and the bottom part means the mind-heart machine. And so, this is as it were an instant of thought. In Sanskrit they use it they use this character as the equivalent for the Sanskrit word Shannah. Then if you put if you double this character but it twice, or three times, and I write the Chinese word for ditto.. Nan Nan Nan. Means thought after thought after thought. Now the Zen master JoShu was once asked "What is the mind of a child?" And he said a ball in a mountain stream. What do you mean by a ball in the mountain stream? He said, thought after thought after thought, with no block. So, he was using of course, the mind of the child as the innocent mind. The mind of a person who was enlightened. One thought follows another without hesitation. The thought arises it doesn't wait to arise, as when you clap your hands, the sound issues without hesitation. When you strike Flint, the spark comes out, it doesn't wait to come out. And that means that there's no block. So I thought Sod thought nin nin nin and describes what we call in our world the stream of consciousness. Blocking consists in letting the stream. Become connected chained together in such a way that when the present thought arises it seems to be dragging its past or resisting its future. Saying I don't want to go.

When then the connection, the dragging, it's better to call it, of these thoughts, drops. You've broken the chain of karma. If you think of this, in comparison with certain problems in music it's very interesting. Because when we listen to music we hear melody only because we remember the sequence. We hear the intervals between the tones but more than that. We remember. The tones that led up to the one we are now hearing and we are trained musically to anticipate certain consequences. And to the extent that we get the consequences we anticipate we feel that we understand the music, but to the extent that the composer does not adhere to the rules and gives us unexpected consequences, we feel that we don't understand the music. And if he gives us harmonic relationships which we are not trained to accept, that is to say to expect. We say well this man is just writing garbage. But of course, it becomes apparent that the perception of music, the ability to hear a melody, will depend upon a relationship between past present and future sounds. And you might say well you're talking about a way of living that would be equivalent to listening to music with a tone

deafmind. So that you would reduce and you would eliminate the melody and have only noise and so in your Taoist way of life. You would eliminate. All meaning and have only senseless present moments. Up to a point that's true. That is in a way what Buddhists and also mean by seeing things in there suchness.

What is so bad about dying for example. It's really no problem. When you die, you just drop dead, there that's all there is to it. But what makes it a problem is that you're dragging a past. And all those things you've done all those achievements you've made, all these relationships and people that you've accumulated as your friends all that has to go see it isn't there now. Meath a few friends might be around you but all that past that identifies you as who you are, which is simply memory, all that has to go. And we feel just terrible about that. But if we didn't if we were just dying that's all death wouldn't be a problem.

And so likewise the chores of everyday life they become intolerable when everything ties together all the past in the future you feel it dragging at you in every way. Supposing you wake up in the morning and it's a lovely morning let's take today right here and now here we are in this paradise of the place. Big Sur. And some of us have got to go to work on Monday. Is that a problem? For many people it is. It spoils the taste of what's going on now. When we wake up in bed on Monday morning and think of the various hurdles we've got to jump that day. Immediately we feel sad bored, and bothered. Whereas actually we're just lying in bed. And so the Taoist trick says. Simply live now and there will be no problems. That's the meaning of the Zen saying. When you are hungry, eat, when you are tired, sleep when you walk, walk, when you sit, sit. Rinzai the great Tang Dynasty master said, in the practice of Buddhism there is no place for using effort. Sleep when you're tired, move your bowels, eat when you're hungry. That's all. The ignorant will laugh at me but the wise will understand. And so also the meaning of this wonderful Zen saying. They have the character of the sun. That is good day. Every day is a good day. On condition and see that day-day is like nyin nyin. They come one after another and yet there's only this one you don't link them.

This as I said into intimated just a moment ago seems to be an atomization of life. Things just do what they do. The flour goes poof, and people go this way go that way and so on and that's that's where that's what's happening. It has no meaning it has no destination, it has no value, it's just like that. And when you see that, you see, it's a great relief that's all it is. But then when you are firmly established in suchness, in that it's just this moment. You can begin again to play with the connections. Only you've seen through them, but now you see that they don't haunt you. Because you know that there isn't any continuous You running on from moment to moment who originated at some time in the past and will die at some time in the future. All that's disappeared. So you can have enormous fun, anticipating the future, remembering the past, and playing all kinds of continuities. This is the meaning of that famous Zen saying about mountains are mountains. To the naive man mountains are mountains, waters are waters. To the intermediate student mountains are no longer mountains waters in the longer waters now the words they've all dissolved into the point instant to the Shana. But for the perfected student, mountains are again mountains and waters are again waters.

In the philosophy of the Tao, it is said, it's always being said this is. You read this in every art book about Chinese art that in Chinese painting, man is always seen as in nature rather than dominating it. You get a painting in titled poet drinking by moonlight. And you see a great landscape and after some search with a magnifying glass at last you see the poet, stuck in a corner somewhere drinking wine. Whereas, if we painted the subject poet drinking by moonlight, the poet really the most obvious thing in a picture. There he would be, dominating the whole thing the landscape out somewhere behind it. But of all the Chinese painters, I mean, the painters of the great classical tradition there are Chinese painters who specialize in family portraits and do these very formal paintings of someone's ancestor sitting on a throne it's quite a different category but the Taoist inspired painters Zen inspired painters, have this view of man as an integral part of nature. Something in it, just as everything else is in it flowers and birds and not they're sent into this world, commissioned by some sort of supernatural being to come into this world and find it and dominated.

The whole conception of nature is as a self regulating self-governing, indeed democratic organism. But it has a totality it all goes together and this

totality is that our. When we can speak. In Taoist and of following the course of nature following the way. What it means is more like this. Doing things in accordance with the grain. It doesn't mean you don't cut wood, but it means that you cut wood, along the lines where wood is most easy to cut, and you interact with other people along lines which are the most genial. And this, then is the great fundamental principle which is called wu-wei, which is not to force anything. I think that's the best translation . Not doing, not acting, not interfering, but not to force seems to me to hit the nail on the air. Like don't ever force a lock while you bend the key or break the law you jiggle until it revolves. So wu-wei, is always to act in accordance with the pattern of things as they exist. Don't impose on any situation act a kind of interference that is not really in accordance with the situation.

For example, we have a slum, and that people are in difficulty and so on and they need better housing. Now if you go in with a bulldozer and bulldoze the slum, and you were put in its place by some architects imaginative notions of what is a super efficient high rise apartment building to stop people you create a total mess. Utter chaos. A slum has what we would call an ecology It has a very complex system of relationships going in it. By which the thing is already a going concern even though it isn't going very well. Anybody who wants to alter that situation must first of all become sensitive, to all the conditions and relationships going on there. It's terribly important than to have this feeling of the interdependence of every form of life upon every other form of life. How we for example cultivate animals that we eat, and look after them and build them up and see that they breed in reasonable quantities. We don't do it too well, as a matter of fact. Troubles arising about supplies of fish in the ocean. All sorts of things.

But you have to see that life that the so called conflict of various species with each other is not actually a competition. It's a very strange system of interrelationship. Of things feeding on each other and cultivating each other the same time the idea of the friendly, the necessary adversary who is part of you. You have conflicts going on in your own body all kinds of microorganisms are eating each other up and if that wasn't happening you wouldn't be healthy. So all those interrelationships, whether they appear to be friendly relationships, as between bees and flowers or conflicting relationships as between birds and worms, they are actually forms of

cooperation. And that is mutual arising. You have to understand this. As the basis, apply this, not forcing anything and you get spontaneity, a life which is so of itself, which is natural, which is not forced. Which is not unduly self-conscious.

Now, another term that is important although I'm not aware that this word because in lots of the book it's found in greater use at a much later time in Chinese thought in philosophy that is called neo-Confucian. And it's also used in Buddhism. But it is a very useful word for understanding. The sort of order that all this constitutes it's the word Li. And this means originally the markings in Jade. Or perhaps the graining would all the fiber and muscle. It is translated nowadays in most dictionaries as a reason for principle. But this isn't a very good translation. Joseph Needham suggested that organic pattern was an ideal translation of this word. Now you see the markings in Jade are always regarded as beautiful. You might say so you look down at the water here when you see the waves break that are patterns in the foam.

Now if you watch those patterns you know they never make an aesthetic mistake. Never. But they're not symmetrical and they're very difficult to describe. They're wiggly. So the markings in Jade's I was the Great in wood but we love the grain wood and you see a judge who has done these paintings of rocks based on exams. I think in the Chinese book called The Mustard Seed Garden. These all exhibit li. That is to say they are forms which we know are orderly. And we can distinguish them from messes quite clearly. And so in the same way the phone patterns the rock patterns, the patterns of vegetation, are at once extraordinarily orderly, but they don't have an obvious order, nobody can ever pin it down. That's what I'd like to say you know that there is order there something quite different from a mess but there's no way of really getting it.

Now in order to be able to paint that sort of way. Or to live that sort of way or to deliver justice that way if you were a judge. You have to have it innately. You have to have an essential sense of Li, and there's no way prescribing it. This is the very devil for teachers. Because you see all our university of them schools now trying to teach creativity. That's the great thing these days now and they are here at Esalen, all of the people are

giving courses and workshops and creativity. Now the trouble is that if we found out a method whereby we could teach creativity., and everybody could just explain how it was done it would no longer be of interest. What always is an essential element in the creative is the mysterious. The dark. It's like the black in lacquer. The impenetrable. And yet the profound depth out of which glorious things come but nobody can see why. There's a poem which says that when the bird calls. The mountain becomes more mysterious. You imagine for example you're in a mountain valley and everything is very silent. And suddenly a crow. Squawks somewhere. You don't know where that crow is, and the little sound emphasizes the silence. Now, all those things have in them, you see, an element of mystery. There's a Chinese poem which puts it this way. It is a poem written by a man who has gone to find a sage in the mountains and the Sage has a little hut at the foot of the mountain and a boy there who is his servant. I asked the boy beneath the pines he said the master's gone alone herb-gathering somewhere on the Mount. Cloud-hidden, whereabouts unknown.

In so many athletic and artistic skills you will find a teacher who teaches you how to do it without forcing it. I once started the piano. I am absolutely no good at it now because I don't practice. I'm involved in other things. But I had an absolutely superb teacher for a while. He was a very very great musicologist you know. There was nothing sloppy about his standards, they were of the highest perfection. But when I went to him, he said "Let me see what you can do so", so I played him a scholarly Sonata. He said "Yeah but the trouble with you is you're trying too hard. You're hitting the piano when you should never hit a piano." He said actually all you've got to do in order to play a piano is to drop your hands on it and you need to have relaxed arms so he made me practice for a while he felt my muscles to see what I was relaxed got not and he's not just dropping out on the piano I don't care what notes you get but just drop your hand let it fall so there's enough energy in the weight of your arm to play as loud as you will, or as soft as you will, but just let it drop, he said that's all you have to do, drop your hands, and kept feeling my arms. He said no no you're getting too tense you must pretend you are Lao Tzu. And he was a very educated man he knew about these things, then he said Now after dropping your hands all you've got to do is hit the right notes. And he said you know, the same thing is involved in making a very complex trill. And he demonstrated, he just

dropped his hand on the piano and at the same time his fingers went for a loop like that and there was this magnificent on a mentation. And then we went on with practices for some time he said Now let's get around it in the right notes and. He found immediately I had a block on reading music, because when I was a small boy started piano at the age of roughly eight, I had a pestiferous teacher who was the mistress in this private school I went to in England. And she used to sit beside you would hit your fingers with a pencil every time you made a wrong note. Gregory Bateson, I think was taught piano and as a child in such a way and he has a total block on reading music. He really has got a brilliant mind you know he's a mathematician and great anthropologist, ethnologist and so on the other total block to reading music. And so this man had to teach me to overcome my block. And he said now, first of all, feel perfectly free to make mistakes, if everybody's going to make some mistakes and it doesn't matter if you make a mistake and if you do make a mistake don't don't go back and do it over again but just go on. So play as slowly as you like don't hurry it just along as you keep the relative rhythm the relative values of thing go slow and take it easy.

Another thing is to not to pay so much attention to the notes but to the distances or intervals between because that is the significant jump. And this sort of overcomes to the difficulty of key signatures where we start out with as we started out learning music with this weird system that the lines on the staff really represent the major scale of C., and that therefore when you put a key signature at the beginning you remember that every time you exposing your playing F. every time you hit B. It should be B. flat. Well that's extremely tedious way of learning music, and we would just have to think in different keys that's the only way to adjust to a key signature and play in the thing according to the intervals appropriate for that. But you see in this instance this man although he was a great perfectionist and was highly skilled in music he used intelligence first of all to give you a shortcut and then he also used relaxation to enter into a difficult thing by the easiest route.

In Zen training, in its initial stages, the master discourages intellectualization. You know, you come in with a lot of ideas but this difficulty you have is not going to be solved by ideas it's not going to be

solved by talk and intellectualization. So in the same way this is discouraged because intellectualization sets up a kind of interval or lack of rapport between you and your life. You think about things so much that you get into the state where you're eating the main you head of the dinner. We all valuing the money more than the wealth. You are confusing as Korzybski would say, the map with the territory.

And what they want to do is to get you into the territory to get you into a relationship with what is as distinct from ideas about what is. And this is an important preliminary discipline. But later on you can realize that the process of thinking is also what is. Thoughts, in their own domain are as real as rocks. Words have their own reality, as much as the sky and water. Thoughts about things are in them their own turn things, and so they lead you eventually to the point where you intellectualize and think in an immediate way. Let's go on and ask then a further problem. How about thinking about thinking? Wouldn't that be pretty far off? Here is a person removed from life because he's in the intellectual world, and he's all in a living in symbols is a kind of or a kind of a living book. Now what about a librarian? A person who writes books about books, a bibliographer. A classifier of classifications that's a pretty dusty occupation and as we know. Sometimes librarians seem to be very dusty people they. Seem away removed from life all tied up in their categories and catalogues and musts. That, you see, is also its level of reality. And thinking about thinking. Can be lived with just as much direct fresh spontaneity as just living without thinking, but in order to live it with full spontaneity. You have to be in a position where you no longer feel the symbol before the idea of the words as a block to Life. No longer feel it as something you are using as a sort of means of escape. To be able to use the symbol not as a means of escape, you have to know in the first place that you can't escape, and not only that you can't escape but there is no one to escape. There is no one to be delivered from the prison of life. That then the liberation of the mind from identifying itself with symbols. Is the same process exactly as breaking up the links between the successive moments. The illusion of a self, a continuing self that travels. From moment to moment and picks them all up, corresponding to the illusion of the moving water in the wave, and the moving lion, the solid circle created by the moving cigarette point in the dark.

This is the meaning then, that there is no one who perceives anything, no one who experiences anything there is simply seeing, and experiencing. Then we introduce all these redundancies through talk. We talk about seeing sights hearings sounds, feeling feelings, all that is irrelevant. There are sights. There are sounds, there are feelings. You don't feel a feeling the feeling itself already contains the feeling of it. They see, it is very simple. To have sight of you don't need something to be seen on the one hand and a sea of something to be seen on the other and then some some mysterious way they come together. The see-er and the seen, the knower and the known are what we call terms. Terms mean ends. And they are what in mathematical language are called limits. Now when we take a stick, the stick has its two ends. They are the terms of the stick, but the ends of the stick do not exist as sort of separate points which encounter each other on the occasion of meeting at a stick. They are actually abstract points, the ends themselves considered as themselves, they're purely geometrical, they're Euclidean imaginations their reality is the stick in thing. So in the same way with that phenomenon called experience the reality is not an encounter of the know and the known. The reality is an experience which can be termed as having two aspects to end the know and the known. But that's only a figure of speech neurologically.

This is true. Everything that you see is yourself. What you are aware of is a state of your nervous system. And there is no other knowledge whatsoever. That doesn't mean that your nervous system is the only existing reality, and that there is nothing beyond your nervous system. But it does mean that all knowledge is knowledge of you, and that therefore in some mysterious way, you are not different from the external world that you know. If you see then, that what you experience, and you, are the same thing. Then realize also, going beyond that, that you are in the external world you're looking at. You see, I'm in your external world, you're in my external world. But I'm in the same world you are. My inside is not separable from the outside world it's something the so-called outside world is doing. Just as it's doing the tree and the ocean and everything else that is in the outside world. Now isn't that great, you see. We've completely got rid of the person in the trap. The one who either dominates the world or suffers under it. It's vanished. It never was there. And when it's when that happens you see. You can play any life game you want to. Link the past and the present in the future

together. Play roles. But you know you've seen through this great. They call it the great social lie that one accumulates owns experiences, memories, sights, sounds and from that, other people. Possessions, so on, and building up always this idea of oneself as the haver of all of this. If you think that you've been had.

Intellectual Yoga

The word yoga, as most of you doubtless know, is the same as our word yoke. Y-O-K-E. And the Latin word iungere, to join. Join, junction, yolk, union, all these words are basically from the same root. And so likewise when Jesus said my yoke is easy he was saying really my yoga is easy. And the word therefore basically denotes. The state that would be the opposite of what our psychologists call alienation. Or what Buddhists call psychiatrist. The view of separateness the feeling of separateness the feeling of being cut off from being. And most civilized people do in fact feel that way. Because they have a kind of myopia attention. Focused on their own boundaries and what is inside those boundaries and they identify themselves with the inside. And they don't realize that you cannot have an inside without an outside. That would seem Wouldn't it be extremely elementary logic that we could have no sense. Of being ourselves. Of having a personal identity without the contrast of something that is not ourselves that is to say other.

But the fact that we don't realize that Self and Other go together is the root of an enormous and terrifying anxiety. Because what will happen when the inside disappears? What will happen when the so-called comes to an end as it seems to. Because if it didn't. I mean if things did not keep moving and changing appearing and dissolving. The universe would be a colossal ball. And therefore you are only aware that the things are all right for the moment I mean I hope most of the people in this gathering have a sort of genial sense inside them that for the time being things are going on more or less OK Some of you may be very miserable. And then your problem may be just a little different but it's essentially the same one but you must realize that that sense of life being fairly All right is inconceivable and unfeeling unless there is way way way in the back of your mind the glimmer of a possibility that something absolutely unspeakably awful might happen. Doesn't have to happen because you'll die one day. But there always has to

be the vague apprehension the hint to get down that the awful awful are possible. It gives spice to life. Now these observations are in line with what I'm going to talk about tonight the intellectual approach to yoga. There are basically certain principle forms of yoga. Most people are familiar with hotter yoga. Which is a psycho physical exercise system and that's the one you see demonstrated most on television because it has visual value. You can see all these exercises with Lotus positions and people curling their legs around their necks and doing all sorts of marvelous exercises and they're good exercises the most honest yoga teacher I know is a woman who teaches hatha yoga and doesn't pretend to be any other kind of guru and she does it very well.

Then there is, back to yoga, Bhakti means devotion. And I suppose in general you might say that Christianity is a form of back to yoga. Because it is yoga practice through extreme reverence for love for. Some being felt more or less external to one's self who is the representative of the divine. Then there is karma yoga. Karma means action and incidentally that's all it means. It does not mean the law of cause and effect when we say that something that happens to you is your karma all it saying is it's your own doing. Nobody's in charge of karma except you. Karma Yoga is the way of action. Of using one's everyday life one's trade or unathletic discipline like sailing or surf riding or track running as your way of yoga as your way of discovering who you are. Then there's Raja Yoga. That's the Royal yoga, and that's sometimes also called can do. And that involves very complicated psychic exercises having to do with awakening the serpent power. That is. As to lie at the base of one's spiritual spine. And raising it up through certain chakras or centers until it enters into the brain there's a very profound symbolism involved in that. But I'm not going into that.

And then finally there is there are several others as mantra yoga Montrealeer go which is the practice through chanting of humming either out loud or silently certain sounds. Which we've come supports for contemplation of what is in Sanskrit called Yana. And Yana. Is the state in which one is clearly awake and aware. Of the world as it is. As distinct from the world as it is described. In other words in the state of jhana you stop thinking. That is to say you stop talking to yourself and figure into yourself and symbolizing to yourself what is going on. You simply are aware of what is and nobody

can say what it is because as courtship ski well said the real world is unspeakable. Lovely double taken. But. That's Jana that's. Where one practice is to sit absolutely wide awake with eyes open. But not thinking. That's a very curious state incidentally. I knew a professor of mathematics at Northwestern University. Who one day said you know it's amazing how many things there are that aren't so. Now I know he was talking about old wives tales and scientific superstitions and so on but when you practice Jana you are amazed how many things there are that answer. Because when you stop talking to yourself and you are simply aware of what is. That is to say of what you feel. What you sense even that saying too much you suddenly find that the past and the future completely disappeared. So also have disappeared the so-called differentiation between the no and the known the subject in the object the feel around the feeling the thinker in the thought they just aren't there because you have to talk to yourself to maintain those things. They are purely conceptual their ideas their phantoms ghosts.

So when you allow thinking to stop. All that goes away. And you find you're in an eternal here or now. And there's no way you're supposed to be there's nothing you're supposed to do is know what you exposed to go because in order to think you're supposed to do something you have to think. And so it's incredibly important to on. At least once a day. For the very preservation of the intellectual life. So if we stop that. Temporarily. And get our mind clear of thoughts. We become as Jesus said again as children. And get a direct view of the world. Which is very useful once here and I doubt it's not much you can do with it when you're a baby. Because everybody pushes you around and you know they pick you up and sit with the city of there and you can't do much except practice contemplation. Only if you can tell anyone what it's like. But when as an adult you can recapture the baby's point of view you will know what all child psychologists have always wanted to know how it is that a baby feels. And the baby according to Freud at least has the oceanic experience. That is to say a feeling of complete inseparability from what's going on. The baby is unable to distinguish between the Universe and his or her action upon the universe. And most of us if we got into that state of consciousness might be inclined to feel extremely frightened. And being beginning to ask. Who's in charge. I mean. Who controls what happens next we would ask that because we are

used to the idea that the process of nature consists of controllers and control ease. Things that do and things that are done to. This is purely mythological. So many spiritual teachers and gurus will look at their disciples and say. I am God. I have realized. But the important thing is that you are. Whether I am or not is that now. Of no consequence to you whatsoever. I could get up and say I have realized I put on a turban and yellow robe and whatever. You come and have Darshan on. I'm going to you need the grace of guru in order to realize and so on and that would be a wonderful hoax if you like picking your pockets and selling you your own watch. But the point is you are. And what are we saying when we say that. We are obviously saying something very important. Alas and alack there is no way of defining it. That is to say going any further into words about it. See when a philosopher hears such a statement as to I must see you or it. Or there is only the eternal now. The Philosopher says I did see where I was so excited about it what do you mean by that. And then he asked that question because he wants to continue in a word game. He doesn't want to go on into an experience will dimension he wants to go on arguing because that's his trip. And all these great mystical statements mean nothing whatsoever. There are alternate statements. Just as you know the trees in the clouds in the mountains and the stars have no meaning because they're not words words have meaning because they're symbols because they point to something other than themselves. But the stars like music. Music only bad music has any meaning. Classical music never has a meaning and to understand. It humans simply listen to it and observe its beautiful patterns go into its complexity.

So when your mind that is to say your verbal systems get to the end of their tether that is to say when they arrived at the meaningless statement. Here is the critical point. And the method of Indiana yoga is to exercise one's intellect to its limits. So that you get to the point where you have no further questions to ask. You can do this in philosophy study. If you got the right kind of teacher. Who shows you that all philosophical opinions whatsoever are false. Or at least if not false extremely partial. And so you feel a kind of intellectual vertigo. Which is called in a Zen Buddhist poem. Above not a tile to cover the head below not an inch of ground to stand on. Well where you where are you then. Of course you where you always were. You discovered your it and that's very uncomfortable because you can't grab it.

So yeah I've discovered that whatever it is that I am. Now is not something inside my head. It is just as much out there as it is in here but whatever it is I cannot get hold of it. Well that gives you the heebie jeebies you get butterflies in the stomach. Anxiety traumas and all kinds of things. But this was all explained by Shankara who the great Hindu commentator on the Upanishads adds the great master of the non-dualistic doctrine of the universe when he said. That which knows which is in all beings the knower is never an object of its own knowledge. So that to everyone who is in quest. Of the supreme kick. The great experience. The vision of God. Whatever you want to call it liberation. When you think that you are not it. Any old guru can sell you on a method to find it. And that may not be a bad thing for him to do. Because as Blake said a fool who persists in his folly will become wise. And a clever girl who is a person who leads you on here kitty kitty kitty kitty I've got something very good to show you. You just wait but you've got to go through a lot of stages yet. He said. I'm Can I get that island together. You know all the time it's you. I was talking of the Zen master the other day. And he said. You should be my disciple. I looked at him and said who was Buddhist teacher. And he looked at me in a very odd way and said. So he burst into laughter and he gave me a piece. Of clover. It's. So. You can you see. So long as you can be persuaded there's something law that you ought to be than you are. You've divided yourself from. Reality from the universe from God or whatever you want to call that the tat and tat. And you will find constantly if you if you're interested in anything like this in psychoanalysis in just out therapy in sensitivity training in any kind of yoga or what have you. That there will be that. Funny sensation of what I'll call spiritual greed. That can be aroused by somebody indicating to you. There are still higher stages for you to attain. You should meet my go. The so you might say then and now it to be truly realized you have to get to the point where you are not seeking anymore.

So then you begin to think well, the way we will we will now be non seekers. In the light disciples of Krishnamurti who because he says he doesn't read any spiritual books they can read anything with mysteries the heart it's. You know becoming spiritually and spiritual. Well you find that that too is what is called In Zen legs on a snake. It's irrelevant you don't need not to see. This you don't need anything. And I mean it's like crawling into a hole and pulling the hole in after you. And of the great master of this

technique was a Buddhist scholar. Lived about two hundred a day. Invented a whole dialectic he had old school called mechanica where the as it were leader of the students would simply destroy all their ideas. Absolutely abolish their philosophical notions. And they get the heebie jeebies. They see he didn't have the B.G.. He seemed perfectly relaxed in not having any particular point of view. But as a teacher how can you stand. We have to have something to hang on to. Who does. Who are you. And eventually you discover of course that it's not necessary to hang on to anything. To rely on and there's nothing to rely on because here it is. Is like the universe it's like asking the question where is the universe. And by that I mean the whole universe. Who care about says it in space. Everything in it is falling around everything else but there's no concrete floor underneath. With the thing to crash. Because the space. You can think of infinite space if you like you don't have to think of space. The space that goes out and out and out forever and ever and has no end what is there. Of course it's you what else could it be. Only the universe is delightfully arranged. So that it as it looks at itself. In order not to be one sided and prejudiced It looks at itself from. An uncountable number of points of view. We thus avoid solid them. With as if I were to have the notion that it's only me that's really here and you're all in my dream. Of course it's that point of view cannot really be disputed. Except by imagining a conference of solipsists arguing as to which one of them is the one that was really the. Now you see if you understand what I'm saying with your intelligence. And then take the next step and say I understood it now but I didn't feel it then next I raise the question. Why do you want to feel it. You say I want something more because that's again that spiritual green. And you can only say that because you didn't understand. There is nothing to pursue because you're it and if you don't know that you always were it. And if you don't know that.

In other words, to put it in Christian terms, or Jewish terms, if you don't know that your god from the beginning what happens is that you try to become God by force. Therefore you start being violent and obstreperous and this and that and the other. All our violence all our competitiveness all our. Terrific anxiety to survive is because we didn't know from the beginning that we were it. Well then you would safe we didn't know from the beginning as in fact you did. When you were a baby. Then everybody says well nothing would ever happen. But it did happen. And it's some of

it's pretty messy. But what people don't realize is they say well take take the Hindus it's basic to Hindu religion that we're all God in disguise. And that the world is an illusion. All that is. Sort of half truth. But if that is the case if Hindus and really awaken Hindus by the knowledge of their union with the Godhead. Would simply become inert. Why then Hindu music. The most incredibly complex marvelous technique. When they sit and play they laugh at each other. They're enjoying themselves enormously with very complicated musical games but when we come in the symphony orchestra gets up everybody dresses in evening dress in a serious expression and all the audience is down on us like it's in a kind of church. And there's none of that to. Records rest well the drama of the tabla player laughs at the sorrow as they compete with each other in all kinds of marvelous improvise ations.

So if you do find out by any chance. Who you really are. You instead of becoming merely lazy. You know you start laughing and laughing leads to dancing and dancing needs music and we can play with each other. For a change.

Myth and Religion

Images of God

Now I'm sure that most of you know the old story about the astronaut who went far out into space and was asked on his return whether he had been to heaven and seen God and he said yes. And so they said to him, "Well, what about God?" And he said "She is black." And although this is a very well known and well worn story, it is very profound.

Because, I tell you, I knew a monk who started out in life as pretty much of an agnostic or an atheist, and then he began to read Henri Bergson, the French philosopher who proclaimed the vital force, the *elan vital*, and so on, and the more he read into this kind of philosophy the more he saw that these people were really talking about God. And I've read a great deal of theological reasoning about the existence of God and they all start out on this line: If you are intelligent and reasonable, you cannot be the product of a mechanical and meaningless universe. Figs do not grow on thistles, grapes do not grow on thorns. And therefore, you as an expression of the universe, as an aperture through which the universe is observing itself, cannot be a mere fluke.

Because if this world peoples, as a tree brings forth fruit, then the universe itself, the energy which underlies it, what it's all about, 'the ground of being' as Paul Tillich called it, must be intelligent.

Now when you come to that conclusion you must be very careful. Because you may make an unwarranted jump. Namely, the jump to the conclusion that that intelligence, that marvelous designing power which produces all this, is the biblical God. Be careful. Because that god, contrary to his own commandments, is fashioned in the graven image of a paternal authoritarian, beneficent tyrant of the ancient Near East. And it's very easy to fall into that trap. Because it's all institutionalized in the Roman Catholic Church, in the synagogue, in the Protestant churches, all there ready for you to accept. And by the pressure of social consensus and so on and so on, it is

very natural to assume that when somebody uses the word God it is that father figure which is intended, because even Jesus used the analogy the Father for his experience of God. He had to. There was no other one available to him in his culture.

But nowadays, we are in rebellion against the image of the authoritarian father. Especially this should happen in the United States, where it happens that we are a republic and not a monarchy. And if you, as a loyal citizen of this country, think that a republic is the best form of government, you can hardly believe that the universe is a monarchy. But to reject the paternalistic image of God as an idol is not necessarily to be an atheist. Although, I have advocated something called atheism in the name of God. That is to say, an experience, a contact, a relationship with God, that is to say, with the ground of your being, that does not have to be embodied or expressed in any specific image.

Now, theologians on the whole don't like that idea, because I find in my discourse with them that they want to be a little bit hard-nosed about the nature of God. They want to say that God has indeed a very specific nature. Ethical monotheism means that the governing power of this universe has some extremely definite opinions and rules to which our minds and acts must be conformed. And if you don't watch out you will go against the fundamental grain of the universe and be punished in some way. Old fashionedly, you will burn in the fires of hell forever. More modern fashionedly [sic], you will fail to be an authentic person. It's another way of talking about it.

But there is this feeling, you see, that there is authority behind the world and it's not you. It's something else. Like we say about something else, that's far out. And therefore, this Jewish, Christian, and indeed Muslim approach makes a lot of people feel rather strange-estranged- from the root and ground of being. There are a lot of people who never grow up, and are always in awe of an image of a grandfather. Now, I'm a grandfather. I have five grandchildren and so I'm no longer in all of grandfathers. I know I'm just as stupid as my own grandfathers were, and therefore I'm not about to bow down to an image of God with a long white beard.

Now naturally of course, we intelligent people don't believe in that kind of a God, not really. I mean, we think that God is Spirit, that God is very undefinable and infinite and all that kind of thing. But nevertheless, the images of God have far more powerful effect upon our emotions than our ideas. And when people read the Bible and sing hymns; "Ancient of Days who sittest throned in glory. Immortal Invisible God, only wise in light inaccessible hid from our eyes," they still got that fellow there with a beard on its way in the back of the emotions. And so we should think, first of all, in contrary imagery, and the contrary imagery is: she's black. Imagine instead of God the Father, God the Mother. And imagine that this is not a luminous being, blazing with light but an unfathomable darkness. Such as is portrayed in India mythology by Kali. K A L I, the Great Mother, who is represented in the most terrible imagery. Kali has a tongue hanging out long, drooling with blood. She has fang teeth, she has a scimitar on one hand and a severed head in the other, and she is trampling on the body of her husband who is Shiva. Shiva represents also furthermore the destructive aspect of the deity, wherein all things are dissolved so that they be reborn again, and here is this blood sucking terrible mother as the image of the supreme reality behind this universe. Imagine, it's the representative of the octopus, the spider, the awful awful, the creepy crawlies at the end of the line which we're all terrified of.

Now that's a very important image. Because let us suppose just for the sake of argument that all of you sitting here right now are feeling fairly alright. But I mean you're not in a hospital. You're not you don't have the screaming meemies, you have a sense you probably had dinner and a feeling pretty good. But you know that you feel that you're fairly good because in the background of your mind's very far off in the background of your minds you've got the sensation of something absolutely ghastly that simply mustn't happen. And so against that, which is not happening which doesn't necessarily have to happen but by comparison with that, you feel pretty all right. And that absolutely ghastly thing that must happen at all is Kali.

And therefore, at once we begin to wonder whether the presence of this Kali is not in a way very beneficence. I mean, how would you know the things were good unless there was something that wasn't good at all. Now

this is I'm not putting this forward as a final position and money putting it forward as a variation, as a way of beginning to look at a problem. And getting our minds out of their normal ruts. She's black. Well she, first of all, feminine, represents what is called philosophically the negative principle. Now of course people who are women in our culture today and believe in women's lib don't like to be associated with the negative, because the negative is acquired very bad connotations. We say accentuate the positive, that's a purely male chauvinist it added to it. How would you know that you were outstanding and less by contrast there was something in-standing. You cannot appreciate the convex without the concave. You cannot appreciate the firm without the yielding. And therefore, the so-called negativity of the feminine principle. Is obviously life giving and very important. But we live in a culture which doesn't notice it. You see a painting, a drawing, of a bird, and you don't notice the white paper underneath it. You see people a printed book and you think that what is important is the printing, and the page doesn't matter. And yet, if you reconsider the whole thing how could there be visible printing without the page underlying it.

What is called substance, that which stands underneath, sub, underneath stands to be substantial is to be underlined. To be the support. To be the foundation of the world. And of course, this is the great function of the feminine. To be the substance. And therefore the feminine is represented by space which is of course black at night. But were it not for black and empty space there would be no possibility whatsoever of seeing the stars. Stars shine out of space and astronomers, very high powered astronomers are beginning to realize that stars are a function of space.

Now that's difficult for our common sense. Because we think that space is simply inert nothingness. Then we don't realize. That space. Is completely basic to everything. It's like your consciousness. Nobody can imagine what consciousness is. It's the most elusive whatever it is that there is, it all because it's the background of everything else that we know therefore we don't really pay much attention to it. We pay attention to the things within the field of consciousness to the outlines to the objects that the so-called things that are in the field of vision the sounds that are in the field of hearing and so forth. But what it is that ever it is that embraces all that. We don't pay much attention to it, we can't even think about it, it's like trying

to look at your head. And you know, you try to look at your head and what you find. You don't even find a black blob in the middle of things you just don't find anything. And yet that is that out of which you see, just as space is that out of which the stars shine.

So there's something very queer about all this. That that which you cannot put your finger on, that which always escapes you that which is completely elusive, the blank seems to be absolutely necessary for there to be anything whatsoever Now let's take this further. Kali also is a principle of death because she carries a scimitars in one hand and a severed head in the other. Death. This is tremendously important to think about. We put it off. Death is swept under the carpet in our culture in the hospital they try to keep you alive as long as possible in utter desperation. They won't tell you that you're going to die. When their relatives have to be informed that it's a hopeless case they say, "Don't tell this to the patient." And all the relatives come around with hollow grins and say, "Well, you'll be all right in about a month, and then we'll go and have a holiday somewhere and sit by the sea and the birds and whatnot." And the dying person knows that this is mockery. Well of course we've made death how with all kinds of ghouls. We've invented dreadful afterlives. I mean, the Christian version of heaven is abominable as the Christian version of hell. I mean, nobody wants to be in church forever. Children are absolutely horrified when they hear these hymns which say "Prostrate before they are thrown to law and gaze and gaze on thee." They can't imagine what this imagery means. I mean, in a very subtle theological way, I could wangle that statement around to make it extremely profound. I mean, to be prostrate at once and to gaze on the other hand, see, is a *Coincidentia oppositorum*, a coincidence of opposites, which is very very deep. But to a child it is a crick in the neck. And that's a sort of imagery we're brought up with.

So the idea what might happen after death. Well, you're going to be faced with your judge. The one who knows all about you, this is Big Papa, who knows you're a naughty boy and a very naughty girl especially girl from the beginning of things. He's going to look right through to the core of your inauthentic existence. And what kind of heebie jeebies may come up or you may be believe in reincarnation, and you think that your next life will be the rewards and the punishments for what you've done in this life, and you

know you got away with murder in this life and of us also all things are going to happen next time around do you look upon death as a catastrophe. Then there are other people who say, well when you're dead you're dead. Just done nothing going to happen at all. So what have you got to worry about?

Well we don't quite like that idea, because it spooks us. You know, what's to be like to die to go to sleep and never never never wake up. But a lot of things it's not going to be like. It's not going to be like being buried alive. It's not going to be like being in the darkness for other. I tell you what, it's going to be like as if you never had existed at all, not only you but everything else as well. There was never anything and there's no one to regret it. And there's no problem. But I'll think about it for a while. It's kind of a weird feeling you get when you really think about that, you really imagine just to stop altogether. You can even call it stop, because you can't have stopped without start. And there wasn't any stop. There's just, no thing. Well then when you come to think of it that's the way it was before you were born. And if you go back in memory as far as you can go you get to the same place. As you go forward in your anticipation of the future as to what it's going to be like to be dead. Anyway it is a funny ideas, that this blankness is the necessary counterpart of what we call being. Now we all think we are alive, don't we? I mean we're really here, that there is something called existence. You know, the existentialist, dasein, thrownness, you know, here we are.

But how could you bring it experiencing that as a reality unless you would once been dead? What gives us any ghost of a notion that we are here except by contrast with the fact that we once weren't? And later on we won't be, but this thing is a cycle. Like positive and negative poles and electricity. So this then is the value of the symbolism of she is black. She, the womb principle. The receptive. The in-standing. The void. And the dark. And so that is to come into the presence of the God who has no image. Behind the father image, behind the mother image, behind the image of Light inaccessible and behind the image of profound and abysmal darkness. The something else, which we can't conceive it all. Dionysus the Areopagite called it the luminous darkness. Nagarjuna called it shunyata, the void. Shankara called it Brahman. That which nothing at all can be said,

neti neti. Beyond all conception whatsoever. And you see that is not atheism in the formal sense of the word. This is a profoundly religious attitude. Because what it corresponds to practically is an attitude to life of total trust. Of letting go. When we form images of God. They're all really exhibitions of our lack of faith. Something to hold on to, something to grasp. How firm a foundation, what lies underneath us, the Rock of Ages or whatever. Ein feste Burg.

But when we don't grasp we have the attitude to face. If you let go of all the idols you will of course discover that what this unknown is which is the foundation of the universe is precisely you. It's not the you you think you are. Now it's not your opinion of yourself, it's not your idea or image of yourself, it's not the chronic sense of muscular strain which we usually call I. You can't grasp it of course not. Why would you need to suppose you could what would you do with it. And who would do what with it. You could never get it it is others that profound central mystery and the attitude of faith is to stop chasing it. Stop grabbing it, because if that happens the most amazing things follow. But all these ideas of the spiritual, the godly, as this attitude of must. And we have been laid down the laws which we are bound to follow, all this jazz, is not the only way of being religious and of relating to the ineffable mystery that underlies ourselves in the world.

Jesus: His Religion

Some years ago, I had just given a talk on television in Canada when one of the announcers came up to me and said, "You know, if one can believe that this universe is in the charge of an intelligent and beneficent God, don't you think He would naturally have provided us with an infallible guide to behavior and to the truth about the universe?" Of course I knew he meant the Bible. I said, "No, I think nothing of the kind, because I think a loving God would not do something to His children that would rot their brains." Because if we had an infallible guide we would never think for ourselves, and therefore our minds would become atrophied. It is as if my grandfather had left me a million dollars, and I am glad he didn't. And we have therefore to begin any discussion of the meaning of the life and teachings of Jesus with a look at this thorny question of authority, and especially the authority of Holy Scripture.

Because in this country in particular, there are an enormous number of people who seem to believe that the Bible descended from heaven with an angel in the year 1611, which was when the so-called King James, or more correctly, [the] Authorized Version of the Bible was translated into English. I had a crazy uncle who believed that every word of the Bible was literally true, including the marginal notes. And so, whatever date it said in the marginal notes – for instance, that the world was created in 4004 B.C. – he believed as the word of God. Until one day he was reading, I think a passage in the Book of Proverbs and found a naughty word in the Bible, and from that time on he was through with it. You know, how Protestant can you get?

Now, the question of authority needs to be understood because I am not going to claim any authority in what I say to you except the authority, such as it is, of history, and that is a pretty uncertain authority. But from my point of view, the four Gospels are to be regarded, I think, on the whole, as historical documents. I will even grant the miracles, because speaking as one heavily influenced by Buddhism, we're not very impressed by miracles. The traditions of Asia – Hindu, Buddhist, Taoist, and so forth – are full of miraculous stories, and we take them in stride. We don't think they are signs of anything in particular except psychic power. We in the West have, by scientific technology, accomplished things of a very startling nature. We could blow up the whole planet, and Tibetan magicians have never promised to do anything like that. And I really am a little scared of the growing interest in psychic power, because that's what I call psychotechnics. And we have made such a mess of things with ordinary technics that heaven only knows what we might do if we got hold of psychotechnics and started raising people from the dead and prolonging life insufferably and doing everything we wished.

The whole answer to the story of miracles is simply: imagine that you are God, and that you can have anything you want. Well, you'd have is for a quite long time. And after a while you would say, "This is getting pretty dull because I know in advance everything that is going to happen." So you would wish for a surprise, and you would find yourself this evening in this church as a human being. So I mean that is the miracle thing. I think miracles are probably possible. That doesn't bother me, and as a matter of

fact, when you read the writings of the early fathers of the church, the great theologians like Saint Clement, Gregory of Nyssa, Saint John of Damascus, even [Saint] Thomas Aquinas, they are not interested in the historicity of the Bible. They take miracles for granted, but forget it. They are interested in it's deeper meaning. And therefore they always interpret all the tales like Jonah and the whale tale. They don't bother even to doubt whether Jonah was or was not swallowed by a whale or rather big fish, but they see in the story of Jonah and the whale the prefiguration of the resurrection of Christ. And even when it comes to the resurrection of Christ they are not worrying about the chemistry or the physics of a risen body. What they are interested in is that the idea of the resurrection of the body has something to say about the meaning of the physical body in the eyes of God. The physical body, in other words, is not something worthless and unspiritual but something that is an object of the Divine Love. Therefore, I am not going to be concerned with whether or not miraculous events happen. It seems to me entirely beside the point.

So I regard the four Gospels, as, on the whole, as good a historical document as anything we have from that period, including the Gospel of John, and that is important. It used to be fashionable to regard the Gospel of Saint John as late. In other words, at the turn of the century, the higher critics of the New Testament assigned the Gospel of John to about 125 A.D., and the reason was simple. Those higher critics at that time just assumed that the simple teachings of Jesus could not possibly have included any complicated mystical theology. Therefore they said, "It must be from a later time." But as a matter of fact, in the text of the Gospel of Saint John, his knowledge of the topography of Jerusalem and his knowledge of the Jewish calendar are more accurate than that of the other three writers, Matthew, Mark, and Luke. And it seems to me perfectly simple to assume that John recorded the inner teachings which He gave to his disciples, and that Matthew, Mark, and Luke recorded the more exoteric teaching, which he gave to people at large.

Now, what about then the authority of these Scriptures? We can take this problem in two steps. A lot of people don't know how we got the Bible at all. We Westerners got the Bible thanks to the Catholic Church. The Catholic Church and members of the church wrote the books of the New

Testament, and they took over the books of the Old Testament, which even by the time of Christ had not been finally decided upon by the Jews. The Jews did not close the canon of the Old Testament until the year 100 A.D., or thereabouts, at the synod of Jamnia and they finally decided which were the canonical books of the Hebrew scriptures, and embodied them Masoretic text, the earliest copy of which dates from early in the 10th century A.D. The books to be included in the New Testament were not finally decided upon until the year 382 A.D. at the synod of Rome and the pope Damasus. So it was the Catholic Church that promulgated the Bible and said, "We are giving you these Scriptures on our authority, and by the authority of the informal tradition that has existed among us from the beginning, inspired by the Holy Spirit." So, you receive, historically, the Bible on the church's say-so.

And the Catholic Church insists, therefore, that the church collectively, speaking under the presumed guidance of the Holy Spirit, has the authority to interpret the Bible, and you can take that or leave it. Because obviously the authority of the Bible is not, first of all, based on the Bible itself. I can write a bible and state within that book that it is indeed the word of God which I have received, and you are at liberty to believe me or not. Hindus believe that the Vedas are divinely revealed and inspired, with just as much fervor as any Christian or any Jew. Muslims believe that the Koran is divinely inspired, and some Buddhists believe that their sutras are also of divine, or rather, Buddhic origin. The Japanese believe that the ancient texts of Shinto are likewise of divine origin. And who is to be judge? If we are going to argue about this, as to which version of the truth is the correct one, we will always end up in a dispute in which the judge and the advocate are the same person, and you wouldn't want that if you were brought into a court of law, would you? If I were to say that I find Jesus Christ to be the greatest being who ever came onto this earth, by what standards do I judge? Why, obviously, I judge by the sort of moral standards that have been given to me as somebody brought up in a Christian culture. There is nobody impartial who can decide between all the religions because, more or less, everybody has been, in one way or another, influenced by one of them. So, if the church says the Bible is true, it finally comes down to you. Are you going to believe the church or aren't you? If nobody believes the church, it will be perfectly plain, won't it, that the church has no authority? Because

the people are always the source of authority. That is why Tocqueville said that “people get the government [they] deserve”.

And so you may say, “God Himself has the authority.” Well, how are we to show that? That’s your opinion. So you say, “You wait and see. The Day of Judgment is coming, and then you will find out who is the authority.” Yes, but at the moment there is no evidence for the Day of Judgment. And it remains until there is evidence simply your opinion that the Day of Judgment is coming. And there is nothing else to go on except the opinion of other people, who hold the same view and whose opinion you bought. So really, I won’t deny anybody’s right to hold these opinions. You may indeed believe that the Bible is literally true and that it was actually dictated by God to Moses and the prophets and the apostles. That may be your opinion and you are at liberty to hold it. I don’t agree with you.

I do believe, on the other hand, that there is a sense in which the Bible is divinely inspired. But I mean by inspiration something utterly different from dictation, receiving a dictated message from an omniscient authority. I think inspiration comes very seldom in words. In fact, almost all the words written down by automatic writing from psychic input that I have ever read strike[s] me as a bit thin. When a psychic begins to write of deep mysteries – instead of telling you what your sickness is or who your grandmother was – he begins to get superficial. And psychically communicated philosophy is never as interesting as philosophy carefully thought out.

But divine inspiration is not that kind of communication, divine inspiration is for example to feel, for reasons that you cannot really understand, that you love people. Divine inspiration is wisdom, which is very difficult to put into words. Like mystical experience, that’s divine inspiration. A person who writes out of that experience could be said to be divinely inspired. Or inspiration might come through dreams, through archetypal messages from the collective unconscious, through which the Holy Spirit could be said to work. But since inspiration always comes through a human vehicle, it is liable to be distorted by that vehicle. In other words, I am talking to you through a sound system, and it’s the only one now available. Now if there’s something wrong with this sound system, whatever truths I might utter to you will be distorted. My voice will be distorted, and you might mistake the

meaning of what I said. So therefore, anybody who receives divine inspiration – and I'm using that in a very loose way, you can mean anything you like by divine, that's your option – anybody who receives it will express it within the limits of what language they know. And by language here I do not only mean English, Latin, Greek, Hebrew, or Sanskrit. I mean language in the sense of what sort of terms are available to you, what kind of religion were you brought up with.

Now, you see, if you were brought up in the Bible Belt, you came out of Arkansas or somewhere, and that's all the religion you knew, and you had a mystical experience of the type where you suddenly discovered that you are one with God. Then you are liable to get up and say, "I am Jesus Christ." And lots of people do. Well, the culture that we live in just cannot allow that. There're only one Jesus Christ. People would say, "You don't look like you're Jesus Christ coming back again, because it says in the Scripture that when he comes back, he will appear in the heavens with legions of angels, and you are not doing that. You are just old Joe Dokes that we knew years ago, and now you're saying you are Jesus Christ." "Well," Joe Dokes says, "when Jesus Christ said he was God, nobody believed him, and you don't believe again." You know, you can't answer that argument.

But you see, he says it that way because he is trying to express what happened to him in terms of a religious language that is circumscribed by the Holy Bible. He has never read the Upanishads. He has never read the Diamond Sutra. He has never read the Tibetan Book of the Dead or the I-Ching or Lao-tzu. And therefore, there is no other way in which he can say this. But if he had read the Upanishads he would have had no difficulty, and nor would the culture, the society in which he was talking, have any difficulty. Because it says in the Upanishads, we are all incarnations of God; only they do not mean by the word God, in fact they don't use that word, they use Brahman, they don't mean the same thing that a Hebrew meant by God. Because the Brahman is not personal. Brahman is, we would say, suprapersonal. Not impersonal, because that is a negation. But I would say suprapersonal. Brahman is not he or she, has no sex. Brahman is not the creator of the world – as something underneath and subject to Brahman – but is the actor of the world, the player of all the parts. So that everyone is in mask, which is the meaning of the word person in which the Brahman

plays a role. And like an absorbed actor, the divine spirit gets so absorbed in playing the role as to become it, and to be bewitched. This is all part of the game, to be bewitched into believing “I am that role.”

When you were babies, you knew who you were, psychoanalysts refer to that as the oceanic feeling. They do not really like it, but they admit that it exists, where the baby cannot distinguish between the world and the way it acts on the world. It is all one process, which is of course the way things are. But we learned very quickly, because we were taught very quickly what is you and what is not you. What is voluntary and what is involuntary, because you can be punished for the voluntary but not for the involuntary. So, we unlearn what we knew in the beginning. And in the course of life, if we are fortunate, we discover again what we really are, that each one of us is what would be called in Arabic, or Hebrew, the Son of God. And the word “Son of” means “of the nature of,” as when you call someone a “son of a bitch.” Or in Arabic you say abn alkalb which means ‘son of a dog’, abn hamar ‘son of a donkey’. So ‘son of beel’ means an evil person. “Son of God” means a divine person, human being who have realized union with God.

Now my assumption, my opinion, is that Jesus of Nazareth was a human being, like Buddha, like Shri Ramakrishna, like Ramana Maharshi etc. who, early in life had colossal experiences of what we call cosmic consciousness. Now you do not have to be of any particular kind of religion to get this experience. It can hit anyone, anytime, like falling in love. There are obviously a number of you in this building who’ve had it, in greater or lesser degree. But it is found all over the world, and when it hits you, you know it. Sometimes it comes after long practice of meditation and spiritual discipline, and sometimes it comes for no reason that anybody can determine. We say it’s the grace of God, that there comes this overwhelming conviction that you have mistaken your identity. That what you thought, what I thought was just old Alan Watts – who I know very well is just a big act on the show. But what I thought was me, was only completely superficial. That I am an expression of an eternal something or other, a name that cannot be named, as the name of God was taboo among the Hebrews. I am. And that, I suddenly understand exactly why everything is the way it is. It is perfectly clear. Furthermore, I no longer feel any

boundary between what I do and what happens to me. I feel that everything that is going on is my doing, just as my breathing is. Is your breathing voluntary or involuntary? Do you do it or does it happen to you? See you can feel it both ways. But you feel everything like breathing. And it isn't as if you had become a puppet. There is no longer any separate you. There is just this great happening going on. And if you have the name in your background you will say that this happening is God, or the will of God, or the doing of God. Or if you do not have that word in your background, you will say with the Chinese, "It is the flowing of the Tao." Or if you are a Hindu, you will say, "It is the Maya of Brahman." The Maya means the magical power, the creative illusion, the play.

So you can very well understand how people to whom this happens feel genuinely inspired. Because very often there goes along with it an extremely warm feeling, because you see the divine in everybody else's eyes. When Kabir, the great Hindu-Muslim mystic was a very old man, he used to look around at people and say, "To whom shall I preach?" Because he saw the beloved in all eyes. Sometimes I look into people's eyes and see that same beloved in the depth of those pools, and yet the expression on the face is saying, "What, me?" It is the funniest thing. But there is everybody, in its own peculiar way, playing out an essential part in this colossal cosmic drama. And it's so strange that one can even feel it in people you thoroughly dislike.

So let's suppose that Jesus had such an experience. And they're of all ranges, as I have said, and his could have been a very strong one indeed. From the sayings of Jesus, especially in the Gospel of Saint John, anybody who studied the psychology of religion can easily detect that that experience must have taken place, or something very like it. But, you see, Jesus had a limitation, in that he did not know of any religion other than those of the immediate Near East. He may have known something about Egyptian religion, and perhaps a little bit about Greek religion, but mostly about Hebrew. There is no evidence whatsoever that he knew anything about India or China. And we, people who think that Jesus was God assume that he must have known because he would have been omniscient. No, Saint Paul makes it perfectly clear in the Epistle to the Philippians that Jesus renounced his divine powers so as to be Man.

So, let's suppose then that Jesus had such an experience. But, you see, Jesus has a limitation, that he doesn't know of any religion other than those of the immediate Near East. He might know something about Egyptian religion, and perhaps a little bit about Greek religion, but mostly about Hebrew. There is no evidence whatsoever that he knew anything about India or China. And people who think that Jesus was God assume that he must have known because he would have been omniscient. No, Saint Paul makes it perfectly clear in the Epistle to the Philippians that Jesus renounced his divine powers so as to be Man.

“Let this mind be in you, which was also in Christ Jesus, who, being in the form of God, thought not equality with God a thing to be hung on to, but humbled himself and made himself of no reputation and was found in fashion as a man and became obedient to death.” Theologians call that kenosis, which means self-emptying. So obviously, an omnipotent and omniscient man would not really be a man.

So even if you take the very orthodox Catholic doctrine of the nature of Christ, that he was both true God and true man, you must say that, for true God to be united with true Man, true God has to make a voluntary renunciation, for the time being, of omniscience, and omnipotence and omnipresence, for that matter.

Now therefore, if Jesus were to come right out and say, ‘I am the son of God’, that's like saying ‘I'm the boss's son’. Or ‘I am the boss’. And everybody immediately says that is blasphemy. That is subversion. That is trying to introduce democracy into the Kingdom of Heaven! That is, you are a usurper of the throne. No man has seen God.

Now, Jesus in his exoteric teaching, as recorded in the synoptic gospels, was pretty cagy about this. He didn't come right out there and say ‘I and the Father are one’. Instead he identified himself with the messiah described in the second part of the prophet Isaiah, the suffering servant who was despised and rejected of man. And that this man is the non-political messiah, in other words, it was convenient to make that identification, even though it would get him into trouble. But to his elect disciples, as recorded in Saint John, he come right out and said: “Before Abraham was, I am. I am

the way, the truth, and the life. I am the resurrection and the life. I am the living bread that comes down from heaven. I and the Father are one, and he who has seen me has seen the Father.” And there can be no mistaking that language.

So the Jews found out what he said and they put him to death, or had him put to death, for blasphemy. This is no cause for any special antagonism to the Jews. We would do exactly the same thing, it's always done. It happened to one of the great Sufi mystics in Persia who had the same experience.

Now, what happened? The apostles did not quite get the point. They were awed by the miracles of Jesus, they worshiped him as people do worship gurus, and you know to what lengths that can go, if you've been around guru land. So the Christians said, “Okay, okay, Jesus of Nazareth was the Son of God. But let it stop right there! Nobody else.” So what happened was that Jesus was pedestalized. He was put in a position that was safely upstairs, so that his troubles and experience of cosmic consciousness would not come and cause other people to be a nuisance. Those who had this experience, and expressed it during those times when the church had political power, were almost invariably persecuted. Giordano Bruno was burned at the stake. John Scotus Eriugena was excommunicated. Meister Eckehart's theses were condemned, and so on and so on. A few mystics got away with it, because they used cautious language.

But you see what happens. If you pedestalize Jesus, you strangle the Gospel at birth. And it has been the tradition in both, the Catholic Church and in Protestantism, to pass off what I would call an ‘emasculated gospel’. Gospel means “good news,” and I cannot for the life of me think what is the good news about the gospel as ordinarily handed down. Because, look here, here is the revelation of God in Christ, in Jesus, and we are supposed to follow his life and example without having the unique advantage of being the boss's son. Now the tradition, both Catholic and Protestant fundamentalists represents Jesus to us as a freak, born of a virgin, knowing he is the Son of God, having the power of miracles, knowing that basically it's impossible to kill him, because he is to rise again in the end. And we are asked to take up our cross and follow him, when we don't know that about ourselves at all.

So what happens is this: We are delivered therefore a gospel which is in fact an impossible religion. It is impossible to follow the way of Christ; many a Christian has admitted it. "I am a miserable sinner. I fall far short of the example of Christ." But do you realize, the more you say that, the better you are? Because what happened was, that Christianity institutionalized guilt as a virtue. [applause] You see, you can never come up to it, never, and therefore you will always be aware of your shortcomings. And so, the more shortcomings you feel, the more, in other words, you are aware of the vast abyss between Christ and yourself.

So, you go to confession, and if you have a nice, dear, understanding confessor, he will not get angry with you. He will say, "My child, you know you have sinned very grievously, but you must realize that the love of God and of our Lord is infinite, and that naturally you are forgiven. As a token of thanksgiving say three Hail Mary's." You may have committed a murder and robbed a bank and fornicated around and so on, the priest is perfectly patient and quiet. Well, you feel awful "I have done that, to the love of God I've wounded Jesus, grieved the Holy Spirit!" and so on. But you know in the back of your mind that you are going to do it all over again. You won't be able to help yourself. You will try, but there is always a greater and greater sense of guilt.

Now, the lady objected that I was putting out the straw man and knocking it down; this is the Christianity of most people. Now there is also a much more subtle Christianity of the theologians, the mystics, and the philosophers. But it is not what gets preached from the pulpit, grant you. But the message of Billy Graham is approximately what I'm giving you, and of all what I would call fundamentalist forms of Catholicism and Protestantism. What would the real gospel be? The real good news is not simply that Jesus of Nazareth was the Son of God, but that he was a powerful Son of God who came to open everybody's eyes to the fact that you are too. This is perfectly plain if you go to the tenth chapter of Saint John, verse thirty, there is the passage where Jesus says, "I and the Father are one." There are some people around who are not intimate disciples around, and they are horrified. They immediately pick up stones to stone him. He says, "Many good works I have shown you from the Father, and for which of these do you stone me?" And they say, "For a good work we

stone you not, but for blasphemy, because you, being a man, make yourself God.” And he replied, “Isn’t it written in your law, ‘I have said you are Gods?’ – he is quoting the eighty-second Psalm – ‘Is it not written in your law I have said you are Gods?’ If God called those to whom He gave His word Gods – and you cannot deny the scriptures – how can you say I blaspheme because I said I am a son of God?”

There is the whole thing in a nutshell. Because if you read the King James Bible – that descended with the angel – you will see in italic in front of these words “Son of God,” “the Son of God,” “because I said I am the Son of God”. And most people think the italics are for emphasis, but they are not. The italics indicate words interpolated by the translators, you will not find that in the Greek. In the Greek [it] says “a son of God.” So it seems to me here perfectly plain that Jesus has got it in the back of his mind and that this is not something peculiar to himself. So when he says, “I am the way. No man comes to the Father but by me”, this “I am,” this “me,” is the divine in us, which in Hebrew would be called the Ruah Adonai. A great deal is made of this by the esoteric Jews, the Cabalists and the Hasidim. The ruah is the breath, which God breathed into the nostrils of Adam. It is different from the soul, the individual soul in Hebraism is called nefesh. So we translate the ruah into the Greek [penafma], and the nefesh in to psike or psyche, the spirit. And you ask the theologians what’s the difference between the soul and the spirit and he won’t be able to tell you. But it’s very clear in Saint Paul’s writings. So the point is that the ruah is the divine in the creature by virtue of which we are ‘sons of’ or ‘of the nature’ of God. Manifestations of the divine. This discovery is the gospel that is the good news.

But this has been perpetually repressed throughout the history of Western religion, because all Western religions have taken the form of celestial monarchies and therefore have discouraged democracy in the kingdom of heaven. Until, as a consequence of the teaching of the German and Flemish mystics in the fifteenth century, there began to be such movements as the Anabaptists, the Brothers of the Free Spirit, and the Levelers and the Quakers. A spiritual movement which came to this country and founded a republic and not a monarchy. And how could you say that a republic is the best form of government if you think that the universe is a monarchy?

Obviously if God is on top in a monarchy, monarchy is the best form of government. But you see, ever so many citizens of this republic think they ought to believe that the universe is a monarchy, and therefore they are always at odds with the republic. It is from principally white, racist Christians that we have the threat of fascism in this country, because, you see, they have a religion which is militant, which is not the religion of Jesus, which was the realization of divine sonship, but the religion about Jesus, which pedestalizes him, and which says that only this man, of all the sons of woman, was divine. And you had better recognize it. And so it speaks of itself as the church militant. The onward Christian soldiers marching, as to war. Utterly exclusive, convinced in advance of examining the doctrines of any other religion, that it is the top religion. So it becomes a freak religion, just as it has made a freak of Jesus, an unnatural man.

It claims uniqueness, not realizing that what it does teach would be far more credible if it were truly Catholic. That is to say, restated again, the truths that have been known from time immemorial, which have appeared in all the great cultures of the world. But even very liberal Protestants still want to say somehow, so I suppose to keep the mission effort going or to pay off the mortgage; “Yes, these other religions are very good. God has no doubt revealed Himself through Buddha and Lao-tzu, but ...”

Now, obviously, it is a matter of temperament, you can be loyal to Jesus, just as you are loyal to your own country, but you are not serving your country if you think that it’s necessarily the best of all possible countries. That is doing a disservice to your country; it is refusing to be critical where criticism is proper. So of religion. Every religion should be self-critical. Otherwise it soon degenerates into a self-righteous hypocrisy. If then we can see this, that Jesus speaks not from the situation of a historical *deus ex machina*, a kind of weird, extraordinary event, but he is a voice which joins with other voices that have said in every place and time: “Wake up man! Wake up and realize who you are.”

I do not think, you see, until church is get with that, that they’re going to have very much relevance. Popular Protestantism and popular Catholicism will tell you nothing about mystical religion. The message of the preacher, fifty-two Sundays a year, is “Dear people, be good.” We have heard it ad

nauseam. Or believe in this, he may occasionally give a sermon on what happens after death, or on the nature of God, but basically the sermon is “Be good.” But how? As Saint Paul said: “To will is present with me, but how to do that which is good, I find not. For the good that I would do, I do not, and the evil that I would not do, that I do.” How’re we going to be changed? Obviously, there cannot be a vitality of religion without vital religious experience. And that something much more than emoting over singing “Onward Christian Soldiers.”

But you see, what happens in our ecclesiastical goings-on is that we run a talking shop. We pray, we tell God what to do or give Him advice, as if He didn’t know. We read the Scriptures. And remember talking it the Bible, Jesus said, “You search the Scriptures daily, for in them you think you have life.” Saint Paul made some rather funny references about “the spirit which giveth life and the letter which kills.” I think the Bible ought to be ceremoniously and reverently burned every Easter. We need it no more because the spirit is with us. It’s a dangerous book, and to worship it is of course, a far more dangerous idolatry than bowing down to images of wood and stone. Because nobody in his senses can reasonably confuse a wooden image with God, but you can very easily confuse a set of ideas with God, because concepts are more rarefied and abstract.

So in this endless talking in church we can preach, but by and large preaching does nothing but excite a sense of anxiety and guilt. You can’t love out of that. No scolding or rational demonstration of the right way to behave is going to inspire people with love. Something else must happen. Well but you say, “Well, what are we going to do about it?” Do about it? Have you no faith? Then be quiet. Even Quakers are not quiet. They sit in meeting and think, at least some of them do. But supposing we are really quiet, we do not think, be are absolutely silent through and through. We say, “You will just fall into a blank space.” Oh? Ever tried?

I feel then, that it is enormously important that churches stop being talking shops. They must become centers of contemplation. What is contemplation? Con-templum; it’s what you do in the temple. You don’t come to the temple to chatter but to be still and know that “I am God.” This is why, if the Christian religion, if the gospel of Christ is to mean anything at all – instead

of just being one of the forgotten religions, along with Osiris and Mithra, we must see Christ as the great mystic, in the proper sense of the word mystic. Not someone who has all sorts of magical powers and understands spirits and so on. A mystic, strictly speaking, is one who realizes union with God, by whatever name. This seems to me the crux and message of the gospel. Summed up in the prayer of Jesus which Saint John records as he speaks over his disciples, praying that they may you be one, even as the Father and I are one, that you may be all one. May we all realize this divine sonship, or oneness, basic identity with the eternal energy of the universe, and the love that moves the sun and other stars.

Spiritual Authority

I may take the liberty of beginning by saying something about myself and my role in talking to you about philosophical matters, because I wanted to be understood perfectly clearly that I'm not a guru. In other words, I talk about what we call these things and that comprises a multitude of interests concerning oriental philosophy, psychotherapy, religion, mysticism, et cetera. I talk about these things because I'm interested in them and because I enjoy talking about them. And every sensible person makes his living by doing what he enjoys doing, and that explains me.

Now in saying, therefore, that I am not a guru, that means also that I'm not trying to help you or improve you. I accept you as you are. I am not out there to save the world. Of course, when a stream, a bubbling spring flows out from the mountains it's doing it's thing. And if a thirsty traveler helps himself, well that's fine. When a bird sings, it doesn't sing for the advancement of music. But if somebody stops to listen and is delighted, that's fine.

And so I talk in the same spirit. I don't have a group of followers. I'm not trying to make disciples, because I work on the principle of a physician rather than a clergyman. A physician is always trying to get rid of his patients and send them away healthy to stand on their own feet, whereas a clergyman is trying to get them as members of a religious organization so that they will continue to pay their pledges, pay off the mortgage on an expensive building, and generally belong to the church, boost its

membership, and thereby prove by sheer weight of numbers the veracity of its tenants. And my objective is really to get rid of you so that you won't need me or any other teacher. I'm afraid some of my colleagues would not approve of that attitude, because it is widely believed and said that in order to advance in the spiritual life, whatever that is, it is essential that you have a guru, and that you accord to that guru perfect obedience.

And so I'm often asked the question, is it really necessary to have a guru? I can answer that only by saying, yes, it is necessary if you think so. In the same spirit as it is said that anybody who goes to a psychiatrist ought to have his head examined. Of course, there is more in that saying than meets the ear, because if you really are sincerely concerned with yourself and are in such confusion that you feel you have to go to a psychiatrist to talk over your state, then of course you need to go. Likewise, if you are in need of someone to tell you what to do to practice meditation or to attain a state of liberation, nirvana, moksha, or whatever it may be called, and you feel that necessity very strongly, then you must have it, because as the poet William Blake said, "The fool who persists in his folly will become wise."

However, I do want to point this out. What is the source of a guru's authority? He can tell you that he can speak from experience. That he has experienced states of consciousness which have made him profoundly blissful or understanding or compassionate or whatever it may be. And you have his word for it. You have the word of other people who likewise agree with him. But each one of them and you in turn, agree with him out of your own opinion and by your own judgment. And so it is you that are the source of the teacher's authority. And that is true whether he speaks as an individual or whether he speaks as the representative of a tradition or a church. You may say that you take the Bible as your authority or the Roman Catholic Church. And the Roman Catholic following very often says that the individual mystical experience is not to be trusted because of its liability to be interpreted in a whimsical and purely personal way, and that it has to be guarded against excess by the substantial and objective traditions of the church. But those traditions are held to be substantial and objective, only because those who follow believe it to be so. They say so. And if you follow it, you say so.

So the question comes back to you. Why do you believe, why do you form this opinion? Upon what basis does all this rest? Well of course, almost everybody is looking for help, and thus when I was younger, so much younger than today, I never needed anybody's help in any way. But there is this feeling of a certain helplessness of being alone and somewhat confused in an unpredictable wayward external world of happenings. And this world of happenings includes an enormous amount of suffering, tragedy, and we wonder why we're here, how we got here, and in short, what to do about the capital "P" Problem of capital "L" Life, to which should be added death. Because it seems to be certain that we are all going to die and that death may be a painful process. That those we love are going to die and so what about it? Is there anyway in which we can become masters of the situation?

Well there are all sorts of ways of trying to escape from the human predicament of being a lonely, isolated consciousness in the midst of this enormous and wayward not-self. We can of course, try to beat the game on a material basis by becoming very wealthy or very powerful. We may resort to all kinds of technology to get rid of our sufferings, hunger, pain, sickness, and so forth. But it will be noticed that as we succeed in these enterprises, we're not satisfied. In other words, if you feel at this moment that an increase in income would solve your problems, and you got an increase in income, this would give you a pleasant feeling for a few weeks.

But then, as you well know if that's ever happened to you, the feeling wears off and you may stop worrying about paying your debts and start worrying about whether you will get sick. There is always something to worry about. And if you are very rich indeed, you've still got the anxiety about sickness and death and also anxieties about revolution and about whether the Internal Revenue Service will take it all away from you or catch you for cheating on your taxes, or put you in prison for no good reason. Now there is always this worry. And so you realize that the problem of life does not really consist in your external circumstances, because you worry whatever they are. The problem consists rather in what you call your mind.

Could you by some method control your mind so that you won't worry, and how on Earth would you do that? Well, there are those people who tell you that the best answer is to think positive thoughts, to be peaceful, to breathe

slowly, and hum gently, and get yourself into a peaceful state of mind by repeating affirmations such as all is light, all is God, all is good, or whatever it may be. But unfortunately, it doesn't always work because you have a nagging suspicion in the back of your mind that you're simply hypnotizing yourself and whistling in the dark. What the Germans call a "hintergedachte", which is the thought concealed way, way back behind your intellect, but has annoying persistence. What if?

And so you realize that this matter of controlling the mind is no superficial undertaking, because although you may be able to smooth the ruffles of your consciousness, there is beneath that a vast area of unconsciousness which erupts as unpredictably as events in the external world. And so you consider seriously the possibilities of psychoanalysis, to go down and get into those depths and see if oil can be put on those troubled waters. And then of course, you get into the guru business. You have to go to someone against who's mirror you can reflect those aspects of yourself of which you are not directly aware.

So as the process goes on, you find there is something awkward about all this, and this awkwardness can be expressed in many different ways. One of them is this. How on Earth are you to get at yourself to do something about yourself? Because it's a project not unlike trying to pierce the point of the pen with the point of the same pen. In other words, if you feel that you could do with some sort of psychological or spiritual improvement, obviously you are the character who's going to have to bring this about. But if you are the one who needs to be improved, how are you going to accomplish the improvement? You're in the predicament of trying to lift yourself up off the floor by pulling at your own boot straps, and as you all know, that cannot be done. And if you attempt to do so, you are likely to land with a bang on your fanny and be lower down than you were in the first place.

So that problem continually arises and it has arisen historically in all the great religious traditions. We find it in Christianity, in the debate between St. Augustine and Pelagius. And Pelagius said that if God had given us a commandment to love him and to love our neighbors, he would not have done so unless we could obey it. St. Augustine countered and said, "Yes,

but the commandment was not given in order for it to be obeyed, God never expected that it would be obeyed, because we were incapable of loving anyone but ourselves. The commandment was therefore given to convince us of our sinfulness from which we could be rescued only by divine grace, that is to say by the infusion of our souls with a power beyond them.” And that was more or less the doctrine of which the judge settled.

The puzzle has always been therefore, how to get grace, because grace is apparently freely offered to all, but some people seem to get it and some don't. With some the medicine takes, and with others it doesn't. Why? Well, apparently you have the power to resist grace, but if you do, you also have the power not to resist it. We would like therefore to know how not to resist it and to be open. And there you see we are back at exactly the same problem with which we began. It's like saying you must relax damn you. Let go. Give in. And I know I ought give in. I know I ought to let go and abandoned my will to the divine will, but his son Paul put it so well, “The will is present with me. But how to do that which is good, I find hard, for the good that I would I do not and the evil that I would not, that I do.”

In other words, we all come down to a basis in ourselves which we will call, so first of all since we are in a Jewish Temple, the Yetzer HaRah, or the wayward spirit which God is supposed to have put into the soul of Adam or in my translation, our element of the irreducible rascality, where we're all basically scamps. And if you haven't found that, you're very unconscious. I know all sorts of people who are full of outward love, but of course, it always turns out that they need money. And when it comes to money, virtue flies out of the window. So we do have the element in ourselves. We know it very well. And the question is therefore once again, how can it be transformed.

But if the transformer is the one who's inflicted, who transforms the transformer, it's the old problem of who guards the guards, who polices the policeman, who governs the governor? And it seems perfectly insoluble for the reason alone that it is a vicious circle.

There's a great deal of talk about two-selves. We love ourselves (called ego), the higher self called the spirit or the atman, and the duty of the atman seems to be to transform the wretched little ego. Well sometimes it does,

but a lot of times it doesn't. So we ask why doesn't so and so's atman succeed in getting through? Is his ego too strong? If so, who will weaken it? Is his atman too weak? And if so, why for surely aren't all atmans the same? The puzzle remains.

So let's take a look at what we're trying to accomplish. We're trying to get better. We are out after that type of experience which we will call the positive, the good, the light, the living, and to get away from the negative, the evil, the dark, and the dead. Unfortunately, however, human experience, human consciousness knows by contrast— we are equipped with a nervous system where the neurons either fire or don't fire. All that we are aware of, is made up of an extremely complicated arrangement of yes and no. And by a recording on magnetic tape it impulses there are areas where there is a pulse and there are areas where there's not a pulse. And by so doing, we can tape almost any form of human experience.

In other words, we can put colored television on the tape so that it is all reduced to a matter of yes and no. And you will understand of course, that that is the philosophy of the Chinese book of changes, the I-Ching, which represents all the situations of life in terms of combinations of the yang, or positive principle, and the yin, or the negative principle. Interestingly enough, a Latin translation of the I-Ching was read by the philosopher Leibniz and from this he invented binary arithmetic wherein all numbers can be represented by zero and one. And that is the number system used by the digital computers, which lies behind all our electronic ingenuity. This great extension of the number system which is based on the same principle.

But you see what we are trying to do. We are trying to have yang without yin. We are trying to arrange a life game in which there is winning without losing. Now how can you arrange such a state of affairs? A game in which everybody wins would end up as W.S. Gilbert put it, "When everybody's somebody, then no one's anybody." If we are all equally happy, it is impossible to know that we are happy because a certain flatness comes over everything. If we lifted up all valleys and lowered all mountains, we should have the sort of thing they're attempting to do with bulldozers in the Hollywood Hills to the destruction of the ecology, in ghastly fulfillment of

the Biblical prophecy that every – every valley should be exalted and every mountain laid low and the rough places made plain.

And I'm sorry to say it was Isaiah whom was tempted – was dedicated – who made that remark. But the same Isaiah also said something that at least Christians do not often quote, which is this following sentence, "I am the Lord and there is none others. I form the light and create the darkness. I make peace and I create evil. I the Lord, do all these things." In spite of which everybody is busy trying to be good, not realizing that we would not recognize saints unless there were sinners, or saviors unless there were fools.

And there is no way out of that dilemma. That is why Buddhism represents existence in terms of a wheel called the Bhavacakra, the wheel of becoming, of birth and death. And on the top of that wheel, there are deva people whom we would call angels. And at the bottom of the wheel, there are Naraka or tormented people in purgatory. And you go round and round, now this way, now that way. It's really like a squirrel cage where you're running and running and running to get to the top and yet you have to run faster and faster to stay where you are. And that's why there is always the sense of the more you succeed in any scale of either worldly or spiritual progress, the more you have the haunting feeling that you're still in the same place.

So you think now, there must be some way out of that. Perhaps there's something ambitious and proud and wrong in aspiring to be enlightened or compassionate. Perhaps there's a great dose of spiritual pride in that I, by my efforts, could make myself into a Buddha or a saint. And therefore, perhaps the thing to do is to try to eliminate all desire, not only the desire for worldly success, but likewise the desire for spiritual success. For the Buddha proposed that desire was the root of suffering and therefore suggested to his arhats that if they eliminated desire or clinging, they might cease from suffering. But you must realize that the so-called teachings of the Buddha are not doctrines in the sense that the Jews and Christians and the Muslims have doctrines. They are proposals. They are the opening steps in a dialogue and if you go away and try not to desire in any way, you will very quickly discover that you are desiring not to desire.

And so we very rapidly come to a situation where you discover that with regard to your own transformation, everything you try to do about it doesn't work. It may have some sort of temporary success to make you feel better, but again and again we come back to the same old gnawing problem and that is why people interested in spiritual things tend to move from one sect to another, from one teacher to another, always hoping that they will meet one who has the answer. Of course, then there are many teachers who say, indeed, there is nothing you can do and therefore you have to practice non-doing as the Taoist call it wu wei, non-striving.

But then you find in turn that it's extraordinarily difficult not to strive. It's like trying not to think of a green elephant and immediately you think of it. And so you come to the dismal conclusion that you can neither achieve what you want to achieve, that is to say liberation from the alternation of the opposites by striving, nor can you achieve it by not striving. And thereby you have learned that you cannot concentrate on purpose. It's like trying to be unselfconscious on purpose or to be genuine on purpose or to love on purpose, when you say I ought to love, well that puts you in a double bind. And we say to the person, well he's trained himself to be deliberately unselfconscious or he has very disciplined spontaneity. What we were looking for was somebody whose spontaneity was genuine, so that the scaffolding didn't show. And we believe that there are such people like children, but they don't know how interesting they are. And when they find out, they become brats.

Imagine for a moment that it was your privilege to have a brief interview with God, in the course of which you were allowed to ask one question. What would you ask? Now you would have to think this over very carefully, because this golden opportunity would come to you only once and you would have to be most careful that you didn't ask a silly question.

Well you might try God out with a Zen Buddhist koan. Such as, beyond the positive in the negative but what is reality? And the law to talk to and say, "My dear child your question has no meaning." And you wouldn't have the opportunity to think up a meaningful one and come back. So perhaps you should've asked, "What question should I ask?" And the Lord would say to

you, “Why do you want to question?” See, it seems you do want one, don’t you? Because you feel that something is wrong if you don’t have a problem. When you’ve got one, that is, the insoluble problem of trying to win without losing it.

Now as long as you can keep that problem, you’ll be busy. Until you see that it can be solved. But there are all sorts of ways of presenting that problem in such a way that you cannot see that it’s meaningless. And the better gurus are very clever at bringing these ways out. You may see for example if you are invited to practice intense concentration, that after awhile you find yourself thinking about concentrating and therefore that your concentration is somewhat divided. Or he may ask you What is your motivation for this activity? And you find out that it’s your element of irreducible rascality. So however, the teacher once he is seeing we’ve mastered that lesson had something still more in jeans. He says now you’ve actually made progress. Because finding out that you could not really concentrate. Lets value on because it began to prick at the illusion of your ego.

But you’ve only got your foot in at the door. Beyond this, are many many higher things to be learned and you must redouble your efforts. And so of course you apply yourself all the more again and again on all sorts of tricks that these old gentlemen can come out with, and you will keep at it just as long as he can make you fall for it, that in the end, you see that it was all tricks. That as the great Zen master Rinzai says “Well after all ,there was nothing much in Obaku’s Buddhism.” And he went on to explain to his students that they art of Zen, or teaching Zen, is like deceiving a child with an empty fist. You know how you can intrigue a child by pretending you’ve got something very precious in your fist. And you can play a game for an hour, provoking a child to ever great enthusiasm to find out what you got. And in the end the revelation is that there was nothing there.

So many people say in the course of there Zen training, I realized there was nothing to realize. It was all there from the beginning. Because you see standing up as to the realisation that you can’t do anything about it. Equivalently that you can do nothing about it. Comes to costly awakening that the reason for that is there is no you separate from you. In other words,

when you try to control your thoughts, or control your feelings there is no difference between the thoughts and the controller. Because what you call the thinker is simply your thought of yourself, the thinker is a sort of monks was and the feeler is a feeling among feelings. And trying to control thoughts the thoughts just like trying to bite your own teeth. So you've found that out. Well then the other side of the picture is of course, that if you do find that out, you discover that the project of controlling yourself was unnecessary. Because you were, yourself, a Buddha from the very beginning. That's what the Upanishads mean when they say quite simply tat tvam asi. You're it. You, as you are. Now how can you conceive that? Supposing you let your imagination go and really think through what you would like to happen. Imagine the most gorgeous state of bliss that you can conceive. Where there are no worries, no anxiety, no haunting future with unpleasant consequences. You're in control of the whole works. And you're sitting on your lotus, perfectly content. And I ask you seriously, "Is that really what you want?" You're quite sure that's what you want. Imagine now, let's get this situation straight. You've got everything you want, you're in the highest possible spiritual state that you can conceive. And yet, I haven't really surrendered myself. Because I know it all. Something I don't know. So please the surprise you know what would happen. You would find yourself sitting here, in this building tonight, feeling exactly the way you feel. There's your answer. Because after all, don't you have it all? You have the feeling of yourself. But the feeling of yourself depends on there being, at the same time, a contrast, the feeling of other. The self has a certain sensation of being in control of life to some extent. Through voluntary action, the Will seems to have a certain freedom, and yet on the other hand there are limits to that and it seems in the end life sweeps us away, and we are overwhelmed by the involuntary. And yet the voluntary keeps popping up new voluntaries come into the world with every baby.

So you see, you couldn't have the experience you call being a voluntarily acting self without the contrast of the involuntary happening. Now do you want to be without the involuntary happening? You want to get rid of that? Alright, if you get rid of it, you won't have the experience of the voluntary self. Or would you like to turn it the other way around? Would you like to have the experience of no voluntary self, and on the other hand everything just happen?

But then you say well I'm not sure about that. Because then I would feel at first that I was floating, that I had no further responsibilities, that I was walking on air. And we do get that feeling sometimes. If you take the ideas of determinism and fatalism to their final conclusion, you do have that sense of freedom from more responsibility, freedom from worry and care. And you float along for a while whereas off. You don't somehow seem to be able to follow that philosophy consistently. Especially if you have children. And somehow society begins to push on you to be responsible, as it pushes on children to be responsible.

And so this nagging duality keeps coming back, that I cannot realize this nice irresponsible condition of involuntary behavior unless I have the contrast to the possibility of the voluntary, and vice versa. And what does that mean? Obviously it means these two aspects, or sides of our experience, which we can call the voluntary and involuntary the knower and the known, the subject and the object, the self and the other, although appearing to be two, are indeed one. Because you can have one without the. And when that state of affairs arises you know at once that this is a conspiracy. That two things which lose different is different can be, are for that very reason the same.

Now, you can detect even under those actions of yours which we call voluntary, the voluntary movement of the muscles or of the mind, that there are processes which are not voluntary. You do not will your blood to circulate, you do not control by intention the synapses in your nervous system, and yet you would be incapable of any voluntary action unless those involuntary processes were going on. So you see these two things go together. And you begin to realize something which is rather difficult to describe, that what you call your experience is a do- happening. We don't have good words for this. We have some words which have a sort of sense like the word cleave, which means to stick together or to hold together and also to split. And the words sacer, in Latin, means holy or accursed.

And so I would like to propose we all should find some word for a do-happening, because it's all a do-happening. That's what the Buddhists mean when they talk about karma. The word karma means action. And when something happens to you, be it good or bad, they say it is your karma. That

means quite simply it is your doing. But you say I didn't mean to do that. No. One school of thought will explain it by saying, but you see you did something in a former life or a former time which now has this consequence, but that's a very superficial understanding of God. You don't need to believe in reincarnation to believe you understand karma.

Karma is simply, that you don't let your left hand know what your right hand is doing. That is one where you are doing what you call the environment. And with the other aspect you are doing what you call the organism, the me, this living body, but as you cannot conceive possibly the existence of a living body with no environment, that is the clue that the two are basically one. Likely to poles of a magnet, north is quite different from South and yet it's all one match so it precisely the same way. You are both what you do and what happens to you. So that you have a little game in which you play that what happens to you that you're not responsible for. That's not you doing your own or responsible for this side of it. And then you can compete with the other side. What it's like is this. Get two knitting pins, one in each hand, and have a fencing match with yourself. And really sincerely try to stick the other hand but that other hand is really sincerely trying to stick the first one and also to defend itself. It's like playing chess with yourself, you see. Now it won't work. You'll come to a sort-of standstill, unless you decide for your right hand that's the one through to going to win. But then you've broken the rule of the game see. But that's what we do. That's what is called by both the Hindus and the Buddhists avidya, ignorance, which really better means ignore-ance.

So what it comes down to, you see is basically this. Just in the same way that the authority of the guru is your authority, you did it. So in the place where you live life. It's where you've put yourself. And just as on the surface of the sphere, every point may be regarded as the center of the surface, so every place may be regarded as the true place. And everyone's in his true place. Everybody, in other words, put it in what language you will, is a manifestation of the divine. Playing this game, that game, the other game. And your not knowing it, if you don't know it, is part of the game. It makes it all the more fun. Get lost, you say to yourself. And lost you get, like children love to play hide and seek. To get lost. Like we all like to go to a play, or see a horror movie. And have the cold shivers, because we think

something awful is going to happen, something is going to be seen on the screen which we can't stand to see. Woo, won't that be a thrill if that happens.. We all expose ourselves to that this is children and young people are always exposing themselves to dreadful things. And the parents get absolutely, they get the heebie-geebs. If it isn't getting drunk, or driving hot rods, they take drugs. And that may ruin their sanity for life. How hard can it be? If they don't take drugs, they will do something else always to see how close to the point of danger you can get. And those people who go in for the racing cars usually end up in a crash. And their life is all the sweeter, for being played dangerously.

So I would say to those among you who are the most dead-heads, in the sense of unspiritual and square, if there's any here, real stuffy people: congratulations. You see, you're playing a very far-out game. You see you're so lost you don't even know where you started, and that's taking a most gorgeous risk. Why, because of you, we might even blow up the planet. How close are we going to get to that one?

Well, just in the same way as that car racer watching is the needle going up, up, up, up, there are these people more and more and more righteous, determined that good will prevail watching that needle go up it's getting hotter and hotter and hotter and finally they go out in a blaze of glory. And then when the dust settles, they say, "that was a close squeak." I mean, that was quite a dream we've woken up from. Where will we go next? Because that's the point, it's simple. That's why I would say that my function is liberative, I want you to see that it's you. It's not me, it's not Swami so-and-so, it's not Buddha so-and-so, it's not Saint so-and-so, it's you. You're doing it.

As Sir Edwin Arnold put the words into the mouth of the Buddha, "Ye suffer from yourselves. None else compels. None other holds you that ye live and die. And whirl upon the wheel, and hug and kiss its spokes of agony, its tire of tears, its nave of nothingness." And when one of the old Zen masters went to his teacher and said "What is the way to liberation?" The teacher said "Who is restraining you?" He said "no one." If so, why should you ask for liberation? See it all bounces back to you. What do you want? Do you know? Can you think it through? Say exactly what you want.

And invariably, you'll get back to the place where you are. Because what you say you want is always the symptom, the expression of what you are now.

If that is the case, that it's all because you are doing. Why meditate? Why do anything of a so-called spiritual nature? People don't understand really what meditation is. They take it up, like they take up psychotherapy or a course in weight reduction. In order to be better. But if you do that. You are not practicing what is called jnana or yoga or Zen. That's not it at all. Meditation is the one human activity which has no purpose. Buddhas, or those who are supposed to have attained anything, are invariably shown in some sort of meditation posture, why should they meditate any more? Because that just happens to be the way that a Buddha sits when he sits. When he sits, he sits. When he walks, he walks. He's not going anywhere, he's just going for a walk. Because he digs it. See to dig, the very word is not merely to appreciate but to penetrate. To go to the heart of the matter and to penetrate the moment, to get right to the root of the moment is nowhere else than the center of you where you are, it's where you start this whole thing.

So to get with yourself is to get at the moment where you begin all this question where does the question come from? Where does the desire spring from? Well that's you, and that you is the point from which the whole universe is created, flowing back into the past like the wake of a ship. Wake doesn't drive the ship, the ship that makes the wake. So here you are, producing it. And meditation is just sitting here and watching it happen. And it's not done because it's good for you, it's done for fun. I might even say meditation is a fun thing. And if it isn't you're meditating. There's an awful game the meditators play which is competitive suffering. They go to some place where they sit for hours on end until their legs ache and practically fall off. And then come back and brag about how they sat through all those hours of leg-aching. Now it's very difficult to put down people who are suffering. Because after all, one has a natural sympathy for pain. But I sometimes want to say "For goodness sake, don't throw your suffering at me, in that way and in that spirit. Don't brag about it. Don't one-up me by saying, 'Well I've suffered more than you'." People do things like that, they say, "Well I'm more aware of my shortcomings than you. I'm

more tolerant than you are. I recognize more than you do what a rascal I am.” Every kind of way one upping somebody else in order to play the game in which I always win. So, once we get into that kind of thing with the meditation scene, we get into hierarchies and ranks and degrees, and who has attained number seven, who has attained number nine, and an expert guru will put a stage higher than anyone’s thought of, so as to see how far your ambition will run, and this goes on endlessly, endlessly, endlessly, until you suddenly wake up.

That you do really meditate all the time by virtue of existing all the time. Only, you miss that eternal now, by always looking for something next minute, expecting a result. Now you can say, let me not expect a result. Because one does anyhow. So you may as well just as well sit and enjoy it.

Image of Man

I want to start by giving what may be to many of you, a new definition of the word myth. As normally used the word myth means an idle tale, a fable, a falsehood, or an idea that is out of date, something untrue. But there is another older and stricter use of the word myth, whereby it doesn’t mean something untrue, but it means an image in terms of which people make sense of life and of the world. Supposing for example, you do not understand the technicalities of electricity, and somebody wants to explain it to you, he wants to explain about the flow of currents. Well, to do that, he compares electricity to water, and because you understand water, you may get some idea about the behavior of electricity. Or if an astronomer wants to explain to you what he means by expanding space, will use the metaphor of a balloon, a black balloon with white spots on it. The white spots represent the galaxies, and if you blow up the balloon, they all get farther away from each other at the same speed as the balloon blows up. In neither case we are not saying that electricity is water, or that the universe is the balloon with white spots on it, we are saying it’s something like it. And so in the same way, the human being has always used images to represent his deepest ideas of how the universe works, and what man’s place in it is. And tonight I am going to discuss certain aspects of two of the greatest myths, in this sense of the word, that have influenced mankind’s thinking. First of all the myth of the universe as an artifact, as something made as a carpenter makes tables,

chairs and houses, or as a potter makes pots, or a sculptor makes figurines. And on the other hand the image of the world as a drama, in which all the things in the world are not made, but acted, in the same way as a player acts parts. For these are the two great images that govern respectively the religions of the West descending from Hebraism, that is to say, Hebraism itself, Christianity, and Islam, and on the other hand the myth which governs those religions which have had their origin in India, most particularly Hinduism itself, and to a lesser extent, Buddhism.

And I want to make it perfectly plain, before I go any further, that in talking about these two great religious traditions in terms of images, I am talking about the way they express themselves at a rather popular level. Sophisticated Christians and sophisticated Hindus think beyond images. For example, a Christian may think of God as the father, but a sophisticated and educated Christian does not imagine that God is a cosmic male parent with a white beard sitting on a golden throne above the stars. Nor does a Hindu imagine literally that God is the super showman, the big actor. These images are what it is like, not what it is, and perhaps when I get through with discussing them we will be able to ask the question as to whether any of these images still make sense to us in this twentieth century, when we have a view of the world so powerfully shaped by Western science.

Now let me begin then with a few things about the image of the world, and thus the image of man, as it comes to us from the Hebrew Bible. It says in the Book of Genesis that the Lord God created man out of the dust of the earth, as if He had made of Adam a clay figure. Then he blew the breath of life into its nostrils and the figurine became alive. And it said that the figurine was made in the image of God. For God who is conceived in this particular image as a personal, as a living, intelligent spirit creates in man something like that. But you must know very definitely that this is the creation, as the potter makes a pot out of clay. For the creature that the Lord God has made is not God. The creature is something less than God, something like God but not God.

And you will see some very interesting consequences follow from this idea of the world as an artifact. What follows from it is that the whole universe is seen as a marvelous technical accomplishment. If it is made, there must

be an explanation of how it is made, and the whole history of Western thought has in many ways been an attempt to discover how the creator did it. What were the principles; what were the laws laid down; what, another words, was the blueprint that underlies this creation? This image has therefore persisted throughout Western history, and continues on into a time when very many people do not believe in Christianity, or Judaism, or Islam. They are, you might say, agnostics or atheists, but they still carry on something of the idea of the world as an artifact. If you are a Christian or a Jew, you believe that the world is the artifact of creation of the intelligent spirit called God. But if in this culture you are an atheist or an agnostic, you believe that the world is an automatic machine without a creator, something that made itself.

We might say then that our original model of the universe was the ceramic model. The Bible is full of references to God as the potter who makes the world out of obedient clay. But when Western thinkers in the eighteenth century began to drop the idea of a personal God, they kept the idea of the artifact. So we could say that after the ceramic model of the universe, we got the fully automatic model.

And still you see, underlying our way of thinking about things is the question, 'How are they put together?' And if you want to find out, one of the obvious ways to proceed is to take them to pieces. Everybody knows that if you want to find out how something is made, you unscrew the parts and see what the secret is inside the box. So Western science in its beginnings took everything apart. It took animals apart; it took flowers apart; it took rocks apart.

And then when they got it reduced to its tiniest pieces, they tried to find methods for taking those apart, too, so that we could eventually discover what the very smallest small things were, and so know what building blocks the creator, or the fully automatic model, used in order to put it all together hoping that that would lead us to an understanding of how life works. Man himself in all this was looked upon as a creation, something made. Only there were some difficulties about this, because if you believe in the world in accordance with the idea of the fully automatic model, you really have got to admit that man, too, is fully automatic, another words, he is a

machine rather than a person. Man is something, in other words, doffs his hat and says, “How do you do? I am a person. I am alive. I am sensible. I talk, I have feelings.” But you wonder, “Do you really, or are you just an automaton? Am I real, or am I just an automaton?”

The general result of the Western image of man hasn't been quite that. What it is come down to, under the dispensation of the fully automatic model, is this: we are living beings, we're very sensitive, and inside the human skin, by an extraordinary fluke of nature, there has arisen something called reason. There have also arisen “values,” such as love. But these was a fluke because it happened inside a fully automatic universe which is stupid, because it is merely automatic. You won't, another words, find anything really intelligent outside human skins. And therefore if that is so, the only thing that people can do if they want to maintain reason and love in this universe is to fight nature, and beat the stupid, external world into submission to the human will. So the war against nature is the great project thus far of Western technology, because you see, each one of us has inherited from thousands of years of history a view of man as something made and almost a sort of breath breathed into a pot of clay, or an image of clay. Each one feels himself to be a globule of consciousness or mind living inside a vehicle called “my body.” Since the world outside that body is stupid, we feel estranged from the world.

When we find out how enormous the universe is, that makes us, as individuals, feel extremely unimportant and rather lonely, because you see, we consider ourselves, our basic image of ourselves is of a soul or an ego or a mind, or by itself in its little house, looking out at a world that is strange, and that is not me. I am therefore a brief interval of consciousness between the darkness and the darkness. That is not too happy. I would like to be able to believe that there is more than that. “If I could – so many of us say – if I could only still believe that there is an intelligent and eternal God in whose eyes I am important, and who has the power to enable me to live forever, that would be very nice.” But for many people that is an extraordinarily difficult thing to believe.

Now I want to contrast this image of the world with another, what I call the dramatic image, as distinct from the image of the potter or the ceramic

image. And this will be the presiding image of Hinduism. Their idea is this: that God did not make the world like a technologist, but he acted it. That is to say, every person and every thing for that matter, every tree, every flower, every animal, every star, every rock, every grain of dust is a role or part that the Godhead is playing. You must understand of course, the Hindu image of God is a little bit different from the Jewish, the Christian, and the Islamic. When I was a little boy, I used to ask my mother interminable questions. And when she got sick of it, she said, "My dear, there are some things in life that we are just not meant to know." And I said, "Will we ever know?" She said, "Yes, if you die and then go to heaven, God will explain it all."

And so I used to hope that on wet afternoons in heaven we would all be able to sit around the throne of grace and say to the Lord, "Why did you do this?" and "Why did you do that?" And He would explain.

Every child in the West asks his mother, "How was I made?" And nobody knows, but they know that somebody perhaps does and that would be God, and He will be able to explain. Likewise, if anybody gets mentally deranged and claims to be God, we always humor such people by asking them technical questions, "How did you make the world in six days?" or, "If you are God, why couldn't you change this plate into a rabbit?" That is because, in our popular image of God, God is the supreme technocrat. He knows all the answers. He understands everything in detail and could tell you all about it.

But the Hindus don't think of God that way. If you ask the Hindu God, "How did you create the human body?" He would say, "Look, I know how I did it, but it can't be explained in words because words are too clumsy. In words I have to talk about things slowly. I have to string them out, because words run in a line, and lines add up to books, and books add up to libraries. And if I explain to you how I made the human organism, it will take all eternity for me to tell you. Unfortunately to me I don't have to understand things in words in order to make them happen. Nor do you." You don't have to understand in words how you breathe. You just breathe. You don't have to understand in words how to grow your hair, how to shape your bones, how to make your eyes blue or brown, you just do it. And somebody who

does understand to some extent, maybe physiologist, he can't do it any better than you.

So that you see is the Hindu idea of divine omnipotence, and that is why their images of the gods very often have many arms. You will often see the god Shiva with ten arms, or the Buddhist Avalokiteshvara with one thousand arms. And that is because their image of the divine is of a sort of centipede. A centipede can move a hundred legs without having to think about it, so Shiva can move ten arms very dexterously without having to think about them. And you know what happened to the centipede when it stopped to think how to move a hundred legs; it got all balled up. So in this way the Hindus do not think of God as being a technician in the sense of having a verbal or mathematical understanding of how the world is created. It is just done simple way, just like that. Only if we had to describe this simple way in words it would be very complicated, but God, in their idea, does not need to do so.

But the remarkable difference is that the Hindu does not see any fundamental division between God and the world. The world is God at play; the world is God acting. Now, how could you possibly arrive at such an idea? Very simply. When he tries to think why there is a world at all, because if you think about it is extraordinarily odd that there is anything. It would have been much simpler and would have required a great deal less energy for they're to have been nothing. But here it is. And why? Well, what would you do if you were God? Or let me put it in the simple way. Suppose that every night you could dream any dream you wanted to dream. What would you do? Well, first of all I am quite sure that most of us would dream of all the marvelous things we wanted to have happen. We would fulfill all our wishes. We might go on that way for months, besides we could make it extraordinarily rich by wishing to dream seventy-five years in one night, full of glorious happenings.

But after you had done that for a few months, you might begin to get a little tired of it and you would say, "What about an adventure tonight, in which something terribly exciting and rather dangerous is going to happen? But I will know I am dreaming so it won't be too bad, and I'll wake up if it gets too serious." So you do that for a while; you rescue princesses from

dragons, and all sorts of things. And then when you've done that for some time, you say, "Now let's go a bit further. Let's forget it's a dream, and have a real thrill." Ooh! But you know you wake up. Then, after you have done that for a while, you will get more and more nerves [the courage, strength to do sth] until you sort of dare yourself as how far out you can get, and you end up dreaming sort of life you are living now.

Now why would one do that? The reason the Hindu would say is that the basic pulse of life, the basic motivation of existence, is what we call the game of hide-and-seek. Now you see it, now you don't. You see, everything is based on that; because all life is vibration, pulsing. Light is a pulsation of light-darkness. Sound is a pulsation of sound-silence. Everything is going da, da, da, da at various speeds. It's like the motion of a wave, now a wave consists of two pulses, the crest and the trough. You can't have crests without troughs; you can't have troughs without crests. They always go together. You can't have hide without seek; you can't have seek without hide. Just for example, you can't have here without there; because if you didn't know where there was, you wouldn't know where here was. You can't have is without isn't, because you don't know what you mean by is unless you also know what you mean by isn't, and vice versa.

So in that way they think that hide-and-seek is the fundamental game as if the Lord God, the Brahman, as they call it, said in the beginning, "Get lost, man. Disappear. I'll find you again later." And then when you know the disappearance gets very far out, then the contrary rhythm begins, and the dreamer wakes up and finds out "Whoo, that's a relief." Then after a rest period, in which everything is of course at peace, it starts all over again because the spirit of adventure springs eternal.

The Hindus had extremely vast ideas of space and time for their period in history. They had the theory that the hiding part of the game goes on for 4,320,000 years; a period called a kalpa in Sanskrit. And then the "dreaming" part is followed by the "waking" part. The dreaming is the hiding where the Godhead imagines that it is all of us. Then for another 4,320,000 years there is a period of awakening, and at the end of that begins the dream again. The dreaming period is further subdivided into four stages. The first stage is the longest, and it is the best. During that stage, the dream

is beautiful. The second stage is not quite so long, and is a little unsettling. There is an element of instability in it, a certain touch of insecurity. In the third stage, which is not again so long, the forces of light and the forces of darkness, of good and of evil, are equally balanced, and things are beginning to look rather dangerous. And in the fourth stage, which is the shortest of them all, the negative, dark, or evil side triumphs, and the whole thing blows up in the end. But then that is like the bang in a dream, you know when you get shot in a dream, and you wake up, and see it was after all a dream. So then there is a waking period, before the whole thing starts again.

And so the Hindus feel that behind the scene, that is to say, in reality, under the surface, you are all the actor. But behind the scenes, in the green room, you might say in a very back of your mind, in a very depths of your soul, you always have a very tiny sneaking suspicion which you might not be the you that you think you are.

The dreaming period is further subdivided into four stages. The first stage is the longest, and it is the best. During that stage, the dream is beautiful. The second stage is not quite so long, and is a little unsettling. There is an element of instability in it, a certain touch of insecurity. In the third stage, which is not again so long, the forces of light and the forces of darkness, of good and of evil, are equally balanced, and things are beginning to look rather dangerous. And in the fourth stage, which is the shortest of them all, the negative, dark, or evil side triumphs, and the whole thing blows up in the end. But then that is like the bang in a dream, you know when you get shot in a dream, and you wake up, and see it was after all a dream. So then there is a waking period, before the whole thing starts again.

Shall you notice, if you compute, I haven't gone to the mathematics of it, but if you do, you will find out, that in this drama the forces of the dark side are operative for one-third of the time; the forces of the light side for two-thirds of the time. This is a very ingenious arrangement; because we are seeing here the fundamental principles of drama.

Consider drama. Here is a stage. And over the stage here is what we call a proscenium arch. And out there, there is the audience. Now you're suppose

to be in the world of reality. Let's suppose this is not a lecture tonight but a show. And you come out side into the show and you know you are real people living in the real world. But you're going to see a play, which isn't real. There are actors coming on the stage, but behind the scene here, there are real people like you. But so that you don't see them that way, they are going to put on their costumes and makeup, and then they are going to come out in front here and pretend to various roles. But you know you want to be half convinced that what they are doing on the stage is real. The work of a great actor is to get you sitting on the edge of your chair, in anxiety, or weeping, or roaring with laughter, because he has almost persuaded you that what is on the stage is really happening. That is the greatness of his art, to take the audience in.

And of course, in the same way, the Hindu feels that the Godhead acts his part so well that he takes himself in completely. So that each one of you is the godhead, wonderfully fooled by your own act. And although you won't admit it to yourself, enjoying it like anything. Because you must not admit it, that it give the show away.

Now it's a funny thing, when you say "I am a person," the word person is a word from the drama. You know, when you open a play script, you see the list of the actors, this is called the *dramatis personae*, the persons of the drama. The word person in Latin is *persona*, meaning "through sound," something through which sound comes; because *persona* in Greek or Roman drama was the mask worn by the actors. And because they acted on an open-air stage, the mouth was shaped like a small megaphone that would project the sound. So the person is the mask. Isn't it funny now how we have forgotten that? And so Harry Emerson Fosdick could write a book called *How to Be a Real Person*, which if translated literally is, "How to be a genuine fake," because in the old sense, you see the person is the role, the part played by the actor. But if you forget that you are the actor, and think you are the person, you have been taken in by your own role. You are "en-rolled," you're bewitched, spellbound, enchanted.

So then, look at something else about the drama and its nature, in the drama there has to be a villain, unless of course you are acting some kind of a non-play that does not have any story. But all fundamental stories start out with

the status quo. Everybody is just sort of going along, and then something has to come in to upset everything. The interest of the play lies in, How are we going to solve it? It is the same when you play cards. Supposing you are playing solitaire, you start by shuffling the deck, and then introduce the chaos. The game is to play order against chaos. So in the drama somebody has to be a villain, and play a dark side, and then the hero can play against it. If you go to the theater for a good cry, then you let the villain win and you call it a tragedy. If you go for a thrill, you let the hero win. If you go for laughs, you call it a comedy. There are different arrangements between the hero and the villain, but in all cases, when the curtain goes down at the end of the drama, the hero and the villain step out hand in hand and the audience applauds both. They do not boo the villain at the end of the play. They applaud him for acting the part of the villain so well, and they applaud the hero for acting the part of the hero so well, because they know that the hero role and the villain role are only masks.

And so you see, behind the stage too, there is the green room, where after the play is over, and before it begins, the masks are taken off. The Hindus feel that behind the scene, that is to say in reality, under the surface, you are all the actors, marvelously skilled in playing many parts and in getting lost in the mazes of your own minds and the entanglements of your own affairs, as if this for the most urgent thing going on. But behind the scenes, in the green room, you might say, in the very back of your mind and the very depth of your soul, you always have a very tiny sneaking suspicion which you might not be the you that you think you are.

The Germans call this a *hintergedanke*, a thought way, way back in your head that you will hardly admit to yourself, because of course, you've been brought up, most of you, in the Hebrew-Christian tradition, it would be very wicked indeed to think that you were God. That would be blasphemy; and don't you ever dare think such an idea! Which of course this is all as it should be, because the show must go on until the time does come to stop.

Now you will see that this involves two quite different ways of dealing with the two fundamental questions. One What is man? that is, Who are you? And in the Hebrew-Christian answer, we more or less say, "Well I'm me. I am Alan Watts, I'm John Doe, I'm Mary Smith, and I firmly believe I am,

because I really oughtn't to think anything else, ought I?" And this "me" is a finite ego, or a finite mind, whatever that is. On the other hand, the Hindu will say that the real self, which he calls atman is what there is, it's the works, it's the which than which there is no whicher. The root and ground of the universe and of reality.

The next problem where they differ so sharply is, Why have things gone wrong? Why is there evil; why is there pain; why is there tragedy? In the Christian tradition you have to attribute evil to something besides God. God is defined as good, and He originally created the scheme of things without any evil in it. But there was a mysterious accident, in which one of the angels, called Lucifer, did not do what he was told. And there was the Fall of Man. Man disobeyed, he went against the law of God, and from that point on evil was introduced into the scheme of things and things began to go wrong, that is to say, against the will of the will of the perfectly good creator.

The Hindu thinks in a different way. He feels that the creator or the actor is the author of both – good and evil for the reasons, as I explained it to you, you have to have the evil for there to be a story. In any case, it is not as if the creator had made evil and made someone else its victim. It isn't like saying "God creates the evil as well as the good, and poor little us are his puppets and he inflicts evil upon us." The Hindu says, "Nobody experiences pain except the Godhead." You are not some separate little puppet who is being kicked around by omnipotence. You are omnipotence in disguise. So there is no victim of this, no helpless, defenseless, poor little thing. Even the baby with syphilis is the dreaming Godhead.

Now this makes people brought up in the West extremely uneasy, because it seems to undercut the foundations of moral behavior. They say, "If good and evil are created by God, isn't this a universe in which anything goes? And if I am God in disguise, surely if I realize that, I can get away with murder." But think it through. Didn't I point out that in the game as the Hindus analyze it, the evil part has one-third of the time and the good part has two-thirds? What sort of a game do you want anyway; you will find out, you see, that all good games, games worth playing, that arouse our interest, are constructed like this. If you have the good and the evil equally balanced,

the game is boring; nothing happens, it is a stalemate. The irresistible force meets the immovable object. On the other hand, if it is all good, and it is hardly any evil, maybe just a weeny little bit of a fly in the ointment, it also gets boring. Just in the same way for example, suppose you knew the future, and could control it perfectly. What would you do? You would say, "Let's shuffle the deck and have another deal." Because for example, when great chess players sit down to a match and it suddenly becomes apparent to both of them that white is going to mate in sixteen moves and nothing can be done about it, they abandon the game and begin another. They do not want to know. There would not be any "hide" in the game, any element of surprise, if they did know the outcome. Again with good and evil equally balanced is not a good game; a game with positive or good forces clearly triumphant is not an interesting game. What we want is a game where it always seems that the good side is about to lose, in really serious danger of losing, but manages always to sneak out. You know how it is in serial stories, and they had a hero at the end of installment, in some absolutely impossible position, where it seems he's going to be run over by a train, and he's tied with his girlfriend to the rails. And somehow in the next installment the author is going to get him out of his difficulty, only he mustn't do it too obviously, because you wouldn't keep reading the installments. So what is necessary is a system in which the good side is always winning but never is the winner, where the evil side is always losing but never is the loser. That is a very practical arrangement for a successful, ongoing game that will keep everybody interested.

And you must watch this in practical politics. Every in-group or group of nice people needs an out-group of nasty people, otherwise they wouldn't know who they were. And you must recognize then that the out-group is your necessary enemy, whom you need. He keeps you on your toes. But you mustn't obliterate him, if you do, you are in a very dangerous state of affairs. So you have to love your enemies in this sense, regard them as highly necessary and to be respected chivalrously. We need the communists and they need us. The thing is to cool it and play what I call a contained conflict. When conflicts get out of hand, all sides blow up. Of course I suppose there is another deal, maybe a million years later.

Now, let me see if I can for a moment put these two visions of the world together. It seems that if you believe the Christian, Hebrew, Islamic view, that you can't admit the Hindu view, because if you are a Christian, one thing you cannot believe, let's say if you are an orthodox, you're an orthodox Protestant Bible type, or if you are a Roman Catholic, you can't believe that you are God. So that excludes Hinduism apparently. But let us go back to Judaism for a minute and ask this question, "If Judaism is the true religion, can Christianity be true too?" No, because the one thing in Christianity the Jew cannot admit is that Jesus Christ was God. It is unthinkable for a Jew that any man was indeed God in the flesh.

Or the second question, if Christianity is the true religion, can Judaism be true too? The answer is yes, because all Christians are Jews. That is to say, they have taken in the Jewish religion, lock, stock, and barrel [completely] in the Old Testament, into their own religion. Every Christian is a Jew plus something else, which is his particular attitude to Jesus of Nazareth.

Let's play this game once again, "If Christianity is true, can Hinduism be true?" The answer is no, for the reason we have seen, the Christians will say, "Jesus of Nazareth was God, but you are not, I'm not." Now then, If Hinduism is true, can Christianity be true? The answer is yes, because it can include it. But how? What would be the attitude of a Hindu to a very sincere and convinced Christian? He would say, "Bravo, absolutely marvelous; what an actor! Here in this Christian soul God is playing His most extraordinary game. He is believing and really feeling that He is not Himself, and not only that, but that He is living only one life, and in that life He has got to make the most momentous decision imaginable." In the course of this four score years and ten, he's got to choose between everlasting beatitude and everlasting horror. And he is not quite sure how to do it, because in Christianity there are two sins to be avoided, among others. One is called presumption, that is knowing surely that you are saved. The other is called despair, which is knowing surely that you are damned. There is always a margin of doubt about this, so work out your salvation in fear and trembling.

So you might say this is preeminently the gambler's religion. Imagine you know at some great casino, late at night, that there is some marvelous

master gambler who has been winning, winning, winning all night. Then suddenly he decides to stake his whole winnings on whether the ball lands on red or black. Sensation! Everybody gathers from all over the casino to watch this terrific gamble. So in the same way, the predicament in which the Christian soul finds itself is this colossal gamble, which is saying, this universe can possibly contain within it ultimate tragedy, there could be such a thing as an absolute, final, irremediable mistake. What a horror that thought is! So the Hindu is sitting in the audience fascinated by this Christian's extraordinary gamble. He says, "That's a beautiful game." The Christian does not know it is a game, but the Hindu suspects it is. And he is a little bit admiring of it, but not quite involved.

Now you would say perhaps, you want to be involved, give your whole self to this, make a active commitment, you know "Once to every man and nation comes the moment to decide, in the strife twixt truth and falsehood, for the good or evil side. Then it is the brave man chooses while the coward stands aside" ect. That sounds great, doesn't it? Commitment; stand up and be counted. This is a virtue, but on the other hand, you see another virtue, what we call being a good sport. If your enemy in the battle of life is to be regarded as an absolute enemy, who is pure evil, black as black can be, you cannot be a good sport and you can accord him no chivalry, no honors of battle. You have got to annihilate him by any means possible, fair or foul. That leads to some pretty sticky situations, especially when he has the means of annihilating you in just the same way.

If, on the other hand, in all contests you know that while you are going to take it seriously and regard it as very important, in the back of your mind and that little hintegedanka you know it is not ultimately important. Although very important. And this saves you, this enables you to be a good player. You may worry about the word play because we often use the word play in a trivial sense: "You're just playing. This life you mean is nothing but a game." The Hindus indeed call the creation of the universe the lila, or the game, or the play of the divine. But we also use "play" in other senses. When you see Hamlet, which is by no means trivial, you are still seeing a play. In church the organist plays the organ. And in the Book of Proverbs, it is written that the divine wisdom created the world by playing before the throne of God. Play also you see, has a deep sense. When we say music,

even the music of Bach, as a great master of what we call serious music, is still playing. So in the deeper sense of play, the Hindu sees this world as “play,” and therefore that the intense situations, personally, socially, and so on, that we are all involved in, are seen not as bad illusions but as magnificent illusions, so well acted that they have just about got most of the actors fooled, so that they’ve forgotten who they are. And man thinks of himself, when he has been fooled, as a little creature that comes into this world, which is all strange and foreign, and is just a little puppet of fate. He has forgotten that the whole thing has, at its root, the self, which is also your self.

Democracy in Heaven

Now as you know this is the great discussion going on in what we call today the new theology. The revolution within standard brand Christianity. Because you see for years and years the clergy the Ministry of the various churches such as Episcopalian, Methodist, Baptist congregational Unitarian even in some cases Disciples of Christ and Lutherans their theological seminaries. Have been discussing religion in terms utterly different than you will normally hear from the pulpit. And every graduate of an intelligent theological school has a sense of intense frustration as he has to get out to work in a community or parish church. Because he does not believe what he is supposed to preach. And this has in the way been true for a long long time. Clergy except in the Roman Catholic Church where the situation is somewhat different are very heavily controlled by the laity because he will pay the piper calls the tune. And therefore they are in a state of constant frustration. Because those who contribute the most heavily and therefore are most interested in the church tend to be conservative minded people and they want that old time religion. Or those a matter of fact what they call the old time religion is really quite modern. But still that’s what they want. And they’re Pete. Will who as I would say would tend to be conservative in their whole attitude to life. Because you see. People of a more liberal disposition couldn’t care less about going to church. In the British army. They have a thing called Church Parade. And there’s a famous story about a drill sergeant who got all the troops up for church parade on a Sunday morning and used to call out can’t Lex to the right Protestants to the late seven legends and nonmetal. And to the degree you see that intelligent people in

our culture have any religion at all it tends to be a fancy religion something in the new kinds of things that may be unity Christian Science Theosophy. Buddhism they downtown. Or some kind of special Protestant. Offshoot such as the Fellowship Church in San Francisco. Or the Community Church in New York and things of that kind. Very liberal very left wing theologically. So the the new theology comes at this time. To a very large extent because a the clergy are fed up. The Christianity has its back to the wall. And the pope knows this better than anybody. And so hand in hand with this if you medical movement there goes a long reconsideration of what on earth it's all about is there a God is there God. And a lot of people are boldly saying that is to be abandoned. As an English priest Father Maskell put it it is the basic assumption of the secularist movement interest in the ology that life. Is a journey between the maternity ward and the climate or him and that is what there is. That's it and that and that is the life that the Christian religion has to do with and to encounter. And therefore more than ever. Being a Christian if it isn't an abandonment of God or of the idea that the universe is supernatural it controlled. The Christian religion and fastens itself therefore with Petunia and increased further to the figure of Jesus of Nazareth. As one whit put it there is no God and Jesus Christ is His only Son. Because you see what otherwise makes you a Christian is something strange about Christianity. In that. It shares with Islam and Judaism what we might call theological imperialism. Christians I've even the most liberal strike. Fervently believe that their religion is the best religion. And they will state it by saying either Jesus Christ is the only Son of God That's an orthodox way it is a matter of fact it isn't really an orthodox way of saying it but it's the way of the dots people do say it or they will say Jesus is the greatest man that ever lived the point is that you make a commitment to the following of Jesus as an historical percentage. And for some reason or other people who commit themselves to this exclusive kind of following of Jesus become exceedingly obstreperous. Because they will either Damn other religions out right off our Mars insidiously damn them with faint praise. Old Buddha taught some very good things you know and we all are indebted to is great and moral principles but. And then comes this pitch you see for the sole following of Jesus as the daughter and master head and shoulders above all. Well the trouble with that as always being that. When you get into a theological argument with a person who is a Christian you get into a situation where the

advocate in the judge or the same person. That is to say that Jesus is judged the best man in the world by the standards of Christianity. Because those are the standards with that with which this kind of person judges. And therefore are. Either And you'll find that people who don't leap to these judgments usually don't know very much about any other kind of religion. The causes and comparative religion in theological schools are shockingly superficial and grossly inaccurate. And. So this is coming to the front now you see in order to be the bit the new to belong to the church really is to be saved and to be saved is to belong to the interest in group. You have to have an in-group you see if you want to know who you are you have to belong to something say if you want to distinguish yourself because you know who you are because of the people who aren't like you there you get a contrast. This is this is the basic arrangement richer. So you see if you want to be in some kind of an in group. You must but everybody else beyond the pale. It's Adama's Aquinas gave the show a actually because he said that the blessed in heaven will often walk to the battlements and look down and delight in the justice of God being properly carried out in it all. So you may not believe in Hell you may be very liberal and after all it's not nice or sophisticated nowadays to believe in everlasting damnation but we have a new word for it. Such as failing to be a real person. Sinking below the human level. Or to entering into final in every media able psychosis. All these are new words either for damnation or heresy. And. So. You Jardine. And you know you are saved only if somebody else isn't. If somebody else is damn. Very difficult to believe or even to imagine a state of affairs where everyone and everything is saved you have to be a mystic even to think about that. Because it requires having a state of consciousness which transcends oppositions and you can't do that along the line of ordinary logic. You have to have a new kind of logic which takes over at a certain point and this logic I'm using at the moment. I pointing out that damned people and saved people needn't bother they are in a symbiotic relationship with. They go together in the same way at the back in the front of something because if something has a front it has to have a back. And so. The very fact that fronts and backs go together. Indicates that there is a unity between these two opposed sides. So also there is a unity between the dammed and the saved. And it's only as you begin to realize that you need the damned people in order to be saved and that the damn people need to save people in order to be damn it you start laughing about it. And that

laughter is very subversive. And it's you know how it is you're not supposed to laugh in church and not in courts of law in their places where laughter makes people nervous. Because it's supposed to be a sign of disrespect Now it may not be so at all. Dante said that the song of the angels in paradise sounded like the laughter of the universe. But in church especially any rather more serious kinds of church laughing is very bad form. Why. Because if you look at the design of a Catholic church. You will notice that it is based upon the design of the court room of a king. And if you look at a Protestant church you will see that it is to based upon the design of a law court. Indeed the Protestant minister whereas exactly the same robes as an American judge. And all those pews and box like stalls are the same or you will find in the old fashioned court with the witness box jury box and all that kind of thing. But you see the original idea of the Christian church these ancient Roman churches are called a basilica. That means the courtroom of the king the throne room the altar is the throne of God. Now in a court room. The king is very nervous. Because anybody who takes it upon himself to govern other people and rule them and better watch out. And therefore he always has his back to the wall. And he is flanked by attending guards and high ministers of state. And just so that nobody will get up and make trouble. He has an either on their knees or flat on their faces when they come into His presence. And of course no one law. That would laughing or miss the big. And so this was the Patton this was the model. Upon which the Judeo Christian idea of God was make it is a political model and the title of God is taken from the supreme emperors of Persia the Diane can the king of kings the lot of Lords and so in the English Church at morning prayer the clergyman gets up and says. Almighty and everlasting God the only ruler of princes King of Kings lot of Lords who dust and die throne behold old well as upon earth most graciously deigned to behold our gracious sovereign Lady Queen Elizabeth and all the royal family. That's the picture and the metaphor you may not believe. Literally that God sits on a throne or even has a body to put on or that he wears a crown or that he has a beer. But the image. Color it's your feeling about the character of God. And imagery is much more powerful. Than intellectual concepts you may know it says in the problem that God is a spirit without body parts or passions omnipresent to all places. Be tunneled to all time and therefore one thinks as he called ours at the gaseous vertebrate. Or else of an enormously diffuse sea of luminous jello. Filling all time and space

everybody uses images but behind it those images. Are the old images that influenced us in childhood. And if you still attend a church and you use that imagery. And you still think emotionally you feel towards God. As one would if you took it literally. So this political model of God has dominated the West. And the world is related to God. As subjects to a king. Or as artefacts to a maker. We have of course a ceramic model of the universe because it said in the book of Genesis that God made Adam out of the dust of the ground in other words he made a clay figurine and then blew the breath of life into the nostrils of the figurine so that it came to life. Now the Hindus. Don't have that model of the universe to cope with. Because they don't look at the universe as God's creation. In the sense of being an artifact they look at it as God's drama. Because they. I see the world as acted not created God is that which is pretending to be all this. And everybody is really God is a mask of God who is playing that he's you but he's doing it so well that he's taken himself in because he is the audience as well as the actor. It's a really successful play. Because the good actor although you know a play is a just a play a good actor is going to try and make you think it isn't and want to get you crying he wants to get you sitting on the edge of your seat in anticipation. And God as the best actor has convinced himself completely that the act was real. The Chinese again have a different model. Their model of the universe is an organic one. It is a great organism. It is alive it grows it is an intelligent order. So those are the three great models of the world. When the west stopped believing seriously in Darwin long time ago they however retained the idea of the world as an artefact and so we graduated from the ceramic model of the universe to the fully automatic model. Which is actual commonsense for most people living today. I return to the point then that the clergy and the church people don't really believe in God in the old fashioned sense of right God at all. If they did believe the Christian religion in some of its orthodox form seriously they would be screaming in the streets. And even the most far out lunatic fringe Jehovah's Witnesses are even more or less polite when they come and call it your house because if they really believe that you were going to hell they would make more fuss about you than if you had to be a bunny. But no. But he really takes it that seriously and. That means they don't believe in it they know they ought to believe in it in fact many sons are exhortations to have more faith. Which means that we all recognize that we don't really believe in this and we ought to we feel very guilty about it

we don't have the moral strength to believe in this but it isn't only a matter of morals it's a matter of being asked to believe what most people feel is nonsense. That the world is run on the lines of a state. How for example can you be a citizen of the United States having taken an oath that a republican form of government is the best form of government and believe that the universe of America. So what has happened is. Intelligent people have always realized. That this political model of other cosmos won't do. Now actually. No seriously Logan ever did believe that God was at the old gentleman with whiskers on the golden throne never. What the bishop willage says in his book Honest to God you know that there isn't some sort of a son when out there. He is very naive in a way because he could have taken huge quotations out of St Thomas Aquinas out of the great fathers of the church from Oregon from Clement of Alexandria Trumpton Gregory nasy ans us from St John of Damascus from some Basil the Great from Saint Augusta and from St Ambrose from Bernard of Clairvaux and Albert the Great he could have quoted all those perfectly orthodox very correctly loaded. And shown that they never believed in a God like that with whiskers. And he could have come forward and said You see this is a perfectly orthodox book and I'm not a revolutionary I'm just going back to the real old time religion. We didn't do that and you know why we told him. He'd never read those writers in theological school. He was entirely confined to biblical studies and never got as far as that it's. So but just as the same with ever so many people. One of the reasons why so many people turned to an Oriental religion was that the level the intellectual level at which oriental religions were first presented in the West was so much higher than the intellectual level at which Christianity was presented at the local church. If you lived in India or so long of course there would be the local Buddhist monastery and it would be just as junky is that stuff was around the local church. They don't tell people about the great void and how to practice meditation and those things. That's for specialists in minority. All they care about is gaining merit mostly by making contributions to the clergy or a better circumstances in your next life. Or getting out of the evil karma. That's the real thing that popular but it isn't about. You. But you see the trouble in the West is that everybody is getting educated. There's a terrific literacy. And therefore. The public. Has to be treated. As if it were intelligent you can't say that publicly down anymore it's too many intelligent people. Now. Let's look at the lineup what sort of a

situation is this really. For my part I would say the God that is dead is this political model god. However conceived the divine paternalistic off Dorothy who rules the universe. And to whom you as an ego are related as a subject to a king by analogy. Now that one. Just isn't holding up. But what's the alternative. Is specially think about what could be an alternative for Western people with a Christian background what other kind of god could we have well one a possibility is not. And this is what people like Al Thais are now discussing and is on the far left of this new theology. It's a man like James Pike is on the right of the new theology. He very definitely believes in God He's a theist but. He doesn't believe in anything with whiskers on it nor does he really believe in the political model. Are we going to settle then for the fact that the universe is just what it appears to be. Or. Are we going to have a very refined conception of God which will be called it instead of he. Makes a lot of difference very powerful the pronoun you use. Or even he she had a Christian Scientist talk about the father mother. It's not a complicated people. Feel as a little bit weird. It is rather simple but then when you say it. Does it mean that God is something like electricity. Which doesn't seem to have any independent intelligence of its own you can use it intelligently is just energy it does something good suit me is that God has got it like that. What. Well it's a funny thing but it's very difficult to be a complete atheist. Related like in the House of Parliament in England when in one thousand twenty eight the Church of England wanted a new prayer book a revised prayer book because the church and the state are inseparable in England. And the Houses of Parliament had to vote on whether this prayer book might be used and somebody got up and said this is perfectly ridiculous and assemblage which contains a number of atheist voting on the in the politics of the Church of England and another member got up and said Oh I don't think there are any atheists here not really we all believe in some sort of something some are. Now a seat in the theological world it just doesn't do to believe in some sort of a something somewhere. Because one thing that the logins detest is they can. Now you should listen to them. Either no god at all because that's clear and precise no beating around the bush and you know it's just. Fuzzy thinking to have that the great universal mind the can and differentiated is that it continuum that's all time thought of a something somewhere. Woolly thinking. Either no god or a god with a definite character and a clear model of will and precise standards that would not be pushed around the biblical god. If you do what

do you do if you put your mind into two watertight compartments one of which you're abreast of science in the modern world and all that kind of thing in the other compartment it's again nothing to do with that is a completely cut off think all religion where you believe in absolutely ludicrous propositions. A lot of people do that but a lot of people want a religion which is difficult to believe in because that's a kind of a test of faith but you can swallow it.

Do you do what do you do do you put your mind into two watertight compartments one of which you're abreast of science in the modern world and all that kind of thing in the other compartment it's again nothing to do with that is it completely cut off think all religion where you believe in absolutely ludicrous propositions. A lot of people do that but a lot of people want a religion which is difficult to believe in because that's a kind of a test of faith but you can swallow it. It's like the story about Abraham being told to sacrifice his son Isaac and he was about to do it because he wouldn't do what you're told to testify if. You. Are people like the security. Of a definite religion I mean you've got to believe in and this is the truth I was once having an argument with a Jehovah's Witness. And he said Don't you think that if there were really a loving God who was concerned about the human race that he would provide us with an infallible textbook that would tell us how to live and I said he would do nothing of the kind it would completely destroy the human mind. You know you never have to think that was the case. And so. While there is that there is then this possibility is it to be no god is a life just this trip around the maternity ward to the crematorium. And that the issue of religion is to improve that trip. That is to say through social concern. Through getting rid of poverty and war and exploitation and disease is that the whole business of religion or is there something else. Those who take this field which we will call the secularist position and reality are parts strongly. Influenced by contemporary philosophy especially in that form which is called scientific imperialism. Or logical positivism. Which maintains that the idea of a god is not a fantasy. But is a meaningless idea. That in other words the proposition that there exists god. And that God is the origin and Creator and governor of everything that is happening they maintain that those sentences are utterly devoid of meaning. As much so as if I were to say everything is up because they will say no logical proposition can be made. About all processes whatsoever because all propositions are

labels on boxes. And you can't have the box containing all boxes because this box would have no outside and therefore it wouldn't be a box.

So all propositions all words must refer. To classes of some kind. And you can't have a class of all classes. And also they would say the notion that there is a God is meaningless because. It doesn't help you to make any prediction. Or they were going to ask it in this plate what evidence supposing somebody could bring it forward would completely satisfy you as disproving the existence of God and no believing in God can think of any evidence. That would conclusively prove that there wasn't a god. Just like psychoanalysts are completely incapable of thinking of any evidence which would. Prove the existence of the Eat at this complex. So they on logical grounds take this position. And so since many theologians are in fact influenced by modern philosophy. Take these arguments seriously. They would like. To move secularized the whole conception of religion or to put it in Bonhoeffer's words have Christianity without religion. Right now. When. You might say there is nothing to life except the trip between a maternity ward incriminatory and that's what Prince I have heard something like that before. When I asked What is the Buddha. The Chinese master replied It's windy again this morning. Another Buddhist master on his deathbed wrote the poem. From the bath tub to the bath tub I have added stuff and nonsense. The bath tub in which the baby is washed at birth and the bath tub in which the corpses washed before burial. All the time between he said I was going yackety yack. Now what about those poems do they mean what they say well not quite. They are something different. Because they are based on. A life devoted. To the discipline of a very particular kind of meditation. Culminating in a complete. Shattering experience. Which is very difficult to talk about. But generally. Speaking. It is the encounter with eternity with the eternal not necessarily in the sense of that which goes on and on on through time but. The A tunnel is the timeless. That which transcends time is beyond measurement in terms of hours and days. And when a person who is. In that state of consciousness or has been through it looks at. The ordinary everyday world it's true he sees the ordinary everyday world as we see it but with a very very extraordinary difference. And if we would have to put that different into some sort of Western Christian influence language he would perhaps a Don't you realize that sitting around here in this room. With our ordinary everyday faces and

clothes and personalities. We are sitting smack in the middle of the Be it if it vision. And that this sitting here in this room. Is infinity and eternity precisely it is it and this is could be a terrific vision. This has got. And it feels that way too. When it does. Something like it. But in this kind of religion. They still have temples they have borders and they chance of tourism after incense and long. I like them. But they're always saying that the highest religion that can get really to get there you have to kill the border. Exposing a clergyman got up one day in court but. And said. Every time you say Jesus Christ you have to wash your mouth out. Or if you meet God the Father kill him. If you meet God the Son killing me God the Holy Spirit killing you meet the pope kill him if you meet St Augustine killing you meet your father and mother kill him. Kill them all right away all right what I've been saying this simply translating into Christian terms a Buddhist. Teacher. Are talking about the eight hundred eighty. What he said and he put it but it's names and where I put the Christian Munden. But I don't think this is what is happening in the movement of the new theology. I think that what's happening there is that they are just getting rid of God. This is not this other thing I'm talking about which could be called the religion of no religion. You see. If you you could take this right into Christianity because it to the extent that every Christian is a Jew. You see we use the Jewish scriptures as the Old Testament so every Christian is that do. You are supposed to believe in the Tenth Amendment among them says. Thou shalt not make to thy self any graven image of anything that is in the heavens above or the earth beneath or the waters that are. Under the earth now shalt not bow to them nor worship. And that is what this thing I've been talking about is it is a destruction of idols because the most dangerous graven images are not those which are made of wood and stone they are those which are made of ideas. And it is well known to the great mystical tradition of the world all over the world. That they have a sort of supreme vision. Can only come. When you have got rid of every idea of God whatsoever. It would be like as I've often used this image cleaning a window. On which somebody has painted blue sky. Well to see the sky you got to scrape up the paint. Well you say my goodness you shouldn't take that nice blue painting up it's very good it was done by a great artist see up at the clouds or you mustn't do that because we won't have in the blue sky anymore. See. So in that spirit the great mystics have always ceased to cling to God that is because the only god you can cling to is the idea of God. In

order to discover God you have entirely to stop clinging. Until you see why does one cling to God. For safety of course. You want to say something you want to save yourself I don't care what you mean by saved whether just means feel happy or feel that life is meaning or you know there's somebody up there who cares. So one claims and if you don't cling to God You cling to something else the state. Money Sex yourself. Power bases are all false gods. But there has to come a state when clinging stops. And only then does the state of faith begin people who believe in God don't have any faith because they want something to hold on to. So real faith is when you do not hold on to anything anymore. In the Christian tradition this is called the Cloud of Unknowing. There is a book of that written by a fourteenth century British monk. Nuns. And he got it from down ISIS the area up a guide. Who assumed the name of St Paul's Athenian convert. He was a Syrian monk living in the sixth century. Those Meister Eckhart and Thomas Aquinas Johns go to Sedona and many other great medieval theologians started down ISIS the very opposite. He wrote a book called The theologian Mystica. In which he explains. That in order to come to a full union with God. You must give up every conception of God whatsoever and he in human rights. Don't think that God is one of three enters or unity or spirit or any kind of anything that the human mind can conceive he is beyond all that. In it what is called This is called Apophatic theology. This is a Greek to contrast it with cataphatic that. When you speak at a phatic. You say what God is like. So in this man down I see us wrote two books one was called The Divine Names and that was can't affect acknowledging the other was called a mystical theology which is Apophatic. Cataphatic what God is like according to analogy he is like a father. We do not say God is a cosmic male parent. But God is in some respects like a father like spirit. Like we say not is like minutes. It's like it's raining you know as an relativity to that statement. So this is the the cat of Atlanta the apophatic says what God is not. And all those theologians in the following of down ISIS said the highest way of talking about God is in negative terms. Just as to use done ISIS's own image when a sculptor makes a figure he does it entirely by removing stone taking something away so in the same way son Thomas Aquinas said because God by. Is infinity. Exceeds every idea to which the human mind can reach that best way to speak of him is by remote. That is to say by removing from our view of God. Every inadequate concept. This is what the Hindus call neti neti saying of the Brahman of the

supreme reality it is not this it is not this. But this intellectual operation. Of destroying concepts must go hand in hand is a it was shall we call it psychological operation. Which is ceasing to cling to any image whatsoever or simply so. You seem to click. Now why. Well because there's no need to. There's no need to claim. Because when you were born you were kicked off a precipice. And it was a big explosion and a lot of other things are falling down with you. Including some pretty large lumps of rock. Once called the Earth. And. It won't help you to cling to the rocks when you're falling off the presidents may give you an illusion of safety. About everything is falling. It's falling apart. That's what the ancients said when all is transient. Plan to pray or flows in the weather had a cloud. And you can cling to anything it's like grabbing a smoke with a nonexistent hand. That's all that clinging will ever achieve only does it make people anxious. So when you come to the realisation that you cannot think of anything that there is nothing to cling to their transpires an inner change of consciousness which we can call either faith or letting go. And then suddenly they think it's. In Sanskrit they put it this way to add to the Massey means literally that after the hour or as we would say you're it. And if you are God. Then you can't have an idea of God any more than you can chew your own teeth. You don't need one the sun doesn't need to shine on itself. Nice don't need to cut themselves. Your eyes don't need to look at themselves. What color is your head. To your eyes. Doesn't black as it. Can't see anything. Matter of fact the way it feels inside your head is what you call what it looks like outside. All these things you see outside our states of the nervous system in the brain. That type peels that's how it looks inside the head and you said what I thought that was what was outside. True. Same way. When the Zen master suddenly discovered that carrying the pail. With water and it was a miracle he discovered that. You realize there isn't anything except God. And boy you don't if you really know that you see you don't need to have a religion. But you can have one because it's a free world I mean if you want to. Try and express this in some way and all religion is pure gravy after that see any outward manifestation of religion. You know it's like a man with lots of money making some more. And it's quite unnecessary. But so in according to the very best the logins it was never necessary for God to create the world. Didn't add anything to him. He didn't have to do it he was under no compulsion. So he did it out of what. Dinosaurs the area up a guy calls. Eat but please. We wouldn't and besides it hyper Cleary's super fullness. In

other words for kicks. I mean you know we don't we don't like using that language but it's completely contemporary because exactly right. That's what the Bible says. And it puts it in a mass a date way it says you His Majesty did it for his pleasure. And that's the way you talk about somebody it was a can't. It's critic talk it said you know we are not amused. And. It says in the book of the products that where the divine wisdom speaks. And speaks you see as an attribute of God standing aside from God. Sort of primitive polity as I'm. And wisdom says that in the beginning of the world how did light was to play before the divine presence. And it's specially to play with the sons of men the word in Hebrew is play but in the King James translation it is rejoice because that is a more sedate. You may rejoice in church but not. You may not have fun but you may rejoice. See the difference. So then. The part of the matter is then there was no reason to make the world. And it was done for making celestial Whoopi that's why the angels a laughing. They just splitting their sides only when you hear it in church or everybody's forgotten what alluvial means. It's lovely. Don't you see Al alone. Hallelujah. It's like but to be you know it's just verbal and it's like birdsong. Birdsong isn't about anything it's just for kicks. Why do you sing. Why do you like dancing what's music for. That's what this hallelujah it's. So when nothing is being tantrum when one gets to that point. Everything blows up. This is what's meant by subtle in Zen sudden. Awakening and you suddenly got heavens. What was I making that up. Because here we are so what we've been looking for old. That's right. And. That's it that's the thing. And you realise that if you any you basically through and through are all this. Only you got into a kind of a funny illusion. I think when we get into that a room. In rather a complicated way. Through our upbringing as children. Because of that many little children know from the beginning what it's all about and if they haven't got words to put it in. The that's the whole problem a child psychologist. What the child psychologist is ideally looking for is an articulate baby who. Can explain what it's like to be a baby you know never get there by the time you teach by teaching the child to speak to you for you to mess it up you give it this language and you can think big thoughts like that with this funny limited language nationally with the words they start children out with. And then finally when they've got the poor thing completely get the tires. They tell it. The most preposterous things they tell it that it must be free. They say to you a huge child are an independent agent and you're responsible see now

therefore we can manage your. Lovett's. And. In other words we require that you do something which will please us only if you do it voluntarily. Now if you want to people of it. So. But I'm afraid you see that the new theology isn't on to this. The new theology really is serious about there not being a God and that the universe is therefore. A rather pitiful predicament in which we caught had some compensation but what all this is a continuation of the nineteenth century philosophy the fully automatic model which is that. It is an essentially stupid universe it's an it's a mechanism it is a gyration of blind energy in which human intelligence and values happens to be a fluke and a rather uncomfortable one because nature doesn't give a damn about us. And so we have to fight it and all that is pure mythology is grossly unscientific. And. But most people believe that it's common sense for today. But what an opportunity that what there is in the new theology and in this whole ferment going on to get them to see this other point of view. And realize that. When you get rid of God. You are all you are doing is you're destroying an idol. And all idols must be destroyed respectfully. Not like those wretched. Puritans who went around destroying all those saints figures in the stained glass in the medieval churches that was disrespectful iconoclasm respectful I. Gods and would be for example every Easter Sunday the Bible should be ceremoniously burned. Because if Jesus is truly risen from the dead you don't need the Bible anymore either run. They'll. Leave the books or burn it up ceremoniously with great respect because certainly God doesn't take himself seriously if he did. I shudder to think what would happen.

Religion and Sexuality

I don't think I need to tell you that in a very special and peculiar way, Western man is hung up on sex. The major reason for this is that he has his religious background, quite unique among the religions of the world. I mean specifically Christianity, and in a secondary way, Judaism, insofar as Judaism in Europe and the United States is strongly influenced by Christianity. Christianity is, of all religions in the world, the one uniquely preoccupied with sex, more so than priapism, more so than tantric yoga, more so than any kind of fertility cult that has ever existed on the face of the earth. There has never been a religion in which sexuality was so important.

And either there is a certain very standards by which this can be judged. In popular speech, when you say of a person that he or she is living in sin, you know very well that you do not mean that they are engaged in a business to defraud the public by the sale of badly made bread, or anything in that kind, setting up a check forgery business, no. People who are living in sin are those who have an irregular sexual partnership. In the same way, when you say something is immoral, it pretty much means something sexually irregular. I remember when I was a boy in school, we used to have a preacher who came to us every year, the same man once a year, and he always talked on the subject of drink, gambling, and immorality. I remember the way he rolled it around his tongue, it was very clear what immorality was. And also I might point out that, present company excepted [za wyjątkiem was], the unitarian church being somehow unusual, most churches in America, England, and other parts of the Western world are, frankly, sexual regulation societies. They occasionally get excited about other moral issues, but really not very much. In other words, when you ask what can people get kicked/be thrown out of a church for, that's supposing you consider important ministers, bishops, priests and so on. They can live in envy, hatred, malice, and all uncharitableness and being perfectly good standing. But the moment anything about their sexual life becomes a little unusual, out you go, and that is about the only thing you can get out for/they can be removed.

You study for example, the Roman Catholic manuals of moral theology, these manuals of moral theology are technical books about sins of all kinds – just exactly what they are, how they are done, how grave they are – mostly for the advice of confessors. They are always arranged according to the Ten Commandments, and when they get to the command “Thou shalt not commit adultery” the volume expands (like this), in fact it occupies two-thirds of the whole book, all the details.

In a very special way, we have got sex on the brain, which is not exactly the right place for it. This needs going into/examination, because it is not as simple as it looks. There are really two roots of the whole problem. One of them is the problem of why sexual pleasure, of all pleasures, as a kind of really supreme pleasure, is singled out for religious people to be particularly afraid of. This is true not only of Christianity. Christianity emphasizes it in

a certain way, but in Asian religions also, especially in India, there is a prevailing view that if you want to attain real heights of spirituality, the one thing you must give up is sexuality, in the ordinary sense of genital sexual relationships with man or woman. This reflects an attitude to the physical world, because it is, after all, through sexuality that we have, along with eating, our most fundamental relationship to materiality, to nature, to the physical universe. It is the point at which we can become most attached to the body, to the physical organism, to material life. That is one reason why sexuality/it is problematic.

The other reason why it's problematic, is more subtle, and is that sexuality is something you cannot get rid of. Do what you may, life is sexual, in the sense for example, that you are either male or female. There are various other gradations, but basically they are all forms of maleness and femaleness. And also, that every one of you is the result of sexual intercourse. This feature of life can be looked at in one of two ways. You can say, on the one hand you can say, that all man's higher ideals, his spirituality and so forth, are simply repressed sexuality; or on the other hand, you can say that human sexuality is a manifestation, a particular form or expression of what is spiritual, metaphysical, divine, or whatever you want to call it. I hold to the latter view. I do not think that religion is repressed sexuality. I think however that sexuality is just one of the many forms in which, whatever all this is, expresses itself. But you see, if it is something you cannot get rid of and if you realize that indeed a way of life in which sexuality is in some way put down or repressed, is nonetheless an expression of sexuality. Then you come to a view of a religion in which sex is a very special taboo, which is rather unusual. It's normally said, you see, the Christianity is a religion in which sex is taboo and there is simply no getting around that. I know, up-to-date ministers today think sex is all right. It's perfectly ok if you are married and you have a mature relationship with a woman, it's all right. And they kind of damn it with faint praise. But if you read anything in Christian writings prior, shall we say, to approximately 1850, you will find that it is not all right, not at all. It is tolerated between married couples and strictly for the procreation of children, but on the whole, to do without it is best. As Saint Paul put it, it is better to marry than to burn, to burn with the fire of lust and automatically to burn in hell. But always consistently, there is no way of getting from it. In all the writings of

the church fathers from Saint Paul himself to Saint Ignatius Loyola to any of the great relatively modern leaders of Catholic spirituality, to Calvin and the great Protestants like John Knox, on the whole sex is sin and sex is dirt.

You can say very simply that this is all bad and something very wrong, but I want to point out that there is another side to all this. There is no way of making a hedge grow like pruning it. There is no way of making sex interesting like repressing it. And as a result of all these centuries of sexual repression and associating it with dirt, the West has developed a peculiar form of eroticism. That is an aspect of this whole problem that I do not think is really very profitable to explore, but I just want to mention in passing that the whole attitude of anti-sexuality in the Christian tradition is not as “anti” as it looks. It is simply a method of making sex prurient and exciting in a kind of dirty way. I suppose it is to be recommended to people who are not feeling very frisky and need to be pepped up.

The other side of the problem is much more interesting. That is to say, the first thing I mentioned, why it is that there has been a problem for human beings about pleasure? We take sexual activity as a supreme pleasure, as a supreme involvement of oneself with the body and the physical world. Why should there be a problem here? Well, the point is simply, isn't it? That the physical world is transient and impermanent; it falls apart. Bodies that were once strong, smooth, and lovely in use begin to wither and become corrupt and turn at last into skeletons. If you cling on to one of those (bodies) and it suddenly turns into a skeleton in your hand, as it will if you speed up your sense of time a little, you will feel cheated. There has been for centuries a lament about this, that life is so short, and all the beauties of this world fall apart. Therefore, if you are wise you do not set your heart on mortal beauty, but you set your heart on spiritual values that are imperishable. Even Omar Khayyam [Khajam] says:

“The Worldly Hope men set their hearts upon

Turns to ashes – or it prospers; and anon

Like snow upon the desert's dusty face

Lighting a little hour or two – is gone.”

So do not bet on that horse.

And read any kind of spiritual literature you want to, Christian, Buddhist, Hindu, Taoist, all of them seem to emphasize the importance of detachment from the body, from the physical world, so that you won't be engulfed in the stream of impermanence. The idea is that, to the degree that you identify yourself with the body and with the pleasures of the body, to that degree you are simply going to be something that is sucked away in the course of transience. Therefore hold yourself aloof, as in for example the advice of many Hindus in the practice of yoga, you are advised to look upon all sensory experiences as something out there, that you simply witness. You, yourself identify yourself with the eternal, spiritual, unchanging self—the witness of all that goes on—but who is no more involved in, say, the smoothness or the color of the mirror is affected by the things which it reflects. Keep your mind like a mirror, pure and clean, free from dust, free from flaws, free from stain, and just reflect everything that goes on but don't be attached. You will find this all over the place. But it has always seemed to me that this attitude of essential detachment from the physical universe has underlying it/raises the very serious problem. The problem being why a physical universe at all in that case? If God is in some way responsible for the existence of creation, and if this creation is basically a snare, why did He do it?

And because according to some theologies, the physical universe is looked upon as a mistake, as a fall from the divine state, as if something went wrong in the heavenly domain, causing spirits, such as we are, to fall from their highest state and become involved with animal bodies. There is an ancient analogy of man, which runs right through to the present time, that your relationship to your body is that of a rider to a horse. Saint Francis called his body Brother Ass. That you are a rational soul in charge of an animal body. And therefore if you belong to the old fashioned school, you beat it into submission. I suppose said I beat my body into submission. Or if you are a Freudian you treat your horse not with a whip but with lumps of sugar, kindly; but it is still your horse. Even in Freud there is a very strong element of Puritanism. Read Phillip Rieff's book, on Freud: The Mind of the Moralizer. And how he shows that Freud basically thought that sex was degrading, but nevertheless something biologically unavoidable, something

terribly necessary, which could not just be swept aside but had to be dealt with. But there is you see that heritage of thinking of ourselves as divided, the ego as the rational soul of spiritual origin and the physical body as the animal component. Therefore, all success in life, spiritual success requires the spiritualization of the animal component, the sublimation of its dirty and strange urges. So that is thoroughly cleaned up. I suppose the ideal sexual relationship of such persons would be held on an operating table under disinfectant sprays.

Of course, it is true that the physical world, its beauty and so on is transient. We are all falling apart in some way or other, especially after we pass the peak of youth. But this has never struck me that is something to gripe about. That the physical world is transient seems to me to be part of its splendor. I can imagine nothing more awful than attaining the age of thirty and suddenly being frozen in that age for always and always. You would become a kind of animated waxworks. And you would discover, as a matter of fact that people who have that physical permanence would feel like plastic. And that is as a matter of fact, what is going to be done about us by technology in order to provide/attained perpetual youth. All the parts of our bodies that decay and fold up are going to be replaced by very skillfully manufactured plastic parts, so that in the end we will be entirely made of very, very sophisticated plastic. And everybody will feel like that, and everybody will be utterly bored with each other, because the very fact that the world is always decaying and always falling away is the same thing as its vitality. Vitality is change. Life is death; it is always falling apart.

There are certain supreme moments at which in the body, we attain superb vitality. And that's the time make it then. That's the moment just like when an orchestra is playing, the conductor wants to get a certain group of violinists to come in at a certain moment, and he is conducting and say 'now make it' and they all have to do it, right now, you see? That is the whole art of life, to do it at the right time. To do it in time, like you dance or you play in time. In the same way, when it comes to love, sexuality, or, equally so, in all the pleasures of gastronomy, timing is of the essence. And then it's happened and you've had it. But that is not something that one should look upon with regret. It is regrettable only if you don't know how to take it when it was time.

This is really the essence of what I want to talk about, because to be detached from the world, in the sense that Buddhists and Taoists and Hindus often talk about detachment, does not mean to be non-participative. You can have a sexual life, very rich and full, and yet all the time be detached. By that I do not mean that you just go through it mechanically and have your thoughts elsewhere. I mean a complete participation, but still detached. The difference between the two attitudes is this: On the one hand, there is a way of being so anxious about physical pleasure, so afraid that you won't make it, that you grab it too hard; that you just have to have that thing, and if you do that you destroy it completely. And therefore after every attempt to get it you feel disappointed, you feel empty, you feel something was lost. And therefore you want it again, you have to keep repeating, repeating, repeating, because you never really got there. This is the hang-up. This is what is meant by attachment to this world, in the evil/negative sense.

But on the other hand, pleasure in its fullness cannot be experienced when one is grasping it. I knew a little girl to whom someone gave a bunny rabbit. She was so delighted with it and so afraid of losing it that taking it home in the car she squeezed it to death with love. Lots of parents do that to their children, a lot of spouses do it to each other. They hold on too hard, and so take the life out of this transient, beautifully fragile thing that life is. To have life and to have its pleasure you must, at the same time, let go of it. Then you can feel perfectly free to have that pleasure in the most gutsy, rollicking, earth-shaking, lip-licking way, with one's whole being taken over by a kind of undulative, convulsive ripple, which is like the very pulse of life itself. But, this can happen only if you let go, if you are willing to be abandoned.

It is funny that word – abandoned. We speak of people who are dissolute as being abandoned, but we can also use abandoned as a characteristic of a saint. A great spiritual book by a Jesuit father is called Abandonment to Divine Providence. There are people like that, who just are not hung up. They are the poor in spirit, that is to say they spirituality are poor, in the sense they do not cling to any property. They do not carry burdens around. They are free. Well, just that sort of spiritual poverty, that let-go-ness is

quite essential for the enjoyment of any kind of pleasure at all, and particularly sexual pleasure.

When I was a boy in school, I go back to this because my experience may not be – I do not know how typical it would be of children brought up in the United States in a religious environment – but my experience in England was quite fascinating. About you know, when as one is baptized as a child and you don't know anything about it, and your godfathers and godmothers are yours sponsors, then there comes a time when you are about to enter into puberty, when you are confirmed, when you undertake for yourself your own baptismal vows. And in England confirmation into the Church of England, which is Episcopalian in this country, confirmation is preceded by instruction. And this instruction consisted very largely of lessons in church history, because the British approach to religion is peculiarly archeological, based on the great past, the great Christian saints and heroes. It is really quite interesting, because it somehow associates you, and puts you in the tradition of King Arthur and the Knights of the Round Table, and all that sort of thing. But the time comes when every candidate for confirmation has a private talk with the school chaplain. And obviously in every process of initiation into mysteries, from time immemorial, there has been the passing on of a secret. So there is a certain anticipation about this very private communication, because you would think if you being initiated into a religion, what the secret consist of some marvelous information about the nature of God or the fundamental reason for being and so on. But (it is) not so in this case. The initiatory secret talk was a serious lecture on the evils of masturbation. What these evils were was not clearly specified, but it was vaguely hinted that ghastly diseases would result. So, in a perverse sort of way, we used to enjoy tormenting ourselves with imagining what kind of terrible venereal disease, epilepsy, tuberculosis, or the great Siberian itch would result from this practice.

The extraordinary thing about it is this: that the very chaplain who gave these lectures had, in his own upbringing, been given the same lecture by other chaplains, and I imagine this went back some distance in history. And they all knew perfectly well that one of the characteristic behavior patterns of adolescence is ritual defiance of authority. But you have to make some

protest against authority, and in this you are in league with all your contemporaries, your peer group. Nobody would dream of giving anybody else away, because then he would be a tattletale, a skunk, definitely not one of the boys. Therefore, obviously, masturbation provided the ideal outlet for this ritual defiance because it was fun, it was also an assertion of masculinity, and it was very, very wicked.

So I meditated on this sometime as the why the system continued and I came to the realization that the Christian putdown of sex is an extremely mysterious thing. In the religious background of the Western world, we have mainly two traditions, one Semitic, and one Greek. So far as the Semitic tradition is concerned, the material world and sexuality are definitely good things. Both Jews and Muslims think that God's creation of beautiful women was a grand idea. In the Arabic book that is the Islamic version of the Kama Sutra known as *The Perfumed Garden*, the book opens with a prayer to Allah that is a very full, detailed thanksgiving for the loveliness of women, with which Allah has blessed mankind. In the *Book of Proverbs*, we are enjoined to enjoy our wives while they are young. But on the whole it is the Semitic belief that sexuality is justified solely for purposes of reproduction of the species. This makes it good in the eyes of God and sexual energy should not really be wasted for other purposes. That's the limitation put on it.

On the other hand, we have a Greek tradition that is peculiar in that, it is strongly influenced by a dualistic view of the universe, in which material existence is conceived of as a trap, as a fall into turgid clogging matter that is antagonistic to the lightness and freedom of the spirit. Therefore, for certain kinds of Greek religions—among which we must name the Orphic Mysteries, the Neoplatonic point of view, and the late agnostic points of view—being saved means being delivered from material existence into a purely spiritual state. From this point of view, sexual involvement is the very archetype of material environment—martyr, mother, mater, matter, are really the same word. So the love of woman is the great snare. This is, incidentally, a doctrine invented by men. It goes back to the words of Adam, “The woman that thou gavest me, she tempted me, and I did eat.”

In the development of Christian theology, from approximately the time of Saint Paul through the beginning of the Renaissance, it was universally held that sex was a bad thing. You should read Saint Augustine on this; he said that in the Garden of Eden before the Fall, reproduction took place in just the same way and with just the same lack of excitement as one excretes, or passes water and there was no shameful excitation of the sexual parts. The whole attitude of the church fathers in those centuries was that the virgin state was immensely superior spiritually to the marriage state, and that sexual relationships were excusable only within the bonds of marriage and for the sole purposes of reproduction. The manuals and moral penitentiaries of the theologians of the Middle Ages list all sorts of penances that must be said, even by married couples who performed sexual intercourse on the night before attending mass or before receiving Holy Communion. Of course, sex must be avoided completely on certain great church festivals. Although in theory marriage is a sacrament that somehow blesses this peculiar relationship, there is a definite attitude that it is after all dirty and not very nice.

You must realize, also, that in those days the institution of marriage was not what it is today. Marriage at the time of the rise and development of Christianity was a social institution for (creating) alliances between families. You did not marry the person of your own choice except under the most peculiar circumstances. You married the girl your family picked out for you, and they thought it over carefully from its political point of view, as well as from the point of view of eugenics, and whether this was a good healthy girl, and whether this was a good healthy man, they had an economic bargaining about it when you married this girl, you were not necessarily in love with her. And it was perfectly well understood in the secular world that on the side you had other arrangements. You had, if you could afford them, concubines or even second and third and fourth wives. And these subsidiary wives were..., there was someone more choice open to you in getting those than in the first one, first one was definitely a family arrangement. That is the context of it, don't forget that. So what the church were saying was only that woman should be your bedfellow, whose marriage has been arranged by paternal authority.

The idea of romantic love does not arrive in connection with marriage until the troubadour cults of Southern France, of Provence, in the late Middle Ages, when they're begins to be this idea of the idealization of woman as the inspiring goddess almost, of the knight-errant. Dante's Beatrice is the inspiring woman who leads him to heaven. Historians today are not agreed as to whether the ladyloves of the chivalrous knights were in fact their mistresses or whether they were simply idealized women, but the influence of the cult of romantic love on the West was profound. And it brought about a weird combination of ideas: one – the notion of the married state being the only licit relationship in which sexual play might be carried on, and two – the notion that the girl you marry should be the one with whom you have fallen in love. Two more ill-adjusted ideas could hardly be put together, because naturally when you love someone very much indeed, in your enthusiasm of youth, you say things that are hardly logical, or rational. You may stand up before an altar and say, "My darling, my sweetheart, my perfect pet, I adore you so much that I will live with you forever and ever, until death do us part." And that is the way you feel at the time. In a rather similar mood, ancient people would hail their kings and say, "O King, live forever." Obviously this was not meant literally; they were just wishing him a long life. But to live forever? No sir, no mortal does that.

The trouble was that when a certain kind of extravagant poetic expression fell into the hands of people like Augustine and Totalian, who were rather influenced by Roman literalists, they wrote it into the law books. And so this amazing situation came about. But we still have not fully explored the subtlety of it. Let us consider certain periods when this attitude of prudery toward sexuality was in ascendancy. Nearest to our time is the bourgeois revolution in Victorian England and the United States. We all say Victorian as an adjective to indicate grundyism, extreme monogamy, a definite disgust for all things sexual. Yet, when we really go into the history of the Victorian period, we find that it was an extremely lascivious epoch. One has only to look at the lushness of Victorian furniture to realize that chairs were disguised women; even the way piano legs were shaped reflects this influence throughout Victorian art forms, and the conduct of the British aristocracy, during that period, beg a description.

People like Freud and Havelock Ellis made a certain mistake. They said about the church and about religion in general, that it was nothing but a form of sublimated sex. They said, “These people for curious reasons suppressed sex, and therefore it became a very powerful force for them.” You must remember of course that they worked on a hydraulic analogy of human psychology. That they likened it all to a river—if you dammed it up, it could burst the dam. It does not actually follow that human psychology is hydraulic, but this is the metaphor they used. They said, “The church has repressed sex, but if you look at its symbolism, it is nothing but an expression of sex. Everything is reduced to libido as the fundamental reality”. The church replied: “It is nothing of the kind. We deny this. We think that this reduction of everything to sex is just a way of attacking holy things, and on the contrary, we would say that people who are fascinated with sex and make it their god are repressing religion.”

The problem in this debate – everybody has missed the boat. The church should have said to Freud, “Well, of course, thank you very much. Yes indeed, our symbolism is sexual. The steeples of our churches, the vesicle-shaped windows and heraldic shields on which we put images of the crucifix or the Virgin Mother of God, these are all quite plainly sexual. But you see, the sexual biology in its turn, reveals the mysteries of the universe. Sex is not mere sex. Sex is a holy thing, and that’s one of the most marvelous revelations of the divine.” But imagine, the church just could not say that.

If you look at Tibetan Buddhist iconography and their images, or you look at Hindu temples, you will find things that Europeans and Americans have never been able to understand. Here are images of buddhas and of the gods engaged in amazing diversions with their female counterparts. Everybody thinks that these are kinds of dirty sculptures, but they are nothing of the kind. They are saying to the people who look at them that the play of man and woman is, on the level of biology, a reflection of the fundamental play of the cosmos. The play of positive and negative principles, of the light and the dark, of the mental and the material, they all play together. And the function of sexual play is not merely the survival and utilitarian function of reproducing the species, as it is among animals to a very large extent. What peculiarly distinguishes human sexuality is that it brings the partners closer

and closer to each other in an intense state of united feeling. In other words, it is a sacrament, the outward and visible sign of an inward and spiritual grace, bringing about love. So, if that is peculiar to human beings, it is perfect nonsense to degrade human sexuality by saying it should only be carried on in the way that animals do this, because they have not yet evolved to the place where sex is the sacramental expression of man and woman's love. And a love in that sense is a kind of enthusiasm, which means being possessed by the Divine. Falling in love, although considered by practical people to be a sort of madness, is actually the same sort of thing as the mystical vision, or grace. In its light we see people in their divine aspect. When the song says "Every little breeze whispers Louise," that is a sort of extraordinary state of mystical intoxication in which the ideal woman becomes a goddess. Which is from one point of view, what every woman is, if you see her with the scales off your eyes. Likewise, every man seen with the scales off her eyes. [to see the true reality]

What happened then, as a result of this historical situation, was mutual name-calling, between the proponents of religion and the proponents of scientific naturalism, such as Freud and Ellis, people of that kind. They have never got together because they have never understood, neither the church nor the opponents of the church, has clearly understood that the secret of unconscious motivation of sexual repression is to make it all more interesting. And on the other side, it has never been clearly understood that sexual biology and all that goes with it, is a triggering forth, on the level of biology, of what the whole universe is about – ecstatic play. So as a result, there has been a kind of compromise. Today in ecclesiastical circles, sex is being damned with faint praise. People are saying, "After all, sex was made by God, and we should remember the Jewish point of view, and perhaps it is for something more than reproduction, it may bring about the cementing of the marriage ties between husband and wife," but still in practice it remains the frightening taboo.

On the other hand, the opposition to Christian prudery goes overboard and always moves in the direction of total license. You see, what's going on is a contest between the people who want the skirt pull down to the floor and the people who want them pulled up to the neck. And you have got to draw the line somewhere. But the play between these forces is: where we're

gonna draw the line. That is very exciting (play), providing neither side wins. I mean, imagine what it would be like if the libertines won and they took over the church, so that on Wednesday evenings the young Presbyterian group could meet for prayer through sex. Every child would go to the school physician for a course in hygienics, they would have classes and plastic models, and all the children would do it in class in very clean, hygienic circumstances all sprayed with rubbing alcohol. Imagine how boring it would all become. So you see, the people who say: 'no, modesty is important' have something right about it. But they must not be allowed to get away with it, but they must not be obliterated. You see, life works that way.

Let's take an entirely different analogy, let's take a given biological group, a species we will call A. It has a natural enemy, B. One day A gets furious at its natural enemy B and says, "Let us obliterate B." They gather their forces and knock out their natural enemy. Suddenly, after a while, they begin to get weak, they get overpopulated. There is nobody around to eat up their surplus members, and they do not have to keep their muscles tensed against any enemy. They begin to fall apart because they have destroyed their enemy. What they should do is cultivate the enemy. That is the real meaning of "Love your enemy." There is such a thing as a beloved enemy. And if you don't have a beloved enemy, another words if the flies and the spiders don't go together, there would be too many spiders or too many flies. These balances keep the course of nature going, what is exactly the same thing as between the libertines and the prudes. They need each other. And you should thank, if you have a prudish father and mother, you should be very grateful to them for having made sex so interesting. So don't defy them completely, don't go to your own campus with signs bearing four letter words, because that's going to spoil the show. But every generation must react to the one before it, to this keeps this tension going. It is by this tension, this play of the opposites that we have the love that makes the world go round.

Philosophy and Society

Veil of Thoughts

The subject of this seminar is The Veil of Thoughts, and following out the theme that somebody once suggested by saying that thought is a means of concealing truth, despite the fact that it's an extraordinarily useful faculty. But in quite recent weeks we've had an astounding example of the way mankind can be bamboozled by thoughts. There was a crisis about gold. And the confusion of money—in any form whatsoever—with wealth is one of the major problems from which civilization is suffering. Because, way back in our development, when we first began to use symbols to represent the events of the physical world, we found this such an ingenious device that we became completely fascinated with it. And in ever so many different dimensions of life we are living in a state of total confusion between symbol and reality. And the real reason why, in our world today—where there is no technical reason whatsoever why there should be any poverty at all—the reason it still exists is people keep asking the question: “Where's the money going to come from?” Not realizing that money doesn't come from anywhere and never did, except if you thought it was gold. And then, of course, if to increase the supply of gold and use that to finance all the world's commerce, prosperity would depend not upon finding new processes for growing food in vast quantities, or getting nutrition out of the ocean, or getting water from atomic energy—no, it depends on discovering a new gold mine.

And you can see what a nonsensical state of affairs that is, because when gold is used for money it becomes, in fact, useless. Gold is a very useful metal for filling teeth, making jewelry, and maybe covering the dome of the Capitol in Washington. But the moment it is locked up in vaults in the form of ingots it becomes completely useless. It becomes a false security, something that people cling to, like an idol, like a belief in some kind of Big Daddy Oh God with whiskers who lives above the clouds. And all that kind

of thing diverts our attention from reality, and we go through all sorts of weird rituals. The symbol, in other words, gets in the way of practical life.

So it was—you remember the Great Depression? I expect a number of you here, looking around, are old enough to remember the Great Depression—when, one day, everybody was doing business and things were going along pretty well, and the next day there were bread lines. It was like someone came to work and they said to him, “Sorry, chum, but you can’t build today. No building can go on. We don’t have enough inches.” He’d say, “What do you mean, we don’t have enough inches? We’ve got wood, haven’t we? We got metal, we even got tape measures!” They say, “Yeah, but you don’t understand the business world. We just haven’t got enough inches! Just plain inches. We’ve used too much of them.” And that’s exactly what happened when we had the Depression. Because money is something of the same order of reality as inches, grams, meters, pounds, or lines of latitude and longitude. It is an abstraction. It is a method of bookkeeping to obviate the cumbersome procedures of barter. But our culture, our civilization is entirely hung up on the notion that money has an independent reality of its own.

And this is a very striking, concrete example of what I’m going to talk about: of the way we are bamboozled by our thoughts which are symbols. And what we can do to become un-bamboozled, because it’s a very serious state of affairs. Most of our political squabbles are entirely the result of being bamboozled by thinking. And it is to be noted that, as time goes on, the matters about which we fight with each other are increasingly abstract, and the wars fought about abstract problems get worse and worse. We are thinking about vast abstractions, ideologies called communism, capitalism—all these systems—and paying less and less attention to the world of physical reality, to the world of earth, and trees, and waters, people, and so are in the name of all sorts of abstractions busy destroying our natural environment. Wildlife, for example, is having a terrible problem continuing to exist alongside human beings.

Another example of this fantastic confusion is that, not so long ago, the Congress voted a law imposing stern penalties upon anyone who should presume to burn the American flag. And they put this law through with a

great deal of patriotic oratory, and the quoting of poems and so on about Old Glory, ignoring the fact entirely that these same congressmen—by acts of commission or omission—are burning up that for which the flag stands. They're allowing the utter pollution of our waters, of our atmosphere, the devastation of our forests, and the increasing power of the bulldozer to bring about a ghastly fulfillment of the biblical prophecy that "every valley shall be exalted, every mountain laid low, and the rough places plain." But—you see—they don't see, they don't notice the difference between the flag and the country. Or, as Korzybski pointed out, the difference between the map and the territory.

Now, however, I think we should begin by talking a little bit about when we use the word "physical reality"—as distinct from "abstraction"—what are we talking about? Because, you see, there's going to be a fight about this, philosophically. If I say that the final reality that we're living in is the physical world, a lot of people will say that I'm a materialist, that I'm unspiritual, and that I think too much of an identification of the man with the body. Any book that you'll open on yoga or Hindu philosophy will have in it a declaration that you start a meditation practice by saying to yourself, "I am not the body. I am not my feelings. I am not my thoughts. I am the witness who watches all this and is not really any of it." And so, if I were to say, then, that the physical world is the basic reality, I would seem to be contradicting what is said in these Hindu texts. But it all depends on what you mean by the "physical world." What is it?

First of all, it must be pointed out that the idea of the "material world" is itself philosophical. It is in its own way a symbol. And so, if I take up something that is generally agreed to be something in the material world, and I argue that this is material—of course, it isn't. Because nobody has ever been able to put their finger on anything material—that is to say if, by the word "material," you mean some sort of basic stuff out of which the world is made. By, say, analogy with the art of ceramics, pottery: we use clay and we form it into various shapes, and so a lot of people think that the physical world is various forms of matter. And nobody has ever been able to discover any matter. They've been able to discover various forms, yes—there is patterns, but no matter. You can't even think how you would describe matter in some terms other than form, because whenever a

physicist talks about the nature of the world he describes a form, he describes a process which can be put into the shape of a mathematical equation. And so, if you say, “ $A + B = B + A$,” everybody knows exactly what you mean. It’s a perfectly clear statement, but nobody needs to ask, “What do you mean by ‘A’?” or “What do you mean by ‘B’?” Or, if you say, “ $1 + 2 = 3$,” that’s perfectly clear, but you don’t need to know one what, two what, or three what.

And all our descriptions of the physical world have the nature of these formulae: numbers. They’re simply mathematical patterns. Because what we’re talking about is pattern. But it’s pattern of such a high degree of complexity that it’s very difficult to deal with it by thinking. In science we really work in two different ends of the spectrum of reality. We can deal with problems in which there are a very few variables, or we can deal with problems in which there are almost infinitely many variables. But in between we’re pretty helpless. In other words, the average person cannot think through a problem involving more than three variables without a pencil in his hand. That’s why, for example, it’s difficult to learn complex music. Think of an organist who has two keyboards—or three keyboards—for work with his hands, and each hand is doing a different rhythm. And then his feet on the pedals: he can be doing a different rhythm with each foot. Now, that’s a difficult thing for people to learn to do, just like to rub your stomach in a circle and pat your head at the same time takes a little skill.

Now, most problems with which we deal in everyday life involve far more than three variables. And we’re really incapable of thinking about them. Actually, the way we think about most of our problems is simply going through the motions of thinking. We don’t really think about them, we do most of our decision-making by hunch. You can collect data about a decision that you have to make, but the data that you collect has the same sort of relation to the actual processes involved in this decision as a skeleton to a living body. It’s just the bones. And there are all sorts of entirely unpredictable possibilities involved in every decision, and you don’t really think about it at all. The truth of the matter is that we are as successful as we are—which is surprising, the degree to which we are successful in conducting our everyday practical lives—because our brains do the thinking

for us in an entirely unconscious way. The brain is far more complex than any computer. The brain is, in fact, the most complex known object in the universe. Because our neurologists don't understand it. They have a very primitive conception of the brain and admit it. And therefore, if we do not understand our own brains, that simply shows that our brains are a great deal more intelligent than we are. Meaning—by “we”—the thing that we have identified ourselves with. Instead of being sensible and identifying ourselves with our brains, we identify ourselves with a very small operation of the brain, which is the faculty of conscious attention, which is a sort of radar that we have that scans the environment for unusual features. And we think we are that, and we're nothing of the kind. That's just a little trick we do. So, actually, our brain is analyzing all sensory input all the time: analyzing all the things you don't notice, don't think about, don't have even names for. And so it is this marvelous complex goings on which is responsible for our being able to adapt ourselves intelligently to the rest of the physical world. The brain is, furthermore, an operation of the physical world.

But now, you see, though, we get back to this question: “physical world.” This is a concept. This is simply an idea. And if you want to ask me to differentiate between the physical and the spiritual, I will not put the spiritual in the same class as the abstract. But most people do. They think that $1 + 2 = 3$ is a proposition of a more spiritual nature than, say, for example, a tomato. But I think a tomato is a lot more spiritual than $1 + 2 = 3$. This is where we really get to the point. That's why, in Zen Buddhism, when people ask, “What is the fundamental principle of Buddhism?” you could very well answer “A tomato.” Because, look how—when you examine the material world—how diaphanous it is. It really isn't very solid. A tomato doesn't last very long. Nor, for that matter, do the things that we consider most exemplary of physical reality, such as mountains. The poet says, “The hills are shadows, and they flow from form to form, and nothing stands.” Because the physical world is diaphanous. It's like music. When you play music it simply disappears, there's nothing left. And for that very reason it is one of the highest and most spiritual of the arts: because it is the most transient.

And so, in a way, you might say that transiency is a mark of spirituality. A lot of people think the opposite: that the spiritual things are the everlasting things. But, you see, the more a thing tends to be permanent, the more it tends to be lifeless. Nothing is so dead as a diamond, and yet, this imagery—the idea of the most mineral objects being the most permanent, and so they get associated with the spiritual. Jesus Christ is called the Rock of Ages. And even the Buddhists have used the diamond—the vajra—as an image of the fundamental reality of the universe. But the reason why they used the diamond was not that it was hard, but that it was completely transparent and, therefore, afforded a symbol of the void which everything fundamentally is. Not meaning that there simply is nothing there, but the void means that you cannot get any idea which will sufficiently define physical reality. Every idea will be wrong. In that sense, it will be void.

So then, the physical world: we can't even find any stuff out of which it's made. We can only recognize each other, and I say "Well, I realize that I met you before, and that I see you again. But the thing that I recognize is not anything, really, except a consistent pattern." Let's suppose I have a rope, and this rope begins by being manila rope, then it goes on by being cotton rope, then it goes on with being nylon, then it goes on with being silk. So I tie a knot in the rope, and I move the knot down along the rope. Now, is it—as it moves along—the same knot or a different knot? We would say it is the same because you recognize the pattern of the knot. But at one point it's manila, at another point it's cotton, another point it's nylon, and another it's silk. And that's just like us. We are recognized by the fact that, one day, you face the same way as you did the day before, and people recognize your facing. So they say that's John Doe or Mary Smith. But, actually, the contents of your face—whatever they may be; the water, the carbons, the chemicals—are changing all the time. You're like a whirlpool in a stream. The stream is doing this consistent whirlpooling and we always recognize—like at Niagara: the whirlpool is one of the sights, but the water is always moving on. And we are just like that, and everything is like that.

So there's nothing in the physical world that is what you might call substantial. It's pattern. And this is why it's so spiritual. To be non-spiritual is not to see that; in other words, it is to impose upon the physical world the idea of thing-ness, of substantiality. That is to be—in the sense that the

Hindus use it—that is “to be involved in matter;” to identify with the body. To believe—in other words—that the body is something constant, something tangible. The body is really very intangible. You cannot pin it down; it’s all falling apart, furthermore. And we’re aging, getting older, and so, therefore, if you cling to the body you will be frustrated. So the whole point is that the material world—the world of nature—is marvelous so long as you don’t try to lean on it, so long as you don’t cling to it. And if you don’t cling to it you can have a wonderful time with it.

Let’s take a very controversial issue: all spiritual people are generally against lovemaking. Ramkr̥ṣṇa used to speak about the evils of woman and gold—I’ve already demonstrated the evils of gold. But what about the evils of woman? In my point of view, yes, women can be a source of evil if you attempt to possess them. I mean, if you can say to another person, “I love you so much I want to own you, and really tie you down, and call you”—well, it’s like that poem of Ogden Nash, where someone claimed that he loved his wife so much he climbed a mountain and named it after her. Called it Mount Mrs. Oswald Tregennis! And so, in other words, if you try to possess people and you make your sexual passion possessive in that way, then, of course, you are trying to cling to the physical world. But, you see, women are—in a way—much more interesting if you don’t cling to them, if you let them be themselves and be free. And, in my opinion, you can have a very spiritual sex life if you are not possessive. But if, on the other hand, you are possessive, then you’re in trouble.

But, you know, the average svāmī won’t agree with that because he confuses—by thinking that the body (the body that I touch) is something evil—he’s hung up with it. It’s like the story of the two Zen monks who were crossing the river, and the ford was very deep because of the flood. And there was a girl trying to get across, and one of the monks immediately picked her up, threw her over his shoulder and carried her across. Put her down on the other side, and then the monks went one way and she went another. And the other monk, who had been in a kind of embarrassed silence and which he finally broke, he said, “You realize that you broke a monastic rule by touching and picking up a woman like that?” And he said, “Oh, but I left her on the other side of the river, and you’re still carrying her!”

So the whole question, then, you see, is that even—you can find this to some extent in some rather irritable saint (Paul), where he speaks of the opposition of the flesh and the spirit. Now, this word—σάρξ (sarx) in Greek; “the flesh”—as he uses it, is really—as Bogaev points out—it’s a spiritual category. For the Christian, you see, the word is made flesh in Christ, and there will be the resurrection of the body in the final consummation of the universe. So you cannot really, as an orthodox Christian, take an antagonistic attitude to the flesh. Why, then, does St. Paul take an antagonistic attitude to the flesh?

Well, you can only save the situation and make the New Testament consistent with itself by saying that he meant by “the flesh” a certain kind of spiritual category. He didn’t mean this [Alan slaps his own arm], because this isn’t flesh. Flesh is a concept, this is not. And so the flesh—or, you might talk about the sins of the flesh—they have entirely to do with certain hangups that we have about our bodies. And that, again, is what I would call leaning on the world, exploiting it.

When you take, as a Buddhist, you take the Third Precept: *Kāmesumicchācāra veramaṇī sikkhāpadaṃ samādiyāmi*. And it’s usually translated “I undertake the precept to refrain from adultery.” It doesn’t say anything of the kind. *Kāma* is “passion.” *Kāmesumicchācāra*, therefore, is “I undertake the precept not to exploit the passions.” So, in other words, you may be bored—see?—and you’re feeling sort of empty and at a loose end, and you think, “Well, I dunno, let’s go and commit adultery. It might liven things up.” See? And that would be what they call in Zen “raising waves when no wind is blowing.” It would be quite a different matter if, in a perfectly spontaneous and natural way, you fell in love with some woman. You wouldn’t be going out of your way to get in trouble. It would be appropriate and natural at the time. Or, in the same way, a lot of people—instead of saying “let’s commit adultery”—when they feel sort of bored they say, “Let’s go and eat something.” And so they become fatter and fatter and fatter because they’re filling the spiritual vacuum in their psyche with food, which doesn’t do the job. It’s not the function of food to fill spiritual vacuums. So, in this way, one exploits the appetites or the passions.

So, likewise, also the Fifth Precept: Surāmerayamajjapamādaṭṭhānā is a list of intoxicating substances. And it doesn't say that you are not going to take them, it says you're not going to be intoxicated by them. In other words: a Buddhist may drink, but not to get drunk. I don't know how that applies to psychedelics, but that's another story.

So one might say, then, that we are confused, through and through, about what we mean by the "material world." And what I'm first of all doing is I'm just giving a number of illustrations which show how confused we are. And let me repeat this to get it clear, because it is rather complicated: in the first place, we confuse abstract symbols—that is to say, numbers and words and formulae—with physical events as we confuse money with consumable wealth. In the second place, we confuse physical events—the whole class and category of physical events—with matter. But matter, you see, is an idea; it's a concept. It's the concept of stuff, of something solid and permanent that you can catch hold of. Now, you just can't catch hold of the physical world. The physical world is the most evasive, illusive process that there is. It will not be pinned down and, therefore, it fulfills all the requirements of spirit.

So what I'm saying, then, is that the non-abstract world—which Korzybski called "unspeakable," which is really a rather good word—is the spiritual world. And the spiritual world isn't something kind of gaseous, abstract, formless (in that sense of "shapeless"), it's formless in another sense: the formless world is the wiggly world. There really is no way that the physical world is. In other words, the nature of truth—I said in the beginning that somebody had said thoughts were made to conceal truth—this is a fact because there is no such thing as the truth that can be stated. In other words, ask the question "What is the true position of the stars in the Big Dipper?" Well, it depends where you're looking at them from. And there is no absolute position. So, in the same way, a good accountant will tell you that any balance sheet is simply a matter of opinion. There's no such thing as the true state of affairs of a business.

But we're all hooked on the idea that there is, you see, an external, objective world which is a certain way, and that it really is that way. History, for example, is a matter of opinion. History is an art, not a science.

It's something constructed, which is accepted as a more or less satisfactory explanation of events which, as a matter of fact, don't have an explanation at all. Most of what happens in history is completely irrational. But people always have to feel that they've got to find a meaning. For example: you get sick, and you've lived a very good life, and you've been helpful to other people and done all sorts of nice things. Then you get cancer. And you say to the clergyman, "Why did this have to happen to me?" And you're looking for an explanation—and there isn't one. It just happened that way. But people feel if they can't find an explanation they feel very, very insecure. Why? Because they haven't been able to straighten things out. The world is not that way.

So the truth—in other words: what is going on—is, of course, a lot of wiggles. But the way it is is always in relation to the way you are. In other words, however hard I hit a skinless drum, it will make no noise, because noise is a relationship between a fist and a skin. So, in exactly the same way, light is a relationship between electrical energy and eyeballs. It is you, in other words, who evoke the world. And you evoke the world in accordance with what kind of a you you are; what kind of an organism. One organism evokes one world, another organism evokes another world. And so everything—reality is a kind of relationship.

So once one gets rid of the idea of "the truth" as some way the world is in a fixed sense—say "it is that way," see?—then you get to another idea of the truth altogether: the idea of a truth that cannot be stated, the truth that cannot be pinned down. And then, that is the kind of truth that is God when we speak of God as the reality that exceeds all thoughts, that surpasses all definitions, that is infinite, unbounded, eternal, immeasurable in terms of time. That's what we're talking about. We're not talking about a gaseous vertebrate or a huge, vast void without any wiggles in it. All gas. We'll put it another way altogether: the truth that cannot be pinned.

Well now, in the first talk I was explaining that the theme of this seminar was the problem of how thoughts protect us from truth and what to do about it, and showing various ways in which the symbolizing process—which we call thinking; the use of signs, words, symbols, numbers to represent what's

going on in the external world or the world of nature—leads us into a curious confusion that we confuse the symbolic process with the actual world. And the temptation to do this arises from the extraordinary relative success that we have had in controlling the world of nature with the power of thought. But I don't know if it's ever struck you that we really don't know whether we have successfully controlled it or not. It could be argued—a very strong case could be made—that the entire intellectual venture of civilization has been a ghastly mistake, and that we are now on a collision course, and that all the vaunted benefits of intelligence (technology and all that) is simply going to draw the human race to an extremely swift conclusion.

Of course, that might not be a bad thing. I've sometimes speculated on the idea that all stars have been created out of planets. And that these planets developed high civilizations which eventually understood the secrets of nuclear energy and, naturally, blew themselves up. And in the process these stars flung out lumps of rock as they blew up, which eventually spun around them and became planets all over again. And that this is the actual method of genesis of the universe which would accord, of course, with the Hindu cosmology where time and the events in time are invariably looked upon as a process of progressive deterioration through the cycles of each kalpa, in which things get worse and worse as time goes on until it can't stand itself anymore, and it blows up and, after a period of rest and recuperation, begins all over again.

Why do we somehow have a distaste for a theory of time which runs in that direction? I mean, would you rather have a rhythm that goes nyeeaw-zhip, nyeeaw-zhip, or one that goes neeiyp-pow-neeiyp? See? I mean, which is it? Or you want one that's going up always? You see? Always getting better. You can't even imagine such a state of affairs because, you know, it's relative. As you succeed in life you simply... well, there was a communist—a Russian, not a communist—a Russian philosopher who accused the communists in their various five-year plans and progressive notions (wherein people were always preparing for tomorrow) of converting all human beings into caryatids. Now, you know, a caryatid is a pillar, shaped in a human form, which supports a roof. And he said “You are turning all men into caryatids to support a stage upon which others will dance.” But, of

course, you know they never will. You have one row of caryatids supporting a floor, and very soon your children are the next row of caryatids supporting another floor: so that it gets higher and higher, and we don't really know where we began and we're always in the same place. Always hoping, always thinking that the next time will be it. And this, of course, is an eternal illusion. It's much better—actually, one would be much happier—to think that the future is simply deteriorating. I can explain that very simply.

Human beings are largely engaged in wasting enormous amounts of psychic energy in attempting to do things that are quite impossible. You know—as the proverb says—you can't lift yourself up by your own bootstraps. But recently, I've heard a lot of references in just general reading and listening where people say, "We've got to lift ourselves up by our own bootstraps!" And you can't! And you can struggle, and tug, and pull until you're blue in the face, and nothing happens except that you've exhausted yourself. All sensible people therefore begin in life with two fundamental presuppositions: you are not going to improve the world, and you are not going to improve yourself. You are just what you are. And once you have accepted that situation, you have an enormous amount of energy available to do things that can be done. And everybody else, looking at you from an external point of view, will say, "My God, how much so-and-so has improved!" But I know—I mean, hundreds of my friends are at work on enterprises to improve themselves—by one religion or another, one therapy or another, this system, that system—and I'm desperately trying to free people from this. And I suppose that makes me a messiah of some kind.

But the thing is that you can't do it for one very simple reason—which, I think, most of you are by now familiar with—is that the part of you which is supposed to improve you is exactly the same as that part of you which needs to be improved. In other words, there isn't any real distinction between 'bad me' and 'good I,' between the 'higher self' which is spiritual and the 'lower self' which is animal. It's all of a piece; you are this organism, this integrated, fascinating energy pattern. And as Archimedes said: "Give me a fulcrum and I will move the Earth." But there isn't one. It's like—you know—betting on the future of the human race. If I were really smart I would lay a bet that the human race will destroy itself,

because (in practical politics) one realizes that nothing is going to work out right. No candidate I've ever voted for ever won the election. But the trouble is there's nowhere to place the bet! And so, since I can't place the bet anywhere, I'm involved in the world and must perforce try to see that it doesn't blow itself to pieces.

But the thing—I once had a terrible argument with Margaret Mead. She was holding forth one evening on the absolute horror of the atomic bomb and how everybody should immediately spring into action and abolish it. But she was getting so furious about it that I said to her, “You know, you scare me. Because I think you're the kind of person who will push the button in order to get rid of the other people who were going to push it first.” And she told me that I had no love for my future generations, no responsibility for my children, and I was a phony swami who believed in retreating from facts. But I maintain my position. Robert Oppenheimer, a little while before he died, said that it's perfectly obvious that the whole world is going to hell. The only possible chance that it might not is that we do not attempt to prevent it from doing so.

Because, you see, all the troubles going on in the world now are being supervised by people with very good intentions. They're attempts to keep things in order, to clean things up, to forbid this and prevent that possible horrendous damage. And the more we try, you see, to put everything to rights, the more we make fantastic messes. And it gets worse. And maybe that's the way it's got to be. Maybe I shouldn't say anything at all about the folly of trying to put things to right. But simply, on the principle of Blake, let the fool persist in his folly so that he will become wise.

Audience:

Would this be an argument against conservationists?

This is an argument against all kinds of do-gooding. In other words, it's simply—it's the... what I'm saying is: don't take me too seriously. I'm pitching a case for the fact that civilization has been a mistake; that it would be much better to leave everything alone. That the wild animals are wiser than we in that they—putting it in our crude and not very exact language—they just follow their instincts. And if a moth mistakes a flame for the signal

on which it gets a mating call and flies into the flame, so what? That just keeps the moth population down. And a moth doesn't worry. You know, it doesn't go buzzing around in a state of anxiety, wondering whether this sex call is the real thing or just a flame. It doesn't think consciously about the future—at least, we suppose this is so. Maybe it does. But we suppose that it doesn't and, therefore, it isn't troubled. But the species of moths goes on and on and on, and so far as we know it's been around for an incredibly long time, and may be even longer than we have. Bees, ants—creatures of this kind—they have long since escaped from history, so far as we can see. In other words, they live a settled existence which you might consider rather boring because it doesn't have constant change in the way that we do. They live the same rhythm again and again and again, but because they don't bother to remember it consciously it never gets boring. And because they don't bother to predict, they're never in a state of anxiety. And yet they survive.

Now we—who “look before and after,” as Emerson says, and predict, and are always concerned whether this generation is gonna be better or worse than the one that came before—we are tormented. And we just don't realize—because of this tremendous preoccupation with time—we don't realize how beautiful we are, in spite of ourselves. Because, you see, the conscious radar is a troubleshooter: it's always on the watch out for variations in the environment which may bring about disaster. And so our consciousness is, from one day's end to another, entirely occupied with time and with planning, and with what has been and with what will be. And since troubleshooting is its function, we then get the general feeling that man is born to trouble. And we ignore in this preoccupation with conscious attention how marvelously we get on, how—for most of the time—our physical organs are in a fantastically harmonious relationship, how our body relates by all sorts of unconscious responses to the physical environment. So that if you became aware of all the adjustment processes that are being managed spontaneously and subconsciously by your organism, you would find yourself in the middle of great music. And, of course, this occasionally happens.

The mystical experience is nothing other than becoming aware of your true physical relationship to the universe. And you're amazed—thunderstruck—

by the feeling that underneath everything that goes on in this world, the fundamental thing is a state of unbelievable bliss. Well, why not? Why else would there be anything happening? Because if the game isn't worth the candle, if the universe is basically nothing but a tormented struggle, why have one? Hasn't it ever struck you that it would be much simpler not to have any existence? It would require no effort. There would be no problems. So why is there anything going on? Let me say not why, but how is there anything going on? Because if it's all fundamentally a drag, I just don't see any reason for its being. Everything would have committed suicide long ago. And to be at rest.

About Ben Adhem—may his tribe decrease

By cautious birth control and be at peace.

—G.K. Chesterton, *The Philanthropist*

So we might work on this possibility, then—that civilization is a mistake and that we've taken completely the wrong track and should have left things to nature, as it were. And, of course, this is the same problem that is brought up in the Book of Genesis. Actually, the fall of man, in Genesis, is his venture into technology. Because in the Bible, the Hebrew words for the knowledge of good and evil are connected with technics. What is technically expeditious and what is not—words connected with, actually, metallurgy—and to be as God, you see. When you “eat of the fruit of the tree of knowledge and you become as God” means you think you're going to control your own life. And God says, “Okay, baby! You wanted to be God! You try it!” But the trouble with you is you've got a one-track mind. And therefore you can't be God. To be God you have to have an infinitely many-tracked mind—which is, of course, what your brain has, you see? The brain is infinitely many-tracked, but consciousness is not—it's one-tracked. As we say: you can only think of one thing at a time. And you cannot take charge of the universe with that kind of a consciousness because there's too much of it. As I explained before: too many variables. And our science can take care of a few variables, or of an enormous number of variables (as in quantum mechanics) by statistical methods—as we can use statistical methods to predict that most people will live to be 65 years old, at least, but we cannot say of any given individual whether he will live

to 65 or not. That's what we wanted to know! But the problem is that the variables on each individual are too complicated. And we have not yet, you see, developed a science which can deal with, say, 50- or 100- or 500-variable systems. It's too complicated to think about. But computers are going to help us. But, as yet, we are either on the low number or the extremely high number. And these are outside the range of the problems with which we are really concerned.

That's why, for example, a lot of people have taken to using the I Ching; the Book of Changes. Because if you're tossing a coin to make your decisions—and everybody does, fundamentally, make their decision by tossing coins—it's better to have a 64-sided coin than a two-sided coin. The I Ching gives you 64 possibilities of approach to any given decision instead of just two: yes or no. It's based on yes or no because it's based on the yang and the yin, but in the same way that digital computers use a number-system which consists only of the figures 0 and 1 out of which you can construct any number. And this was invented by Leibniz, who got it from the Book of Changes. It's amazing how this book is somehow always with us. But this, then, is a way of helping your own multi-variablened brain arrive at decisions, cooperating with your own mind. Because, then again, after you've tossed your 64-sided coin, the oracle that you read—that explains each particular hexagram in the Book of Changes—is a sort of Rorschach blot. It is a very laconic remarks into which everybody reads just exactly what they want to read. But that helps you make a decision by the fact that you don't really have to accept responsibility for it. See? Then you can say, "It told me. I consulted the oracle." The same way when you go to a guru. You say, "My guru is very wise and he's instructed me this, that, and the other." But it was you who decided on this guru. How did you know he was a good one? See? You gave him his authority because you picked him out. It always comes back to you, but we like to pretend it doesn't. But the thing is that one's self is certainly not the stream of consciousness. One's self is everything that goes on underneath that, and of which the stream of consciousness is a mere—well, it has about the same relation to one's self as the bookkeeping does to a business. And if you're selling grocery, there's very little resemblance between your books and what you move over your shelves and counters. It's just a record of it, and that's what our consciousness keeps.

Now supposing, then, we work with the argument that we've made an awful mistake in bringing out civilization and we're not going to survive. Now, there are various things that can be said about this. Just as I made the joke that all stars used to be planets, one could say, "Well, is it such a good thing to survive?" You know T. S. Eliot's *Waste Land* says "this is the way the world ends: not with a bang, but a whimper." But some people would rather end with a bang than a whimper. Some people are stingy and they like to burn up their fire very gradually, conserving the fuel and just keep enough heat going so that they get a long time. Other people prefer a kind of a potlatch situation where they have a huge whiz-bang fire that goes out in a hurry. Now, who is right? Do you want to be a tortoise? You know, a tortoise that lives for hundreds of years but drags itself around all the time very slow, slow, slow sullen? Or would you rather be a little hummingbird—yeah, yeah! Humming bird, that's the thing! See?—that dances and lives at a terrific pace? Well, you can't say one is right and the other's wrong. And so there may be nothing wrong with the idea of a world, a civilization, a culture that lives at a terrific increasing pace of change and then explodes. That may be perfectly okay. My point is that if we could reconcile ourselves to the notion that that is perfectly okay, then we would be less inclined to push that button. It's the anxiety. If you cannot stand anxiety—and if you cannot simply be content for issues to be undecided—you are liable to push the button because you say, "Let's get it over with."

People who have trouble with the law and are manipulating the courts in one way or another always learn to delay everything: put it off, introduce legal red tape managed to—like Ralph Ginzburg, who's been in trouble because of the *Eros Magazine*. He's got a very smart attorney who's simply the—although the case has gone to the Supreme Court—he's simply mumbling away and putting up all sorts of things so that he keeps Ralph out of jail. And that's life! Life is simply a way of postponing death. And that's what we have to do.

So then, let's say, "Well, civilization wasn't really a mistake. It was just as natural as anything else: a being that exists under conditions of illusion that imagines that it's controlling its own destiny, that thinks it's capable of improving itself, and—by virtue of this illusion—destroys itself rapidly in an interesting way." You see? Let's suppose that's what we are. But you still

come back to the point that you are spending an enormous amount of energy in doing things that can't be done—that is to say, tugging at the bootstraps. And if you find this frustrating, if you really don't like it, you don't have to do it! You can stop. And the paradox is that, when you stop, you become happier and more energetic. People always wondered about the Calvinists because Calvinists believed that, from the beginning of time, God had foreordained who was to be saved and who is to be damned, and you have no choice. Predestination. Therefore, the logical assumption would be that people who believed in predestination would be a *laissez faire*: they just sit and wait saying, “There's nothing we can do about it.” But Calvinists were quite other than that. They were very energetic people; too energetic. Very, very vigorously moral. They gave us the Protestant ethic. But they believed in predestination because, you see, they simply had all the psychic energy which Catholics were dissipating upon wondering whether they were saved or not—see?—and being in a state of fear and trembling about “Have I made the right decision? Did I act rightly?” and so on. So they didn't have as much energy as the Calvinists.

So then, in this day and age we say—in the line of thought of psychiatry or of most schools of psychotherapy—it's important for you to accept yourself rather than to be in conflict. Get with yourself. But everybody says, “But!” Because nobody dares take that too far. There's always a little bit of reservation on the end of it. It's like, I've never heard a preacher—to this day!—give a sermon on the passage in the Sermon on the Mount which begins: “Be not anxious for the morrow.” They do, occasionally, refer to it and say, “Well, that's all very well for Jesus.” But the the actual putting into practice of this—nobody will agree with. They say it's not practical to not give a damn about how you're going to provide for the next day's meals, and all that sort of thing. But it is practical. It's much more practical than what we're doing, if you mean by “practical” that it has survival value. Only, I want to point out that this is a kind of a two-step way. See, the first step is not being anxious for the morrow, not dreaming for one moment that you can change anything, or improve anything. Which of you—by being anxious—can add one cubit to his stature, you see? But this, just like the belief in predestination, has an unexpected consequence: namely, the making of the energy available so that, in fact, you can take care of the morrow—but for the simple reason that you're no longer worrying about it.

And thus it comes about that people who do not live for the morrow have some reason to make plans, but those who live for the morrow have no reason to make plans for anything because they never catch up with tomorrow; because they don't live in the present. They live for a future which never arrives. That is very stupid.

But, you see, so all this is said in quite another spirit than the spirit of sermonizing. I'm not talking at all about something you should do. All I'm doing is explaining a situation, and you can do anything you like about it. Actually, you know, you cannot lift yourself up by your own bootstraps—however hard you try—and I'm merely pointing out that it can't be done. I'm not saying that you shouldn't try, because it may be your lifestyle to be constantly attempting to do things that can't be done. I do this in a way because all poets do it. A poet is always trying to describe what cannot be said. And he gets close, you know? He often really gives the illusion that he's made it. And that's a great thing: to be able to say what can't be said. I'm trying to say, to express, the mystical experience—and it just can't be done. And therefore, everything I'm saying to you is a very elaborate deception. I'm weaving all kinds of intricate nonsense patterns which sound as if they were about to make sense, and they don't really. But, you see, we could take that to another level and say, "Well, that's just life!"

Once I was talking with Fritz Perls at the Esalen Institute and he said, "The trouble with you is you're all words. Why don't you practice what you preach?" So I said, "I don't preach. And furthermore, don't put words down. Because the patterns that people make with words are just like the patterns of ferns, or of the marks on seashells. They are a dance. And they're just as much a legitimate form of life as flowers." He said, "You're impossible!" But, you see, that's very important.

And that is why—in certain forms of methods of meditation and religious rituals—we use words in a way that is not ordinarily in accord with the use of words. Words are normally used to convey information. But in religious rituals words are not used to convey information: words are used musically for the sake of sound. And this is a method of liberating oneself from enthrallment with words. When you say any ordinary word—just take a word like "body," see?—and you say it once, and it seems to be quite

sensible. But say it four or five times: body, body, body, body, body, body. And you think, “What a funny noise.” Isn’t that curious? Or “apple dumpling.” Apple dumpling, you know? That’s kind of a nice sound: apple dumpling.

And so in one of the great methods of meditation—which is called mantra yoga—the use of sound for liberating consciousness is precisely that. You take all sorts of nonsense and chant it. And you concentrate on these sounds quite apart from anything that they may mean. See, this is why the Catholic Church has made a ghastly mistake in having Mass celebrated in the vernacular. Now everybody knows what it means, and it really wasn’t so hard after all. And—while it was in a tongue that was completely incomprehensible—have this sense of mystery to it. And furthermore, if you knew how to use it as a *sādhanā*; a method of meditation—you could do very well. All monks were trained when they recited the Divine Office. They would explain to a novice: “Don’t think about the meaning of the words. Just say the words with your mouth and keep your consciousness on the presence of God.” They used it that way, see?

So it’s a very good thing, then, to use words in this way to overcome slavery to words. I’ve just written a book of nonsense ditties which are to be used in this way. To get the rhythm going—which is an incantation. Which is a way of getting beyond the bondage of thought. Because, you see, you cannot think without words. You can use numbers and a few things like that. But if you preoccupy your consciousness with meaningless words, that very simply stops you from thinking. And then you dig the sound. Do you know what it is, to dig the sound of anything? Anybody who’s had a psychedelic experience knows exactly what this means. That you—I can only call it “you go down into sound,” and you listen to that vibration, and you go into it, and into it, and into it, and you suddenly realize that that vibration that you’re listening to—or singing—is what there is. That’s the energy of the cosmos. That’s what’s going on. And everything that’s going on is a kind of a pulsation of energy, which in Buddhism is called “suchness” or “thatness”—*tathātā*. You see? What’s da-da-da, da-da-da, da-da-da-da-da. And that’s what we’re all doing. Only: we look around and, you know, here we all are with people. We’ve got faces on, and we talk, and we’re supposed to be making sense, but actually we’re just going da-da-da,

da-da-da, da-da-d-da-da in very complicated ways, see? And playing this life-game. And the thing is that if we don't get with it, it passes us by. That's alright! You can miss the bus; it's your privilege. You see? But it really is a great deal to go with the dance and know that that's what you're doing, instead of agonizing about the whole thing.

Well, now, we've been discussing—in two sessions—the ways in which thought can conceal truth, and so now we have to come to the other aspect of the problem, which is: how to get un-bamboozled. And I often say that, in a way, this is the wrong question because it reminds me of the famous tale about the American tourist in England who wanted to find a way to obscure a little village called Upper Tuddenham. And he asked a local yokel the way, and the man scratched his head and said, "Well, sir, I do know the way, but if I were you I wouldn't start from here." And the problem, therefore, of what to do is, in a way, the wrong question. Because—as I pointed out yesterday—you have to begin with the assumption that you can't do anything. You can't change yourself because the whole idea involves a sort of schizy situation where this "I" is going to change "me." And this is where the genius of Krishnamurti comes out, where he won't give anyone a method. And, actually, he gets you into the meditation process by pretending not to. He's a real tricky character! Very, very great guru, except that nobody really knows what to do with him. Because whenever you suggest that there might be something that you could do to bring your mind to tranquility or your heart to the knowledge of the ultimate reality, he says simply, "Well, why do you want to? Find out why you want to." And then he gives you a kōan. And, in a way, this gets you meditating naturally instead of it being a kind of artificial process; you get so bugged by this questioning that you are involved in the kōan process right away. And he's very insistent about this.

But my own view is very generous. I think that all ways of meditation can be followed. And because even if some of them are folly—to quote Blake again—the fool who persists in his folly will become wise. All that's required that you keep at it. So I want to talk this morning about the various central methods of meditation, and we'll begin—why not—with the Yoga Sūtra, Patañjali, where [in] the first he says, "Now, yoga is

explained.” This is the first verse. And the commentators point out that the word “now” means that this is a discourse following other discourses. Something has gone before; certain things you have to have mastered before you try yoga. And this is in line with the Hindu view of life that life is divided into ashramas, or stages: that you start out with the stage called brahmacharya, which is the studentship, and then you become a gṛhastha, which is householder. And only after you’ve fulfilled the life of the householder do you take up yoga. And this is, of course, also in line with Jung’s views that spiritual awakening belongs properly to the second half of life.

But you mustn’t take that literally. The stages of life can be lived simultaneously, and they don’t necessarily follow each other in chronological order. And today, the predominance of interest in yoga in the West is among young people. And these are the people who are now the new saṁnyāsa; the “wandering monks,” the drop-outs. After all, a saṁnyāsa is a drop-out—only a high-class drop-out. But he has—in India, of course—fulfilled his social debts. He has raised a family, established his work, and put his oldest son in charge of the business. But we are in an entirely different situation because many of our oldest sons despise the business that we, as adults, were involved in. Because they see through the hollowness of a way of life that has so hopelessly confused symbol with reality. So I guess in our circumstances yoga is important for everyone.

Now, the next verse of the Yoga Sūtra says, “Yogas citta vritti nirodha.” And this is a complicated thing to translate. It says “Yoga is the cessation of turnings of the mind.” Vritti means “to turn,” to be turbulent. When you talk about a cakravartin as a great ruler, a great king, means “one who turns the wheel.” Vartin is the same as vritti. And a vartin is one who turns; a vritti is a turning, a wave. Like a wave rolls over and splashes. Citta means, approximately, “consciousness.” It refers to the basic awareness that we have, whether it is strictly conscious or subconscious. Citta means something like—let’s suppose we make the mind analogous to a mirror, a reflecting mirror. The mirror itself would correspond to what is meant in Sanskrit by citta. You see, we’re not aware of the color of the lens of our eye, and so we just name that color transparent. If it had a color, we wouldn’t know it, and so we don’t. But you can’t really altogether ignore

the background of vision because it's very important, even though you never see it. It's basic to all that you see, just as the diaphragm in the speaker of the radio is basic to all that you hear on the radio. But so, in the same way, there is something basic to all our sensations, and that is citta.

So now, there are two schools of thought. One who says that yoga—that “citta vritti nirodha,” the cessation of the turnings in the citta—is the elimination of all sense experience and all thought and all feeling whatsoever from consciousness. And when one speaks, then, of the goal of yoga as being samādhi—and particularly what is called asamprajnata samādhi, which means “samādhi without a seed in it,” or nirvikalpa samādhi—nirvikalpa is a moot word. Some people think that that means this total elimination of all contents from consciousness. It's like when you get into a sensory deprivation chamber and you learn to relax the muscles of your tongue, and the muscles of your eyes, and you really go blank. But I think that is a false interpretation. It's a very interesting experience to go through and I recommend it if you want to make a little adventure. I was just in a sensory deprivation chamber a day or two ago; it was fascinating. But, you know, it's real quiet. It's just as nice as nice can be and I recommend that everyone install one in a New York apartment! But nirvikalpa means, strictly, “without concept.” Vikalpa means a “concept,” having an idea. And that's a symbolic thing. It doesn't mean having no sensation.

And they make a great point of this in the instruction about practicing meditation in Zen. They say quite definitely, “Don't shut your eyes. Don't close your ears. But simply: eliminate thought.” If you cut out your sensation input entirely and have a blank mind, then you're no better than a log. In that case, logs and rocks would be Buddhas. The point, then, is, in other words, they have various poetic phrases in Zen to indicate the nature of samādhi. One is the moon in the water. You see, there's a verse which says, “All waters contain the moon. Not a mountain, but the clouds encircle it.” So “all waters contain the moon” means that whenever the moon rises, instantly, it is in all waters. They didn't know, of course—in those days—anything about the speed of light. But they felt that the moon comes into the water when the moon is in the sky in exactly the same way as, when the hands are clapped, the sound issues without a moment's hesitation. And so

another verse says, “The geese do not intend to cast their reflection. The water has no mind to receive their image.” It’s zzwht, there. Like that.

And so the ideal of samādhi is for you to have a mind like that—what they call a “mind of no hesitation.” A mind which doesn’t, as it were, stop to say whether this should or should not be reflected. And so they would go on to explain the basic nature of your mind is like that from the beginning. That’s what it is to have a mind. That’s what Zen master Bankei would call the “unborn mind,” or the “Buddha mind” in every one of us that we all have as a natural gift. And so he says when you hear a crow go caw, you know immediately it’s a crow. (I am a crow, for the moment!) And so, in the same way, when Bankei was once giving a talk, there was a Nichiren priest—you know, those Nichirens are kind of a Buddhist Jehovah’s Witnesses—and this priest was heckling him in the back and he said, “I don’t understand anything you’re saying.” And Bankei said, “Come closer and I’ll explain it.” And this man began to weave his way through the crowd. And Bankei said, “Come closer still.” “Still closer. Come right here.” And he came right up. And Bankei said, “You see? You understand me perfectly!”

So the feeling, then, is that the nirvikalpa samādhi is this state of just perfectly clear consciousness which responds to everything going on without labeling it, without categorizing it. And even to say “respond” isn’t quite right because that means as if consciousness was something that is pushed by life and then reacts to it. Action and reaction, like cause and effect. The crow caws, and the ears vibrate: cause and effect. That’s not the Buddhist theory. The Buddhist theory is not cause and effect, it is called pratīyasamutpāda. And that means “interdependent origination.” In other words: when the wind blows, the trees move. This is not two events, but one. Wind blowing and trees waving are all the same process. And so the verse says, “The tree displays the bodily power of the wind.” It manifests it. Because nobody would know there was any wind blowing unless the trees were waving. Nobody would know there was any light shining unless there was something reflecting it. They really go together, you see? So the tree displays the bodily power of the wind, the water exhibits the spiritual nature of the moon. Because, you see, when the water flows and ripples, it breaks the moon into thousands of pieces. So that is the spiritual power: the one becomes many.

So then, what we are looking at, then, is a state of consciousness which is like that—which is one with the whole thing going on. And this is saying the same thing as Krishnamurti says when he tries to explain that there really is no feeler separate from our feelings and no thinker separate from our thoughts. There is simply a process going on. And so, in the same way, Huìnéng—the Sixth Patriarch—prefers not to use the image of the mirror for the mind, but he prefers the image of space. That’s why, when his rival for the patriarchy made up the poem which explained that “the mind is a mirror and we must wipe it to keep off the dust,” Huìnéng countered this by saying “there isn’t any mirror, and so whereon can the dust fall?” See? So this is saying that you will never, never be able to discover a thinker other than thoughts, a feeler other than feelings, a sensor other than sensations. That’s the meaning of the dialog between Bodhidharma and Eka. When Eka said, “I haven’t any peace of mind. Please pacify my mind.” And Bodhidharma said, “Bring out your mind in front of me, and I will pacify it.” Eka said, “When I look for it, I can’t find it.” Bodhidharma said, “There! It is pacified.”

So Eka, you know, was looking for his mind. It’s like “Who are you?”—the question that the Maharshi Ramana always asked to anybody who said, “Maharshi, who was I in my last incarnation?” And he would always reply, “Who’s asking the question?” Which is the same as Krishnamurti’s “Why do you want to know?” Because this throws the question back at the questioner. Who are you? Who has the problem? And you look, and you look, and you look, and you can’t find it. When you look for—Hume, the British philosopher, really went through the same experience, because when he tried to find out what was his consciousness he couldn’t find anything but sensations, or images, in his head. And so, in the same way, when you want to find out what’s behind your eyes—most people think that they have a blank space behind their eyes; kind of a non-dark, non-light blind spot which you can’t ever see. That’s not the case. You know how the inside of your head is? Why, it’s what you’re looking at! That’s how it feels inside your head. It’s all this that you see in front of you: that’s inside your head. It’s all in these nerves back here, where the optical nerves are centered.

And so this is saying that our conscious relationship to the world is a transactional relationship in which you can speak about the subjective

standpoint and the objective standpoint. But that, really, you've got one continuum in which these two standpoints are simply opposite ends of a diameter. You go with it, it goes with you, and vice versa. So this is the whole meaning of the Taoist idea that is called "mutual arising." When Lao Tzu says that "to be" and "not to be" arise mutually, that "difficult" and "easy" suggest each other, "high" and "low" subtend each other, and so on—he's describing this polar relationship. So you don't get an '—in other words, you don't get a confrontation, you don't get a kind of a meeting from things that impinge on each other from entirely separate situations. You get the opposite sort of thing where, when a flower buds and the bud breaks, the petals expand. And it's true—you have the petals on the far left and you have the petals on the far right. But they arise together, like that, see? That's how all life is happening. When you come into being, the universe comes into being. When you go out of being, the universe goes out of being. And that's true for everyone. Not only people—all sentient beings whatsoever. So without the being—the sentient being—there is no cosmos. All we are saying in talking about a cosmos that existed before any sentient beings existed is we're simply describing what would have happened if there had been any sentient beings around. It's a kind of extrapolation.

So that relativity of the sentient being and the universe is basic to Buddhist philosophy and is saying, then, that the one implies the other. Because this is the philosophy called *jiji muge* (事事无碍): that between thing-event and thing-event there is no barrier. This is the philosophy of the mutual interdependence of all things and events. That the moment there is anything at all, it implies everything else. So, in the same way—you know—with laser beam photography: you can take a tiny fragment of a photographic negative, and by laser beam photography you can restore the whole negative from which it was cut. Because the crystalline structure of any part of the negative is in an inseparable relationship with its whole area. So you can imply it. You'll get a picture which is (around the area that you have taken out) very clearly definite, and as it moves away from it the outlines will become a little vaguer, but you'll be able to see everything that was there. It's fantastic. So in the same way, every hair on your head—this is the real meaning of the saying that the hairs of your head are all numbered—that every hair on your head implies all galaxies because it

wouldn't exist without all the galaxies. Nor would all galaxies exist without the hair, or without the hair having existed. It doesn't make any difference.

So then, this state of complete unity of mind and nature (what's going on) without the intervention—first of all—without the intervention of thought is the state of meditation. It may be called dhyāna, it may be called samādhi, and you may make certain subtle differences between these two states, but forget it for the moment. Now, the way of arriving at this is, of course: there is no way. Because that's the way your mind is working anyway. But you have to find that out. You have to find out that you don't need to accept yourself by trying to accept yourself. It doesn't mean anything to accept yourself because who accepts what? But you don't know that at first. You think there is a "who" who has to accept "what." And you can only do this by trying to do the impossible. This is the method of reductio ad absurdum. So then, in the beginning of meditation there are alternative methods you can use. You can use the questioning method: "Who am I?" and "Who is it that wants to know?" "Who is asking who it is that is asking?" You can—that's the method of interiorization; look within: thou art Buddha.

Then there's the method of concentration: a method of banishing the interior stream of chatter by watching your breathing. Or by focusing your attention on a small point of light or upon a single sound. If you have a tape recorder, all you have to do is you make a loop tape with one sound on it. And you turn your tape recorder on, and that practices meditation for you. And you just listen to that sound. Or—easier still—you hum a sound like om. And you take a long, long, easy, deep breath, and you hum "om, om, om." And just keep it going. And that's a great method. It's one of the best ways if you are an auditory kind of character.

Then you can also do it by looking into a crystal ball or by using a mandala. You see, the way a mandala is constructed with circles, you eventually get the feeling from looking at a mandala that you're dropping into it. And you're going in, in, in, in, in to that circle. Always in, in. And that brings you altogether in one place, and you go in, in, in to the heart of it. The radii—or whatever they may contain—simply have the function of being, as they were, slides which bring you into the center. And you go in, in, in to that, and you get the same effect, visually, as when you do when you listen

into a sound. And you go in, in, in to the sound. You get down to the basic, basic, ungh—you know?—which everything is. And then, when you get that basic ungh, you stay there, see? And you dig that. And eventually you see that that's what there is, and always was, and always will be. In fact, there isn't any time in meditation; time completely disappears. You discover there is only the present.

And that brings up another form of meditation that you can practice, and it is a good one for practicing while being active. You see, sitting isn't the only way of meditation. There are actually four types of meditation. Sitting meditation (called zazen), walking meditation, standing meditation, and lying down meditation. So it's also good to lie flat on your back for these things—except that you may easily go to sleep that way. Walking meditation has long been practiced both by Christian monks and by Buddhist monks. And in the satipatṭhāna method of meditation that is practiced today—in Burma, and Thailand; in Silom—they do a great deal of it walking. It's a very good way because you certainly don't go to sleep that way. And it's a rhythmic movement, and therefore is peaceful: you just walk slowly up and down. This is the way I use mostly. Especially if you go out to Jones Beach and it's clear—you know? You go out on a weekday and it's absolutely clear, and nobody is there, and you can go for miles and miles along the beach in the walking meditation. Beautiful.

So in [those] various ways of posture, shall we say, you can concentrate on sight, on sound. Nobody has done much with touch, but people have done meditation on bodily motion—as in dancing or mudra. That is another thing. Mantra is sound, mudra is gesture. And in Huston Smith and Elda Hartley's film of Tibetan Monks you'll see them doing the mudra method of meditation: constantly moving their hands. This is the same kind of a thing.

Or another method is the letting everything alone, where you allow all your psychic processes and sensuous processes free reign to do anything they want to do. And you will find, for example, that—let's, supposing that, at this very moment, you are all hearing the sound of my voice. Now, if you turn your conscious attention from the meaning of what I'm saying simply to the sound of the words, you will be surprised to discover that you don't have to make any effort to understand what I'm talking about because your

brain will take care of that. And you can just listen to the noise. It'll all go into you and you'll understand. But you can just concentrate on the flow of sound. American Indians often do that when they're encountering a stranger, because they can tell more about him by the tone of his voice than what he says. He may be lying. So you can listen to the tone of my voice and find out whether I'm putting something over on you.

It's the tone that is important, you see? Fundamentally. It's the music that finally counts in life. As I was explaining yesterday, one may regard the universe as a musical phenomenon. That it is a huge system of extremely complex vibrations which is playing. And that's what it's all about. Just, you don't ask what does Mozart mean? You just listen to Mozart. It's great. So you don't ask what the universe means.

Well, now—in a way—this meditation method of just letting your mind alone and let it go where it wants to go has the same disadvantage as lying down on the floor: you may go to sleep. But don't worry about that too much, especially if you do it early in the morning. And, on waking, immediately, is the easiest time. You're just in that moment between sleeping and waking. You will find you are in a very fascinatingly clear state of mind. That's the ideal hour of the day for having an experience of cosmic consciousness. And you can move right into it at that point—don't get up immediately, just lay flat out. You may want to do something or other to refresh yourself a little, like taking a drink of water or something, but right at that moment you find you can have extraordinary clarity. And then you see—as you go on—it begins to become clear to you that there really is no one separate from this changing stream of feelings who's having them; they're just there. And in that moment the problem of what to do about yourself vanishes because there is no separate self.

Thereafter, the most fascinating thing that follows from this is that you can keep up meditation while thinking. This is why a Zen master can also be a scholar and an intellectual: because the way he does his thinking is exactly the way as he sweeps a floor or meditates. There is no illusion of the thinker doing the thinking, there is just the thinking process. And therefore, he doesn't get misled and bamboozled by his thoughts. So, you see, it's very important to emphasize this because the process of meditation is not anti-

intellectual. In fact, it is—I would say—a basic requisite for leading the intellectual life because the person who lives the intellectual life is, of all people, the most liable to be bamboozled with words. And that's the besetting danger of all academicians. That's why they get so stuffy and doubtful, and they suffer from intellectual porcupinism. They're always prickly and querulous, and so on. So the reason is they're starved. They don't have anything to think about except thoughts, and they write books about books. And they don't, therefore, have any first-hand experience of life to use for thinking; to think about.

So—of all places—in a university is the place where meditation should be practiced; of getting out of thought for some time of the day. This refreshes the intellectual life. This gives it a zip and a quality so that, as you begin, like Suzuki—old D. T. Suzuki—he was a great intellectual. But he practiced scholarship in the same natural way that one would sail a boat, or watch clouds. So that he was never (in his pursuit of scholarship) cantankerous and pretentious, he was never pedantic. And, of course, in the field of sinology today in the United States you will find some of the most pedantic people in existence. It's represented by the *Journal of the American Oriental Society*, which is a testy, quarrelsome, bitchy journal. Everybody's going kkrk, kkrk, kkrk at everybody else. And when, you know—a scholar doesn't always have to be a scholar. You can write a scholarly book. I wrote a book called *The Way of Zen*, which is rather scholarly. But then I can do a movie called *The Mood of Zen* which isn't scholarly at all, which is just creating an atmosphere. But boy do the scholars hate it! They say, "This is of no value at all. This is just..." And they call you a popularizer. And they call Suzuki a popularizer because he didn't put in the right kind of footnotes. He was a little vague about some things. But he had forgotten than most of them ever knew!

So, in this way you can sit light to intellectuality. It's a very good thing, because otherwise you become hopelessly ponderous. You become a sort of mechanical, tick-tock being that is full of—it's like you put fish in your mouth, and the whole thing were very small bones with no meat on them at all. And that's the sort of feeling you finally get from being over-intellectual. So, really, I do want to make this plain, because so many people think that the domains of the intellect and the domain of intuition are

mutually exclusive. They're not. It's only: people keep saying, "I understand what you say intellectually, but I don't really feel it." And, therefore, seem to think that an intellectual understanding may even be an obstacle. And a lot of teachers sometimes give that point of view. They say, "The more you think about it, the further you are from it." But I don't think that's true. At least it's oversimplifying the matter. If you've got an intellect, you must use it. It's a divine gift. It's a talent. And nobody can make the sacrifice of the intellect unless they've got one to sacrifice.

A lot of fanatics think they've made the sacrifice of the intellect and say, "I've given up my private opinions, and I'm purely obedient to holy scripture"—or whatever; authority. And that's a lot of—if I may say so—bullshit! Either they haven't thought it through, or else they are concealing from themselves that their obedience to scripture is, at root, their own personal opinion. So there isn't this antagonism. It's very—if you've got an intellect at all, it's very important that you think things through as far as they can be thought through. But, you see, your intellect will eventually tell you its own limitations. It will—in other words—say, "I have a certain function (as intellect) just like the dial on the telephone has a certain function." And if you spell out questions about the existence of God on the dial of the telephone, you'll be told to go to hell! That's not its function! And so you can easily see—as I've tried to explain to you—that the thought process has limitations; that there are things it will not do. It is the symbolizing of the world, but it is not the real world—except insofar as: thoughts are, themselves, vibrations. That's (how I was discussing yesterday) that you can say words, and listen to the words simply as sounds. Then you're getting in closer contact with the real world; with the vibration that's at the basis of everything.

So thought itself tells you that it can't go all the way. And then, when you understand that, thought naturally gives up. And you become quiet. Let it go. Let all the senses go. And eventually you find you're quiet, and you're centered, and still. But don't make an exercise of it! Dōgen, the great Japanese Sōtō Zen master, always told his students, "Do not practice zazen to attain satori. Sit just to sit. This, already—practicing zazen—is being a Buddha." This is sitting like a Buddha. And if you do it with an ulterior motive, you're not doing it. There is nowhere to go. So, likewise, if you

practice centering on the present, you can't do it with an objective, because you're off it. And so: in action. And you try to do what Gurdjieff calls self-remembering, and you've always got your mind on the present, and you're fully aware of what you're doing all the time —see?—then, eventually, you will discover that there is nothing else you can do. Because if you think about the past, that's happening now. Think about the future—that's happening now. There's nothing else but now! So then, when you discover that, meditation becomes automatic. You're always in it. Only: you have to be stupid and exercise a little folly in order to find it out; that is: to try to be there. You see? That's putting legs on a snake, or a beard on a eunuch. Or we would say gilding the lily. But somehow, to wake up, that has to happen.

So it's a most marvelous discovery, you see, when you've been working to try an center, to be present, to be alert and awake, and be just here. And you work at it, and work at it, and one day you go boing! There is nowhere else to be! And then you get a very strange sensation. It seems that the now and you are all the same. And it's like a stream which is moving along, carrying you, but not going anywhere. It moves and doesn't move. It's like looking at a blot, like a Rorschach blot, and seeing the blot running—but into the place where it is. Everything is moving into where it is. And this is state called eternal now. This is the meaning of eternity. Eternity isn't static. So, this is the meaning of the Zen poem which says:

I walk over the bridge, and it's the bridge flow, not the water.

I'm walking on foot, and yet riding on the back of an ox.

I'm empty-handed, and yet a spade is in my hand.

Divine Madness

This morning I'm going to talk to you about a particularly virulent and dangerous form of divine madness which is called falling in love. Which is, from a practical point of view, one of the most insane things you can do, or that can happen to you. Because in the eyes of a given woman or a given man, an opposite who go to the eyes of everybody else a perfectly plain and ordinary person can appear to be God or Goddess incarnate, to be such a

and enchantment that one can say in the words of an old song which probably dates me every little breeze seems to whisper Louise. And this is an extraordinary disruptive experience a subversive experience in the conduct of human affairs. Because you never know when it will strike off for what reason. It's something like contracting a very chronic disease once you get into it, and we try to resolve it sometimes by making it the basis for a marriage, which is an extraordinarily dangerous thing to do. And this is because in Western civilization we have a tradition of the family which is very curious and which would seem to be the most ridiculous composition of disparate ideas imaginable.

When we go back to the origins of Western civilization in the Hebrew and Christian traditions, we find that the idea of marriage and the experience of falling in love are really rather separate things. Because in those earlier times, in agrarian cultures, nobody ever chose their marriage partner. There are certain exceptions to this that in ancient Greece. You would occasionally find a woman who is called a parthenos, which has been mistranslated Virgin. The correct meaning of parthenos is a woman who chooses her own husband. And there were very few of them and in that passage in the Gospel and the Book of the prophet Isaiah where it says "Behold a virgin shall conceive and bear a son and his name should be called Emmanuel." That is in Greek Parthenos, a parthenos shall conceive. And therefore [this] has nothing strictly to do with a virgin, although a woman who chooses her own husband might conceivably be a virgin.

But by and large a marriage was an alliance of families. And it was contract did not simply for the purpose of raising children, yes, but also to create a social unit smaller than a village, a village therefore being a cluster of families. And these families were rather large. So families allied the oldsters, the grandpa and grandma, who had an enormous voice in who their children were going to marry. Used to, you know—I suppose this is no news to any of you—used to dicker and. Use go between. Ones and they considered not only whether this girl was suitable for their son and vice versa but also what kind of a dowry she would bring and whether it would be advantageous to the two families to form such an alliance and of course these things almost up to quite recent times were always important in the marital affairs of royal families. But as is notorious, all royal families and

kings and queens kept concubines and had outside arrangements when and if they should happen to fall in love. And even if they didn't they had mistresses simply to prevent monogamy from becoming monotony. So, that is the basis, you see, and that is why to this day marriage is a civil or our own and or religious ceremony, the basis of which is a contract, a legal contract, which one signs on the dotted line. And therefore there are all kinds of laws as the laws relate to contracts that this contract is very difficult to get out of. The rationale for that being quite obvious. That society believes that it requires a secure environment for children. But also just the general stability of things. Because when people break up a marriage it's sort of unnerving for everyone. You see a couple and you think for a long time that they're the happiest and best adjusted couple you ever met. The next thing you know is that they've split up, and you begin to think now what goes on here are all my friends crazy because you see people breaking up all around. Because if you call it breaking up that's a put-down phrase, to break up. Especially It sounds a smashing something as if for the something precious and been smashed. Whereas it may be something quite different altogether depending on how you evaluate it.

But now, into this kind of feudal conception of marriage. There came in, very largely I think as a result of the poetic movement that was centered in southern France in Provence in the Middle Ages what is called The Cult of Courtly love. This is something about which scholars dispute. According to one theory, the knightly or courtly lover who was also a poet would select a lady to be his heart's desire, preferably a married lady. And he would yearn for her, and sing songs under her window and to send messages to her and little tokens of his devotion, but according to this particular theory he must never go to bed with her. Not only would that be adultery, but it would spoil the state of being in love. That it should always be an unfulfilled state and an unhappy state this is the theory of Denis de Rougemont, in his book *Love in the Western World*, or *Passion in Society*, it has two titles.

And the other theory is probably more realistic that this was first of all the the great ladies of the noble families were awfully bored because their husbands were always out hunting and making war and wenching and so on and therefore they had to have lovers too. And so they did indeed have adulterous affairs on the side, and a great deal of poetry rose out about this,

because you see it's that the my friend Yon Carvarde [sic], always says that laws about sexual relationships should never be liberalized. There should always be strict. Disapproval of adultery and fornication because if there is not that strict disapproval and if it's not difficult to attain it's less fun. And I have worked out those of you who read my book *Beyond Theology*, I worked out a whole theory of the Christian repression of sex that the secret intent of this was to make people more interested in sex because if there is complete liberality in prep promiscuity in every direction it all becomes so easy that it might indeed be in danger of becoming a bore. And then people would seek other dissipations of perhaps a less healthy kind.

So then, as a result of the gradual fusion of these two approaches to the relationship of the sexes we have arrived at the idea of the romantic marriage. In which the two trends are ms-allied to say the very least. You are supposed there for to fall in love with someone. And of your own choice naturally it has to be that way for going to fall in love if that is a choice. And then enter in to that relationship. With a legal contract. In which you get up before a magistrate or a priest do solemnly curse and swear that you will be faithful to each other until death do you part which leads often to matter. And it seems to me perfectly obvious that two young people are extremely anxious. To get into each other's embraces and the only way of doing so under the circumstances is entering into this contract will naturally be ready to promise anything. To fulfill this desire. And while there are indeed many, many married legally married couples who have a very very happy alliance that goes on all their lives and we don't hear about them because. Good news is never news. It's only the unhappy couples who make the newspapers. And there are enormous numbers of them but they are mainly I think people who are lucky. There is no way of making a marriage work, so far as I know, because every attempt to make a marriage work is secretly it within that breast of each partner builds up hostility. You can, I know all this, I'm speaking from a certain amount of that experience. You can work very hard to keep a marriage together, and as you do so, you may fail to recognize you see that you are being untrue to your own emotions. And you think well, I must control my emotions, for the sake of children, for the sake of society, for the sake of everything, like that and so you work, and work and one of the ways of working is to try to convince yourself that you're in love. And you go through the pretenses of love you

empathise yourself with loving language towards your partner you go out of your way you make little lists to remember the tensions you must pay you keep a diary in which you remember your wedding anniversary because you were very liable to forget it and all these things and you really work it now the more you work it the more you are building up promises and expectations for something that you are probably not going to come through with at the level of deep feeling. And everyone is well aware of that is a *hintergedachte*, there you know it in the back of your mind. And so you build yourself increasingly into a wall to wall trap. And so the mutual hostility grows worse and worse and worse so that one psychologist was recently known to ask a patient with whom are you in love against. The most awkward course from the falling in love is between people who are already married to someone else. And because you see this is a cataclysmic and disruptive experience in the presence of shorter and we know I mean Victorian novels—a lot of people are still living out the door in novels. But in Victorian novels, the great thing is where a couple madly in love with each other say to each other well it's best for us that we don't see each other any more this is becoming bigger than either of us. And this, this fantastically mad experience is denied, swept under the rug and strangled. What should one do.

Well as I've often said I'm not a preacher and therefore I don't know what you should do. But I would like to make some reflections on this particular form of madness, and to raise again a very disturbing question. And this disturbing question is as follows: Is it only when you are in love with another person that you see them as they really are? And in the ordinary way, when you are not in love with people you see only a fragmented version of that being. Because when you are in love with someone you do indeed see them as a divine being. And suppose that's what they are truly. And your eyes have by your beloved been opened in which case your beloved is serving to you as a kind of guru. An initiator. And that is why there is a form of sexual yoga, based on the idea that man and woman are to each other as mutual guru and student. And through a tremendous outpouring of psychic energy in total devotion and worship to this other person who is respectively the goddess of the god. You realize by total fusion and contact with the other organism. You go down to the divine center in them and it bounces back and you discover your own or you could

put it in this way which is another aspect of it that by falling in love and regarding falling in love not just as a sort of sexual infatuation, because it's always more than that, isn't it. I mean you can have a great sexual enjoyment with a pleasant friend, you know. But you may do so simply because he or she appeals to your aesthetic senses. But when you fall in love, it's a much more serious involvement, you just cannot forget this person. You feel miserable when not in their presence, you're always yearning, that's get to see more of each other let's get together that's we're completely entangled and then you see you've actually kind of out what I would call spiritual element has been introduced. And the Hindus were sensible enough to realize that this was a means of awakening, enlightenment, and therefore it was. Surrounded. With a sort of rigid religious ritual meditative art, with a form of sexual yoga that is designed to allow the feeling of mutual love to the extent of grand passion to have an extremely fitting fulfillment and expression.

Falling in love is a thing that strikes like lightning and is therefore extremely analogous to the mystical vision. We don't know. No how really people attain the mystical vision. There is not as yet a very clear rationale as to how it happens because we do know that it is opened to many people who never did anything to look for it. And many people especially in adolescence have had the mystical vision all of a sudden without the slightest warning and with no previous interest in that kind of thing. On the other hand many people who have practiced yoga or zen disciplines of what you will for years and years and years have never seen it. And in both classes, there are of course exceptions—there are those who have never had the spontaneous experience and there are those who through yoga or zen have attained this inside. But as yet we are not clear as to why it comes about and if there is any method of attaining it the best one is probably to give up the whole idea of getting it.

But you see it is completely unpredictable and so it is in that way like falling in love, capricious and therefore crazy. But if you should be so fortunate as to encounter either of these experiences. It seems to me to be a total denial of life to refuse it. And what we therefore have to. Admit in our society is so that we can contain this kind of madness. We must be far more realistic about the marriage arrangement so that it can contain the

possibility of falling in love. When you base marriage you see on the falling in love and you go into a pseudo love affair, which is simply hot pants, and set up a rigid family in which you expect to the other person that they will. Always be in love with you, and then, in that context, you go and fall in love, then your falling in love is of necessity disruptive of the marriage and of the family. But you see it could only disrupt it because the love relationship between the two partners was false, was pretended.

But if marriage were based more on the old idea of the reasonable contract between two people to bring up children, who may be expected at the best to be good friends and to allow each other to be persons that is to say in the ordinary sense of the word person to have their own freedom. Then if Love strikes it is tolerated within this arrangement provided you're not going to be so unreasonable as to go on to say well life since I've fallen in love with somebody else I must marry them. Well that's perfectly ridiculous.

You see, in this way we can think about and structure the necessary stable social institution of family sometime without it being constantly threatened of foundering on the rocks of love. Now you see this this then means that when when people marry is they take it any vows at all to each other instead of. Saying that they will always be true to each other in the sense of meaning I Will Always Love You. It means I will be true to you in the sense of I will always be truthful to. I will not pretend that my feelings towards you ARE other than what they are. Because I marry you because I think that you are a reasonable person to live with and therefore I want you to be you I want you to be someone else I want to be a rubber stamp of me—how boring that would be?! So it is a really and the arrangement not of us leave we always say jocularly did you get the ball and chain on him. But an arrangement in which people set each other free and make an alliance to cooperate with each other in certain ways. Now if it should so occur that they are of immense sexual attraction to each other, so much the better? That this should not be a primary factor in entering into marriage. Admittedly, you must be to a certain extent attractive to each other otherwise there will be no progeny. But this is this is seems to me to be a sensible and reasonable view and just because it is sensible and reasonable it can accommodate what is not sensible and reasonable which is falling in love. We should regard then marriage as it is especially if it should possibly

be called holy matrimony, as a mutual, well, setting free of to people to live together in freedom and therefore in responsibility because the present situation although it's pretending to be responsible is in fact extremely irresponsible. Because it is dishonesty with respect to the way you feel towards another person.

Well now really when we go back then to falling in love. And say it's crazy falling. You see we don't say rising into love. There is in it the idea of the fall. And it goes back as a matter of fact two extremely fundamental things that there is always a curious tie at some point between the fall and the creation. Taking this ghastly risk, is the condition of there being life. You see, for all life is an act of faith and an act of gamble. The moment you take a step, you do so on an act of faith, because you don't really know that the floors not going to give in to your feet. The moment you take a journey what an act of faith. The moment you enter into any kind of human undertaking in relationship what an act of faith you see you've given yourself up. But this is the most powerful thing that can be done surrender see and love is an act of surrender to another person. Total abandonment. I give myself to you. Take me, do anything like with me. So, that's quite mad because you see it's letting things get out of control all sensible people keep things in control. Watch it, watch it, watch it. Security. Vigilance. Watch it police, watch it Gods, watch it , who's going to watch the Gods? So actually there for all the cost and wisdom what is really sensible is to let go that is to commit oneself to give oneself up and that's quite mad, so we come to the strange conclusion that in madness lies sanity.

We as Organism

I wonder if it's ever struck you how curious a thing it is that most of the things that we experience we regard as things that happen to us, which we ourselves do not originate, which are events expressing some sort of power or activity that is external to ourselves. And if you consider that, you realize that what you mean by 'yourself' is rather narrowly circumscribed. Even events that go on in our own bodies are put in the category of things that happen to us in the same way as things that go on in the world outside our skins. If there's a thunderstorm or an earthquake—well, it happens to you; you're not responsible for it. But so, in the same way, when you have

hiccup you didn't plan on it. If you have belly rumbles, you had no intention of doing it. And as for the catastrophic act of getting born... well, you had nothing to do with that. And you can spend all your life blaming your parents for putting you in the situation in which you find yourself.

And this way of looking at the world in this sort of passive mood—as something that happens to you—goes right down to our general feeling about life. It goes down to the way in which, as Westerners, we have been accustomed to look at human existence as a precarious event in a cosmos that, on the whole, is depicted as being completely unsympathetic and alien to our existence. In other words, if you're reared with a 20th century—or, shall we say, an early 20th century—common sense (which is based on the philosophy of science of the 19th century with its rejection of Christianity and Judaism), you regard yourself as an accident—a biological accident—in a stupid universe which is mechanical but has no feelings—no finer feelings. A vast, pointless gyration of radioactive rocks and gas in which you happen to occur.

Of course, if you don't have that point of view and you are more traditional, you look upon yourself as a child of God and therefore under authority. In other words, there's a big boss on top of all this who allowed you, at his pleasure, to deign to have the disgusting effrontery to exist, and you better watch your Ps and Qs because that Almighty is looking after you with the attitude of “this is going to hurt me more than it's going to hurt you.”

And when you look at the world in that image—or in the other image that it's a stupid mechanism—either point of view you take, you don't really belong. You're not really part of all this. And I could use a stronger word than ‘part,’ only we don't have it in English. We have to say something like ‘connected with it,’ ‘essential to it.’ Or, to put it in the strongest possible way, it is quite alien to Western thought to conceive that the external world—which is defined as something that happens to you, and your body itself is something that you got caught up with—it is quite alien to our thought to consider all that as you, yourself. Because you see, we have such a myopic view of what one's self is. It's as if, in other words, we selected how much experience is really to be regarded as “me,” as if you focused your attention

on certain restricted areas of the whole panorama of things that you experience and say “I will take sides with that much of it.”

Now, we come here—right at the start—to an extremely important principle, which is the different points of view you get when you change your level of magnification. That is to say, you can look at something with a microscope and see it a certain way, you can look at it with a naked eye and see it in a certain way, you look at it with a telescope and you see it in another way. Now, which level of magnification is the correct one? Well, obviously, they’re all correct, but they’re just different points of view. You can, for example, look at a newspaper photograph under a magnifying glass and where, with the naked eye, you will see a human face, with a magnifying glass you will just see a profusion of dots rather meaninglessly scattered. But as you stand away from that collection of dots, which all seem to be separate and apart from each other, they suddenly arrange themselves into a pattern. And you see that these individual dots add up to some kind of sense.

Now you’ll see at once, from this illustration, that maybe you—when you take a myopic view of yourself, as most of us do—but you may add up to some kind of sense that is not apparent to you in your ordinary consciousness. When we examine our bloodstreams under a microscope we see there’s one hell of a fight going on. All sorts of microorganisms are chewing each other up. And if we got overly fascinated with our view of our own bloodstreams in the microscope we should start taking sides, which would be fatal. Because the health of our organism depends on the continuance of this battle. What is, in other words, conflict at one level of magnification is harmony at a higher level. Now could it possibly be, therefore, that we—with all our problems, conflicts, neuroses, sicknesses, political outrages, wars, tortures and everything that goes on in human life—are a state of conflict which can be seen in a larger perspective as a situation of harmony?

Well, it is claimed, you see, that some human beings have broken through to that vision. That they slipped, somehow or other, into states of consciousness where they see the apparent disintegration and disorganization of everyday life as the functioning of a totality which, at its

level, is completely harmonious. And you could say, “A-ha, at last, I see. I got the point. I’ve seen how all this makes sense.” But what this insight depended upon was your overcoming the illusion that space separates things. That is to say the space—the interval between your body and mind, the interval created by birth at one end and death at the other, and then after somebody’s death, then somebody else’s birth—these are events with intervals between them. And normally we regard these intervals in time and these intervals in space as having no importance, no function.

We tend to see the universe itself as really consisting in all the stars and galaxies. That’s what it is, that’s what we notice. But the space in which all this happens is sort of written off as something that isn’t really there. But what one has to realize is that the space is an essential function of the things in the space. After all, you can’t have separate stars unless there is a space around them. Eliminate the space and you would see you couldn’t have this phenomenon at all. And vice versa: you couldn’t have the space—it wouldn’t be there in any sense whatsoever—if there weren’t the bodies in it. So the bodies in the space and the space are two aspects of a single continuum. They’re related together in exactly the same way as a back and a front, and you just don’t get one without the other.

So the moment you see that intervals—that space—is connective, you can understand at once how you are not just to be exclusively defined as a flash of consciousness that occurs between two eternal darknesses, which is the popular common-sense view which Western man has of his own life: that you consider that in the darkness that comes before your birth there was no you, and in the eternal darkness that follows your death there is, likewise, no you. And I’m going to discuss these matters not by appealing to any special, spooky knowledge—as if I had been traveling on the higher planes and knew all my previous incarnations, and therefore could tell you authoritatively that you are much more than this individuality. I’m going to do it on a basis of complete common sense that everybody has access to the facts, and that just what you have to realize is that life is a pattern of immense complexity, and what you call ‘yourself,’ as a living organism—say, I am my whole body, at the very least—now what is that body? That body is recognizable, and I recognize my friends when I meet them again (with luck), and you recognize me. Although, the last time any of you saw

me, I was absolutely something entirely different from what I am now; just as the flame of a candle is never a constant. A flame of a candle is a stream of hot gas. Only, you say “the flame of the candle” as if it were a constant. Well, it is a recognizably constant pattern: the spear-shaped outline of the flame and its coloration is a constant pattern. But in exactly the same way, we are all constant patterns, and that’s all we are; the only thing constant about us at all is the doing rather than the being. It’s the way we behave, the way we dance; only there’s no ‘we’ that dances, there’s just the dancing. Just as the flame is the streaming of hot gas, just as a whirlpool in a river is a whirling of streaming water. There is no thing that whirlpools, there is the whirlpool.

And in the same way, each one of us is a very, very delightfully complex undulation of the energy of the whole universe. Only, by process of mis-education we’ve been deprived of the knowledge of that fact—not as if there was someone to blame for this because it’s always with our own tacit consent. Because life is, basically, a game of hide-and-seek. Because life is pulsation: on and off, here it is and now it isn’t. And by being this pulsation, we know it’s there. See, you don’t know what you mean by ‘on’ unless you know what you mean by ‘off.’ That’s why, when we want to awaken someone, we knock at the door. It’s not enough to slam the door once with your fist and make this big noise, but you keep up a pulsation. Because that, by its on-and-off-ness, attracts attention.

All life, you see, is this flickering in and out. Only, there are enormous rhythms in it. There are very fast flickering ins and outs like the reaction of light upon our eyes, such that when I take a lighted cigarette in the dark and I spin it, you will see a circle of fire. Because the reflection of that cigarette tip on your retina lasts; it endures, just in the same way as on a radar screen an image stays a little while until it’s revived by another round. So in that way, you see, you notice continuity. And in the same way, then, you notice the continuity of a light. Because although, like, say, with an arc lamp—an arc lamp is actually a flickering light, and that’s why they don’t allow arc lights to be used in any shop where there’s a circular saw moving: because sometimes the flickering speed of the arc light so synchronizes with the turning speed of the teeth on the blade, that the teeth look as if they’re not

moving, and so anybody who might put his hand on the blade will have it chopped off thinking it was a still one.

So, in this way, very fast impulses are looked upon as constant. And we see—where there are fast impulses—a solid thing. When you look at the blade of a propeller or an electric fan, the separated four or three blades become a solid disk and you cannot throw an egg through it. Well, so in exactly the same way, you can't put your finger through a rock because the rock is moving too fast for your finger to go through. That's the meaning of the whole phenomenon of hardness. Hardness in nature is immense energy, but acting in a very concentrated space; restricted space, but going to beat hell. That's why you can't get through it.

Now, from those very tiny fast rhythms, which give us the impression of continuity, there are also—in this universe—immensely slow rhythms, and these are very difficult for us to keep track of. And they impress us and depress us as our own life and death, as our coming and going which goes for what is—to us—such a slow pace that we can't possibly believe that it is really a rhythm. We think of it as our birth, as something quite unique that could never occur again, because we're so close to it, you see? And it's moving so slowly. And so, with that point of view, we are like Marshall McLuhan has said—he borrowed a metaphor from me—which is that we are driving a car looking at the rear-vision mirror. That means that the environment in which you believe yourself to exist is always a past one, it isn't the one you're actually in. The process of growth, the basic process of biology, is one in which lower orders are always being superseded by higher orders. But the lower order can never figure out—or only very rarely figure out—what the higher order is that's taking over, and may see it as a terrible threat; as total disaster, as the very end. But [it] can never be aware that the principle of growth always has, and always will, continue. Because that's what's going on. But you never know what the next step is going to be, because if you did know you wouldn't take it—because it would already be past. Do you understand this? That any certainly known future is an event of which we can say you've had it, and in that sense it's past.

When we play at games, and we—say, in chess, or in bridge, or whatever game you're playing—the outcome of the game becomes certain, we at that

point cancel the game and begin a new one. Because the whole zest of the thing—and which takes me back to the idea that this whole thing is a hide-and-seek game—is that you don't know what the next order coming up is. But one thing you can be sure of: it will be an order, and it will comprehend you.

At the moment we stand at a time in history where we're beginning to think of the great countdown on the end of the human race. Terrifying possibility that, through atomic energy, we may obliterate this planet and turn the whole globe into a star. Maybe that's the way all the stars started. Imagine, you know, this great thing coming up; the countdown on the end: seven, six, five, four, three, two, one, PEEEEERRRRRRRRRUUMMMM! Ssshhhhhhhhwshwshwshwshwww... POOSSSSHHHHH! Ssshhhhwwwrrrrhh... POOSSSHHHH! Where have you heard that before? You sit on the seashore and you hear the waves going in and out. And you don't stop to think. That's what you're doing. That's what the whole business is doing. And there are places where the wave mounts and mounts, and it gets too big for its boots or whatever, and it spills and breaks. We could do just that. But... very important to realize that that's what you're doing because then you don't get panicky about it. And the person who's going to press that button is the person who's going to be in panic.

So if you realize that that's what it is and that it doesn't really matter if the whole human race blows itself up, then there's a chance that it won't do it. That's the only chance we have. Not to do this thing, which attracts us like a kind of vertigo, like a person who looks over a precipice and is all set to throw himself over, or a person who jumps out of a plane when they're skydiving and forgets to pull the parachute ring because he gets fascinated with a target. It's called target fascination; you just go straight at it, you see? So we can get absolutely fascinated with disaster, with doom. All—you know—all the news in the newspapers is invariably bad news. There is no good news in the newspaper. People wouldn't buy a newspaper consisting of good news. Even the free press is full of terrible news. Except the San Francisco Oracle. And the fascination, you see, for this doom might be neutralized if we would say, "Well, why bother about that?" It's just another fluctuation in this huge, marvelous, endless chain of our own selves and our own energy going on.

See, here's the problem: because of our myopia, because of the way we've restricted consciousness to focus upon just that certain little area of experience that we call 'voluntary action'—that's us—and everything else happens to us. Now, that's obviously absurd. Let's suppose you take in your hand one of those toys—a gyroscopic top—and you suddenly notice, the minute you get this in your hand, that it has a kind of vitality to it. It seems to resist you, it starts pushing you in a certain way, see? And sometimes you're with it and following it, and then sometimes—you see, it's just as if you held a living animal in your hand. You know, you pick up a hamster, you know, or a guinea pig, and you hold this little thing in your hand and it's always trying to escape. So the gyroscope always seems to be trying to escape your hold. Now, in exactly the same way, what you're experiencing all the time: all sorts of things are getting out of control and doing things you don't expect. It's trying to escape your hold. Alright, then don't grab it so hard! And you discover that this living thing that you're feeling—like the gyroscope top—it's your own life. Because you can see very simply that you would not understand the experience that you call 'voluntary action' and 'decision,' 'being in control' and 'being yourself,' unless in opposition to that there were something else. You couldn't realize self and control and will unless there were something other, out of control, and instead of will, won't! It's the two, together only, that produces the sensation that you call 'having a personal identity.'

Only, there is a funny thing about human consciousness which has been worked out very carefully in Gestalt psychology, which is that our attention is captured by the figure rather than the background, by the relatively enclosed area rather than the diffuse area, and by something moving rather than what is relatively still. And to all those phenomena that—in this way— attract our attention, we attribute a higher degree of reality than the ones we don't notice. That's only because, for the moment, those are more important to us. Consciousness, you see, is a radar that is scanning the environment to look out for trouble just in the same way as a ship's radar is looking for rocks or other ships. And the radar, therefore, does not notice the vast areas of space where there are no rocks, no other ships. So, in the same way, our eyes—or rather, the selective consciousness behind the eyes—only pays attention to what we think is important.

I am at this moment aware of all of you in this room, of every single detail of your clothing, of your faces and so on, but I'm not noticing it all. And therefore I will not be able to remember tomorrow exactly how each one of you looked and what you were wearing. Because what I notice is restricted to things that I think are particularly important. If I notice some particularly beautiful girl in the audience, then I might notice also what she's wearing, and that would be memorable. But by and large—you see—we scan things over, but we pay attention only to what our set of values tells us we ought to pay attention to. And so, in this way, we have this rather myopic way of looking at things and we screen out—from attention—anything that is not immediately important to a scanning system based on sensing danger. But, quite obviously, you—as a complete individual—are much more than this scanning system. You are in relationships with the external world that, on the whole, are incredibly harmonious.

Going back to this illustration of every living body as something like the flame of a candle: the energies of life—in the form of temperature, light, air and food, and so on—are streaming through you all at this moment in the most magnificently harmonious way. And you're—all of you—far more beautiful than any candle flame. Just sitting in these chairs; just zzzhwwwwt: going, you know? Only, we're so used to it we say about that, "So what? Show me something interesting. Show me something new." Because it's a characteristic of consciousness that it ignores stimuli that are constant. When anything is constant it says, "Okay, that's safe. It's in the bag. Needn't pay attention to that anymore." And therefore we eliminate—systematically, from our awareness—all the gorgeous things that are going on all the time, and instead only become focused on the troublesome things that might happen to upset it. Which is alright, but we make too much of it and become... we make so much of it that we identify our very selves—I, ego—with the radar; with the troubleshooter. And that's only [a] tiny fragment of one's total being.

So that if you do become aware that you are not simply that scanning mechanism, but you are your complete organism, then—very swiftly in turn; as a consequence of that—you become aware that your organism is not the way you think about it when you look at it from the standpoint of conscious attention, from the standpoint of the ego. From the standpoint of

the ego, your organism is your—kind of—vehicle, your automobile, in which you go around. But from a physical point of view, your organism is, again, like the candle flame or the whirlpool: it is something which is a continuous patterning—or activity—of the whole cosmos.

The key idea here is pattern. Let's suppose—I'm going to borrow a metaphor from Buckminster Fuller—suppose we have a rope, and one section of this rope is made of manila hemp, the next section is cotton, the next section is silk, the next section is nylon, and so on. Now we tie a knot in this rope—just an ordinary one-over knot—and you find, by putting your finger in the knot, you can move it all the way down the rope. Now as this knot travels, it's first of all made of manila hemp, it's then made of cotton, it's then made of silk, it's then made of nylon, and so on. But the knot keeps going on. That's the integrity of pattern; the continuing pattern, which is what you are. Because you might, you know, be—for several years—you might be a vegetarian, and you might be a meat-eater, and so on. And, you know, your constitution changes all the time, but your friends still recognize you because you're still putting on the same show. It's the same pattern that is the recognizable individual.

But we are trained in our language. The very structure of the language we talk deceives us into misunderstanding this, because when we see a pattern we ask, "What's it made of?" Like, you see a table: is it made of wood or is it made of aluminum? But then, when you inquire into what is wood and how does wood differ from aluminum, the only thing a scientist can tell you is the different patterns—that is to say, the different molecular structure of the two things. And the molecular structure is not a description of what something is made of, it is a description of what dance it is performing, what motions, what kind of a symphony this is. Because, basically, all phenomena of life are musical, and gold differs from lead in exactly the same way that a waltz differs from a mazurka: it's a different dance. And there isn't any thing that's dancing.

That is a deception we get into because we have two parts of speech in our grammar: we have nouns and verbs. And verbs are supposed to describe the activities of nouns. And this is simply a convention of speech. You could have a language with only verbs in it; you don't need any nouns. Or you

could also have a language with nouns only and no verbs, and it would perfectly adequately describe what's going on in the world. So if you were used to speaking with a language that had one part of speech, you could say just as much as we can with two and be a lot clearer—only: at first it would sound awkward, but you'd soon get used to it. And then, when you got used to it, it would be a matter of common sense that the patterning of the world is not some kind of stuff that's patterning; you don't have to seek for a substance underlying the whole thing, it's just patterning! And we're all that.

And so, in this way, there is—to a person who really wakes up—you very soon realize that your existence is not something that is just the hopeless little creature that's suddenly confronted with a great big external world that goes GAAAH! at it—you know?—and eats him up. Every tiniest little thing that comes into being—every minute little fruit fly or gnat or bacterium—I will go so far as to say is an event upon which this whole cosmos depends. Because this thing goes both ways: it's not only that every little organism which exists depends on its total environment. The reverse is also true: that the total environment depends on each and every one of those little organisms. So that you could say this universe consists of an arrangement of pattern in which every event is essential to the whole thing.

Now, we screen that idea out of our consciousness in exactly the same way that we screen out the perception of space as an important reality. Just as we pay attention to the figure and ignore the background, so we see one way of looking at things: mainly, that the organism is very frail against the environment. It lasts a long time—the environment—but the organism only lasts a short time. What do you mean, the environment lasts a long time? What does the environment consist of? Just a lot of little things. And yet, there is the environment just as the same way as there is the face in the newspaper photograph behind all those little dots. When you get far enough away from it you see the face. When you get far enough away from all the organisms and the little bits of things you see the environment in another scale of magnification. But actually, the whole thing is arranged in a polar system where the enormous depends on the tiny and the tiny depends on the enormous, and you get a relationship between these extremes which can be called a transaction. That is to say, a transaction—when there's buying and

selling, it's impossible to have buying without selling and selling without buying.

So you always—wherever you are looking at the general panorama of sensory experience, try switching. Try shifting your attention to all the things you thought were unimportant—to the constants, to the background—and begin looking at the spaces between people. All painters have to learn this, because—especially if you're working in oils—you actually have to paint in the background. Weavers know this because when they are making patterns in weaving they've got to weave the background as well. Or if you do needlepoint with embroidery, think of the hours you spend putting in the background over the canvas in wool. And you become aware of it. Same way that people have made the great oriental carpets. They're much more aware of the background as constituting an essential part of the total experience.

So as you become aware of this you see the same thing that you notice in music, namely that it is only as a result of hearing the interval between tones that you hear any melody. If you don't hear the interval you're tone deaf, and all notes are the same noise; all you hear is rhythm if you don't hear any melody. You've got to hear the interval. So then: watch the intervals between people, the things that aren't said, the things that are tacit, the things that are implicit rather than explicit in all life. And then you begin to get connected. You know, it's very important to have a connection in life and to be in the know. And this is the way it fundamentally comes out of seeing the thing you forgot.

You know, you can always bug people in a beautiful way—in a very helpful way—by just saying to them, “What did you forget?” They say, “Well, I don't know. Was I supposed to remember?” “I'm really not trying to put you on. I mean, it's not difficult; this is something completely obvious that you forgot. You'll easily remember it because it's so obvious.” Well, that's the hardest thing in the world to think of. What's the most obvious thing I forgot? Huh, what's that? Well, who do you think you are? Well, how do you answer that question, “Who are you?” Well, you give a name. You say, “I'm Joe Dokes, I'm Alan Watts.” That's not true. That's what people told you you were. They put that name on you and they taught you to identify

with it and to behave as it was expected to behave. But that's not who you are. You know very well. Go back in your memory, go back into your infancy before they started telling you all this stuff. Who are you? And if you get with that you'll know very well who you are: the jolly old ancient of days.

Only: there's a conspiracy that you mustn't let on about that because everybody is. And if one person realizes it, the other is a little bit offended and will say, "Well, how come you're so great?" We worked it in Christianity by a very clever thing: of allowing just one individual to be recognized as the God incarnate, and nobody else, therefore, could be. And since he had been safely crucified and whisked up to heaven, he wouldn't bother us anymore. So everybody, therefore, who gets an intimation of who they really are and ever comes out with it—in Christian civilization—people say, "Who the hell do you think you are? You're Jesus Christ?" Well, you say, "Jesus Christ said he was Jesus Christ and everybody put him down for it, and that's what you're doing to me." "Oh," they say, "forget that one." Because that's like somebody comes out and composes some perfectly terrible music, and the critics say, "This man is a cacophonist, he is completely incompetent." And he said, "Did you read the reviews of Beethoven's First Symphony when it was performed at Vienna?"

Now, the thing is: we allowed one person, you see—one human individual—to be the incarnate God, because we have all been living in a theory of the universe in which the individual is simply involved in something that happens to him. And we feel that this thing that happens to us is reality, it is facts that we have to face and accept and cope with. See? It's always something other than you. You don't recognize it as an integral part of your own being without which you cannot know what you mean by the word 'I.' But in the truth of the matter is, though, that if you will face it out, every single one of us knows that that isn't true. There is, as it were, a recess of the soul—of the psyche—where everybody knows perfectly well that you are not just this irresponsible little mouse that's been chucked down into this world, but that you are really doing this work. You're running it.

Only: you can't admit it just in the same way as you can't admit that you're responsible for the way your own heart beats. You say, "Oh that's not my

doing. I've no control over my heart." Do you have any control over being conscious? Do you know how you will? When you say, "I intend to take my hand down from my face and put it on my leg"—I can do that, but I don't know how the hell it's done. So that what we mean by the capacity of voluntary control—in the ordinary sense of the word—we don't understand it at all! So you might say, in a funny backwards way, that the only kind of control you really understand is that where you're not using your will because you just do it. So easy, like you open and close your hand. You know how to do it? Sure you know how to do it. But you can't put it into words and explain to someone how to do it. You say, "Well, come on. Aren't you human? Don't you know how to open and close your hand? Just do it, silly!"

But we don't realize, you see, that just as we know how to do this, we know equally well how to turn the Sun into light, how to blue the sky, how to blow the wind, how to wave the ocean, how to digest food. And, I might add, to be digested—by bacteria—and transformed. As we transform our steaks we will, in turn, be transformed. But the pattern keeps going. And it's always you. Only, you see, you have this marvelous capacity to transform yourself without knowing that you're doing it. Therefore, you keep surprising yourself, and therefore you keep on doing it. Because if you didn't surprise yourself you wouldn't go on doing it. It's just the very fact, you see, that you seem to be the victims of a thing you don't understand, and that you seem to conclude your life every time in a wipeout called 'death'—where all your control goes—it's just exactly that opposite condition to what you call 'being alive' that allows you to be alive! Only: every time it happens it's like it's new. It's like every time you're born it seems like it was the only time. But, of course, if it wasn't like that you wouldn't do it.

On Being God

Between Western psychology, psychiatry, and psychotherapy and the so-called religions of Asia, there is common ground because both are interested in changing states of human consciousness. Whereas, institutional western religions – Christianity, Judaism, and even Islam – are relatively less interested in this matter. Western religions are more

concerned with behavior, doctrine, and belief than with any transformation of the way in which we are aware of ourselves and of the world. But this matter concerns psychiatry and psychology very much. Only, those states of consciousness which are not normal are usually treated in Western psychology as being in some way sick.

There are, of course, exceptions to this. And they have increasingly been exceptions. In the work of Jung, and to some extent even of Groddeck, of Prinzhorn, of more modern people as Rogers and Ronald Laing, changing consciousness is often looked upon as a form of therapy. But in general, different states of consciousness from the normal are regarded as a form of sickness. And therefore, official and institutional psychiatry constitutes itself the guardian of sanity and of socially approved experience of reality. And very often it seems to me that reality appears rather much the way the world is seen on a bleak Monday morning, in this official doctrine – I might even say dogma – of what reality is. Because after all, we know that our science, such as it is of psychology, is founded in the scientific naturalism of the nineteenth century. And the metaphysical and mythological assumptions of that science still underlie a great deal of psychological thinking. In behaviorism eminently, but also, to a large extent, in official psychoanalysis.

Indeed, one might say that psychoanalysis is based on Newtonian mechanics, and in fact could be called psycho-hydraulics. Not that that analogy is altogether inappropriate because there are certainly respects in which our psychic life flows and exhibits the dynamics of water, but of course we want to know what kind of water. And for the scientific naturalism of the nineteenth century, the basic energies of nature were considered to be very much inferior to human consciousness in quality. Ernst Haeckel, the biologist of that time would think of the energy of the universe as blind energy. And correspondingly, it seems to me that Freud thought of the libido as essentially blind, unconscious energy embodying only a kind of formless, unstructured, and insatiable lust.

This is a generalization, some modification in that thinking is of course possible. But the tendency is to regard all that which lies below the surface of human consciousness as being less evolved, because you must remember

that it was also the time of Darwin's theory of evolution, of seeing the human mind as a fortuitous development from much more primitive forms of life coming forth by purely mechanical processes, by natural selection, and by the survival of the fittest.

And therefore, man was, in general seeing, as a fluke of nature and embodiment of reason, emotion, and values for which the more basic processes of nature had no sympathy and about which they did not care. If, therefore, the human race was to flourish, we must take charge of evolution. It can no longer be left to spontaneous processes, but must be directed by human ingenuity. Despite effect, that although our brains are capable of dealing with the colossal number of variables at once, our conscious attention is not. Most people cannot consider more than three variables at the same time without using a pencil. And this shows that in many ways the scanning process of man's conscious attention is very inadequate for dealing with the infinitely many variables, the multidimensional processes of the natural universe. However a serious attempt has been made, and scientific naturalism issued in a fantastic fight with nature.

In this whole notion of the conquest and subordination of nature which has, as a matter of fact, very ancient, non-scientific and biblical origins. With the idea of man as the head, and chef, and ruler of nature, in the image of God, and the time has now dawned upon us all when our attempts to beat nature into submission are having alarming results. Because we see that it is very dangerous to mess around with processes that we don't understand, that have enormous numbers of variables, and we have begun to wonder whether we hadn't better leave well enough alone.

At the same time, although I said that Western psychology had more in common or more common interests with Oriental religion than it does with Western religion, there is a sense in which psychiatry and psychotherapy are becoming the religion of the West. Psychoanalysis has much in common with the forms and procedures of institutional religion. There is, for example, apostolic succession: the passing down of mana [mana: impersonal force, authority, magical power], of qualified power to practice therapy from the father-founder Sigmund Freud through his immediate apostles to an enormous company of archbishops and bishops. Among

whom there are of course, as there was in Christianity, heresiarchs such as Jung, Groddeck, Rank, and Reich, and the heresiarchs are duly excommunicated and anathematized. There are rituals, as there are also rituals with religion. There is the sacrament of the couch, there is the spiritual discipline of free association. There is the mystic knowledge of the interpretation of dreams, and there are also the two great symbolic fetishes: the long one and the round one.

Now it is extraordinarily easy to make fun of all this. And we must not forget that we owe a tremendous debt to Freud if for nothing else than pointing out that much of ourselves – of which we are aware in terms of the conscious ego – is not really ourselves. It is something superficial, however we define its nature it is superficial, and the realities of human life are not under the gaze of its scanning process, at least not in the ordinary way. And that was a tremendous revelation, there is no question about that. But one sees troublesome signs when the doctrines and processes of psychiatry, psychoanalysis, and so forth become officialised. And I think, Thomas Szasz, in his books *The Myth of Mental Illness* and *The Manufacture of Madness*, is pointing out something extremely important to us: which is that in a fact the psychological official of today is the priest. And that he is beginning to exercise the same sort of controls over human life as were exercised by the church in the Middle Ages. So the professor of psychiatry at Columbia or Harvard or Yale medical schools has today the same sort of intellectual respectability and authority as the professor of theology at the University of Toledo or Padua would have had in the year 1400.

Now you must realize that the theologians of those days not simply believed in their cosmology and theology, they almost new it was true, in the same way that our scientists know certain things to be true – despite the fact that they change their opinions very often while they hold them. Their have in a fact the force of dogma, as witness the anathematization of Velikowsky for his uncomfortable ideas. And therefore, there are heresies existing today which are persecuted in the same way as heresies were persecuted by the Holy Inquisition. And they are persecuted out of kindness in exactly the same way that the Holy Inquisition persecuted heresy out of kindness and deep concern for human beings. That is unimaginable to us, but it was so. But after all, if you seriously believe that someone who did

not hold the catholic faith and who voluntarily rejects it, would be tortured physically and spiritually forever and ever and ever in hell, you would resort to almost any means to preserve a fellow human being from such a fate – especially if the complaint, or disease of heresy from which he suffers was infectious.

You would first of all reason with him. And if he was not responsive to reason, you would resort to abuse and to forceful argument. And if he was responsive to that, you would give him shock treatment and bang him about. If that didn't work, the thumb screw, the rack, and the iron maiden. And if that didn't work – as a last desperate result – you would burn him at the stake in the pious hope that in the midst of those searing fires he would think better and make a last act of perfect contrition and so be rescued from everlasting damnation. And you did all this in the spirit of “this is going to hurt me more than it's going to hurt you”, in the spirit of the surgeon who is very, very sorry indeed that he has to make you undergo this extremely painful operation, but it is in your best interest, and there really is at least a fifty-fifty chance that you may survive.

And so therefore, in perfectly scientific, medical spirit, people may be very arbitrarily and without due process deprived of their civil rights, incarcerated in prisons that are in many cases much worse than prisons for criminals, and generally left to rot, be neglected and ignored and when they are bumptious, given shock treatment or put in solitary confinement. For what? Because they have unorthodox and heretical states of consciousness.

A lot of these people are not dangerous until provoked into being dangerous by being ignored, by being treated as machines and in general define as nonhuman. And if you are define as nonhuman there is precious little you can do about it, because everything you say that sounds human will be taken as a kind of utterance of a mechanical man, as imitating humanness out of lunatic cunning. You will be suspicious, everything you say will be listened to in a different way and with different ears. And you will have one heck of a time talking yourself out of it, because there really are no rules as to what one must do when incarcerated for having unorthodox consciousness. There is no clear road to repentance.

And this is found likewise in jails where people are incarcerated on one, to ten year sentences, as in places like Vacaville, California. When I visited such prisons young men have come to me in perfect desperation and said, “I don’t know what’s happened to me because I want to live like a decent citizen. I know I’ve done things that are wrong, but I simply don’t know what is expected of me here. If I try to do what’s expected, they say I’m compliant, and that seems to be some sort of a sickness.”

Thomas Szasz drew attention to this when he quoted a discussion of the types of schoolchildren who may very well need therapy. There were overachieving, there were underachieving children. There were children who exhibited erratic patterns, there were children who were sort of dully mediocre. In fact, every sort of child can be given a diagnostic name, for his behaviour, which sounds sick. As Jung once suggested, “Life itself is a disease with a very poor prognosis. It lingers on for years and invariably ends with death.”

And I submit that with our present knowledge of the human mind, such power in the hands of psychiatrists is amazingly dangerous. What I would suggest that today we know about as much concerning the human mind as we knew about the galaxy in 1300. And that while there are indeed individuals who are certainly able to perform psychotherapy, it is the sheerest arrogance for anybody to say that he is officially qualified to do so. We do not know how it is done, just as we do not know, really, how musical, artistic, and literary genius is done. You cannot really teach it, you can put the tools for doing these things into people’s hands, and you can show them how to use the tools, but whether they will use those tools with genius is quite unpredictable.

And this is above all true of the art of psychotherapy. We don’t know how it’s done. We have got some vague ideas. There probably are some people who, by reason of their mental derangement are probably not qualified to perform it because they are maybe out just to make other people into messes. But to say that there are certain standards and certain examinations that can be passed and certificates that can be issued which doing it qualify people for this work is, I think, pernicious nonsense. And is used, of course

out of economic self-interest, when those who consider themselves official therapists run into competition.

The same was done by religion. I was talking, imagine it, to a Buddhist priest in Thailand, some years ago. I was looking at some books in a bookshop in the precincts of a Buddhist temple, and I was wondering over it, and I noticed a book on a certain form of Buddhist meditation, and I murmured, “Hmm, Satipatthana,” which is the name of a certain kind of Buddhist meditation.

And a voice suddenly said to me, “You practice Satipatthana?” I looked up and there was a skinny Buddhist monk in a yellow robe with rather red eyes looking at me.

I said, “Not exactly Satipatthana. I use a different method. It’s called Zen.”

“Oh Satipatthana not Zen.”

I said, “Well, it’s something like it, isn’t it?”

“No.”

“Well, it’s rather like yoga,” I said. “Isn’t it?”

“Not yoga, no. Satipatthana different. Only right way.”

“Well, look,” I said to him. “I have a lot of Roman Catholic friends who tell me that their way is the only right way. Whom am I to believe? You know, I said, you’re like someone who’s got a ferryboat for crossing the river, – I used the Buddhist simile – and another fellow down the stream has opened up a ferry business. You go to the government, and say, ‘He’s not authorized to operate a ferryboat, because he’s competition to you. Let all operate ferryboats who will. And if you haven’t got the sense to get off, to stay off one that sinks, it’s your fault.’” And after all I could say to him “You believe that everything that happens to you is your own karma, so why worry?”

But now, it's so interesting that sense, official psychiatry, and I underline the word official because I hope those of you in this audience who are therapists will regard yourselves as unofficial. At least that'll give you an out. But nevertheless, official psychiatry has curious things in common with Western religion as well as with Eastern. It believes, that I said, only insofar as it has an interest in states of consciousness, and in times to regard other states of consciousness than the ordinary as sick. But it has one very important feature in common with Western religion. And to (understand) that we have to go a little bit (deeper) into Western religious history and ask ourselves what in Western religion – and especially in Christianity, and this goes also for Judaism, Islam – what is the great heresy?

Curiously enough the great heresy was first, in the West, committed by no less a person than Jesus Christ who believed himself to be God. This of course will be unquestionably true if you think that the Gospel of St. John has historical value. It is a little vague in the synoptic Gospels, but if you read the Gospel of St. John there is absolutely no doubt about it, for he said, "I and the Father are one. He who has seen me has seen the Father. Before Abraham was, I am. I am the way, the truth, and the life. I am the resurrection and the life." He said all that, according to this Gospel, and that is something that in the Western world you are not supposed to say. Especially, you are not supposed to believe it, and naturally it was very difficult for Jesus because he was saying all this in the context of the Hebrew culture. And he tried to find language in the Hebrew scriptures with which to express his state of consciousness because he had an unusual state of consciousness, as I read it, he had cosmic consciousness, otherwise known as mystical experience, otherwise known as moksha, nirvana, bodhi, satori, fana-al-fana or what you will. And that happens to people. It has happened as far back as we know. It happens all over the world, and in all cultures. We don't know very much about it. We don't really know ways in which to make it happen because it seems to be of the nature of it that it is a spontaneous surprise. But it unquestionably happens, and most people keep their mouths shut about it when it does.

I had a friend who, in the middle of having a stroke, had this illumination. And he said to me, "I fear to speak to my friends of this, but it was the most beautiful experience. I shall never be afraid of death. In fact, I recommend

to everyone to have a stroke.” This was my friend Jean Varda, the lately deceased Greek painter.

But Jesus certainly had this transformation of consciousness, and he was crucified for it. Why? Because he had committed an act of insubordination and treason against the cosmic government. Because if you believe that God is a monarch, an absolute, omniscient, and omnipotent authority – shall we say a sort of cosmic ego – then to claim to be that, is to introduce democracy into the Kingdom of Heaven. To usurp divine authority and to speak in its name without proper authorization. And they asked Jesus, “By what authority do you speak – of heaven or of men?” And he was tricky about answering that one, he said “By what authority did John the Baptist speak?” And they were nervous about answering that one. He could have asked by what authority did Isaiah speak etc, or Moses?

If you believe that God is a monarch, an absolute, omniscient, and omnipotent authority – shall we say a sort of cosmic ego – then to claim to be that, is to introduce democracy into the Kingdom of Heaven. To usurp divine authority and to speak in its name without proper authorization. And they asked Jesus, “By what authority do you speak – of heaven or of men?” And he was tricky about answering that one, he said “By what authority did John the Baptist speak?” And they were nervous about answering that one. He could have asked by what authority did Isaiah speak etc, or Moses?

But Moses became official authority, and if you could wangle it, you said that your words were simply an extension of what Moses said, because Rabbi So-and-so said it who got it from Rabbi So-and-so who got it from Rabbi So-and-so who got it from Moses. Then it was okay. Notice this, that to be an authority today in the academic world depends on documentation. It is not enough to say, “For I say unto you.” You must put in your footnotes, and the more the footnotes, the more the authority, obviously. So our dissertations tend to be books about books about books, and our libraries multiply by mitosis.

So when somebody speaks as an authority, that means to speak as an author, that all it means. It’s a statement of which you are the author and, therefore, for which you assume responsibility. That is to speak with authority, and to

be original – is likewise not to be freaky – but to speak from the origin. That is what Christians mean when they say to speak in the spirit, to have your mouth possessed by the Holy Spirit, as they believe the mouth of Jesus was possessed by the Holy Spirit.

So the Gospel of Jesus, which of course was hushed up from its inception, was that, “Wake up, everybody, and find out who you are!” Asking that, again in the Gospel of St. John, they – pointing to his disciples – may be one, “even as you, Father, and I, are one.” And when he was accused of blasphemy, the Jews took up stones to stone him if you know, and he said, “Many good works have I shown you from the Father, and for which of these do you stone me?” And they said, “For a good work we do not stone you but for blasphemy, because you, being a man, make yourself God.” Now listen to the reply. He said, “Is it not written in your law, I have said ye are Gods? And if that is what the Scripture says, it cannot be denied. So why do you tell me I blaspheme because I say, ‘I am a Son of God’?” No answer. Because I said, I am a Son of God.

It doesn't say that in your King James translation, it says: I am the Son of God. And you will see the italicized, then you will think that is done for emphasis if you don't realize that passages in italics in the King James Bible are interpolations by the translators. In Greek, leaving out the definite article is equivalent to having the indefinite article. Υἱὸς τοῦ Θεοῦ (Hyiòs toû Theoû) is “a Son of God,” not ὁ Υἱὸς τοῦ Θεοῦ (ho Hyiòs toû Theoû). So “Son of” in Hebrew and in Arabic means “of the nature of.” When we call someone a “son of a bitch” we mean bitchy. And so if you call someone a “Son of God,” you mean divine, of the nature of God. As the Nicene Creed subsequently defined it, “He is of one substance with the Father.”

But what happened was, that this being blasphemy for the Jews, it became blasphemy for the Christians, for anyone else than Jesus to say it. They said, “Okay. It was so with you, but there it stops! No more of this business.” And as a result of that, Jesus was made irrelevant by pedestalization, by being kicked upstairs, in spite of the fact that he said, “Greater works than these that I do, shall you do.” Oh no. Upstairs with you baby, because we just cannot have that sort of thing going on in a monarchical universe. We're not going to have democracy in the Kingdom

of Heaven. So this is why the Gospel is impossible, because we are supposed to follow the example of Christ when he says for example, “Be not anxious for the morrow.” Do not worry about what you shall eat, what you shall drink, and what you shall wear. God will take care of you. Doesn’t he take care of the birds? Don’t the flowers grow. And they’re wonderful, they’re crazy, they’re great! What are you worrying about? I have never heard a sermon preach on that, never; because it’s totally subversive, the economy would crash. So they said, “Oh yes, that’s all very well, but he was the boss’ son.” He had that colossal advantage, take up your cross and follow him.

Hey! But wait a minute! I don’t know if I’m going to be resurrected three days later, I can’t do all those miracles. He had an unfair advantage, so how can they ask us to follow the example of Christ?

But supposing he didn’t have an unfair advantage, supposing that what was true about Jesus as the Son of God is true for us. Only a few of us know it, and we are pretty careful to be quiet about it, lest the same thing happen to us as happened to Jesus – and indeed it often does.

And you know, you get these people from Arkansas or Texas or, anywhere in the Bible Belt – who never heard of the Upanishads – and they have this cosmic consciousness experience and they realized that that’s what happened to Jesus, they he says, “I’m Jesus, come back.” Well, everybody says to him, “You aren’t Jesus. It’s pretty obvious you’re not Jesus. You’re just Joe Doggs. He says “Well, that’s what they said about Jesus.” He has a perfect argument, except they say, “You’re not much of a Jesus.” They say, “Alright, if you’re Jesus, command that these stones be made bread.” And he says, “A wicked and deceitful generation seeketh for a sign, and there shall be no sign given.”

Now, why talk about this? Is it interesting, is it important for the human being to realize that in some sense of the word – whatever it means – he is God or one with God, as is plainly taught by the Hindus, hinted at by the Buddhists, only they don’t like to put it out as a concept, in case people will use the concept as an idol to hang onto. They want you to find out for yourself – and not believe in it. And certainly the Taoists understand it, the Sufis understand it. A lot of people understand it. But so what?

What the importance of this is this: that to know that you are God is another way of saying that you feel completely with this universe. You feel profoundly rooted in it and connected with it. You feel, in other words, that the whole energy, which expresses itself in the galaxies, is intimate. It is not something to which you are a stranger but it is that with which you – whatever that is – are intimately bound up. That in your seeing, your hearing, your talking, your thinking, your moving, you express that which it is, which moves the sun and other stars.

And if you don't know that (you are God), if you don't feel that, well, naturally you feel alien, you feel a stranger in the world. And if you feel a stranger, you feel hostile. And therefore you start to bulldoze things about, to bit it up, and to try and make the world to submit to your will and you become a real troublemaker.

So I feel also, one reason why you become hostile is that feeling that you were just brought into this place, that your father and mother went up to some monkey business, that they probably shouldn't have done, or it was bad rubber goods, and as a result of this, here you are, and you didn't ask to be here. You will always feel you can turn around and blame them. You can blame somebody. You can blame the government. You can blame the rascals. You can blame the cheaters. Always supposing you yourself aren't a rascal, which is a long odds. You always can blame someone and say, "I didn't ask for it. Take it away." And yet, and yet, and yet very few people are all too ready to take it away.

Camus said that "The only serious philosophical problem is whether or not to commit suicide." And if you don't, if you don't say "Take it away", what are you going to do? You really got to assume responsibility for it. You have got to say "yes" to what happens. It is my karma. And that doesn't mean merely, cause here are many main misinterpretations of the doctrine of karma. It is usually and popularly understood to be that what happens to you, either fortunate or unfortunate, is the result of good or bad deeds in a previous life. Well, that's popular superstition. The real meaning of karma, the word in Sanskrit means simply "doing." And if I say of event, that "is your karma", it is saying "it is your doing." So the exposition a book which

would expounds karma would be not so much a whodunit as a youdunit. But that seems fantastic.

Now therefore what I propose we do is that we, instead of just ideologising, we have a clinical experience. You know, in psychiatric school, in medical school, it's very usual for a doctor to bring a patient out in front of the students, and talk with the patient. As a kind of demonstration, he says, "I want you to recognise the difference between a psychopath and a manic depressive or a schizophrenic or something" – they don't know what all these things mean. And especially, there's schizophrenia, and... so, he has a dialogue with the patient right there. So, let us suppose that I'm the patient and you are the students and the doctors, and I suffer from what you would call the delusion that I'm God. And therefore, you might want to do something about me or with me, or humour me, or ask me questions. And so I'm perfectly willing to submit to your examination and your treatment and invite you to help yourselves.

Male voice: When did you become God?

Watts: Now.

Female voice: Will you marry me?

Watts: No.

[Laughter]

Male voice: Do you sleep on your front or your back?

Watts: Sleeping is like politics. One sleeps on the right side, and then when you're tired of that, you sleep on the left. When you're tired of that, you sleep on your back, and when you're tired of that you sleep on your stomach, and it is thus that the world goes round.

[Laughter, light applause]

Male voice: If you are God now, what were you yesterday?

Watts: Now...

Female voice: How do you become God?

Watts: You don't become God.

Female voice: Interesting.

Male voice: Am I also God?

Watts: Yes.

Male voice: Are we, then, the same person?

Watts: No. Remember, three persons but one God.

[Laughter]

Male voice: God, will you tell us a little bit about Satan?

Watts: Could I tell you a little bit about Satan? [pauses] Yes. Although the matter is a little esoteric, but I told you all about it in the Book of Job, where you will see that in the court of Heaven, Satan is the District Attorney. He is not, as Christians imagine, the enemy of Heaven, and the enemy of mankind. He's merely the person who sees the bad side of things and carries out the dirty work. And therefore, he saw Job, and wondered whether Job was really as great a guy as he seemed to be, and suggested that God should appoint a committee of investigation to find out. And the committee did its work very thoroughly but the case went against Satan because it was proved in the end that Job was an honourable man. Now you notice that although we pay the salary of the District Attorney, whenever there's a great criminal case before the public eye, people begin to take the side of the underdog. And the prosecutor always has less public sympathy than the defence – except in political trials. On the right hand of God, and you know the defence is always on the right hand of the judge in court, is our only mediator and advocate, which is the phrase referring to Jesus Christ, Our Lord. So there is the defence, and there is the prosecution, and it is the function of Satan to be the prosecutor. There's a good deal more to it than that because before all this started, lies in a stage play, there was an arrangement in the green room before coming on stage, in which certain

things were understood but that are only to be revealed when the curtain goes down at the end of the play.

Female voice: Is Job God too?

Watts: Yes, but he doesn't know it.

Female voice: Why do you hide from the sight of so many?

Watts: Why do you hide? It's for the same reason you're hiding!

Male voice: God, did you create [inaudible]?

Watts: Yes.

Male voice: [inaudible]

Watts: Who else?

Male voice: Does man have free will?

Watts: Huh?

Male voice: Does man have free will?

Watts: Man has free will to the extent that he knows who he is. Not otherwise.

Male voice: Where does he get free will from?

Watts: Where I got it from.

[laughter]

Female voice: Does woman have free will too?

Watts: Yes. To the extent that she knows who she is, yes.

Male voice: If man has free will and knows just what he is, and man is God, then, you're saying then you'd say that you are no more than any God in this room – or any man.

Watts: That is correct, I am no more God than any of you.

Male voice: And you only have the power to know who you are?

Watts: Well, that is saying quite a bit. Yes.

Male voice: What is not God?

Watts: What is not God? There is nothing that is not God.

Male voice: How do you learn who you are?

Watts: It's like waking up from a dream. After a while one's experience begins to have what I would call a "haven't we been here before?" feeling. Going round and round and round...and then you begin wondering: "where am I going?" And to answer that question you have to try and find out what you want. And so I went into that very thoroughly. What do I want to happen? And, of course, as soon as you ask yourself that you begin to fantasize. And our amazing technology is of course an expression of human desire, desire for power, for what we want to achieve. So I simply set myself to thinking through how far we could go. And so I soon found myself at a great push-button place where I had a fantastic mechanism, with buttons available for every conceivable thing I could wish! So I spent quite a bit of time playing with those. And science fiction wasn't doing it. You know, you go "going" like that and here is Cleopatra. And so on – you know press this button; symphonic music in – ahh...4 channel sound, 16 channel sound – anything! All possible pleasures are available. And when you're like everybody's dream of the sultan in the palace, you suddenly notice there's a button labeled "surprise". You push that. And here we are.

Male voice: Is boredom a problem?

Watts: Yes boredom is of course the problem. Boredom is the other side of creativity. And the energy of creation has as its – that is the Yang. The Yin

side of that energy is called boredom. Everything is of course fundamentally Yang and Yin. If you understand that you really don't need to understand anything else.

Male voice: As God, what responsibility do you feel to ameliorate evil in the world?

Watts: As God, what responsibility do I feel to ameliorate evil in the world? I begin with the point that I am responsible for the way the world is. If I couldn't feel that I'd have to blame somebody else. I'm not willing to do that because I know that under various changing circumstances, it might be appropriate for me to be as big a rascal as rascals have been. Now as to improving the world, the world is always improving. It may look to some people slow, but it's improving even when it is declining, because the world works in an undulatory process, like a wave: it goes up and it goes down, it goes up and it goes down. And it couldn't go up all the time because if it did, we wouldn't know that that was up. So it goes down some of the time so that we can know when it goes up because if we didn't know when it went up it would be like being in a space where everything was light. There'd be nothing to write home about. There'd be no black marks on the space and so it would be like a piece of perfectly empty paper. Similarly, to be in a completely black space would also be a kind of unconsciousness with nothing to write home about, as there'd be nothing – nothing would make any difference. So, therefore, if you're going to have black, you won't know that it's black unless you have some white and if you're going to have white, you won't know that it's white unless you have some black.

Male voice: Why do you teach us all to love one another, because if we get to that point, there won't be any ups and downs?

Watts: Correct, but that's not a teaching it's a kōan. A kōan is a Japanese word for a spiritual problem, used in Zen Buddhism, such as 'what is the sound of one hand?' And these problems are given to those who ask questions concerning their spiritual development. And sometimes, as St. Paul pointed out, commandments are given not in the expectation that they will be obeyed, but in the expectation that they will reveal something to those who hear them. That was St. Paul's comment on the whole Mosaic law... Yes, sir?

Male voice: If we are all God –

Watts: Yes –

Male voice: – what of the hereafter? Is there a heaven, is there a purgatory, is there a hell?

Watts: The hereafter is of course now, because if you will examine it closely there is no-when else than now. And if you want to make hell of it, you can make hell of it – if you want to make a heaven of it, you can make a heaven of it – purgatory, purgatory. It's all here. Always was, always will be.

Female voice: What is death?

Watts: Death is an undulation in consciousness. How would you know you were alive unless you'd once been dead?

Male voice: Do you realise – in the same way that Jesus did the will of God – why was it unnecessary for him to have material possessions and necessary for you?

Watts: It wasn't unnecessary for him to have material possessions. They said of St. John The Baptist that he was an ascetic – but of Jesus: “this man consorts with gluttons and wine bibbers and comes eating and drinking.” And when the Lady Mary poured precious ointment on his feet and anointed him, they said the same thing that the members of the vestry say to the ministers today – “why this great expense? Couldn't it all have been sold for much money and given to the poor?”

Male voice: ...but this is a problem...

Watts: It is a problem, sure. But you see, in many ways when you get down to these very deep ethical problems, where there sure is no easy decision one way or the other, you must look at the problem from the point of view of an artist. Which way of doing this is in some sense greater? It may be better to go off with a bang than with a wimper.

On Being God Q&A

Let me see. Ye—

Are you God all the time? I mean, are you consciousness all the time?

There is no time, my dear. It's always now.

[???] and it's during every event. [???] In every precise moment in consciousness, are you conscious of it?

Oh, of—yes, if you put it that way, of course.

You are consciously God, as an experiencing unit on this plane of—

Wait a moment. Consciously? Not necessarily, because that would spoil the fun.

That's what I'm asking.

If you press button "Surprise!" you'll press the button so that you forget who you are.

Wait, so then you don't always know the answers to a given problem?

Yes, that's perfectly true. This is called in the Bible kenosis. In St. Paul's epistle to the Philippians he says, "Let this mind be in you which was also in Christ Jesus who, being in the form of God, sought not equality with God a thing to be grasped, but humbled himself and made himself of no reputation, and was found in fashion as a man, and became obedient to death." And so you get, from this, the kenotic theory of creation—held by some of the Greek fathers—that the creation of the universe is the self-emptying, or self-forgetting, of the Godhead.

Yes, I think it's your turn now.

How does your concept of creation [???] so that man could see that good is different from the old story of man beating his head against the wall so he could feel how good it is when you stop?

It's really rather like it. Because the universe is fundamentally a system which creeps up on itself and then says "Boo!" And then it laughs at itself for jumping. And, you see, every time it does it, it forgets that it did it before, so it never becomes a bore.

Yes, the lady in red.

Can you make yourself into a point of consciousness and travel around the cosmos, such as Dr. Lilly was speaking of last night [??]?

Yes, but it isn't necessary to travel. The question is: can I make myself into a point of consciousness and travel around the cosmos, and see things from all sorts of places? I say: yes, but it isn't necessary to travel. One is already there. In other words, I'm using your eyes where you are like you're using mine. Just in the same way, my head is not my feet, it uses my feet. The head is very different from the feet. You couldn't possibly say the head and the feet are the same, but they are one organism.

They each have a sole/soul.

Two.

What do you do about boredom?

What do I do about boredom? Press button "Surprise!"

Oh, it's always there.

Yes, always.

Yes, the lady in purple here.

You talk about boredom. It seems to me [??] many people that one of the biggest problems in life is being forced into earning living and something which is not what you'd rather be doing. And I often wonder: is the answer to go somewhere and live on less money and do the things that I would like to do, or must I resign myself—as many people have—to do the thing that gets me the bread and then, in my spare time, try to make up for the many days and years of this time of [??]. What is the answer?

Well, there are two sort of answers, one of which you've already indicated, which is to do with less and do what you want. Which...

But if everyone did that, you know, those things [???] accepted as part of life, when they get done?

I think the objection "if everyone did that" is rather like asking what would happen if everybody wanted to catch the four o'clock train from Grand Central to Westport, or if all the molecules of air in this room were suddenly to congregate over in that corner. There is a bare chance that it might happen, but very low.

Yes?

Would you say we're going around in circles trying to eliminate evil because we never will? And it might not be an evil?

Yes.

We'll never eliminate it, so we're just playing games.

We are going 'round in circles. But, you see, going 'round in circles—you may have observed by looking at the sky—is what the universe is doing. You see, before...

As long as we recognize that we're going around in circles, we're all right.

Yes. Yes, that's the thing. It's a dance. And when you dance you don't dance to get somewhere

I didn't mean going around in circles [???] ocean.

Yes, alright. But you turn—when you wake up—you turn the confusion into a dance. And so I go back to your question: what is the alternative to clearing out of the job you're doing and, say, doing less with more fun? Well, there are ways of making almost any activity into a dance. Supposing you had to drive a bus in New York—which is a very harrowing job in the ordinary way—you must not take seriously anything about it. This is the first rule: that it doesn't matter a damn if you don't get there on time, but it

would be fun to go as fast as is consistent with safety. And therefore, you swing that bus, and you play things through the horn; you take the whole thing lightly as if it is not serious.

Because—and this is the nature, say, in ritual, when you have a procession. Now, people who don't understand religion don't know how to make the right kind of processions. There are those who go in military march, and they don't understand it because their objective is to get there. There are those who dawdle like ducks, and they don't understand because they are trying to be dignified. On the other hand, there are those who walk as if they had already arrived, and this is the way kings walk. Because a king is the center, and he is always where it's at. Where it's at is where the king is, by definition.

So if you work in this way, even—I mean—people who are practicing meditation take up monotonous things for fun, and meditation is supposed to be fun—I hope John Lilly told you that this morning—where you say you're going to do Aum Mani Padme Hum. Aum Mani Padme Hum. Aum Mani Padme Hum. Aum Mani Padme Hum. You know, you can really have a gas doing that. And so that anything monotonous can be treated in the same way. This is the way—one of the ways—of overcoming boredom. Because boredom's the great problem for energy. See, energy's always on the go.

Yes, sir? Yes, the gentleman in the white shirt, here.

Does it bother you to be called mythic [??]?

Mythic? No. Mythic is a great word. The question is: does it bother me to be called mythic? No. Myth is very powerful. Myth is fun! Myth is stories told to children. Everybody loves them.

Yes, sir?

Is God omniscient?

Is God omniscient? Well, it depends what you mean by the word. A lot of people think that omniscience is like knowing everything that's in the

Encyclopædia Britannica. That's not omniscience, that's intellectual elephantiasis.

Now, you see, let me explain this question because it's always important, and when anybody announces that he or she is God, people say at once, "Well, will you tell us, in millimeters, the height of Mont Blanc?" And I say, "Look it up in the encyclopedia, it's there." The thing is this: what we ordinarily call knowledge is the translation of life into words, and that is a very cumbersome process because if we had to translate the process into words every time we took a breath, we'd never get around to it. It takes so long to describe and think through the whole physiology of breath. Therefore, we do it without thinking about it. And I find that I'm shining the stars in just the same way. I mean, if you want it in words it's going to take us a long time to get through them because words are strung out in a line.

[???] and we're all gods, how come as gods [???] therefore I am God, how come [???] difficulty recognizing and understanding [???] peace and tranquility within myself?

How do you—if you are God—how do you find such difficulty in finding peace and tranquility in yourself? That's because you're looking for it away from the place in which you are. You are seeking it apart from the experience which you have at this moment and you are regarding that experience and saying, "That's pretty lousy, I'd like something better than that." But the trouble with that is that it splits you in two pieces, and once you're split in two pieces you're lost. Because you made a difference between the experience you are now having, on the one hand, and yourself, who is having it, on the other. And you wish you could get away from that experience. Now, the truth of the matter is: you can't. Because you are what you experience. It's a myth, purely, that there is some sort of experiencer who has the experience. You are what you know because it is not "I know something," there is simply a process called "the knowing." You could say that knowing, like the world, has two poles: north and south. And so the knowing-ball has the knower and the known, but only in that sense. Now, knowing changes; it changes itself. But if you try to stand outside it and change it, it'll be like standing outside your hand and trying to move your

hand from outside. And so comes the difficulty. In other words, this would be the difficulty for God in the press-button “Surprise!” situation, where you think you want something different from what you have. But if you do think that you’ve got to ask yourself the question: what it is that you really want? This is the most fundamentally important question. And you will find, if you go into it very, very deeply, that you have it. Now, you may change your mind about it, but you do have what you want.

God, if this place caught on fire I would find myself so scared that I wonder if I also feel that I was God, and if I am God and scared, what do I do about that?

Well, one of the ways of not being bored is to scare yourself. Don’t we all go to the—we go to the movies just to be scared. We put certain limits on it, indeed, before we go and say, “Well, this isn’t really going to happen. It’s only a play or a movie.” And therefore, while we see the safe outline of the presceni-um arch, back in the back of our minds is a sort of Hintergedanke—we know it’s only a play.

I’m talking about what it is [???

How do you know it isn’t? If, you see, after all, the task and the act are on the stage is to come on so well that the audience thinks it’s real. So that he has them crying, so that he has them shaking with fear, so that he has them sitting on the edges of their chairs. Well, that’s just one ordinary Joe Dokes actor. But supposing the actor of the play is the real big actor—wow! That play would seem real. So that’s what happens when the house catches on fire.

Yes? Lady in red. Yes, you’re looking behind yourself.

God, what is sleep for you?

What is sleep? The seventh day.

When is it?

When is the seventh day? When you sleep!

Yes?

Yes, God. The only reason I know that I'm God is because I take the responsibility for it.

Yes...

Doesn't that answer the lady's question about the fire?

Oh yes, that also would answer it. Yes. It's a question of taking responsibility for what happens.

What happens if you don't do anything about the boredom?

If I don't do anything about the world?

The boredom.

The boredom.

What's through the boredom?

Well, that's another way. That's another way. You can explore boredom. You can bore into boredom and watch it. Sometimes, when you're bored, that's the only thing to do, because even for God you can't lift yourself up by your own bootstraps. Because that is, by nature of the definition, impossible.

You said [???] you would enjoy having [???] you.

Yes, I think that would be fun. I mean, why else does one go on stage except to make myths?

[???]

Excuse me, what did you say?

[???] motivation for going on stage?

What is my motivation for going on the stage? That is like asking, “Why is there a universe?”

Why is there?

Well, now, if you listened to George Leonard last night, George Leonard explained how children were befuddled by being taught to ask ‘why’ about everything. Because you always look away from what you’re asking about to its antecedents, and that won’t lead you anywhere at all. Why am I here? And I answer that question. Then somebody says, well, why that? And then somebody says, well, why that? Why that? Why that? And you get back and back and back, and eventually you get tired of answering. And so fathers, when their children say, “Why, daddy? Why? Why?” they say, “Oh shut up and eat your lollipop!” But what happens, you see—when we trace the causation of things into the past, it all begins to fade out in silence and no answer. Why? Huh. Because it didn’t begin there. The universe begins now, it didn’t begin in the past. And the past trails back from now like the wake of a ship.

If everything is God and there is no time except now, what is the role of chance?

If everything is God and there is not time except now, what is the role of chance? Chance pairs with order. We’ll say randomness—we’ll call it—and it pairs with order. And it is part of the nature of order—if you know what you mean by order, you know that you mean contrast with randomness. And if you know what you mean by randomness, you know that you mean contrast with order. So if you want to have order you must have randomness, and vice versa.

Yes?

Did you have this much charisma before you discovered your true nature?

Yes, but it came out in a different way.

Yes?

I think there's a sort of danger here, though. The riddles are funny and if you have time enough to think each one through they'd be very profound. There's a certain danger of everything and everyone being God, because if you've really found yourself as God, then you know that certain things that you, as God, have created that don't personally affect you. You created them for the reason you stay out of them, and you aren't a do-gooder. But if you think you're God, and then you try to go into too much social action and change the evils of the world, you end up hurting yourself and a lot of people, and you're playing God and you're not really being God.

Well, I admit to you, my dear, that this is a very, very dangerous conversation. And... that I thoroughly agree with, but we didn't come here—did we?—to play it safe. All profound ideas and profound questions are dangerous. It is dangerous to go into science. As we all know too well, it is dangerous to go into medicine. Dangerous to go into writing, because the pen is often mightier than the sword. And so I don't think we should withdraw from certain things because they're dangerous, but I entirely agree with you that if I were, as it were, in the spirit of God to go about social reform, I would be failing to realize the construction of my own universe, which is that when you interfere with it you've got to know exactly how you're interfering. Otherwise, the most amazingly unexpected things will happen. So when people ask for miracles they don't realize what the miracles involve. I mean, if I turned the microphone into a rabbit, it's altogether possible that you might drop dead because those events might be connected.

Have you ever studied with Carl Jung?

Did I ever study with Carl Jung? I never s—

Or work with him?

I didn't study with him. I knew him and I read a lot of his writings, yes.

Does the notion of watching yourself, like watching your boredom or being aware of yourself, imply that there's separation somewhere?

It does in a way, yes. And it depends how you're watching. I some— there is a very interesting thing that comes up in this respect with regard to the Bhagavad Gita and to the Yoga Sutra, where they talk about the witness. There is, as it were—behind our ordinary self with its emotions and involvements—a witness self that does nothing more than perceive what happens. And this is the Ātman, or the puruṣa, which is not involved. And some of you, no doubt—especially in times of crisis—have suddenly discovered this sort of witness center behind everything that just isn't involved. The most terrible things can be going on, but the witness is impassive.

Now, when we go into these states we've got to be very careful about descriptive language, because the descriptive language makes the witness seem something apart from what is happening in such a way that—if we want to become, really, sort of schizy and catatonic about things—we can always be withdrawn and go in and in and identify ourselves with the solitary and uninvolved witness who is merely a hang-up for the ego, as when the police raid a house in which there are burglars. And the burglars know they'll be caught if they're on the ground floor, so they go up to the first floor. So then, the police come up to the first floor, they're up to the second. Finally, they get to the roof, the open sky and the infinite. And, in this way, this was why the Buddha did not teach about the Ātman—the real Self within us—because he knew people would use the real Self as a hideout for the ego.

And so, when, say, Krishnamurti tries to explain this, he doesn't talk about the witness. He talks about awareness and people say to him, "But who is aware? What is aware?" And he seems a little sticky in his answer here, because what is the matter is that the people asking the question are bewitched by grammar. They are using a language in which it is part of the grammatical convention that the verb always have a noun subject. Now, how on earth do verbs get started by nouns? I ask you: how can a thing start a process? Surely, this is really the same problem Descartes was wrestling with when he tried to find out how spirit could influence matter, or how mind could influence body. Because everybody knows that all proper ghosts walk straight through walls without disturbing the bricks. So how can the

ghost in the machine, as Koestler put it—the soul in the body—how can it do anything to the body with no connection? Two different realms.

The point is, when we're talking about this awareness... what we call thought, feeling, sensation, emotion, we could say in a very clumsy way is: it's aware of itself. It's the very nature. There wouldn't be sensation without awareness. You don't have to have some thing which is aware of it any more than you have to have a thing called lightning which does something called flashing. The flashing is the lightning. And so awareness is the one who's aware of it. You could say this awareness—if I say, "I am aware," the word "I", as William James suggested, is simply a word of position like "this" or "here." Awareness here. And your awareness there.

Yes, sir?

Is life, like, one great kōan that [??]?

Yes, life is like one great kōan.

Is death the solution of it?

No, death is not the solution; it has no solution. Otherwise it wouldn't happen. You see, the thing is like this—this is what is hard, for Westerners especially, to understand: I said if you understand the yang and the yin, you don't need to ask any further questions, and all you I Ching buffs ought to know this by now. What is not a component of Western common sense is that nothing is something. Now, that may sound a little contradictory, but I think I can explain it. We treat nothingness as if it were ineffective, as if it wasn't really important at all. And yet, when we look out at the night and we see all these stars in space, try and imagine what the heavens would look like if there weren't any space. Then, obviously, there wouldn't be any stars. I mean, you could think they would all be jammed together in a lump. There are various objections to that; how would you see the edge of the lump, and know it was a lump, without space around it? Furthermore, we know, when we investigate the constitution of matter physically, that at the atomic level there's more space in something than there is anything else. Most of it is empty, which led a physicist at the Argonne Lab at the University of Chicago to become a little nutty. He was so impressed with

the emptiness of matter that he went around in the most enormous padded slippers in case he should fall through the floor.

So... now, the point that I'm making is this: if space is essential to solid, it's perfectly obvious, then, that nothing is essential to something. If you can't have something without nothing, it means nothing is pretty powerful stuff. Because something comes out of it. BLWWP, like that! It's a dogma of Western thought expressed in the Latin phrase *ex nihilo nihil fit*: "out of nothing comes nothing." But that's not so, out of nothing comes something! Now, you would say, "Well, if something comes out of nothing, there must be some kind of mystery inside nothing, it must have a secret structure of some kind. I mean, there must be, sort of, electrical goings-on." This is the trouble they have about cosmology: how could this world generate? Could it just be out of free-floating hydrogen? No! It's a much simpler idea than that: it comes out of real, solid nothing.

It's so simple! Look: if you listen, you see, you live in a world where there's only sound, for a moment. You'll hear every sound coming out of silence. Where do these sounds come from? They come out of silence. Suddenly: BOOIINGG. And you can accustom yourself to seeing light doing the same thing. You can open your eyes and see all this world emerging out of nothing. BOOIINGG, like that, and fading off into the past. So that's why the future is unknown, because the future is zero. And everybody who tries to know it—and that's the whole endeavor of... you see, trying to be God... you don't need to try to be God, you are! But if you try to be God it means you don't know you are, and therefore you try to know and dominate the future. And you believe prophets, and things like that. Well, prophecy is simply contaminating the future with the past; projecting what we know upon the unknown. And that's why, really, things like astrology—although interesting—are rather ridiculous. Because if you know the future, there's no surprise for you. A completely known future is past; you've had it.

Quick question.

Yes?

Where the future and the past come together, it seems to be there isn't anything. There is no now, really. [???] seem like you don't exist—you

know, how could we exist if there's no now to exist in? The past and the future come right together. Where is that place in between? How long is it?

Ah, there are two answers to that question. This is a real fun question; I love it. The question is about now. He's saying: really, there is no now. There is the future and the past come together, and the future turns into the past. They go BLWP, and it's gone, like that. So, you know, in no time at all, the future has become past. And so we get this frantic feeling: where do you go?

Well, let's take the small view, first of all. The now is infinitely short, and yet it's the only thing that is. In that case, this whole world is an illusion. It doesn't really exist. So when the king—the emperor Akbar—once was feeling a little sorry for himself and asked his jeweler, he said, “Make me a ring that will restrain me in prosperity and support me in adversity.” And so the jeweler made him a ring, and gave it to the emperor, and he saw written on it: “It Will Pass.”

Now, the other side of the matter is this: that this short now is an illusion of the clock. We make our second-marks on clocks as thin as is consistent with visibility. And therefore, we always think of the present as crossing the hairline. TICK. That's too long, see? How short can you get? You see? But really, the present isn't like that at all. Everything'd go BWWWP, got it. There is nowhere else but now! Everything that happens is happening now. Well, it's like your field of vision. Your field of vision isn't just a point of light, your field of vision is an oval. And it isn't fuzzy at the edges, it just ceases to be at the edges. But there's plenty of room in it to see something move across. So, in your field of time—your now—there is enough now to include a phrase of music. If there weren't, you wouldn't be able to make out melodies because there'd just be instantaneous notes with no connection between them. You would never hear intervals. So, now is a big, sloppy thing. But it comes out of nothing.

Yes? Lady standing by the pillar.

Is there no need for man to seek for some meaning [??]?

So the question is: is there, then, no need for man to seek for a meaning in his life?

Not only his life.

Not only his life, but the life of the universe? Right.

No, there is no need to seek for a meaning. Meaning—I use the word in rather a definite way—and for me, meaning is a function of signs. Particularly of words and symbols. Meaning is the referent of words, as when we take the word “water”—the meaning of it is something drinkable, whereas the sound “water” is not drinkable. So, therefore, if we ask life to have a meaning, we look for something other than life to be that meaning. And therefore, we reduce life to a being mere words and mere symbol.

Now, of course you may use the word “meaning” in a less precise way, and say, now, although the music of Bach has no meaning in the sense that it is not like the music of Tchaikovsky, designed to imitate natural events and noises, nevertheless it has meaning in the sense that it enchants us, the patterns of it ravish us in the same way as abstract patterns in an arabesque. That’s a little different sense of the word “meaning.” And yes, I would say that life has that kind of meaning. But you don’t seek it. Because if you seek it you lose it. I see the process of life as an essentially musical process which has no meaning except itself. It is going ’round in circles like we love to spin in circles when we’re dancing, like children love to spin around in circles ’till they get dizzy. That’s fun. And so the articulation of wonderful patterns is the meaning of life.

If you seek for meaning—now, this applies to all seekers; I’m sorry, growth-seekers. But seeking’s alright. I mean, it’s a free country. But it invariably takes you away from what you’re looking for because every search supposes I will find it later, not now. In the next moment. That somehow, by some gimmick, by some exercise, by some process of transformation I will later discover what I want. This is postponement.

Yes?

I do not [???

Yes.

...and I feel that it's much more common than that, and if you do seek meaning it doesn't take away from life, it's gives to life. And it gives it a much more meaningful and [???] a profound thing. That's all [???]

Well, this is a matter of words, my friend, because you may think that dancing is superficial, whereas I think it's profound.

Yes.

And so on. And I suggested two meanings of the word "meaning," one of which reduces life to being symbolic of something else, something always beyond. Then I'm going to ask what's the meaning of that? And then we get into that infinite regression of questions. I feel that instead of getting into these infinite regressions of what is beneath, what is behind—look. It's right out in front of you now. And when you catch on to that, now gets very profound. I mean, it's the moment when nothing becomes something and I don't see how much profounder than that you can get.

Yes?

But isn't the hide-and-seek sort of the essential game, and seeking fun in itself? Even if you never find it.

Oh yes! I'm telling—that's... I agree with. Seeking can be fun! But it won't get you to what you're looking for. You see, it's a way—seeking is a way of postponing finding. Let's put it off, you see? Children, on a hot day, they're terribly thirsty and they say, "Let's get an ice cream soda." The other kid says, "No, let's get thirstier." So when we finally get the ice cream soda, we are a real Zomb. This is the principle of postponement, and everybody who is questing, who is practicing yoga, and Zen meditation—all that kind of thing—is putting off that ice cream soda.

Well, then, if that's the case, what do you propose?

What do I propose? Nothing.

I don't think [??] in just quite that way. Then you will say nothing is something, and then we'll go around and [??]

But if you really believe that, then there would be no [??] on society. [??] whether it's doing something or thinking something, we definitely are not just feeling that we are going to sit and let everything happen to us. Why do I come here? Or why does anyone come here?

Yeah, but I mean, look here: when you ask, always, "Why did you come?" I repeat: that is a barren question. Why did you do it? Why did this happen? It goes—a question that peters out. So this is not important. What is important, surely, is this immediate now. Not why are we here, but what are we here? In—unless you live in the eternal now consciously, you have no use for plans. Because people who live in the future—or for the future—when their plans come off, they're not there enjoying them. They're planning for another future. They never catch up with themselves.

Can you not put your future in the now?

Yes, in that sense. Of course. When you make plans you plan now, and that can be a gas, making plans. But for goodness sake, do it in the now spirit rather than, as it were, "Oh, I can't wait 'till that happens." Because then, if you're in an I-can't-wait spirit, you just bolt life like somebody swallowing food so fast they can neither taste it nor digest it.

Yes?

Aren't there really two different ways to [??] search? The way of intellectually trying to figure it out and plan it, and a way of experiencing it. And part of your experience would be taking in what will happen in the future, and that second way isn't a bad search, it's just really being.

Yeah.

So isn't there a type—that's the type of searching for meaning that would be okay, that would be fulfilling?

Well, yes. The searching in a spirit that the search is more fun than the finding—you know that? When you're traveling, for example, going somewhere is the real joy of it, often. That's the fallacy of the jet plane: that it abolishes distances between places. And all places which have a distance abolished between them become the same place. So there's no point going to Tokyo if it's already Los Angeles. I mean, this is the thing.

Yes, [???] here.

Is it possible [???]?

Well, the comment is about seeking. Is it necessarily a road, like taking a road, or is seeking also conceivable as readiness to receive? Well, of course, the road isn't a merely Western analogue. It's a very common metaphor. The path, and the stages of the path, the steps of the path are used in both East and West. But the Chinese word for the Way is Tao, and the path is what we're looking for—in the Chinese sense, you see? The Tao is the works, baby. That is the which than which there is no whicher, and to be in harmony with the Way, to be on the way, you see? But the Tao isn't going anywhere. And that's like when the Chinese poet is wandering in the forest, and he looks at the clouds and he says, "Where are they going? No one knows. Where does this path lead? No one cares. I'm wandering on and on in a great forest without thought of return." That is poetic feeling to the far East; both to the Japanese and the Chinese. They call that spirit yūgen, and it's the mysterious going-nowhere-ness of things, the wandering spirit. So that sort of seeking is different from anxiety to get something in the future which you don't have now.

Yes, sir?

What difference between just existing in now and experiencing everything [???] not seeking anything, and pure hedonism?

Well, pure hedonism is a quest for pleasure. The hedonist, in that sense of the word, would not live in the eternal now if he found it not altogether enjoyable. He would then read romances of the past or fantasies of the future to get away from now, because what he's looking for is pleasure. But when we look for pleasure, you see, we split ourselves. We divide ourselves

from pleasure in seeking it and in trying to get away from pain. We divide ourselves from pain not realizing that that's what creates pain, is the division of experience so that the wholeness of experience is broken and we are dis-integrated.

Yes?

Before you made the distinction between nothingness and something [???] was a category, isn't that just an intellectual fallacy? There's no such thing as any category [???]?

That's true. Categories do not really exist in nature. Categories are like taking a network printed on cellophane and putting it over a picture of a forest, and then numbering the trees according to what squares they're in on the cellophane. That's categorization.

If you believe that, then that category of nothingness really is anything because there's no such thing as that category out there.

Oh, I said it was thoroughly empty. But—wait a minute—it is a category in the sense that something is its limit. So it has an edge, and that's what you see in the yang-yin diagram.

Would you comment on China and the recent developments?

No. I don't want to comment on China at the moment.

Could you repeat that about pain, what you just said?

Yes, what I was trying to say about pain is this: we are in a split relationship with the contents of our experience. The knower and the known. Then there is: the knower is opposed with a known called pleasure and tries to identify with it. The knower is confronted with a known called pain and tries to be disentangled from it. But it is this very split; it is trying to get away from pain that makes pain painful. It's as if you got caught in some brambles and you pulled away from them, and they just dug more deeply into your skin. You would have to go the other direction to let the brambles out, you'd have to go into the bush.

Enter the pain.

Yeah.

Ride with it.

Yeah.

Not fight it.

So—I mean, that’s only a metaphor. But the point is that as we keep up this distinction of the knower from the known, we’re always running away and want a changed experience. And as a fundamental, therefore, escape in every project to transform consciousness, there is an escape from what is. And when you realize you cannot get away from what is—not should you, not might you, but you can’t—then, at that point, when you realize you can’t get away from what is, there’s nothing left to you but to watch it. And then, for the first time, you’re taking a good look at your real self. Because your real self is a happening. The Chinese call it ziran—‘nature,’ ‘what is so of itself’—and that’s you. And you is this happening, and everything that you’re aware of is your happening—and a good deal more besides. You’re not aware of all of yourself. Like, you don’t have an immediate vision of the contents of your stomach; you haven’t got eyes down there.

Um... yes, sir?

God, what is your criteria for heaven now or hell now? Are you going to [???] beauty as opposed to ugliness?

Yes. This—you see, I know when I’m confronted with the beautiful or when I pass into the beautiful as I know when I pass into the ugly. When I try to say what these are or what my criteria are, all I’m doing is I’m trying to find a form of words that will apply to all my different sensations of beauty or of ugliness. The problem is not to know what is beautiful but to know how to put it into linear language. That’s where the complexity comes in. We very well know what is beautiful, but when we come to talk about it the words disappear.

Here's our fundamental problem because, you see, in a certain way, what we mean by sense is God. Now, it is not that God doesn't have a sense of nonsense—look at giraffes, for heaven's sakes! But it's this old thing. One form is: could God make a stone so heavy that he couldn't lift it? That is an equivalent question to saying, "Could God make a dead body into a living body?" That is the same question as asking, "Could a dead body be a living body?" And that is the same question as asking, "Could the head be the feet?"

God, earlier, though, you did say that everybody alive had been dead before.

Yes, that's a different matter.

[???

Now, look: one of the most interesting meditations is to think about death and imagine what it would be like to go unconscious and never become conscious again. That is, as Keats said of the Grecian Urn: "it teases you out of thought." And while you think of that, say, "Good heavens, fancy. Never coming to again," you get a mirror image thought which is about your birth. My goodness, you came to without ever having gone unconscious! That's pretty weird, and it seems to me that if that happened once it can happen again.

Now, what happens is this: when you die, BOING; there's a blank. And the next thing you know is, WAAAAH! Just as you did it before. Because every "I" that comes into this world is I, is me, is you. On this level it is diversified. But yet, I is always central. Everyone feels he's the center of the universe, and on the surface of a sphere any point may be the center of the surface.

So here it is. Every time it happens it's me. So I should worry about reincarnation.

Yes?

According to the Sufi doctrine, if you reach the third level you're supposed to have the choice. You don't have to be reincarnated. Do you feel that? Is that [??]?

All wise action is never the result of choice.

Say again?

Wise action is never the result of choice.

Because it implies logic?

Huh?

Does choice imply logic?

Choice implies ignorance, indecision. When you know what to do you don't choose, you do it.

What question could we ask you about love?

What?

What question could we ask you about love?

What question could you ask about love? What is love? Love is not a what. Love is the energy of the world, and nobody can say what that is. If anybody were to say what God is or what the energy of the world is, he would be talking nonsense. Now, there are times when it is important to talk nonsense because we can discover the energy of the universe through nonsense. When you, say, you take a sound that really doesn't mean anything much, like Aaaaauuummmmm, that's the energy of the universe going. Dig it! See? As you listen to sound. That's why music is a marvelous support for meditation. Digging sound. Listening, just listening to that hum. There goes the energy of the universe, see? What is it? Aauuummmmm, that's what it is. Auuummmmmmm, see?

Yeah?

Would you say that we meditate for the sake of the meditation?

Yes.

In other words, not if I meditate at some future date, something may or may not happen?

Yeah, that's right. Then, if you do that, it isn't meditation.

Right.

Meditation is centered in the here and now. Done for some other reason it isn't meditation, it stops dead right there.

God, what is satori?

What is satori? Satori is any kind of a-ha, Eureka! phenomenon, only specifically applied to discovering who and what you are.

It's the clear light.

The clear light is that. You say, "I saw the light!" It doesn't necessarily mean that there was the physical hallucination of a flash. It may mean suddenly everything becomes transparent. That may be a way of feeling it. It's just that the problem vanishes and you stop asking the question.

Would you risk being God outside of this [???] situation?

I, uhm... what do you mean, risk it? The thing or the problem—there's no risk being God, the risk is being human!

Mysticism and Morality

I'm referring to a kind of experience, a kind of—shall we say—state of consciousness which seems to be as prevalent among human beings as measles. It's something that simply happens, and we don't know why it happens. And although there are all sorts of techniques which claim to be able to promote it, and which are more or less successful in doing so—and

sometimes rather less than more—nevertheless, there is this peculiar thing that happens to people. And it's been recorded as far back in time as we have any recording at all. And that is coming over people the peculiarly convincing sensation that their ordinary sense of individuality—of personal identity—is transcended, and the individual suddenly feels an experience that... actually, it could be described from a number of quite different points of view. But we could add up these dominant characteristics:

That—instead of the ordinary feeling that I, as an individual, confront a world that is foreign to me, that is not me—in this kind of experience I find myself to be of one and the same nature or identity as the world outside me. In other words, I suddenly feel no longer a stranger in the world, but as if the external world were my own body.

The next aspect of the feeling is even more difficult to assimilate to our ordinary practical intelligence. But a very overwhelming feeling that everything that happens—everything I have ever done, everything anybody else has ever done—was part of a harmonious design. That there is no error at all. And that's the sort of thing I'm referring to.

Now, you see, I'm not talking about a philosophy, I'm not talking about a rationalization, some sort of theory that somebody cooked up in order to explain the world and make it seem a tolerable place to live in. I'm talking about a rather whimsical, unpredictable experience that suddenly hits people, and it includes this element of feeling the total harmoniousness of everything. Now, I realize that those words can carry with them a sort of sentimental feeling, a sort of Pollyanna feeling. There are various religions in our society today which try to inculcate in you the belief that everything is a harmonious unity. You know, things like Christian Science—or the Unity Movement, and so on—they want to make a kind of propaganda for one to believe, and through believing, to feel that everything is harmonious.

Now, to my mind that is a kind of pseudo-mysticism because it's an attempt to make the tail wag the dog, to make the effect produce the cause. Because this sensation of things being harmonious is somehow never brought about by insisting to yourself that that is so. Because when you do that—when you would say to yourself all things are light, all things are God, all things are beautiful, et cetera—actually, by doing that, you're implying that

they're not. Because you wouldn't be saying all this stuff if you really knew it to be true.

So this thing—the sensation of a kind of universal harmony—can not come to us when it is sought, when we look for it as something to be an escape from the way we actually feel or to compensate for the way we actually feel. It's a thing that comes out of the blue. And when it comes out of the blue—just like hiccups come out of the blue, or something like that—it's overwhelmingly convincing and it stands as, actually, the foundation for most of mankind's profound philosophical, mystical, metaphysical, and religious ideas. Someone, in other words, to whom this sort of thing has happened. And as I said before, it strikes us as measles may strike us. Someone to whom this sort of thing has happened can't restrain himself when it has happened, and he has to get up and tell everybody about it. And, at last, he becomes the founder of a religion. Because people say, Look at that man! How happy he is. What conviction he has. He has no doubts. He seems to be sure in everything he does.

You see, that the wonderful thing about a great human being: he's like an animal or a flower. See, when a flower buds and the bud goes pop and opens, it has no hesitation or doubts about it. But when a young woman appears in society as a debutante—you know, she's not quite sure if she's going to come off—and she appears on the stage of society with some doubts in her mind. Therefore, all appearances of this kind are of a rather sickly nature. But when the bird sings, or the chicken's egg breaks, the flower buds, there's no doubt about it at all. It comes forth.

And so, in the same way, when somebody has an experience of this kind he just has to tell everybody about it. Because, you see, he sees everybody around him looking dreadfully serious, looking as if they had a problem, looking as if the act of living were extremely difficult. But from his standpoint—the person who's had this experience—he feels that they look funny, that they don't understand that there isn't any problem at all. That he has seen—from where he stands, you see—that the meaning of being alive is just being alive. That is to say, I look at the color of your hair and the shape of your eyebrow, and I understand that that is the point. That's what we're all here for. And it's so plain, and it's so obvious, and so simple. And

yet, here is everybody rushing around in a great panic as if it were necessary for them to achieve something beyond all that. And the funny thing is: they're not quite sure what it is. But they're devilishly intent upon it, after that thing.

And so, to the person in this state of consciousness—which I call 'mystical'—that all seems very weird, very absurd. But it's not something that you criticize in an unkindly way. You don't say, Those damn fools! Those idiots! You say, It's such a pity that they don't see it. Because although they are going around in this wildly ignorant pursuit, one of the funny things about it is that they don't realize that there is a dimension, a sense, in which their pursuit is magnificent. It's to give an obverse sense to the saying, Father, forgive them for they know not what they do. Turn that into its opposite. Not forgive them, but give them a blessing because they don't know what they do. Give them an honor.

In other words, the intensely serious preoccupations and anxieties of mankind appear from this standpoint not to be foolishness, but to be a kind of marvel in the same way, perhaps—as you could say—that the protective coloring of a butterfly, who has somehow contrived to make its wings look like enormous eyes. So that when a bird who is about to devour this beast is confronted by these staring eyes, the bird is a little hesitating—as when you stare at somebody they're always taken a little bit aback. And so the butterfly appears to stare at the bird. And perhaps, you see, this phenomenon—of the marvel of staring wings of the butterfly—is in some way a result of anxiety. The anxiety to survive, all the problems and struggles of natural selection. Nevertheless, in this intense struggle, we are unknowing poets.

You see, one of the greatest ideas in the world that has ever been produced is, for my thinking, the Hindu idea that the world is a drama in which the central and supreme Self behind all existence gets lost and involved, and pretends—plays—that he, or it, or he/she, or whatever you want to call It, is all the creatures that there are and gets totally involved. And thus, you see, the more involved, the more anxious, the more finite, the more limited the infinite manages to feel itself to be, the greater the artistry, the greater the depth of the illusion which is created. For, you see, all art is—in a way—

illusion. The art of the magician is the art of illusion, the art of misdirecting attention so that the magic seems to appear.

And so, in this way, the more there is anxiety, the more there is uncertainty, to that degree the play has succeeded in the same way as, when you are watching an actual play or reading a novel or a movie, the more the author or the actors manage to grip you and to persuade you just for a moment that you are actually involved in reality, the more they have succeeded as artists. You may have a faint recognition in the back of your mind that this is, after all, only a play. When you sit on the edge of your seat, and you're sweating and your hands clutch the arms of the chair. When the scene so grips you... that is magnificent acting. And so the Hindus feel that the whole arrangement of the cosmos is something exactly like that.

But when, in the reality of actual life, you are sweating it out and you're wondering whether this surgeon—who's got to operate on you in a matter of life and death—is a competent man or a charlatan. Or whether the investment that you made is a good thing or whether it's going to make you lose your shirt. You see? All those matters of terrific crisis are exactly the same as when you're sitting in the theater, sweating it out there. But now, a far more convincing theater has been arranged. Because, as the Hindus would say, that in you which is It—the basis of you, the thing that is real in you and that connects you under the surface with every other being that is alive—this is the player of the parts, this is the maker of the illusion. This, the player of the game which has got you involved in this mess, and is living it up in the same way as those actors on the stage are living it up to convince you that this is a real situation.

And this is very understandable because, basically, everybody loves to play this game. The game of hide-and-seek. The game of scaring one's self. Running up behind yourself in the dark and saying, BWOOO! All children like to do this. And this is the most human thing. That's why we go the play, to the movie, and why we read novels. And our so-called real life is, from the position of the mystic, an extension of the same thing. Because, you see, he is the person who suddenly has realized that the game is a game and that behind all—you see, if the game is hide-and-seek, or if the game is lost-and-found, everything to do with the hide side or the lost side is connected

with where we, as individuals, feel lonely, impotent, put down, and so on; all the negative side of existence

I have tried to show you at various times that there's really one simple principle that underlies everything, and it's so simple it's funny. The principle is: all insides have outsides. Because, you see, you don't know that the inside is inside unless there's an outside, and you don't know that the outside is outside unless there's an inside. Okay. Then you, as you ordinarily feel yourself, are the inside. You are the animate, sensitive being inside the skin. But the inside of the skin goes with the outside of the skin. If there weren't the outside of the skin there wouldn't be no inside. And the outside of the skin is the whole darn cosmos. Galaxy beyond galaxy, and everything. You see? And that goes with the outside in the same way that front goes with back. So that if you wake up and understand that, you find that the two are one and the same identity, one and the same Self, one and the same life. So that's the mystic's point of view. He finds that out.

Now, if I may switch: what is morals? In the sense in which I am using the term 'morality,' or 'morals.' It's a set of rules analogous to the rules of language. Now, it's perfectly obvious, isn't it, that we can talk to each other in English only if there is mutual agreement among ourselves as to how to use the language. What words refer to what experiences, and what ways of stringing words together to be meaningful, how to be used. And it's very much of interest that we don't have too much trouble in coming to this agreement about language. We don't find that the police have to enforce grunt [?]. The schoolteacher—yes, for little the school teacher does sometimes have to enforce grammar and say in an authoritative way, and in the old-fashioned schools with the aid of some implement of corporal punishment. You know? You use the correct grammatical forms. But when we grow up into adult life we use these grammatical forms without much difficulty and very rarely do the police have to enforce it.

But it is otherwise—with other arrangements that we have to make—in common, because just as we have to agree in order to communicate about language, we have to agree about, say, the rules of driving on the highway, the rules of doing business, the rules of doing banking, and so on, and so on, the rules of family arrangements and whatnot. And these are actually

rules of the same kind as the rules of grammar. But, alas, this is not very often recognized because the authority, the sanctions, the power behind these rules is different from the authority behind grammar.

What I mean is this: if you transgress the rules of grammar people will shrug their shoulders and say, Well, he doesn't make sense. They won't summon the police. But if you transgress the rules of driving on the highway, or the rules of finances, someone is likely to summon the police. And so one sees the authority of the state as standing behind those rules. And there are other rules where our society sees standing behind them not the authority of the state but the authority of the Lord God Almighty, so that if you transgress those rules you're in danger not simply of going to jail but, according to your religious persuasion, of frying forever in hell or, on the other hand, of failing, lamentably, to be a real person.

Now, the problem is this: where the domain of mysticism and the domain of morals come into conflict. You see, throughout all known history of religion the mystics have been suspect insofar as religions have been the upholders of moral rules; the—as it were—the guardians, the authorities. In the same way, for example, as the lexicographers of the Grammarians guard the rules of grammar and expound upon them, so in the same way priesthoods and the lawyers guard the rules of social behavior. But when, into the domain of religion, there appears the mystical experience, then the priests are very, very disturbed.

Now, you all know that—in recent months, in California—there has been a very strange outbreak in the most respectable of all churches, the Episcopal church. Various congregations of the Episcopal church have had a phenomenon called glossolalia, and this means 'speaking with tongues.' If you will turn on your radio to any [African-American] revival meeting on a Sunday night, you will hear glossolalia. That is to say, when the preacher starts talking sensibly but the congregation gets more and more enthusiastic and says, Ah yeah! Amen! Yes, Lord! And so on, and it works up the preacher so that, by the time he's through, he is not talking sense anymore, he's just lalling. He's going through glorious nonsense. In other words, he's become a—all the dry, theological categories have turned into, not only poetry, but beyond poetry, into music, and he's just saying, Haaaa dedade

badede! Haaabele, ba de de de dah, haaaaaa dewahloh! You see? It's just going like that. And the congregation's behind him and it's wonderful. You see, he's become—at that moment—one, in spirit, with the universe. Because that's what that stars are doing. The stars above us, the galaxies, they're not making sense, see? They're making a colossal display of fireworks in the sky. Haaaa dedade badede! See? It's going like that.

Well, it so happened that, in recent months, various congregations of the Episcopal church had outbreaks of this. The bishop of California, when all this happened—bishop Pike—wrote an encyclical letter to his pastors and said, With all due regard for everything, you know, we must not be too dogmatic. We must recognize always that the spirit of God may work in mysterious ways that cannot be foreseen. And we should keep an open mind about all these matters. (This was said in a very complicated way across several pages.) Then, finally—when it came to speaking with tongues—in effect, This must not happen in the Episcopal church! Yeah. I mean, in effect, this is what was said. It was said—you know, the iron hand was in a velvet glove—but: this mustn't happen.

Now, you see, this has characteristically—through the ages—been the attitude of priesthoods, of the guardians of law and order—or, as they say in the Episcopal church, everything should be done decently and in order. The guardians of this kind of thing have always been afraid of the spontaneous manifestations of the spirit. And not only of things like mysticism, but also of things like falling in love. They're very, very dangerous happenings. And so, here an absolutely astounding paradox comes about, and it goes like this:

We know, on the one hand, that human love is only genuine when it is felt in the depths of the heart. And we know that this is true whether it be the love of man or whether it be the love of God. We're always looking for the genuine article, you see? We don't want someone to love us because they're forcing it. We want them to love us because they really do, in their heart. Now, you see, when you go back to the study of the history of the Hebrew religion underlying the history of Christianity, you will find this problem in this way: that you've got two traditions constantly compensating one against the other, playing each other off in the history of the Hebrew religion—the priestly tradition and the prophetic tradition. The priesthood is

always concerned with the external observance of the laws. But the prophetic tradition is always concerned with do you really mean what you do? They constantly condemn as a hypocrite—and, you see, in this sense, Jesus is the greatest of the prophets—they constantly condemn as a hypocrite the person who obeys the law without meaning it. Maybe this man does not commit adultery, but the prophet says if he has looked at a woman to lust after her, he has already committed adultery in his heart. So that if you really obey the law, you obey it with your feelings and not just outwardly. For as Jeremiah says, The day will come when no man shall anymore say to his brother: ‘Know God.’—that is to say, know the law of God—but they shall all know me, for I will write my law in their inward parts. The ideal, in other words, is people who do not simply obey and do the right things, but who want to do the right things, whose desires are transformed. For the heart—to write the law in the heart—means to change one’s desire.

So, you see, what this comes to, then, is a peculiarly paradoxical situation that you are required, by law, to be completely honest. And more than that; you are required, by law, to be loving, and honestly loving. You must love God and love your neighbor honestly, not forcing it, not pretending to it, not being a hypocrite. You must really feel it. Now that, you see, is where the astonishing conflict occurs between the mystic and the moralist. For the moralist knows that he has to be more than a legalist. He has to be more than one who insists that the outward observance of the law be kept to. Luther said that the law which requires that inward compliance is the most terrible thing. He based a great deal of his philosophy on an attack on the idea that one’s own inner feeling could be commanded. Because, you see, the moment you subscribe to the idea that your inner feeling should be commanded, you let yourself in completely for hypocrisy. If, you see, you tell another person that you love them because you know you’re supposed to love them and, in fact—in your heart—you don’t love them, you’re a liar. And therefore, the more you insist on that lie, the more you feel it’s your duty to make your feelings over and to love that other person, the more you get yourself deeper, and deeper, and deeper into trouble. Because here, if anywhere, the truth will out. You will not be able to sustain the pretense. You will not have sufficient energy to go on pretending and making a kind of mock of the feeling of love. And you have at last, then—if you’re honest

—to say, I don't. It doesn't matter whether this is to some other human being or whether, in a religious situation, you have to sit back and look at the Lord and say, Lord, I don't love you. I think you're a bore. You're demanding, you're authoritarian, you're domineering. And probably I ought to love you, but I'm sorry—I don't.

Now, we think—you see—that an honest expression of our feelings would be disruptive of law and order. It wouldn't; not in the least. Actually, it would be contributive to it. Because if I say to somebody, Look, I'm not doing this for you because I love you or because I like you, I'm doing it for you because the book says I must. Now, that puts it up to the other person, who has to look within himself and say, honestly, Ought I to accept this favor from this person, or ought I to go about seeing how I could provide myself with these conveniences? He may say, I understand you don't like doing this, but excuse me—I'm in a terrible jam and I will be most beholden to you if, for a little while yet, you will go against your feelings and help me out. See? That's a nice way of doing things. That's the kind of real understanding that we have to have.

I was associated once with somebody—in a business way—who was a complicated person who pretended, always, that he was a great idealist and that he was doing whatever he did for the benefit of mankind, for the furtherance of mutual understanding, for unselfishness and love between human beings. Actually, his dealings were ethically of a very shady character and I couldn't get on with him because he wouldn't come clean. If he had said, Look, I'm in a kind of a jam. And in order to get around this problem we have to manipulate things thus and so. And I know this isn't very ethical, but that's what we have to do. I would have said, Well, I'm entirely in agreement with you. But then he wouldn't've come on with this sort of pious line that was so sickening and offensive. He would've come on in a human way and we would've understood each other.

You see, now, how real honesty is a genuine basis of morals. Real honesty is always not pretending that you're feelings are other than they are. We know, as we deal with situations practically, that we may have to do things that go against our feelings, and it's the same with helping people—when you have to—whom you don't like and you don't want to help, but on the

whole it's rather necessary to do so. But don't ever be dishonest in playing that you're feelings are not what they are.

Now, from this standpoint we can perhaps understand something about the deep relationship between morals and mysticism. If we go back, you see, to the experience that I described as mystical we see that it is the vision—I tried to put it, fumblingly, in the sense of the rightness, the harmoniousness of everything that you are from one moment to another. That, in other words, human behavior—its ups and its downs—is no different in principle from the behavior of the clouds, or of the wind, or of dancing flames in the fireplace. As you watch the pattern of the dancing flames they never do anything vulgar. Their artistry is always perfect. Ultimately, it is the same with human beings. We are just as much a part of the natural order as flames in the fire or stars in the sky. But this is only apparent to the person who is honest in the sense in which I have spoken. In other words, the person who is tied up with trying to pretend that his feelings are other than what they actually are—he can never see this, and he's always a troublemaker. He is the original hypocrite. The person who is unbelievably destructive is the person who pretends that he is a model of love and rectitude and justice, and, in fact, isn't. Because nobody really can be. But then, superior altogether is the kind of person I would call the 'loving cynic' who knows, of course, that everybody has his weakness and his price and so on, but isn't contemptuous for that reason.

Incidentally, may I be so bold as to recommend a book? *Memories, Dreams and Reflections* by C. G. Jung: Jung's autobiography. The life story of a man who, in my opinion, was a superb human being in this particular sense of thoroughly knowing his own limitations, and of having a certain humor about them. A man who understood how to integrate into his whole being the devil in himself and the monkey in himself.

So then, in the metaphysical sphere the mystic is the one who feels that everything that happens is in some way harmonious, is in some way right, is in some way an integral part of the universe. Now, when we transplant or translate that into the moral sphere, the sphere of human conduct, the equivalent is this: there are no wrong feelings. There may be wrong actions in the sense of actions contrary to the rules of human communication. But

the way you feel towards other people—loving, hating, et cetera, et cetera—aren't any wrong feelings. And so to try and force one's feelings to be other than what they are is absurd and, furthermore dishonest.

But, you see, the idea that there are no wrong feelings is an immensely threatening idea to people who are afraid to feel in any case. And this is one of the peculiar problems of our culture: that we are terrified of our feelings. Because they take off on their own and we think that if we give them any scope, and if we don't immediately beat them down, they will lead us into all kinds of chaotic and destructive action. It's so funny that we, in our Western culture today, say that kind of thing. We, who do more chaotic and reckless kind of action than anybody ever did.

But if, for a change, we would allow our feelings and look upon their comings and goings as something as beautiful and as natural and necessary as changes in the weather, the going of night and day, and of the four seasons, we would be at peace with ourselves. Because what is problematic for Western man is not so much his struggles with other people and their needs and their problems, as his struggle with his own feelings, with what he will allow himself to feel, and what he won't allow himself to feel. He's ashamed to feel really, profoundly sad, so much so that he could cry. It is not manly to cry. He is ashamed to loathe somebody because you're not supposed to hate people. He's ashamed to be so overcome with the beauty of something—whether it be a natural landscape or a member of the opposite sex—that he goes out of his mind with this beauty. Because all that kind of thing is not being in control, old boy! Not—kind of—having your hand on the wheel!

But it is because, you see, we don't go with that that we are not in control, that we try to pretend that our inner life is different. So I think this is the most releasing thing that anybody can possibly understand: that your inner feeling is never wrong. That's to say, what you feel—it's never wrong that you feel that way. It may not be a right guide to what you should do. In other words, if you feel that you hate someone intensely, it isn't necessarily the right way of dealing with that feeling to go out and cut his throat. But it is right that you should have the feeling of hating, or of being sad, or frightened, terrified—whatever it is.

For, you see, when a person comes to himself, he comes to be one with his own feeling. And that is the only way of being in a position to control it. It is in exactly this way that the sailor always keeps the wind in his sails. Whether he wants to sail with the wind or whether he wants to sail against the wind, he always uses the wind. He never denies the wind. Well, it's in exactly that same sense that a person has to keep going with his own feeling. Whether he wants to act as the feeling obviously suggests or act in a different way, he has to keep the feeling with him because that's his own essential self. But when he attempts simply to sail against the wind, he's lost himself. He's become just a kind of empty mask which hasn't got any real life behind it. And all its protestations of love and good will are hollow.

So, you see, it is in the most basic, simple situation: a mother has a child. She got it by accident. You know? And she thinks, Oh, heavens. Now I'm all tied up full of responsibility, and I can't stand it. So I really didn't want to have it, and I—uh-oh-oh... I mustn't think that thought! All good mothers naturally love their babies. And so, when she gets the baby, she says, Darling, I love you, but her milk is sour and the baby gets the other message, and the baby's mixed up. And it will be much better if that mother said to the baby, Listen, you're a pest, and you're a nuisance, and I didn't want to have you around. Well, then they understand each other and everything's clear. There's no confusion, there's nothing mixed up here. And, too: when you feel somebody is a pest and a nuisance, and you really let it go and you tell them so, you're apt—in a while—to get a sense of a kind of humorous feeling about it. That you can begin from telling them that they're a damn nuisance, and I wish you'd just disappear and get lost. After a while you say, Yeah, you old bastard. You know? And it begins to have a kind of affectionate feeling to it.

So, to sum up: what the mystic primarily feels is the divinity, the glory, of whatever is. And when we apply that to the moral sphere, what is is what one feels genuinely. And this must always be admitted, always allowed. It doesn't mean to say—let me emphasize this—it doesn't mean that we always are therefore compelled to act upon the basis of what we feel. That is to say, to kill the person we hate. Hatred does not necessarily lead to violence. It is unacknowledged hatred that leads to violence. Honest hatred can be expressed in much simpler ways. But the expression, the

recognition, the acceptance of what is honestly felt is the moral equivalent of the vision that whatever exists is a manifestation of the divine.

What is Reality

I find it a little difficult to say what the subject matter of this seminar is going to be, because it's too fundamental to give it a title. I'm going to talk about what there is. Now, the first thing, though, that we have to do is to get our perspectives with some background about the basic ideas that, as Westerners living today in the United States, influence our everyday common sense, our fundamental notions about what life is about. And there are historical origins for this, which influence us more strongly than most people realize. Ideas of the world which are built into the very nature of the language we use, and of our ideas of logic, and of what makes sense altogether.

And these basic ideas I call myth, not using the word 'myth' to mean simply something untrue, but to use the word 'myth' in a more powerful sense. A myth is an image in terms of which we try to make sense of the world. Now, for example, a myth in a way is a metaphor. If you want to explain electricity to someone who doesn't know anything about electricity, you say, well, you talk about an electric current. Now, the word 'current' is borrowed from rivers. It's borrowed from hydraulics, and so you explain electricity in terms of water. Now, electricity is not water, it behaves actually in a different way, but there are some ways in which the behavior of water is like the behavior of electricity, and so you explain it in terms of water. Or if you're an astronomer, and you want to explain to people what you mean by an expanding universe and curved space, you say, 'well, it's as if you have a black balloon, and there are white dots on the black balloon, and those dots represent galaxies, and as you blow the balloon up, uniformly all of them grow farther and farther apart. But you're using an analogy—the universe is not actually a black balloon with white dots on it.

So in the same way, we use these sort of images to try and make sense of the world, and we at present are living under the influence of two very powerful images, which are, in the present state of scientific knowledge, inadequate, and one of the major problems today are to find an adequate,

satisfying image of the world. Well that's what I'm going to talk about. And I'm going to go further than that, not only what image of the world to have, but how we can get our sensations and our feelings in accordance with the most sensible image of the world that we can manage to conceive.

All right, now—the two images which we have been working under for 2000 years and maybe more are what I would call two models of the universe, and the first is called the ceramic model, and the second the fully automatic model. The ceramic model of the universe is based on the book of Genesis, from which Judaism, Islam, and Christianity derive their basic picture of the world. And the image of the world in the book of Genesis is that the world is an artifact. It is made, as a potter takes clay and forms pots out of it, or as a carpenter takes wood and makes tables and chairs out of it. Don't forget Jesus is the son of a carpenter. And also the son of God. So the image of God and of the world is based on the idea of God as a technician, potter, carpenter, architect, who has in mind a plan, and who fashions the universe in accordance with that plan.

So basic to this image of the world is the notion, you see, that the world consists of stuff, basically. Primordial matter, substance, stuff. As parts are made of clay. Now clay by itself has no intelligence. Clay does not of itself become a pot, although a good potter may think otherwise. Because if you were a really good potter, you don't impose your will on the clay, you ask any given lump of clay what it wants to become, and you help it to do that. And then you become a genius. But the ordinary idea I'm talking about is that simply clay is unintelligent; it's just stuff, and the potter imposes his will on it, and makes it become whatever he wants.

And so in the book of Genesis, the lord God creates Adam out of the dust of the Earth. In other words, he makes a clay figurine, and then he breathes into it, and it becomes alive. And because the clay become informed. By itself it is formless, it has no intelligence, and therefore it requires an external intelligence and an external energy to bring it to life and to bring some sense to it. And so in this way, we inherit a conception of ourselves as being artifacts, as being made, and it is perfectly natural in our culture for a child to ask its mother 'How was I made?' or 'Who made me?' And this is a very, very powerful idea, but for example, it is not shared by the Chinese,

or by the Hindus. A Chinese child would not ask its mother 'How was I made?' A Chinese child might ask its mother 'How did I grow?' which is an entirely different procedure from making. You see, when you make something, you put it together, you arrange parts, or you work from the outside in, as a sculptor works on stone, or as a potter works on clay. But when you watch something growing, it works in exactly the opposite direction. It works from the inside to the outside. It expands. It burgeons. It blossoms. And it happens all of itself at once. In other words, the original simple form, say of a living cell in the womb, progressively complicates itself, and that's the growing process, and it's quite different from the making process.

But we have thought, historically, you see, of the world as something made, and the idea of being—trees, for example— constructions, just as tables and houses are constructions. And so there is for that reason a fundamental difference between the made and the maker. And this image, this ceramic model of the universe, originated in cultures where the form of government was monarchical, and where, therefore, the maker of the universe was conceived also at the same time in the image of the king of the universe. 'King of kings, lords of lords, the only ruler of princes, who thus from thy throne behold all dwellers upon Earth.' I'm quoting the Book of Common Prayer. And so, all those people who are oriented to the universe in that way feel related to basic reality as a subject to a king. And so they are on very, very humble terms in relation to whatever it is that works all this thing. I find it odd, in the United States, that people who are citizens of a republic have a monarchical theory of the universe. That you can talk about the president of the United States as LBJ, or Ike, or Harry, but you can't talk about the lord of the universe in such familiar terms. Because we are carrying over from very ancient near-Eastern cultures, the notion that the lord of the universe must be respected in a certain way. People kneel, people bow, people prostrate themselves, and you know what the reason for that is: that nobody is more frightened of anybody else than a tyrant. He sits with his back to the wall, and his guards on either side of him, and he has you face downwards on the ground because you can't use weapons that way. When you come into his presence, you don't stand up and face him, because you might attack, and he has reason to fear that you might because he's ruling you all. And the man who rules you all is the biggest crook in

the bunch. Because he's the one who succeeded in crime. The other people are pushed aside because they—the criminals, the people we lock up in jail—are simply the people who didn't make it.

So naturally, the real boss sits with his back to the wall and his henchmen on either side of him. And so when you design a church, what does it look like? Catholic church, with the altar where it used to be—it's changing now, because the Catholic religion is changing. But the Catholic church has the altar with it's back to the wall at the east end of the church. And the altar is the throne and the priest is the chief vizier of the court, and he is making abeyance to the throne, but there is the throne of God, the altar. And all the people are facing it, and kneeling down. And a great Catholic cathedral is called a basilica, from the Greek 'basilikos,' which means 'king.' So a basilica is the house of a king, and the ritual of the church is based on the court rituals of Byzantium.

A Protestant church is a little different. Basically the same. The furniture of a Protestant church is based on a judicial courthouse. The pulpit, the judge in an American court wears a black robe, he wears exactly the same dress as a Protestant minister. And everybody sits in these boxes, there's a box for the jury, there's a box for the judge, there's a box for this, there's a box for that, and those are the pews in an ordinary colonial- type Protestant church. So both these kinds of churches which have an autocratic view of the nature of the universe decorate themselves, are architecturally constructed in accordance with political images of the universe. One is the king, and the other is the judge. Your honor. There's sense in this. When in court, you have to refer to the judge as 'your honor.' It stops the people engaged in litigation from losing their tempers and getting rude. There's a certain sense to that.

But when you want to apply that image to the universe itself, to the very nature of life, it has limitations. For one thing, the idea of a difference between matter and spirit. This idea doesn't work anymore. Long, long ago, physicists stopped asking the question 'What is matter?' They began that way. They wanted to know, what is the fundamental substance of the world? And the more they asked that question, the more they realized they couldn't answer it, because if you're going to say what matter is, you've got to

describe it in terms of behavior, that is to say in terms of form, in terms of pattern. You tell what it does, you describe the smallest shapes of it which you can see. Do you see what happens? You look, say, at a piece of stone, and you want to say, 'Well, what is this piece of stone made of?' You take your microscope and you look at it, and instead of just this block of stuff, you see ever so many tinier shapes. Little crystals. So you say, 'Fine, so far so good. Now what are these crystals made of?' And you take a more powerful instrument, and you find that they're made of molecules, and then you take a still more powerful instrument to find out what the molecules are made of, and you begin to describe atoms, electrons, protons, mesons, all sorts of sub-nuclear particles. But you never, never arrive at the basic stuff. Because there isn't any.

What happens is this: 'Stuff' is a word for the world as it looks when our eyes are out of focus. Fuzzy. Stuff—the idea of stuff is that it is undifferentiated, like some kind of goo. And when your eyes are not in sharp focus, everything looks fuzzy. When you get your eyes into focus, you see a form, you see a pattern. But when you want to change the level of magnification, and go in closer and closer and closer, you get fuzzy again before you get clear. So everytime you get fuzzy, you go through thinking there's some kind of stuff there. But when you get clear, you see a shape. So all that we can talk about is patterns. We never, never can talk about the 'stuff' of which these patterns are supposed to be made, because you don't really have to suppose that there is any. It's enough to talk about the world in terms of patterns. It describes anything that can be described, and you don't really have to suppose that there is some stuff that constitutes the essence of the pattern in the same way that clay constitutes the essence of pots. And so for this reason, you don't really have to suppose that the world is some kind of helpless, passive, unintelligent junk which an outside agency has to inform and make into intelligent shapes. So the picture of the world in the most sophisticated physics of today is not formed stuff—potted clay—but pattern. A self-moving, self-designing pattern. A dance. And our common sense as individuals hasn't yet caught up with this.

Well now, in the course of time, in the evolution of Western thought. The ceramic image of the world ran into trouble. And changed into what I call the fully automatic image of the world. In other words, Western science was

based on the idea that there are laws of nature, and got that idea from Judaism and Christianity and Islam. That in other words, the potter, the maker of the world in the beginning of things laid down the laws, and the law of God, which is also the law of nature, is called the 'loggos.?,.' And in Christianity, the loggos is the second person of the trinity, incarnate as Jesus Christ, who thereby is the perfect exemplar of the divine law. So we have tended to think of all natural phenomena as responding to laws, as if, in other words, the laws of the world were like the rails on which a streetcar or a tram or a train runs, and these things exist in a certain way, and all events respond to these laws. You know that limerick,

There was a young man who said 'Damn, For it certainly seems that I am A creature that moves In determinate grooves. I'm not even a bus, I'm a tram.'

So here's this idea that there's kind of a plan, and everything responds and obeys that plan. Well, in the 18th century, Western intellectuals began to suspect this idea. And what they suspected was whether there is a lawmaker, whether there is an architect of the universe, and they found out, or they reasoned, that you don't have to suppose that there is. Why? Because the hypothesis of God does not help us to make any predictions. Nor does it— In other words, let's put it this way: if the business of science is to make predictions about what's going to happen, science is essentially prophecy. What's going to happen? By examining the behavior of the past and describing it carefully, we can make predictions about what's going to happen in the future. That's really the whole of science. And to do this, and to make successful predictions, you do not need God as a hypothesis. Because it makes no difference to anything. If you say 'Everything is controlled by God, everything is governed by God,' that doesn't make any difference to your prediction of what's going to happen. And so what they did was drop that hypothesis. But they kept the hypothesis of law. Because if you can predict, if you can study the past and describe how things have behaved, and you've got some regularities in the behavior of the universe, you call that law. Although it may not be law in the ordinary sense of the word, it's simply regularity.

And so what they did was got rid of the lawmaker and kept the law. And so they conceived the universe in terms of a mechanism. Something, in other words, that is functioning according to regular, clocklike mechanical principles. Newton's whole image of the world is based on billiards. The atoms are billiard balls, and they bang each other around. And so your behavior, every individual around, is defined as a very, very complex arrangement of billiard balls being banged around by everything else. And so behind the fully automatic model of the universe is the notion that reality itself is, to use the favorite term of 19th century scientists, blind energy. In say the metaphysics of Ernst Hegel, and T.H. Huxley, the world is basically nothing but energy—blind, unintelligent force. And likewise and parallel to this, in the philosophy of Freud, the basic psychological energy is libido, which is blind lust. And it is only a fluke, it is only as a result of pure chances that resulting from the exuberance of this energy there are people. With values, with reason, with languages, with cultures, and with love. Just a fluke. Like, you know, 1000 monkeys typing on 1000 typewriters for a million years will eventually type the Encyclopedia Britannica. And of course the moment they stop typing the Encyclopedia Britannica, they will relapse into nonsense.

And so in order that that shall not happen, for you and I are flukes in this cosmos, and we like our way of life—we like being human—if we want to keep it, say these people, we've got to fight nature, because it will turn us back into nonsense the moment we let it. So we've got to impose our will upon this world as if we were something completely alien to it. From outside. And so we get a culture based on the idea of the war between man and nature. And we talk about the conquest of space. The conquest of Everest. And the great symbols of our culture are the rocket and the bulldozer. The rocket—you know, compensation for the sexually inadequate male. So we're going to conquer space. You know we're in space already, way out. If anybody cared to be sensitive and let outside space come to you, you can, if your eyes are clear enough. Aided by telescopes, aided by radio astronomy, aided by all the kinds of sensitive instruments we can devise. We're as far out in space as we're ever going to get. But, y'know, sensitivity isn't the pitch. Especially in the WASP culture of the United States. We define manliness in terms of aggression, you see, because we're a little bit frightened as to whether or not we're really men. And so we put

on this great show of being a tough guy. It's completely unnecessary. If you have what it takes, you don't need to put on that show. And you don't need to beat nature into submission. Why be hostile to nature? Because after all, you ARE a symptom of nature. You, as a human being, you grow out of this physical universe in exactly the same way an apple grows off an apple tree.

So let's say the tree which grows apples is a tree which apples, using 'apple' as a verb. And a world in which human beings arrive is a world that peoples. And so the existence of people is symptomatic of the kind of universe we live in

You, as a human being, you grow out of this physical universe in exactly the same way an apple grows off an apple tree.

So let's say the tree which grows apples is a tree which apples, using 'apple' as a verb. And a world in which human beings arrive is a world that peoples. And so the existence of people is symptomatic of the kind of universe we live in. Just as spots on somebody's skin is symptomatic of chicken pox. Just as hair on a head is symptomatic of what's going on in the organism. But we have been brought up by reason of our two great myths—the ceramic and the automatic—not to feel that we belong in the world. So our popular speech reflects it. You say 'I came into this world.' You didn't. You came out of it. You say 'Face facts.' We talk about 'encounters' with reality, as if it was a head-on meeting of completely alien agencies. And the average person has the sensation that he is a someone that exists inside a bag of skin. The center of consciousness that looks out at this thing, and what the hell's it going to do to me? You see? 'I recognize you, you kind of look like me, and I've seen myself in a mirror, and you look like you might be people.' So maybe you're intelligent and maybe you can love, too. Perhaps you're all right, some of you are, anyway. You've got the right color of skin, or you have the right religion, or whatever it is, you're OK. But there are all those people over in Asia, and Africa, and they may not really be people. When you want to destroy someone, you always define them as 'unpeople.' Not really human. Monkeys, maybe. Idiots, maybe. Machines, maybe, but not people.

So we have this hostility to the external world because of the superstition, the myth, the absolutely unfounded theory that you, yourself, exist only

inside your skin. Now I want to propose another idea altogether. There are two great theories in astronomy going on right now about the origination of the universe. One is called the explosion theory, and the other is called the steady state theory. The steady state people say there never was a time when the world began, it's always expanding, yes, but as a result of free hydrogen in space, the free hydrogen coagulates and makes new galaxies. But the other people say there was a primordial explosion, an enormous bang billions of years ago which flung all the galaxies into space. Well let's take that just for the sake of argument and say that was the way it happened.

It's like you took a bottle of ink and you threw it at a wall. Smash! And all that ink spread. And in the middle, it's dense, isn't it? And as it gets out on the edge, the little droplets get finer and finer and make more complicated patterns, see? So in the same way, there was a big bang at the beginning of things and it spread. And you and I, sitting here in this room, as complicated human beings, are way, way out on the fringe of that bang. We are the complicated little patterns on the end of it. Very interesting. But so we define ourselves as being only that. If you think that you are only inside your skin, you define yourself as one very complicated little curlique, way out on the edge of that explosion. Way out in space, and way out in time. Billions of years ago, you were a big bang, but now you're a complicated human being. And then we cut ourselves off, and don't feel that we're still the big bang. But you are. Depends how you define yourself. You are actually—if this is the way things started, if there was a big bang in the beginning— you're not something that's a result of the big bang. You're not something that is a sort of puppet on the end of the process. You are still the process. You are the big bang, the original force of the universe, coming on as whoever you are. When I meet you, I see not just what you define yourself as—Mr so-and- so, Ms so-and-so, Mrs so-and-so—I see every one of you as the primordial energy of the universe coming on at me in this particular way. I know I'm that, too. But we've learned to define ourselves as separate from it.

And so what I would call a basic problem we've got to go through first, is to understand that there are no such things as things. That is to say separate things, or separate events. That that is only a way of talking. If you can understand this, you're going to have no further problems. I once asked a

group of high school children ‘What do you mean by a thing?’ First of all, they gave me all sorts of synonyms. They said ‘It’s an object,’ which is simply another word for a thing; it doesn’t tell you anything about what you mean by a thing. Finally, a very smart girl from Italy, who was in the group, said a thing is a noun. And she was quite right. A noun isn’t a part of nature, it’s a part of speech. There are no nouns in the physical world. There are no separate things in the physical world, either. The physical world is wiggly. Clouds, mountains, trees, people, are all wiggly. And only when human beings get to working on things—they build buildings in straight lines, and try to make out that the world isn’t really wiggly. But here we are, sitting in this room all built out of straight lines, but each one of us is as wiggly as all get-out.

Now then, when you want to get control of something that wiggles, it’s pretty difficult, isn’t it? You try and pick up a fish in your hands, and the fish is wiggly and it slips out. What do you do to get hold of the fish? You use a net. And so the net is the basic thing we have for getting hold of the wiggly world. So if you want to get hold of this wiggle, you’ve got to put a net over it. A net is something regular. And I can number the holes in a net. So many holes up, so many holes across. And if I can number these holes, I can count exactly where each wiggle is, in terms of a hole in that net. And that’s the beginning of calculus, the art of measuring the world. But in order to do that, I’ve got to break up the wiggle into bits. I’ve got to call this a specific bit, and this the next bit of the wiggle, and this the next bit, and this the next bit of the wiggle. And so these bits are things or events. Bit of wiggles. Which I mark out in order to talk about the wiggle. In order to measure and therefore in order to control it. But in nature, in fact, in the physical world, the wiggle isn’t bitted. Like you don’t get a cut-up fryer out of an egg. But you have to cut the chicken up in order to eat it. You bite it. But it doesn’t come bitten.

So the world doesn’t come thinged; it doesn’t come evented. You and I are all as much continuous with the physical universe as a wave is continuous with the ocean. The ocean waves, and the universe peoples. And as I wave and say to you ‘Yoo-hoo!’ the world is waving with me at you and saying ‘Hi! I’m here!’ But we are consciousness of the way we feel and sense our existence. Being based on a myth that we are made, that we are parts, that

we are things, our consciousness has been influenced, so that each one of us does not feel that. We have been hypnotized, literally hypnotized by social convention into feeling and sensing that we exist only inside our skins. That we are not the original bang, just something out on the end of it. And therefore we are scared stiff. My wave is going to disappear, and I'm going to die! And that would be awful. We've got a mythology going now which is, as Father Maskell.?, put it, we are something that happens between the maternity ward and the crematorium. And that's it. And therefore everybody feels unhappy and miserable.

This is what people really believe today. You may go to church, you may say you believe in this, that, and the other, but you don't. Even Jehovah's Witnesses, who are the most fundamental of fundamentalists, they are polite when they come around and knock on the door. But if you REALLY believed in Christianity, you would be screaming in the streets. But nobody does. You would be taking full- page ads in the paper every day. You would be the most terrifying television programs. The churches would be going out of their minds if they really believed what they teach. But they don't. They think they ought to believe what they teach. They believe they should believe, but they don't really believe it, because what we REALLY believe is the fully automatic model. And that is our basic, plausible common sense. You are a fluke. You are a separate event. And you run from the maternity ward to the crematorium, and that's it, baby. That's it.

Now why does anybody think that way? There's no reason to, because it isn't even scientific. It's just a myth. And it's invented by people who want to feel a certain way. They want to play a certain game. The game of god got embarrassing. The idea if God as the potter, as the architect of the universe, is good. It makes you feel that life is, after all, important. There is someone who cares. It has meaning, it has sense, and you are valuable in the eyes of the father. But after a while, it gets embarrassing, and you realize that everything you do is being watched by God. He knows your tiniest innermost feelings and thoughts, and you say after a while, 'Quit bugging me! I don't want you around.' So you become an athiest, just to get rid of him. Then you feel terrible after that, because you got rid of God, but that means you got rid of yourself. You're nothing but a machine. And your idea that you're a machine is just a machine, too. So if you're a smart kid,

you commit suicide. Camus said there is only one serious philosophical question, which is whether or not to commit suicide. I think there are four or five serious philosophical questions. The first one is 'Who started it?' The second is 'Are we going to make it?' The third is 'Where are we going to put it?' The fourth is 'Who's going to clean up?' And the fifth, 'Is it serious?'

But still, should you or not commit suicide? This is a good question. Why go on? And you only go on if the game is worth the gamble. Now the universe has been going on for an incredible long time. And so really, a satisfactory theory of the universe has to be one that's worth betting on. That's very, it seems to me, elementary common sense. If you make a theory of the universe which isn't worth betting on, why bother? Just commit suicide. But if you want to go on playing the game, you've got to have an optimal theory for playing the game. Otherwise there's no point in it. But the people who coined the fully automatic theory of the universe were playing a very funny game, for what they wanted to say was this: all you people who believe in religion—old ladies and wishful thinkers— you've got a big daddy up there, and you want comfort, but life is rough. Life is tough, as success goes to the most hard-headed people. That was a very convenient theory when the European and American worlds were colonizing the natives everywhere else. They said 'We're the end product of evolution, and we're tough. I'm a big strong guy because I face facts, and life is just a bunch of junk, and I'm going to impose my will on it and turn it into something else. I'm real hard.' That's a way of flattering yourself.

And so, it has become academically plausible and fashionable that this is the way the world works. In academic circles, no other theory of the world than the fully automatic model is respectable. Because if you're an academic person, you've got to be an intellectually tough person, you've got to be prickly. There are basically two kinds of philosophy. One's called prickles, the other's called goo. And prickly people are precise, rigorous, logical. They like everything chopped up and clear. Goo people like it vague. For example, in physics, prickly people believe that the ultimate constituents of matter are particles. Goo people believe it's waves. And in philosophy, prickly people are logical positivists, and goo people are idealists. And they're always arguing with each other, but what they don't

realize is neither one can take his position without the other person. Because you wouldn't know you advocated prickles unless there was someone advocating goo. You wouldn't know what a prickle was unless you knew what a goo was. Because life isn't either prickles or goo, it's either gooey prickles or prickly goo. They go together like back and front, male and female. And that's the answer to philosophy. You see, I'm a philosopher, and I'm not going to argue very much, because if you don't argue with me, I don't know what I think. So if we argue, I say 'Thank you,' because owing to the courtesy of your taking a different point of view, I understand what I mean. So I can't get rid of you.

But however, you see, this whole idea that the universe is nothing at all but unintelligent force playing around and not even enjoying it is a putdown theory of the world. People who had an advantage to make, a game to play by putting it down, and making out that because they put the world down they were a superior kind of people. So that just won't do. We've had it. Because if you seriously go along with this idea of the world, you're what is technically called alienated. You feel hostile to the world. You feel that the world is a trap. It is a mechanism, it is electronic and neurological mechanisms into which you somehow got caught. And you, poor thing, have to put up with being put into a body that's falling apart, that gets cancer, that gets the great Siberian itch, and is just terrible. And these mechanics—doctors—are trying to help you out, but they really can't succeed in the end, and you're just going to fall apart, and it's a grim business, and it's just too bad. So if you think that's the way things are, you might as well commit suicide right now. Unless you say, 'Well, I'm damned. Because there might really be after all eternal damnation. Or I identify with my children, and I think of them going on without me and nobody to support them. Because if I do go on in this frame of mind and continue to support them, I shall teach them to be like I am, and they'll go on, dragging it out to support their children, and they won't enjoy it. They'll be afraid to commit suicide, and so will their children. They'll all learn the same lessons.'

So you see, all I'm trying to say is that the basic common sense about the nature of the world that is influencing most people in the United States today is simply a myth. If you want to say that the idea of God the father with his white beard on the golden throne is a myth, in a bad sense of the

word 'myth,' so is this other one. It is just as phony and has just as little to support it as being the true state of affairs. Why? Let's get this clear. If there is any such thing at all as intelligence and love and beauty, well you've found it in other people. In other words, it exists in us as human beings. And as I said, if it is there, in us, it is symptomatic of the scheme of things. We are as symptomatic of the scheme of things as the apples are symptomatic of the apple tree or the rose of the rose bush. The Earth is not a big rock infested with living organisms any more than your skeleton is bones infested with cells. The Earth is geological, yes, but this geological entity grows people, and our existence on the Earth is a symptom of this other system, and its balances, as much as the solar system in turn is a symptom of our galaxy, and our galaxy in its turn is a symptom of a whole company of other galaxies. Goodness only knows what that's in.

But you see, when, as a scientist, you describe the behavior of a living organism, you try to say what a person does, it's the only way in which you can describe what a person is, describe what they do. Then you find out that in making this description, you cannot confine yourself to what happens inside the skin. In other words, you cannot talk about a person walking unless you start describing the floor, because when I walk, I don't just dangle my legs in empty space. I move in relationship to a room. So in order to describe what I'm doing when I'm walking, I have to describe the room; I have to describe the territory. So in describing my talking at the moment, I can't describe it as just a thing in itself, because I'm talking to you. And so what I'm doing at the moment is not completely described unless your being here is described also. So if that is necessary, in other words, in order to describe MY behavior, I have to describe YOUR behavior and the behavior of the environment, it means that we've really got one system of behavior. Your skin doesn't separate you from the world; it's a bridge through which the external world flows into you, and you flow into it.

Just, for example, as a whirlpool in water, you could say because you have a skin you have a definite shape you have a definite form. All right? Here is a flow of water, and suddenly it does a whirlpool, and it goes on. The whirlpool is a definite form, but no water stays put in it. The whirlpool is something the stream is doing, and exactly the same way, the whole

universe is doing each one of us, and I see each one of you today and I recognize you tomorrow, just as I would recognize a whirlpool in a stream. I'd say 'Oh yes, I've seen that whirlpool before, it's just near so-and-so's house on the edge of the river, and it's always there.' So in the same way when I meet you tomorrow, I recognize you, you're the same whirlpool you were yesterday. But you're moving. The whole world is moving through you, all the cosmic rays, all the food you're eating, the stream of steaks and milk and eggs and everything is just flowing right through you. When you're wiggling the same way, the world is wiggling, the stream is wiggling you.

But the problem is, you see, we haven't been taught to feel that way. The myths underlying our culture and underlying our common sense have not taught us to feel identical with the universe, but only parts of it, only in it, only confronting it—aliens. And we are, I think, quite urgently in need of coming to feel that we ARE the eternal universe, each one of us. Otherwise we're going to go out of our heads. We're going to commit suicide, collectively, courtesy of H-bombs. And, all right, supposing we do, well that will be that, then there will be life making experiments on other galaxies. Maybe they'll find a better game.

Comparative Philosophy

Mind Over Mind

The general title of these talks that I'm giving here is mind over mind. And I'm going into all the various problems which have to do with the control of the mind. And so I might introduce what I'm going to say by saying it from different points of view. For example, if you're interested in Communications, it will be the problem of feedback. Or if I may put it in theological terms, how does man follow the will of God if the will of man is perverse? The theologians say you cannot do this without having divine grace all the power to follow the will of God. How then do you get grace. Why is grace given to some and not to others? If I cannot follow the will of God by my own effort because my will is selfish, how will my will which is selfish be transformed into an unselfish will? If I cannot do it because I am already the selfish will, then Grace must do it. If Grace has not already done it, why not? Because I didn't accept it. But by definition I have no power to accept it because my will was selfish. Must I then become a Calvinist, and say that only those people who are predestined to receive grace will be able to live the good life?

Then we come back to the inadmissible position that people who live evil lives and do not get grace because they are not predestined to it out of the infinite wisdom of the Godhead then God Himself must be held responsible for their evil deeds. And so that is a nice little tangle. If I put this in the language of oriental philosophy and religion it would be something like this. The Buddha said that wisdom must come only from the abandonment of selfish craving, or desire. One who abandons that desire attain is nirvana. Which is supremely peace liberation. Nirvana means in Sanskrit 'blow out'. That is exhale the breath. The opposite, desire, is to breathe in. Now if you breathe in and hold it. You lose your breath. But if you breathe out. It comes back to you. So the principle here is if you want life don't cling to it. Let go.

But the problem is, “If I desire not to desire, is that not already desire? How can I desire not to desire? How can I surrender myself. In myself is precisely. To hold on to cling to cling to life to continue to survive. I can see rationally that by clinging to myself I may strangle myself. I may be like a person who has a bad habit, as a result of which he is committing suicide and he knows that but can’t give it up. Because the means of death are so sweet. So, it all comes down to this basic question. That human beings have, for a long, long time, been concerned about transforming their minds. Is there any way in which one’s mind can be transformed. Or is it simply a process which is nothing more than a vicious circle? I could ask why have you come here this afternoon? What were you looking for? Would it be too presumptuous of me to say that you were looking for help? That you hoped you would hear somebody who had something to say that would be of help and relevance to you as members of a world which is running into the most intense difficulty. A world beset by a complex of problems, any one of which would be bad enough. But when you add together all the great political social and ecological problems with which we are face they are appalling. And one naturally says the reason why we are in such a mess is not. Simply that we have wrong systems for doing things whether they be technological, political, or religious but we have the wrong people. The systems may be all right but they are in the wrong hands because we are all in various ways self-seeking. Lacking in wisdom, lacking in courage, afraid of death, afraid of pain. Unwilling really to cooperate with others. Unwilling to be open to others. And we all think that’s too bad, it’s me that’s wrong! And if only I could be the right person is this man going to tell me something. That will help me to change myself. So that I will be a more creative and cooperative member of the human race. I would like to improve.

So, in so many people’s minds and from so many different angles, there is this urgent feeling that I must improve me. And this is critically important because it’s obvious that at least it’s superficially obvious, that the way things are, we are going to hell fast. Now in this question, can I improve me, there is the obvious difficulty that if I am in need of improving, the person who is going to do the improving is the one who needs to be improved. And there immediately we have a vicious circle. All right, you want grace. Well ask God, maybe I’ll give it to you. And the theologian will

tell you, “Yes, God gives His grace freely. He gives it to all because he loves all. It’s here like the air, all you have to do is receive it Ari Law author doxie Catholic Christian would say all you have to do is to be baptized. To take the holy sacrament of the altar of the bread and wine the Body and Blood of Christ and there is the grace right there. And it’s given by the simple physical means so that it’s very easily and readily available. Well a lot of people got baptized. And it doesn’t always take. People fall from grace. Why do they? You see, we’re just talking about the same old problem, but we’ve put it a step up—but it’s the same problem. How can I improve myself. Was the first problem, the second problem is how can I accept grace they’re both the same problem.

Because you’ve got to make a move. Which will put yourself out of your own control into the control of a better. If you don’t believe in the Christian kind of a God you can believe in the Hindu kind of a God who is your inner Self. You see you’ve got a lower self, which you can call your ego, that’s that little scoundrel is fella that’s all is out for me, the behind the ego there is the Atman. The inner self the inward light as Quakers would call it. The real self, the spirit which is substantially identical with God. So you got to I meditate in such a way that you identify with your higher self how do you do that well you start by watching all your thoughts. Very carefully. Watching your feelings watching your emotions. So that you begin to build up a sense of separation between the watcher and what is watched. So that you are as it were no longer carried away by your own stream of consciousness you remain the witness impassively impartially suspending judgment, and watching it all go on.

That seems to be something like progress at least you are taking an objective view of what is going on you are beginning to be in a position to control it but just wait a minute, who is the Self behind the self the watching self, can you watch that one? Interesting if you do. Because you find out of cause that this is just as the problem of grace is nothing more than a transposition of the first problem, how am I to be unselfish by my own power? It becomes how am I to get grace by my own power. So in the same way we find that the watching Self, the observing Self behind all off thoughts and feelings is itself a thought that is to say. When the police enter a house in which there are thieves. The thieves go up from the ground floor

of the first floor. When the police arrive on the first floor, the thieves have gone up to the second. And so to third, and finally out of the roof. And so when the ego is about to be unmasked, it immediately identifies with the higher Self. It goes up a level, because the religious game is simply a refined and highbrow version of the ordinary game. How can I outwit me? How can I one up me? So, if I find for example that in the quest for pleasure. The ordinary pleasures of the world. Food, sex, our possessions. All this becomes a drag. And I think now it isn't there so I go in for the arts literature poetry music. And I absorb myself in that in those pleasures, and after a while, they aren't the answer so I go to psychoanalysis you see. And then I found out that's not the answer I got to religion. I'm still thinking what I was seeking when I wanted can be bought. I want to get that goodie. Only I see now that it costs not going to be a material goody, all material goods fall apart, but maybe there's a spiritual good it's not going to fall apart. But in that quest, the quest is not different from the quest for the candy bar. Same old story only you have refined the candy bar made it abstract and holy and bless it and so on. So it is with the highest self the highest self zeroed ego. And you sure hope it is eternal, indestructible and all wise, then the great problem is how to get that higher self working? How does it make any difference to what you do and what you think. I know all kinds of people who got this higher self going practicing their yoga. But they're just like ordinary people. Sometimes a little worse. And they can fool themselves. They can say for example. Well my point of view in religion is very liberal. I believe that all religions have divine revelation in them. But I don't understand the way you people fight about it. You fight and say that we. Jehova's witnesses have the real religion, others say well we Roman Catholics have it and the Muslims say no it is in the Koran. And this is the right way. And somebody else gets up and he may be a rather high brow Catholic and say well God has given the spirit through all the traditions but ours is the most refined and mature.

And then somebody comes along and says well as I said they're all equally revelations of the divine, and in seeing this of course I'm much more tolerant than you are. You see how that game is going to work. The architect this position, supposing you regard me as some sort of a guru. And you know how gurus hate each other. Always putting each other down. And I could say well I don't put other groups down. See we're always doing

that. Were always finding a way to be one up. And by the most incredibly subtle me. So you see when you see me and you say I realize I'm always doing that tell me how do I not do that. I say why do you want to know. Why I'll be better that way yeah but why do you want to be better. You see the reason you want to be better is the reason why you aren't. Should I put it like that?

We aren't better because we want to be. Because the road to hell is paved with good intentions. Because all the do gooders in the world whether they're doing good for others or doing it for themselves are troublemakers. On the basis of 'kindly let me help you or you'll drown', said the Monkey putting the fish safely up a tree. We white anglo saxon protestants; British, German, American. We have been on a rampage for the past hundred or more years to improve the world. We have given the benefits of our culture, our religion, our technology to everybody except perhaps the Australian aborigines. And we have insisted that they receive the benefits of our culture even our political styles our democracy you better be dead Democratic I will shoot you. And having conferred these blessings all over the place we wonder why everybody hates us. Because sometimes doing good to others and even doing good to oneself is amazingly destructive. Because it's full of conceit. How do you know what's good for other people? How do you know what's good for you? If you say you want to improve. Then you want to know what's good for you. But obviously you don't because if you did you would be improved. So we don't know. It's like the problem of geneticists, which they face today. I went to a meeting of geneticists not so long ago where they gathered in a group of philosophers and theologians and said Now look here we need help. We now are on the verge of figuring out how to bring in any kind of human character. We would want to have. We give you saints, philosophers, scientists, great politicians, anything you want, just tell us what kind of human beings ought we to breed.

So I said, 'How will those of us who are genetically unregenerated make up our minds what genetically generated people might be.?' Because I'm afraid very much that our selection of virtues may not work. It may be like for example this new kind of high-yield grain which is made and which is becoming ecologically destructive. When we interfere with the processes of

nature and breed efficient plants and efficient animals there's always some way in which we have to pay for it. And I can well see that a eugenically-produced human beings might be dreadful. We could have a plague of virtuous people. Do you realize that? Any animal considered in itself is virtuous it does its thing but in crowds they're awful. Like a cross crowd of ants, or locusts on the rampage, they're all perfectly good animals. But it's just too much I could imagine a perfectly pestiferous mass of a million signs. So I said to these people, 'Look, if there's anything you can do, just be sure that a vast variety of human beings is maintained.' Don't please bring us down to a few excellent types excellent for what we never know how circumstances are going to change. And how. Our need. For different kinds of people changes.

At one time we may need very individualistic and aggressive people, at another time we may need very co-operative team working people. At another time we may need people who are full of interest in dexterous manipulation of the external world, at another time we may need people who explore into their own psychology and are introspective. There is no knowing but the mall varieties and the mosque ills we have obviously the better. So you see here again the problem comes out in genetics we do not really know how to interfere with the way the world is. The way the world actually is is an enormously complex interrelated organism. The same problem arises in medicine, because the body is a very complexly interrelated organism. And if you look at the body in a superficial way you may see there's something wrong with it, here's chicken pox. And the spots that it should come all out all over the place well you might say well spots of that cut them off. So you kill the bug. But then you find you've got real problems. Because you have to introduce some bugs to kill the bug, it's like bringing rabbits into Australia. And that starts going all over the place and getting out of hand. And then you think well now wait a minute, it wasn't the bugs in the blood there are bugs all over the place. What was wrong with this person that his blood system suddenly became vulnerable to those particular bugs his resistance was in doubt? Therefore what you should have given was not an antibiotic but vitamins. OK so we're going to build up his resistance but resistance to what. You may build up resistance to this and this and this class of bugs, but then there's another one that loves that situation it comes right in. See we always look at the human being

medically, in bits and pieces, because we have heart specialists, lung specialists, bones specialists, nerve specialists, and so on. And they each see the human being from their point of view there are a few generalists but they realise that human bodies. Complicated that no one mind can understand it. And furthermore, supposing we do succeed in healing all these people of that diseases. What do we then do about the population problem. I mean we've stopped cholera, the black bubonic plague, we're getting the better of tuberculosis, we may fix cancer and heart disease.

Then what will people die of? Well they'll just go on living. On the enormous quantities of others. Then we have to fix this birthing. Pills for everybody. Then we find one of the effects the side effects of those pills. What are the psychological effects upon men and women of not breeding of children in the usual way? We don't know. And what seems a good thing today or yesterday like D.D.T. turns out tomorrow to been a disaster. What seemed in the moral and spiritual sphere, to like great virtues in times past are easily seen today as hideous evils, let's take for example the Inquisition, in its own day among Catholics the Holy Inquisition was regarded. As we'd today regard the practice of psychiatry. You, you see, you feel that in curing the person of cancer almost anything is justified. The most complex operations, the most weird surgery people suspended for days and days on end on the end of tubes with X. ray penetration burning. Or people undergoing shock treatment, people locked in the colorless monotonous corridors of mental institution. In all good faith, they knew that witchcraft and heresy were terrible things. Often plagues imperiling people souls forever and ever. So any means we're justified. To cure people of heresy. We don't change. We're doing the same thing today. But under different names. We can look back at those people and see how evil that was but we can't see it in ourselves. So therefore, beware of virtue.

Lao Tzu, the Chinese philosopher, said "the highest virtue is not virtue and therefore really is virtue." But inferior virtue cannot let go of being virtuous and therefore is not virtue. Translated in more of a paraphrastic way, the highest virtue is not conscious of itself as virtue, and therefore really is virtue. Lower virtue is so self-conscious that it's not virtue. In other words, when you breath, you don't congratulate yourself on being virtuous. But breathing is a great virtue. It's a living.

When you come out with beautiful eyes, blue or brown or green as the case may be, you don't congratulate yourself for having grown one of the most fabulous jewels on earth. Just eyes. And you don't to count it a virtue to see, to entertain the miracles of color and form. But that's real virtue virtue in the sense of the old sense of the word as strength, as when we talk about the healing virtue of a plant. That's real virtue. But the other virtue is a stuck on they're ersatz, they're imitation virtues. And they usually create trouble, because more diabolical things are done in the name of righteousness. And be assured that everybody of whatever nationality or political frame of mind or religion all ways goes to was with a sense of complete rightness. The other side is that devil.

Our opponents, whether in China or Russia or Vietnam, have the same feeling of righteousness about what they're doing as we have on our side. And a plague on both houses because, as Confucius said "the goody good is of the thieves of virtue." Which is the form of our own problem the road to hell is paved with good intentions. So in a way the moral, or the immoral, of these considerations is that if you are really aware of your own inner workings, you will realize there's nothing you can do to improve yourself. Because you don't know what better is, in any case, and you, who will do the improving, are the one who needs to be improved. And this also goes for society. We can change society, we can get enormous enthusiasm going out of the idea that there is a revolution afoot, and that this revolution is going to set everything to right. Do you know a revolution that ever said anything to right? Whether the revolution came from the left wing or from the right wing.

The best forms of government that have ever existed in the world others which muddled through. Where they didn't have any very clear set up of control, but they muddle along. A kind of what are called controlled anarchy seems to work out better than anything else. When we have a great system and great power to put it into effect there, is always more violence more bloodshed more trouble. Makes no difference whether it be Chairman Mao or Adolf Hitler.

So, what instead therefore if we see, that you can't out with yourself. You can't be shall I say unselfconscious on purpose. You can't be design it was

spontaneous. And you cannot be genuinely loving by intending to love. Either you love someone or you don't. If you pretend to love a person, you deceive them, and build up reasons for resentment. So you say well I ought to be honest. That's the beginning of so many lies you can't imagine. It like when I hear lots of Love the big love thing on the way everybody's gotta love everybody but he sings songs about love. Do you know what I do? I buy a gun and board my door. Because I know there's a storm of hypocrisy brewing. So let's look at this thing from another point of view which you will at first think highly depressing.

Let's suppose we can't do anything to change also. Suppose we're stuck with it. Now that is the the worst thing an American audience can hear. There's no way of improving yourself because every kind of culture in this country is dedicated to self-improvement. Let's take jogging, that deplorable practice. It's a very nice thing to run. And to go dancing across the hills at a fast need. But these drugs are such trash. Truck junk shaking their bones and rattling their brains running on their heels and because there's a grimness about. It's determinately good for you. See, why do you go to school? Now wait a minute, you may not clap when I'm through. Thirty one reason for going to school. And that is that somebody is got something whether it's a professor, or a library that you want to find out. That you are incredibly interested in how to write Chinese characters. Or how to understand botany. And you would like to know, you are just interested in flowers and you would like to find out everything there is to be known about them. That's the point of coming. Or you might like to know how to practice yoga there are causes now being offered at U.C.L.A. on Kundalini Yoga. For credit! Pretty funny, when I think back ten years. But the whole point of coming to school is that you're interested in something. You don't come to improve yourself. But the trouble is that the schools got the wrong idea. They gave people Honors for learning. And the reward for studying French should be the ability to speak French and enjoy reading French and having fun with French people, but when you get a degree for it, then the degree becomes the point in a game of one upmanship. And of course one upmanship is the main business of the educational community today. You learn all the rules of how to be a good professor. It's instructive to go to a professors' meeting. In my field which is philosophy you go to a congress of philosophers and you'll find when they all get together in the

bar or in the restaurant and somebody is the one thing they don't talk about his philosophy. It is very bad form indeed to show interest in philosophy among your colleagues. The same is exactly true in clergy gatherings they we don't talk about religion what they both talk about is politics, church politics and academic politics. Because it's bad form to be brilliant on the faculty, because it out classes your colleagues therefore faculty people tend to cultivate a studied mediocrity. And you've got to watch out for that, I mean if you get mobs of students coming to your lectures, you get pretty black looks from your colleagues. And then of course there's a whole world of one upmanship in research and publication of learned papers how many was that the relative quantity of footnotes to basic text footnotes on for now. And the various ways of making your bibliography painfully accurate. It's endless, but you see what it is it's scholarship about scholarship and not scholarship. Just as learning because learning is good for you is irrelevant to learning the whole idea of improving yourself by learning is irrelevant to the learning process and in the same way, doing business is doing business doing business such as manufacturing clothes. Is a very good thing to do. I could conceive that it would be extremely enjoyable something I want to be very proud of to make good clothes 'cause you need to sell them because you need to eat. But to make clothes to make money raises another question. Because then your interest is not in making clothes but in making money, and then you are going to cheat on the clothes. And then you do get an awful lot of money and you don't know what to do with it.

You can't, you can't eat ten roasts of beef in one day. Can't live in six houses that one can't drive three Rolls Royces at the same time. What do you do? When you discover make more money you put your money back invested in something else it'll make mom and you don't give a damn how it's made so long as they make it. You don't care if a foul or reversed put oil fumes throughout the area where kill off all of fish—so what?—so long as you see these figures happening you're not aware of anything else. So you see you went out to do a self-improvement thing making money you see is a measure of improvement a measure of your economic worth while or less, or least that's what it's supposed to be it isn't anything of the kind but you well are in other words for the status instead of for the actuality.

So if, in other words you do not you're a musician Why do you play music the only reason for playing music is to enjoy it. If you play music to impress an audience. To read about yourself in the newspaper you're not interested in music. So in the same way, why do I come and talk to you. Because I enjoy it. I like the sound of my own voice and I'm interested in what I'm talking about. I get paid for it and that's modernist life is to get paid for what you enjoy. So here's the situation you see there is no that the whole idea of self-improvement is a is a will o' the wisp on a. That's not what it's about. Let's begin where we are. What happens if you know if you know beyond any shadow of doubt that there is nothing you can do to be better. Well it's kind of a relief, isn't it.

Now you say well now what will I do. See there's a little fidget comes up. Because we're so used to making things better, leave the well a better place than when you found that sort of thing. I want to be of service to other people and all these dreadfully hazy ideas. And so we think there's that little itch still. But supposing instead of that, seeing that there isn't really anything we can do to improve ourselves or to improve the world, if we realize that that is so, It gives us a breather in the course of which we may simply watch what is going on. Watch what happens. Nobody ever does this, you know. And therefore it sounds terribly simple it sounds so simple that is almost looks as if it isn't worth doing. Never just watched. Watch what's happening, and watch what you are doing by way of reaction to it just watch it happen. And don't be in a hurry. To think you know what it is. In other words, people look at the well that's the external world. Oh? How do you know? The whole thing from a neurological point of view is a happening in your head. That you think there is something outside the skull is a notion in your nervous system. May or may not be, but it's a notion in your nervous system. You think this exists the material world. Well that somebody is philosophical idea. Or maybe you think it's spiritual. That too is somebody is philosophical idea this is real world is not spiritual. It is not material. The real world is simply.

So could we look at things in that way? Without as it were fixing labels and names and gradations and judgments on everything, but watch what happens. Watch what we do. Now you see if you do that you do at least give yourself a chance. And it may be that when you are in this way freed from

busy-bodiness, and being out to improve everything. That your own nature will begin to take care of itself. Because you're not getting in the way of yourself all the time.

You will begin to find out, that the great things that you do are really happenings. For example, no great genius can explain how he does it. Yes he said I have learned a technique to express myself, because I had something in me that had to come out I had to know how to give it out so if I were a musician I had to learn how music is produced, that means learning to use an instrument or learning a technique of musical notation or whatever it may be. If I want to describe something I have to learn a language, so that others can understand me. I need a technique but then beyond that, I'm afraid I can't tell you how it was that I use that technique to express this mysterious thing I wanted to show you. If we could tell people that, we would have schools where we would infallibly train musical geniuses, scientific, miracle minds, and they would be so many of them we wouldn't know what to do with them. Geniuses would be a dime a dozen and then we would say well these people are after all not very ingenious. You know P.H.D.'s how many of them are there? Because what is fascinating always about genes is the fellow does something we can't understand. He surprises us. But you see just in the same way we cannot understand our own brains; neurology knows relatively little about the brain, which is only to say that the brain is a lot smarter than neurology. Yes it didn't get there is this which can perform all these extraordinary intellectual and cultural miracles, but we don't know how we did. But we did we didn't have some campaign to have an improved brain over the monkeys or whatever may be our ancestors. It happened. And all growth, you see is fundamentally something that happens. But, for it to happen, two things are important. First this, as I said you must have the technical ability. To express what happens. And secondly, you must get out of your own way. But right at the bottom of the whole problem of control is how am I to get out of my own way. And if I showed you a system, let's all practice getting out of our own way, it would turn into another form of self-improvement. See here's the dynamics of this thing. And we find this problem you see repeatedly throughout the entire history of human spirituality. In the phraseology of Zen Buddhism, you cannot get this by thinking. You cannot attain to it by not thinking. It is only

you see, as you, as getting out of your own way ceases to be a matter of choice, when you see that there's nothing else for you to do.

When you see in other words that doing something about your situation is not going to help you. When you see equally, that trying not to do anything about it is not going to help you where are you where you stand. Your nonplussed. And you simply reduced to watching.

Now you may say I need some help in this process, and therefore I am going to find someone else to help me. It may be a therapist. It may be a clergyman, it may be a guru. It may be any kind of person who teaches a technique of self-improvement. Now how will you know whether this person is able to teach you. How can you judge, for example, whether a psychotherapist is effective or just a charlatan? How can you judge whether a guru is himself spiritually wise or merely a good chatterbox? Well of course, you ask your friends, you ask of his other students or patients and they're all of course enthusiastic. You have to be enthusiastic when you bought something expensive. If you bought an automobile which turned out to be a lemon it's very difficult to admit that it was a lemon that you were fooled and it's the same when you buy a religion or an expensive operation. But what people do not sufficiently realize is that when you pick an authority, whether it's a psychotherapeutic one or a religious one. You chose it. In other words, that this fellow, or this book, or this system is the right one is your opinion. And how are you competent to judge? After all, if you're saying to this other person or other source, I think you are the authority, that's your opinion. So you cannot really judge whether an austerity is a sound off already unless you yourself are a sound off already. Otherwise you may just be being food. You may say, for example, I believe that the Bible is the Word of God. All right, that's your opinion. I know the Bible says it's the Word of God, but it's your opinion that the Bible is not lying. The church says the Bible is the Word of God but it's your opinion that the church is right. You cannot escape from that situation, it's your opinion!

So you see when you select an author who will help you to improve yourself it's like hiring the police out of your tax money. And putting them in charge of seeing that you obey the law. I mean, can't you take care of

yourselves? I mean is this the land of the free and the home of the brave or isn't it? But you see nobody seems to want to be in charge of themselves. Because they feel they can't do it. The St. Paul said "To will is present with me. But how to do good I find not, for the good that I would I do not and the evil that I would not that I do."

So, there at once we are in difficulty, because trying to improve yourself is like trying to lift yourself up into the air by tugging at your own bootstraps, and it can't be done. Now, there are all sorts of ways in which religious people try to explain that it can be done I referred already to the grace of God. And say No you can't do the job yourself. Because the improving you is the one that needs to be improved, therefore you have to say God help me. Now of course, that God exists is your opinion, that God will answer your prayer is your opinion and your idea of God is your idea of God If you bought somebody else's script, you bought it. Maybe your mother and father talked to you about God in a very impressive way. But basically you bought their idea. And if you're a father yourself; I'm a grandfather now, I've got five grandchildren and I know I'm a stupid as my own grandfather must have been. You know I am one I sit there in the position which they look at they go wowwe as a man. I know that just like anyone else. So I hope my children are not believing things on my authority, because it's always their authority. If I look impressive and make big noises at them, they've just been taken.

Philosophy of Nature

Compare a physical globe and a political globe. The physical globe is a pretty thing with all kinds of green and brown and wiggly patterns on it. The political globe on the other hand has still got the wiggly outlines of the land, but they are all crossed over with colored patches many of which have completely straight edges. A lot of the boundary between the United States and Canada, once you get west of the Great Lakes is simply a straight line. What has that got to do with anything? With any difference between Canadians on one side of the line or Americans on the other side of the line or what have you. It's absolutely a violation of the surface of the territory. And look at the fair city of San Francisco. It's a lovely place but they planted on the hills of San Francisco a city pattern that was appropriate for

the plains of Kansas. A gridiron. And so you get streets that go straight up and that are extremely dangerous where they should have followed the contours of the hills.

Now however I think we should begin by talking a little bit about when we use the word physical reality, as distinct from abstraction, what are we talking about? Because you see there's going to be a fight about this philosophically. If I say that the final reality that we're living in is the physical world, a lot of people will say that I'm a materialist, that I'm unspiritual and that I think too much of an identification of the man with the body. You, any book that you open on yoga or Hindu philosophy will have in it a declaration that you start a meditation practice by saying to yourself I am not the body. I am not my feelings, I am not my thoughts, I am the witness who watches all this and is not really any of it. And so if I were to say then that the physical world is the basic reality, I would seem to be contradicting what is said in these Hindu texts. But it all depends on what you mean by the physical world, what is it?

First of all on this be pointed out that the idea of the material world is itself philosophical. We confuse physical events, the whole class and category of physical events with matter. But matter you see is an idea it's a concept it's the concept of stuff how something solid and permanent that you can catch hold of. Now you just can't catch hold of the physical world. The physical world is the most evasive, elusive process that there is. It will not be pinned down and therefore it fulfills all the requirements of the spirit. So what I'm saying then is that the way the non abstract world which Korzybzski called unspeakable which was really rather a good word. Is the spiritual world. And the spiritual world isn't something gaseous. Abstract. Form-less, in that sense of shape. It's formless in another sense the formless world is a wiggly. See it's where when we say something is shapeless like a cloud. What shape as this cloud you say well it's so they get shapeless. That's the real formless world.

The formal world is the one that human beings try to construct all the time. See wherever human beings have been around to see rectangles and straight lines. As we're always trying to straighten things out. And so that's the very mark of our presence. I don't know why we do it it's always been a puzzle

to me why architects are always using rectangles. But the thing is that with that they make us feel very uncomfortable if they don't. I have an architect friend who built somebody a house like a snail shell. And it was a it's spiraled in and in and in and the John was right at the center. But everybody rebels against this house, they just feel very uncomfortable and that no these are the furniture doesn't fit. Because all furniture is made to fit in a rectilinear scene.

And so we're always putting things in boxes, see all thoughts all words are labels on boxes therefore we feel we've got to get everything boxed. And so we put ourselves in boxes everything is put in boxes. But actually everything else in nature doesn't go that way, as for example the snail doesn't put itself in a box. The crab doesn't put itself in the box. It has these fascinating goddess objects. What is for example more beautiful than a Conch shell? Or a lovely scallop shell? These are gorgeous things. We could make the most delicious shells out of concrete or plastics. They could be very beautiful. And we could distribute ourselves over the landscape like shellfish along the seashore. But instead we have to live in boxes. There's nothing you can't fight it, it's the system. So you know, then you have to you begin to build your furniture and chairs, everything, accordingly to those shapes because they're easy to store away in a place that is a box in the first place.

But you see then that is this rectilinear world. This is unspiritual. This is the world of what we all call the artificial as distinct from the natural. And when we live in a world like that, we begin to have ourselves bamboozled by it. You think, you begin to think that reality is this sort of straightened out situation that we all have to limit. And you don't remember that reality is precisely the wiggly world, you see. We don't realise that we are all wiggly. The problem is that we wiggle in rather the same way, we have head, two arms, two legs, etc. But notice how we do all sorts of things to ourselves to sort of evade our willingness. The way we dress, especially men. But this world, this physical world, is wiggly. And this is the most important thing to realize about it as I've sometimes said. We're living in the middle of a Rorschach inkblot. And there really is no way that the physical world is.

In other words, the nature of truth, I said in the beginning somebody had said that thoughts were made to conceal truth this is this is a fact because there is no such thing as the truth that can be stated. In other words, ask the question, "What is the true position of the stars in the Big Dipper?" Well it depends where you're looking at them from. And there is no absolute position, so in the same way accountants are good accountant will tell you that any balance sheet is simply a matter of opinion. So there's no such thing as the true state of affairs of a business. But we're all hooked on the idea that there is you see, an external objective world which is a certain way. And that there it really is that way history, for example, is a matter of opinion. History is an art, not a science. It's something constructed, which is accepted as a more or less satisfactory explanation of events which in as a matter of fact don't have an explanation at all most of what happens in history is completely irrational. But people always have to feel that there they've got to find a meaning. For example, you get sick, and you lived a very good life and you've been helpful to other people and done all sorts of nice things and you get cancer. And you say to the, to the clergyman, "Why did this have to happen to me?" And you're looking for an explanation and there isn't one. It just happened that way. But people feel if they can't find an explanation they feel very very insecure why? Because they haven't been able to straighten things out. The world is not that way. So the truth, in other words what is going on, is of course a lot of wiggles. But the way it is, is always in relation to the way you are. In other words, however hard I hit a skinless drum, it will make no noise. Because noise is a relationship between a fist and a skin. So in exactly the same way light is a relationship between electrical energy and eyeballs. It is you in other words who evoke the world. And you evoke the world in accordance with what kind of a you you are. What kind of an organism you are. One organism evokes one world another organism evokes another world and so everything air to reality is it is a kind of relationship. So once one gets rid of the idea of the truth as some way the world is in a fixed sense, say "It is that way."

Then you get to another idea of the truth altogether. The idea of the truth that cannot be stated the truth that cannot be pinned down. I might say that I'm interested in Japanese material, because contrary to popular belief, Americans are not material. We are not people who love material. But our

culture is by and large devoted to the transformation of material into junk as rapidly as possible. God's junkyard.

In science, we really work in two different ends of the spectrum of reality. We can deal with problems in which there are very few variables. Or we can deal with problems in which there are almost infinitely many variables. But in between we're pretty helpless. In other words, the average person cannot think through a problem involving more than three variables without a pencil in his hand. That's why, for example, it's difficult to learn complex music. Think of an organist, who has two keyboards or three keyboards, for work with his hands and each hand is doing a different rhythm. And then his feet on the pedals, he could be doing a different rhythm with each foot. Now that's a different difficult thing for people to learn to do, just like to rub your stomach and circle and pat your head at the same time takes a little skill.

Now, most problems with which we deal with everyday life involve far more than three variables. And we are really incapable of thinking about them. Actually, the way we think about most of our problems is simply going through the motions of thinking. We don't really think about it we do most of our decision making by hunch. You can collect data about a decision that you have to make. But the data that you collect has the same sort of relation to the actual processes involved in this decision as a skeleton to a living body. It's just the bones. And there are all sorts of entirely unpredictable possibilities involved in every decision and you don't really think about it at all. The truth of the matter is that we are as successful as we are which is surprising. The degree to which we are successful in conducting our everyday practical lives, because our brains do the thinking for us in an entirely unconscious way. The brain is far more complex than any computer. The brain is in fact the most complex known object in the universe because our neurologists don't understand it they have a very primitive conception of the brain and admit it. And therefore if we do not understand our own brains that simply shows that our brains are a great deal more intelligent than we are. Meaning, by we the thing that we have identified ourselves with. Instead of being sensible and identifying ourselves with our brains. We identify ourselves with a very small operation of the brain which is the faculty of conscious attention which is a sort of

radar that we have that scans the environment for unusual features. And we think we are that and we are nothing of the kind that's just a little, little trick we do. So actually, our brain is analyzing all sensory input all the time. Analyzing all the things you don't notice don't think about don't have even names for. And so it is this marvelous complex goings on which is responsible for our being able to adapt ourselves intelligently to the rest of the physical world. The brain is furthermore an operation of the physical world.

But now you see though we get back to this question, physical world. This is a concept. This is simply an idea. And if you want to ask me to differentiate between the physical and the spiritual. I will not put the spiritual in the same class as the abstract but most people do. They think that one plus two equals three is a proposition of a more spiritual nature than say for example a tomato. But I think it tomato is a lot more spiritual and one plus two equals three. This is where we really get to the point that's why in Zen Buddhism when people are asked What is the fundamental principle of Buddhism you could very well answer it tomato? Because look how, when you examine the material world, how diaphanous it is. It really isn't very solid. Tomato doesn't last very long. Nor for that matter, do the things that we consider most exemplary of physical realities such as mountains. The poet says, the hills are shadows and they flow from form to form and nothing stands.

Because the physical world is diaphanous. It's like music when you play music it simply disappears there's nothing left and that for that very reason it is one of the highest and most spiritual of the arts, because it is the most transient, and so in a way you might say that transiency is a mark of spirituality. A lot of people think the opposite, that the spiritual things are the everlasting things but you see them all a thing tends to be permanent the more it tends to be lifeless.

So then, the physical world, we can't even find any stuff out of which it's made. We can only recognise each other, and I say well I realise that I met you before and that I see you again. But the thing that I recognise is not anything really except a consistent pattern. Let's suppose I have a rope. And this rope begins by being Manila rope, then it goes on by being cotton rope,

then it goes on with being nylon then it goes on with the silk. So I tie not in the rope. And I move the knot down along the rope. Now is it as it moves along the same now or different. We would say it was the same because you recognize the pattern of the knot but at one point it's Manila at another point it's cotton to another point it's nylon another it's silk, and that's just like us. We are recognised by the fact that one day you face the same way as you did the day before and people recognize your facing. So they say that's John Doe or Mary Smith. But actually the contents of your face. Whatever they may be, the water the carbons, the chemicals are changing all the time you are like a whirlpool in a stream the stream is doing this consistent well pulling and we always recognize like at the Niagara, that the whirlpool as one of the sites about the water is always moving on. And this is why it's so spiritual. To be non-spiritual is not to see that. In other words, it is to impose upon the physical world the idea of things of substantiality that is to be involved in matter. To identify with the body. To believe in other words that the body is something constant, something tangible. So therefore, if you cling to the body you will be frustrated. So the whole point is that the material world, the world of nature, is marvelous so long as you don't try to lean on it.

I was in the morning seminar making a rather outrageous suggestion. Instead of the attitude that we are either objects of fate which are puppets manipulated by natural forces. And instead also of the attitude if you can't lick 'em, join them. That is to say, as it were pretending that everything that happens is just the way you really intended it to happen. There is still something else which is intuited in all forms of mystical experience which is, not that you have to pretend anything, but that in exactly the same way as. Your own organization keeps functioning without your apparently having anything to do with doing it. That process is continuous with is one process with all the behavior going on around you of other people of nature and of the entire universe. And as you contemplate this possibility, you shall I say begin to get the feel of it. And there is a curious point where a concept which after all this is a kind of concept slips over into getting a knack. Of actually feeling that's the way it goes it's exactly the same sort of thing as getting say, the feel of the wind in sailing. Well you need to keep a certain. A certain tautness, I say in the sails. Keep up a kind of even pressure. It's the same as in many many other skills Well there comes a

point of getting a knack and at every moment of getting the knack you have the curious sensation that this what you are doing is doing itself.

You get it when you first remember riding a bicycle, when you first actually swam. Don't you remember the feeling of somehow it is doing it rather than I am doing it in the ordinary way it haven't. You know, 'Look Momma no hands.' And so in it in respect to what I'm talking about. There is a point at which it becomes perfectly clear to you that you are not something struggling against everything else or being victimized by everything else. But that what is going on, insofar as you can experience it is your own doing. And the flip, from one state to the other is just like getting the knack in swimming, riding a bicycle or any other athletic or artistic activity. But then at that point you see, you become from the world's point of view, crazy. You become a divine madmen. And at that point, you are able to practice what Jesus taught in the Sermon on the Mount. Be not anxious, for the morrow what you shall eat, what you shall drink and where with all you shall be clothed. You know that passage is the most of verses passage in the New Testament. And I have never yet heard a sermon. In which any preacher seriously advocated. They say well that's a very high ideal, and might have been all very well for Jesus who was God. And people like that you see are regarded as completely irresponsible by the clergy in general. See, and somebody actually goes out because they say they that those hippies aren't really doing it because they are relying on money from home which is by the square father. All from scrounging. And the still not quite the attitude of let it all go.

But you see, if you are a really genuine divine Madman, you are not necessarily at the same time an irresponsible being. Perhaps one of the best examples of the divine Madman, was a Japanese Zen monk by the name of Riokan. He was a poet. And a kind of a solitary lived in the cottage on a hill. And would appear to be completely naive and I want to give you a story about Riokan which shows how a divine madmen relates to the practical world. One day, he was invited to a house I suppose a fairly wealthy home because he was much prized as a guest. And he went into the reception Room. And sat down to serve tea, and then when he thought he was alone he was looking around and he saw a hanging scroll where there was a painting of a tiger. And he looked at it, was delighted it's great and he

said “Ahhr!” And have a great time playing Tiger and suddenly he noticed that there was still present in the room sitting very quietly a servant maid. He looked and said ‘Don’t you tell anybody about that they’ll think I’m crazy.’

At another time he was sitting outside his little hut and he had finished dinner. And he had put his bowl rice bowl on top of one chopstick and the spinning this and suddenly a messenger came from a local diner you know that is to say a noble dignitary, and asked him some important question as to whether he could possibly attend and I know what it was a specialty ceremony or something like that. And all he could answer was the bowl keep spinning, and the messenger went back and said the master says the bowl keeps spinning.

On another occasion, he did very very interesting calligraphy. Though nobody can read it except very great experts because it looks as if an inky spider had crawled on the page. And but it’s highly prized, and today specimens of real comes writing sell for thousands of dollars. And people were always there for asking him if he would do a specimen and he was kind of cagey about it and reluctant. So one day a very cunning nobleman invited him to his house. And laid out on the mats some absolutely gorgeous writing paper great long strips of it with ink stone already full of ink, brushes and everything just sitting there. And Riokan went into the room and sat waiting for the house to arrive and he walked over and looked at this gorgeous paper of the brushes and sniffed around. And then absolutely couldn’t resist the temptation to write a poem down the scroll. Then suddenly he realized he’d done something awful. Because after all this was the most expensive paper you could get. And he didn’t realize that it was laid out for him to do something. He just thought, you know, it was there somehow and he’d And then at that moment the host walked in. And Riokan said “Oh I’m so I’m horrified I’m so sorry I just couldn’t resist the temptation.” The host said, “That’s perfectly all right don’t worry about it at all please he removed the feet try another one. And Riokan also loved to play with children, all crazy people do. Because you can get away with things with children that you can’t with other people.

And I while I just want to put us out of interspersed remark here I don't approve really of baby talk because I think that's insulting to children. It somehow makes them into dolls. But absolutely different from baby people, is play talk is that and what I mean not play talk is distinct work, talk about dancing talk you know you can do things you can make faces at children you can. Let yourself go in the company of children in a way that you can't with other people and that's there is a certain point in life as children grow up somewhere around five, six, seven but they become spoiled. And they become embarrassed by your really hassling with them anymore in that way. So Riokan loved to play with children, and he used to play all sorts of games of hide and seek with them. And one day he was it, and he had to go off and stay in a certain place and all the children went to hide and then they would say you-hoo and he'd start the fun so he went off to hide. And I know you. So he waited. For you-hoo, to stay there all night. Waiting for this the children does later joke on him and run off. Well one says You see that's not a very practical man. So, but he was adored by everybody. He was a kind of cherished village idiot, who was yet very much respected because everybody knew that in truth he was the only person in the village who was without basic fear. And who was therefore living life as a Zen monk who is called an un-sui. This is the two words, un, cloud, sui, water. And he's given this name every month he's called and I'm sorry because he's supposed to drift like a cloud and flow like water.

And this is exactly the see the same spirit. As not being anxious for the morrow and going along with the grass of the field in the fowls of the air. One day Confucius was out for a walk with his disciples. And he saw an old man fall into a big mountain stream, and thought alas he is sick and old and tired of life and he's making off with himself. For below where the point where he fell in there was an enormous cataract and then rocks and rapids underneath. But suddenly, the old man appeared way down below the rapids call out of the stream and went strolling along the banks. Confucius was amazed and he immediately sent a disciple to run after the old man so that he could talk to him. He said I thought you were about to make away with yourself but I see now that you must be a spirit. And he said 'No I'm not a spirit I'm just a perfectly human being.' Well then how did you survive the cataract he said in no special way I just went in with the swell and came out with a well. I did nothing I simply adapted myself to the nature of the water.

And so in the same way we have it connected with the Taoist and Zen, early Zen traditions many instances of famous monks who were quite mad on the Esalen announcement for this series of workshops and seminars there is a drawing of hunch on. And he and his companion shutter all the Japanese say Han-Shan on and Jitoku. They were two mountain hermits, who are favorite subjects of Zen artists because they are shown. Wandering about together in the woods laughing at falling leaves. And, Sang-Gi used to like that to draw them with the sutras open. Chanting away with their hair all frazzled and laughing chanting the sutras. And really not paying any attention to what they mean at all but just having a ball making these noises. But as a matter of fact, Han-San was an extraordinarily competent poet, in perfect control of the language when he needed to be. But all that controlled mastery was somehow based on. The attitude of what we will call fundamental nonsense, fundamental goofing off because you really don't need to make life work.

The point is you see these two ways of being. And not incompatible. They appear to be incompatible, when you think that the foundation of everything is the tough discipline. That that's basic. It is not basic, it's secondary and it's an important secondary. But you can't really make it work. Unless you build it on top of the primary which is the goofing off attitude of the child. To learn an excellent discipline and to learn it well you've got to goof your way into it. In other words, you have to learn. say in drawing, how to make very fine lines, by getting absorbed in doodling them. You see, do it not because there's anything special to be accomplished but just because it's such a it's such a gas to make the brush go in a certain way, like that when you practice calligraphy for example Western calligraphy or Chinese calligraphy you begin to dig the in amazing shapes that a brush can make and you play with your hands just as it just goes so you're not trying to please anybody the master all that make an impression you're just digging that brush. Chinese are very clever about this because they they make writing such a delight. For example, they puff you in the ink and it has a very subtle perfume is extremely great and then they rub the ink on a stone in water and it makes a beautiful blue black mixture and the feeling of sliding the stick back and forth on the stone is, is just as groovy as can be. Especially when the ink begins to get thick and smooth and the feeling of rubbing that and you get this satisfactory of sense then when you feel it's

just right you pick up the brush in for a while you play with the brush with the point getting it just to the right quality that you want. And then, to write, you learn to dance with the brush on the paper and here again is the thing of knack that when you write correctly you feel it is doing it. Now do you see the spirit in which underneath the accomplishment is playfulness. That it doesn't matter, and I found in studying the bringing up of children, education and so on, that a child gets completely discouraged when you tell that child that it is absolutely important that success be attained in a certain task.

Well, it just has to be done, I mean there is no wall down to if you've got to do it see you've got to be able to build it, to learn it to which this this distinction or whatever it is and that's like pushing the child and knocking them down. It's totally discouraging. Because if you must do it. The feeling is I don't think I will ever be able to. So instead every good teacher stirs up interest. Makes it, takes it that goofing off is basic. But subtly, by a kind of Judo, arranges the goofing off to go in this way. So then the world may be taken then to be fundamentally mad, crazy. All basic life is crazy life because it's nonsense. The death poem of a great Zen master was 'I have uttered nonsense from the bathtub to the bathtub.' All the time in which the baby is washed at birth in which the corpses washed before cremation, that's the two terms of life. And so all his Zen teaching and all his carryings on were just he said to start this stuff and nonsense. Because here we are, you know, we think we make sense.

I'm talking English to you and you understand the meaning of my words, but let's just drop this situation into another context what is the meaning of your understanding what I'm saying. We're all sitting around here. And you are listening to these signals and you are interpreting them into signals of your own, but look at the situation from above. What a crazy assembly, because what we're doing gathering here making noises, very complicated noises, is essentially no different from what this tree is doing out here spreading out its branches with all these little twigs and things sticking out and my job what is it doing well you say if we look at it from a practical point of view. Those leaves have a purpose and they are to absorb moisture and sunlight and to sort of go down into the tree and help the sap to come up and. Then then the real object of this is that it grows some kind of flower

or cone and that gets fertilized a little seeds inside and they come out and fall on the ground and get blown about and some get picked up by birds and distributed and they make other trees, you see. That's the thing, that's what it's all about, that's very very important function, actually it's sheer nonsense. Is this tree is going to say wow isn't that great you know let's spread this around and get everybody else going to do it but you know. What we're doing exactly the same thing. And the trouble with the loss of civilized people is we don't know it. He think we're being serious. And we know we have tremendously important schemes going on and that it's desperately vital that, for example, the human race survives. And that we go on with this great thing called Circle I think the United States of America the U.S.S.R.. Whatever it is we think that's the great thing we have to do but that's what's destroying us. Because it's nobody is going to blow up the world with an atom bomb for the sake of da-do-da-do-da-do-da-do. Know life is this fundamentally directionless wandering cloud like River drifting play and yet I casually use the word we should understand. And just as I pointed out earlier on this the problem that when you see that the world is like this and that you are all one with it and it's your doing and then you get it absolutely clear in your mind it is very clear indeed and you suddenly want to explain it to somebody and you find there are no words for it well so in just the same way, when one is trying to say this is what we should do, there seems to be a complete contradiction. And it's there's a verbal and logical hang up here that it's difficult to get across if you keep on using words it's only words that are making the difficulty. There is no difficulty in practice.

So I'm saying in words you should do something that you really can't help doing anyhow. Because you're thinking about it in words you don't realize it. You don't realize that you are doing it anyhow because you are thinking about it in words. And therefore the problem arises why am I saying you should do it when you can't help doing it anyway. So the words I'm using are getting in the way of the message or the meaning. So that this this could be called understanding is to be so, that we should be madmen in the sense of abandoning this whole project of the survival of the race, civilisation and so on. That this is the only way in which we can really structure human life and unplug various purely abstract and political engines that are totally destructive. But you see, you can't, you can't unplug them if you're still

afraid of them. If you are still fundamentally worrying about what is going to happen to civilisation. It's only when you see, in your own inner experience, that it simply doesn't matter. That what is important is what is unimportant which is the jazz. And that is important not that it should go on. But in the doing there off.

So this creates, what I would some people might call a new political strategy. Which we will call the politics of diversion. That is to say living a style of life. Which everybody sees that we're enjoying, that is so great. They'll say oh I wish we could be like that. No, but we've got to be earnest, all that kind of thing is easy. But that doesn't really achieve much except trouble. It is through application and study and earnestness that we have the atom bomb. We say well now look at all the things we civilized people have achieved. But sure about to blow up the planet that seems to be the prize of it. But here again let me underline the fact that I'm not trying to talk down technical skill, I'm only trying, and let me repeat the point that you cannot employ. Non-hostile, nondestructive technical skill. Unless you realize basically that you yourself are this whole domain of nature that's the real you. You are not in a fight against nature, you're not here to conquer nature because there's nothing that conquer it's all you. And so when you use technology to bulldoze everything into submission, you're fighting yourself. You're all tied up, clutched up, like the person trying to lift himself off the floor by his own bootstraps. And in that process, you're dissipating all your energy. On something that can't be done. And therefore you're just getting tired out need to drop dead. So I know you see that there are paradoxical elements in this, but I repeat, the paradoxes appear because of the nature of the language. When we try to explain these things, we run into contradictions for the simple reason that we are trying to explain it. To put it into a language with either-or categories in it, where you say either you try or you don't try. Either you let things go as they will or you do something about it. Either there is something you can do and therefore you should do it, or there's nothing you can do and therefore no one search would say 'Should.' No one should say should look how messed up you get. But that's what the way these difficulties arrive at the linguistic level these difficulties are not a rising at what I will call for the moment the material or the real level. Because there, at that domain, you will find yourself acting in a way that is in many ways more intelligent than you act

when you make up your mind. But that you see that simply living in complete natural spontaneity that's the way of the child. That may be the way of the animals, we don't know. But certainly, as a child is irresponsible, in that sense, and begins to learn responsibility and so on we must be terribly careful to realize. That irresponsibility is the basis of responsibility. That if we destroy the basic irresponsibility then the consequent style of responsibility that we learn is useless because it's all for nothing. It's all a process of continuing with anxiety and guilt and uptightness and making more and more and more and more of it by a kind of Parkinson's Law. You see what's happening, if we succeed in business in the ordinary way, what does that lead to? More Business.

So I say we don't get rid of this business and handed over the computers so they will do all the accounting then what Or you think up some new kind of business see and then we have to hand that over to computers because it's a boring. And that means new more investments bigger things going chicky-chick to get it, but it's all machinery. You think this is a great erection! It never comes off.

The Cosmic Drama

After long consideration I have come to the conclusion that there are four fundamental philosophical questions which have been debated for as long as we know anything about intellectual history. The first one is 'Who started it?' The second is 'Are we going to make it?' The third is "Where are we going to put it?" The fourth is "Who's going to clean up?" But when you consider all of these together they prompt a fifth question which is perhaps more fundamental than all of these: "Is it serious?" And when we say to the doctor about someone we love who is in some ghastly kind of sickness "Doctor, is it serious?" That means is the person in danger of his life. Because it is almost the fundamental supposition of western thought, at any rate, that life is serious. That we have an obligation to survive. And that there is therefore something shameful about dying. Life, in other words, is not a game. If it is a game, the first rule of this game is that this game is serious.

I remember some years ago counseling a woman much older than myself who was afraid of dying, and she wanted to know why she was afraid. She couldn't figure it out. And we had a long discussion, and she was clear that it wasn't the idea of being annihilated, and she had really outgrown her childhood fears of hell. She didn't really, wasn't really terrified by the pain of death, but she said "Do you know I finally realize I think what it is? I'm afraid of what people are going to say. They're going to say at the funeral, I can see them all there, 'Poor old Gert, she couldn't make it.'" Because you see, we all labor under this obligation to live. And this comes from our earliest training in childhood where we are taught that we must live, and it comes about in very odd ways. We run into a basic confusion about the meaning of the word must and the confusion is as to whether this word expresses a state of affairs, a condition that is, or whether to precept the commandment. In order to be human, you must have a head. That's obviously not a precept, nobody ever attempted to have a head. But when a mother says to a child, "Darling you must go to sleep. It's for your health." This is taken by the child as a commandment. And so the child tries to go to sleep which is an infallible method of staying wide awake.

So likewise, you must have a bowel movement every morning after breakfast. This too is taken as a commandment instead of simply a condition of being healthy. The worst one of all is the commandment, 'You must love me.' Not darling of course because I say so, but I would only want you to do it if you really want to. That is one of the most discombobulating, subversive things that you can ever say to another human being. You must love me. In other words, I command you to do something which will be acceptable only if you do it voluntarily. And so imagine it how often this happens when one spouse says to the other darling do you really love me. What answer you're looking for? 'I'm trying my very best to do so.' Oh dear me, no. You want the spouse to say 'Darling, I can't help loving I love you so much I can eat you I'm out of my mind about you.' In other words, you want them to express a state of affairs which is a matter of fact anything but voluntary. You want the person who loves you to say. That they love you in the same way as they exist they didn't ask to exist, they can't help it, and there it is, for better or for worse. And that is one of the basic paradoxes in which we all get tied up and it's

called, been christened by the ethnologist Gregory Bateson, a double bind. And we are always being tied up in this thing.

And I gave you one right at the beginning when I started to be the first rule of this game is that it's not a game. The supposition of this drama is that it's not a play. Of course, every great actor will try to put that over on you. You know that here stands the Proscenium Arch. When there's a performance going on, and that what happens on the stage is in jest, is in play. It isn't somehow real, and yet the actor is going to use all the skill that he has to convince you that what's going on the stage is real life. He wants you on the edge of your seats with anxiety, he wants you crying, he wants you laughing, because he's taken you in completely.

Now the Indian Hindu theory of the cosmos is precisely this: that the universe is a play. A dramatic act. Which they call Lila. Whence our word lilt. Lila means play or sport and the universe is looked upon as the playfulness of the Godhead, who is playing a game of hide and seek with himself. And that every so often, he pretends that he is not himself and that he is all of us not only the human beings but the animal beings the angelical beings the diabolical beings the vegetable beings, the mineral beings, every kind of being that there is he hides from himself in these forms. And then after four million three hundred twenty thousand years, which is the basic reckoning unit of the in-goings and the outgoings of the cosmic game with supreme self the which then which there is no which or wakes up and discovers who he is after all and that's great. What a relief, because in the end, the thing becomes a nightmare, it becomes a tragedy and the universe finally blows up. In the awful awfuls, just as it does for each of us individually when we die.

But there behind the great show is the actor. And these, this idea is of course fundamental to all the conventions of the stage, because the whole notion of the stage of the drama is that the actor comes out not as himself but as a persona. And the word persona, in Latin, means that through which the sound passes, and refers specifically to that mask worn by actors in classical drama. A mask with a mouth shaped in the form of a megaphone, so that it would project the sound in an open air theatre. And so, at the beginning of a play, the dramatic personae is the list of masks but how to be

won by the actors. And by a curious inversion of the meaning of words the word person has come to mean not the mask, but the real thing. Harry Emerson Fosdick wrote a book called How to be a Real Person. That is incorrectly styled, How to be a Real Fake. In Act In other words how to be a good actor. But it disquiets us, doesn't it, that the idea that the whole world might be a big act. We're also in social life a bit disquieted when we get into the company of stage people people in showbiz, because we're not sure whether in real life they're still acting.

Who are you? That's the great question. One of the most magnificent Indian sages of modern times, Sri Ramana, always faced people with this question, when people came to him and said 'Oh master, who was I in my past incarnation? Will I be reincarnated again?' et cetera et cetera he always used to say 'Who is it that asks? Who are you?' And he asked this question. I've got a photograph of this man, I never met him but I know lots of people who did and he has a funny look in his eyes, a curious twinkle. And you can feel those eyes from the very photograph going right through you, not with judgment, not with condemnation but with a kind of a wicked humane twinkle.

In other words it says 'Listen buddy, don't fool me, I know who you are! And you say me. Why I'm just little me. I'm not a very important person I'm just a poor little human like Houseman's verse 'I, a stranger and afraid, in a world I never made.' The teacher looks at you and so on. Old Shiva don't give me that stuff. I know who you are in your million masks and you look out and say I'm just a poor little me. That's the technique you see of the Awakeners, the people who in Hindu, in the Hindu world are called gurus. The so-called spiritual teachers who kid us out of our egocentricity. Egocentricity being the predicament wherein the universe, and all that is beyond the universe identifies itself with a particular role or part that it's playing in the game.

Now in our culture, You just mustn't get mixed up with that kind of thinking. I've been thinking for a long time what is really a taboo in our culture. And in a good many other cultures besides, what used to be sex, but sex isn't taboo anymore. You can buy books on sex anywhere any child can find out all about it, it's the easiest thing in the world. There's a slight flavor

of Taboo hanging over it from the older generations but it isn't a serious taboo anymore not since Freud. You know there's a two ages B.F. and A.F., and in A.F. sex is no longer taboo. What is taboo? There's always something. The real taboo is what the Hindus call in the immortal phrase *tat tvam asi*, which means that art thou. You lurking behind the mask of being an impermanent human person. Really responsible for the whole thing. But if anybody claims that in our culture we put them straight away into an asylum that is the very hallmark of insanity. But in India, if somebody suddenly wakes up one. Morning says 'My goodness, I'm God.' Everybody says instead of you're crazy or blasphemous they say 'Congratulations, at last you found out.' But of course you see they have a rather different idea of God from ours.

Our popular idea of God, quite aside from any of the ideas of the more profound theologians. Our popular idea of God is that he is the master technician who has created this universe in much the same way that an engineer creates a machine, a carpenter makes a table, or a potter makes a pot, and he knows how he does it. So anybody who says I'm God, we immediately challenge him with technical questions. If you are God how did you create the universe in six days? And all sorts of questions like that, but you see the Hindus God does not need to know in words how he does what he does, in exactly the same way that you don't know how you grow your hair. You just do it and after all can you know how to do a thing better than by just doing it. You may have a physiologist knowledge of how you open and close your hands but that doesn't enable you to open and close them any better than anyone else. Unless of course you've got a wrecked hand and you need a physiologist to put it back in shape. But in the ordinary way of things, you know how to think because you think, but you don't know how you think. You don't understand all the intricacies of the nervous system underlying the process of thought you just do it. So like a centipede who can manipulate a hundred legs without having to think how to move each one so the Hindus can see the Godhead not as a technician but as a cosmic centipede. Who is wiggling all of us. Like so many legs that's why the Hindu gods have many arms there's one Buddhist divinity with one thousand arms. But this thing doesn't have to stop to think how it's done that would be inefficient because thinking is a process of concentrating our attention on what is called One thing that is to say one think at a time. And

that won't do it all for the regulation of complex processes. That's why we're now so fatigued with thinking that we're getting computers to do it for us. Because computers can think of ever so many things at once and that's where they have the advantage of us. So a Hindu therefore feels no kind of blasphemy or inconsistency or insanity in suddenly realizing that he is basically what there is. That you aren't directly aware of this of course just in the same way that you are not directly aware of your brain structure. Nor are you aware of the incredibly subtle interconnected system of relationships balances, networks, whereby your brain, is part and parcel of the whole physical universe. And exists with it, in the same kind of togetherness as a front exists with the back.

So in this sense you see, we are all something that everything is doing. Every wave is the ocean waving the whole ocean waving announcing its presence, so in the same way each one of us is a waving of all that there is saying you there I am. Only it comes and it goes. All waves come and go they have their ups and downs and we have our ups and our downs when we are up then we suddenly see John Doe when we're down there's just a corpse. And works it comes up again as Mary Smith and worked it goes down and so it goes. Like the sparks in the soot on the back of the fireplace, in and out in and out in and out. Every one different than the one before and yet somehow the same.

Now in, as I said, in the Hindu view of the cosmology, this is a drama. And that means it is its basic spirit is playful it is a game. But the difficulty that we have in understanding this idea is that we don't distinguish between the many connotations of the word play or game. A lot of people say to me when I produce this idea, do you mean it's only a game? That all this is somehow therefore trivial. And I say no. Look, when you go to listen to a great pianist play the Beethoven sonatas, you are actually going to an entertainment. You pay entertainment tax to get in. But you wouldn't say would you that this was mere entertainment. There is something about music which is beautifully illustrative of the point that I'm making. Because music is sheer and total play, the highest music that both West and East have produced has no meaning beyond itself. That is to say Mozart Sonatas do not imitate the sound of charging horses tinkling brooks, or screeching

factories. They convey no social message. They are pure delight, in complex orders of sound. Almost mathematical.

And you see music is purposeless in the sense that it has no direction. It is not designed to arrive somewhere. I mean, if the point of music or of any musical composition were to arrive that is to say to reach the finale the best conductors would be those who got there the faster. And in the same way with the dance the dance as a high and lofty art. It is not mere entertainment, but when we dance we do not dance with the object of reaching a particular position on the floor. You see we could go straight there, and cut out the dance. In music and in dancing, the point of it is always the going along of it in a kind of continuing present. Now what about the world. Let's take a look at nature. Is this a musical thing or is it a compulsively purposive thing. Look around at the creatures. The vast variety of insects. The amazing multiplicity of plant forms, of bacteria. Look at the stars, the nebula at night. This tremendous prodigality, this profusion of energy. If we ask the question 'What is it all for?' I think this is the wrong question. It sort of doesn't need that question, it answers itself. Just as when you listen to music. You don't after you what does it mean? You just dig the sound. You swim with it.

And so in exactly the same way, the world may be seen in all the multiplicity of its creatures as fabulous. G.K. Chesterton once made a very profound remark when he said it's one thing to wonder at a fabulous creature like a god or Griffin that doesn't exist but it is of a much higher order to wonder at a rhinoceros, a creature that does exist and looks as if it doesn't. Now you see there are people with engineering mentalities. I don't want to insult and engineers present in the audience but what I will call a certain kind of engineering mentality that has an explanation for everything. Namely, that butterflies have those big eyes on their wings as a kind of survival dodge, that comedians change color in order to affect something or other or they have another way round of putting the same point which is, that because certain butterflies had eyes on their wings they frighten the birds more than other kinds of butterflies and therefore survived. Everything, in other words, is nature is approached from the standpoint of an efficiency expert and the idea is that there is an instinct to survive this is the same old compulsion I was talking about you must go on surviving but

actually, things don't live in order to survive because surviving and living are the same thing. Now you survive until you don't. And that's that. It seems to me altogether more rational to look upon this amazing profusion of existence as poetic and musical, and therefore as playful. But, in order to be a good play, it has to have an element and a subordinate element of seriousness in it. That is to say, we can't have a good stage play without introducing a villain, and the villain has to be convincingly played. There has to be a real big act and they get everybody gets afraid of that villain. That's absolutely essential.

So in the same way there has to seem about life an element, a very convincing element indeed of the ultimately tragic. Only the big question is, is it so? To put it in another way, is the universe a system in which there can occur an irretrievable mistake. As indeed the Christians have conceived in the idea of eternal damnation. That is one of the most extraordinary ideas ever had start of the brain of man. That there might be the possibility of things going wrong for ever and ever and ever. Well the Hindus, of course, when they look at that idea and realise that the Christians hatched up this ghastly possibility to scare themselves with, they rather applaud what they say the Christian, they see that a Christian so in peril of everlasting damnation is actually the Supreme Lord playing this part. And they think now he's really scare the wits out of himself. And this is the most marvelous performance in the whole thing.

In this brief life of four score years and ten, you have set before you the choice, once to every man and nation comes the moment to decide, and the strife quicks true from false, or for the good or evil side that it is the brave man to run the coward stands aside. Ugh, he hasn't made that choice and you don't know how to make it. The suspense of that as a great dramatic move. But the Hindu has that funny look which says, huh! Right now. We've got to get to the bottom of this and I want to really I have I'm a little diffident about this because I don't want to insult anyone's intelligence.

But I do want to give you what should be called the first lesson. What your mother should have told you before you learned about one two three and ABC. There is something underneath all that the something much deeper. And it's about black and white. But now let me introduce it by asking you to consider all your senses as forms of one sense. Basically a sort of sense

of touch. Because seeing is touching at a distance. Our eyes are so sensitive that they can touch light our ears are so sensitive that they can touch vibrations of air. Our fingertips are less sensitive in Western civilization our noses are almost insensitive. But these are all forms of response to touch. Whether they be rather solid things like tables and rocks or whether they be very subtle things like tiny particles in the air or light waves.

So when your senses are touched. They go off and on. Either there's something there or there isn't. Now when you consider for example the phenomenon of sound. There isn't actually such a thing as pure sound. When you hear a sound, a note being sung, you are actually hearing a vibration. You are hearing sound silence, oscillating, because it is the alternation of sound and silence that impresses us. This is so with almost all contacts. If you have a delightful girl sitting next to you and you want to make your presence known to her and you put your hand on a knee and you leave it there, she will cease to notice it. But if you gently pat her on the knee, she'll know you are still there. Because you come and you go. Now you see It, now you don't.

So all physical, all physical manifestations are in the sense vibrating. They are pulses, light is a power. And the most solid rock is also a pulse and you can't put your finger through it for the same reason that you can't put your finger through an electric fan when it's revolving. It's going too fast, so this table is going so fast that I can't done it philosophers are always using tables with a straight something because they speak of classroom gets a little boring but still. It resists because it's going so fast. On Off On Off On Off On Off On Off. So you see, this is the process the nature of the wave. You can't have it is not such a thing in nature as half a wave. A wave that is the say, which has only a crest and no trough. To get a wave you have to have a crest and a trough at the very least. So the up and the down go together. Likewise therefore, the black and the white. So what we call existence is being-nonbeing. So therefore to be on not to be is not the question. To be and not to be are inseparable companions. Just like Tweedle Dum and Tweedle Dee, who incidentally agreed to have a battle.

So between all these explicit differences, like the top and the bottom, the up in the down, front in the back the light in the dark. Explicit differences have

behind them an implicit unity. That is to say they are always found together. There is as it were a conspiracy under the surface. To look as different as possible and yet to be one. It takes one to produce difference because you see you don't know what you mean by difference unless you know what you mean by unity. You don't know what you mean by is, unless you know what you mean by isn't. You know there is a matchbook in this hand and there isn't one in this hand. Abstract from that and you get the idea of being and nonbeing. But they go together. Now the whole joke that's been played on you, by you of course, is that they don't go together. That in other words black might win. That seems very persuasive. After all when one looks at existence. You realize it's quite an effort. Lot of energy going on. Wouldn't it have been so much easier over there not to have been anything at all? When it once you get that idea existence becomes odd. And so also, when you think about death. What would it be like to go to sleep and never wake up. That thought always makes us intellectually dizzy. And it makes you think about birth the funny event of waking up after never having gone to sleep. You know something distinctly spooky about that.

But you see that this is all part of it. That the black side has to be real genuine black so that the white side can be real genuine White. And it's always seem, as if whenever black turns up that's going to be the end. And this is a conspiracy, so when you when you've got the game, uh-oh black might win, you have to play the next game which is all white must win. And so we start it all out, the battle between the sides. And from this battle come all the complexities of human culture. Just out of black and white. Look how complicated we can make them. The game of heads and tails, is one of the very simplest forms. Will it be heads, will it be tails? That gets boring. We make it more complicated, we make them into dice. We make them into checkers more complicated still chess that's all based on black and white, but how elegant. Even color emerges finally from black and white. Analyze our composite structure down to its final terms and we seem to turn up to be something like a newspaper photograph. You know, black and white dots that stand away from them, and they seem to be light and shadow. The point at least painted saw this. But we are all this buzzing little on off yes no yes no yes no yes no yes no yes no every neuron is either firing or not firing yes no yes no yes no and out of this multiplicity of yes and no. Look at this thing.

But it all depends on this little joke, see. That we forget somehow. That yes or no go together. A person who understands that, you see, is a sort of initiate. He's been let in behind the scenes. He's in what you would call a person who is very far in. There a lot of our most of us are very far out actually. With a person you might call a square is the most far person there is because he really believes that black might win. That white must win, he's completely bamboozled he's altogether forgotten the secret. So he's way way out, lost as lost can get. But Harbor. How magnificent. But so that he doesn't go off his head altogether there are always in societies some foreign people. And they want to call the esoteric people as compared with exoteric people and the foreign people are out of cages. They don't give the show away too easily now you might say you're not being very far in your explaining to us. What the joke is and you really shouldn't do that because if we knew that it was all right and that the whole thing was a joke what would happen to our incentives.

Now I feel I can say all this quite safely because very few people will believe it. Because it's very difficult to believe. The other position, that black might win, is marvelously persuasive. So maybe in this audience there might be a few people who would understand. And then our anxiety is, will such people stop the show? Will they suddenly become inert, be enemies of progress or become frankly immoral because. You know you want to obliterate someone and after all they're not serious they're just a mask of God which is the same as you are having to push them out of the way them not. Will they get like that. Well there's always a gamble you see, for all things again. And there's always danger. Every good thing in this world is dangerous. The moment you teach a child how to walk, you give it the capacity to kick it's mother. The moment you have. Fire to warm yourself and to cook with. You have the possibility of destruction there is no way around danger so of course a person who was in the highest sense of the word disenchanted. You see that it's a marvelous word because it has a positive meaning as well as the usual negative one to be enchanted is to be spellbound. To be fascinated like a chicken with its nose on a chalk line.

So the actor who is really involved in playing the world is fascinated, he is enchanted by his own spell. Spell in the beginning was the word. You see. The chant. So, to be disenchanted is to suddenly recover from a state of

auto-hypnosis, to wake up, that's why a Buddha means that from the Sanskrit word good to waken, to be awakened it is one who was woken up. And who knows. My goodness, it's all a dream. But what a magnificent dream, a beautiful thing a great work of art art in the highest sense. Maya, as the Hindus call the world as well as Lila. Maya means very roughly illusion but it means a lot more besides it means magic it means art it means creative power it means construction, from a root word martyr lay down the foundations of a building hence our word meter. Measure metric. And also matter. Does it matter, means does it put on a good show? Does it amount to something or. Is it a convincing illusion. Illusion likewise connected with the Latin Ludere, to play.

But you see, we have a culture in which words like play illusion and so on have a bad connotation. We don't want to get with an illusion. And we want in the end to know, I wonder if we really do want this, that at least God is serious. Now look, if I say to you I love you. And supposing I say this in a very personal way to a particular individual. The person I says that to turns around to me and says 'Are you serious?' I say no. No no, indeed. But I am sincere. This is a commitment. It's a rash commitment, it's the height of rashness. But it's therefore not serious. Keyserling, in his South American meditations, makes the point that a man of spirit is above all a man lacking in seriousness. He, as a man of courage, plays with his life now to quote G. K. Chesterton again he said the angels fly because they take themselves lightly. Are much more so than the lot of the angels I mean just let me put this in anthropomorphic terms because there's an important thing about talking about God in anthropomorphic terms. A) Nobody takes it too seriously. B) It puts things vividly in ways that escape more abstract intellectual language. I mean, when all those angels and saints around the throne of God in Heaven forever and ever, what sort of a show do you want to be going on everybody going to look at each other. Are they going to stare into the eye of the lord as say yeah. Dante in the Paradiso, describes the Hymn of the angels, and he says it is like the laughter of the universe. In other words they sing Alleluia, Alleluia, Alleluia. What the devil does that mean? It doesn't mean anything, except it's a kind of celestial whoopee. So you see, what I'm pointing out is this, that even in the tradition of the most serious religion that there is, the one that really takes life seriously, because there's the possibility of ultimate tragedy. Even in this most serious religion

its mythological forms, its symbology, gives a little tweak to give away the show. Just as in those Hindu images of Shiva the Destroyer aspect of the divinity when he is dancing Tandava, the dance that he dances at the end of a cycle when the whole universe is destroyed he showed the ten arms and fierce aspect and in his nine of his arms he has bells unfun the bolts and clubs and knives but one is in this gesture. The hand, palm outwards, fingers up, it means don't be afraid, this is a big act.

So you see, the notion of the world as playful is I think you may agree, the only finally workable and rational solution to our predicament. There is always, of course, the chance that it might not be. But it is indeed the chance that you may wake up. Divine yourself everlastingly down. All that you may never wake up at all. I don't know what that would mean. Except nobody would ever know whether it was serious or wasn't there. But, it seems to me that there are certain metaphysical systems, some of which are good gambles, and some of which are not. Because a great deal of the problems of life resolve themselves to the question, 'What are good game rules?' Ethical questions have to be decided this way, aesthetic questions, and questions of simple political organization. Now you can obviously see can't you that a social order. In which nobody trusts anybody else. Is not set up as a going game. If everybody is spying on his next door neighbor and if we have a big brother who's got a kind of television outlet and a mike in every room everybody is bugged, and there's no game, because the poor old big brother can't even take a walk in the park. He's got to sit there watching everybody. The Hindus work this out in a book called The Afathrastra [sic], where it is a manual of operations, for the perfect tyrant. And it gives minute instructions, how to hedge himself in, with the rings like the rings of a spider's web. How he gets the different ranks of his courtiers and advisors, he puts them all at enmity with each other so that they will all spy on each other, and all report on each other and then right in the center he lives in the super protected room. Where he has guards, but other guards watching these guards. And he has a secret exit out from the middle that goes somewhere down to the river where he's got a fast speed boat waiting. And on the way out there's a keystone he can pull and make the whole palace collapse. Now here is a man living in perpetual paranoia. He can't even sleep, he has to have some valid taste is food for him to be sure it isn't

poison. He's the maximum non-trust, and this is a non workable system. You cannot throw a ball unless you're willing to let go of it.

So in exactly this way game rules have to have play in them, that is to say, they have to be a good game has to involve. A wonderful balance of chance and skill. Randomness and order. And then it has a chance of going on. I was discussing tossing a coin. That's a very boring game. Tic-Tac Toe is a pretty boring game, because if you know how to play it anyone who starts wins, so it reduces itself to tossing coins. On the other extreme, three dimensional chess. Is much too complicated for most people to keep tangles of it. And they lose themselves in the tangle from. But somehow in the middle games like poker, bridge, chess. Even Go. Marvelously intriguing people, can get fascinated you know how it is once you become a chess buff, you can go you go on and on and on and on well that's what we call the instinct for survival. Where you know the math game, the bee game, the bird game the man game you can't let go it's fascinating. So we're all human buffs. A universe that man's all the people started as an apple tree apples. And the apple tree apple serves to go after him because applying is great. So is tree-ing, but you can see different forms of trees and different forms of animals in the same way as you get the difference between Mazurka waltz, Charleston twist, rumba or so not a few partita all Mahjong, chess, dominoes, so it's all like that. The question is to find out the most fascinating thing. See if you play chess, which can become a game of pure skill with the element of chance almost eliminated when a real champion is concerned. It ceases to be fun after a while unless you have an opponent who is a little bit unpredictable. The whole point of it is that you cannot quite figure out the other person's skill and that introduces an element of chance but if a game is pure chance. The fun goes out of it, unless you're out of your mind. And think that there is a serious chance you might win.

So it's in looking for that strange balance that we find a clue to what it's all about. The question is simply fundamentally. Do you have the nerve to follow that through? Can you look black,night, in the face. And say, 'Well I really do know you're the other side of white. You come on pretty fierce. But that's your nature.' And that anxiety which constantly asked the question to be on not to be, and therefore trembles between them, will in the

end turn into laughter the same trembling, when it knows that to be and not to be are inseparable twins.

Spectrum of Love

We know that from time to time there arise among human beings people who seem to exude love as naturally as the sun gives out heat. These people, usually of enormous creative power, are the envy of us all, and, by and large, man's religions are attempts to cultivate that same power in ordinary people. Unfortunately, they often go about this task as one would attempt to make the tail wag the dog. I remember that when I was a small boy in school, I was enormously interested in being able to do my schoolwork properly. Everyone told me that I did not work hard enough, that I ought to work harder, but when I asked, "How do you work?" everybody shut up.

I was extremely puzzled. There were teachers who apparently knew how to work and who had attained considerable heights of scholarship. I thought that maybe I could learn "the secret" by copying their mannerisms. I would affect the same speech and gestures and, insofar as I could get around the school uniform, even clothing. (This was a private school in England, not a public school in America.)

But none of this revealed the secret. I was, as it were, copying the outward symptoms and knew nothing of the inner fountain of being able to work. Exactly the same thing is true in the case of people who love. When we study the behavior of people who have the power of love within them, we can catalogue how they behave in various situations, and out of this catalogue formulate certain rules.

One of the peculiar things we notice about people who have this astonishing universal love is that they are often apt to play it rather cool on sexual love. The reason is that for them an erotic relationship with the external world operates between that world and every single nerve ending. Their whole organism—physical, psychological, and spiritual—is an erogenous zone. Their flow of love is not channeled as exclusively in the genital system as is most other people's. This is especially true in a culture such as ours, where

for so many centuries that particular expression of love has been so marvelously repressed as to make it seem the most desirable. We have, as a result of two thousand years of repression, “sex on the brain.” It’s not always the right place for it.

People who exude love are in every way like rivers—they stream. And when they collect possessions and things that they like, they are apt to give them to other people. (Did you ever notice that when you give things away, you keep getting more? That, as you create a vacuum, more flows in?)

Having noticed this, the codifiers of loving behavior write that you should give tax deductible institutions and to the poor, and should be nice to people, that you should act towards your relatives and friends and indeed even enemies as if you loved them (even if you don’t). For Christians and Jews and believers in God, there is a peculiarly difficult task enjoined upon us; namely, that “thou shalt love the Lord thy God,” not only going through the motions externally, but with all your heart, with all your soul, and with all your mind. And that is, of course, very demanding indeed.

It is as if, for example, we admired the music of a certain composer and, having studied his style very thoroughly, we drew up rules of musical composition based upon the behavior of this composer. We then send our children to music school where they learn these rules in the hope that if they apply them, they will turn into first-class musicians, which they usually fail to do. Because what might be called the technique of music—as the technique of morals, as well as the technique of speech, of language—is very valuable because it gives you something to express. If you don’t have anything to say, not even the greatest mastery of English will long stand you in good stead.

So the question and the puzzle remain: You cannot imitate this thing . . . there is no way of “getting” it, and yet it is absolutely essential that we have it. Obviously, the human race is not going to flourish harmoniously unless we are able to love each other. The question becomes: How do you get it? Is it something that you simply have to contract, like measles? Or, as theologians say, is it “a gift of divine grace” which somehow is dished out to some but not to others? And if there is no way of getting divine grace by

anything you do, as the Calvinists aver, then hadn't we better just sit around and wait until something happens?

Surely, we can't be left in that sort of hopeless situation. There must be some way of getting "grace" or "divine charity" or "divine love"—some sort of way in which we can, as it were, open ourselves so as to become conduit pipes for the flow. And so the more subtle preachers try to see if we can open ourselves and teach methods of meditation and spiritual discipline in hope that we can contact this power. The less subtle preachers say 'you don't have enough faith, you don't have enough guts, you don't have enough willpower...' If you only put your shoulder to the wheel and shoved you would be of course an exemplar and a saint. Actually, you will only be an extremely clever hypocrite.

The whole history of religion is the history of the failure of preaching. Preaching is moral violence. When you deal with the so-called practical world, and people don't behave the way you wish they would, you get out the army or police force or "the big stick." And if those strike you as somewhat crude, you resort to giving lectures—"lectures" in the sense of solemn adjuration and exhortation to "behave better next time."

Many a parent says to the child, "Nice children love their mothers. And I'm sure you're a nice child. You ought to love your mother, not because I, your mother, say so, but because you really want to do so." One of the difficulties here is that none of us, in our heart of hearts, respects love which is not freely given. For example, you have an ailing parent, and you are a son or daughter who feels dutifully that he should look after his parents because they've done so much for him. But somehow, your living with your father or mother prevents you from having a home and a life of your own, and naturally you resent it. Your parents are well aware that you resent this, even if they pretend to ignore it. They therefore feel guilty that they have imposed upon your loyalty. You in turn can't really admit the fact that you resent them for getting sick, even though they couldn't help it. And therefore no one enjoys the relationship. It becomes a painful duty to be carried out.

The same thing would naturally happen if, a number of years after having (at the altar) made a solemn and terrible promise that you would love your

wife or husband come what may forever and ever “until death do you part,” suddenly you find that you really haven’t the heart to do it any more. Then you feel guilty, that you ought to love your wife and family.

The difficulty is this: You cannot, by any means, teach a selfish person to be unselfish. Whatever a selfish person does, whether it be giving his body to be burned, or giving all that he possesses to the poor, he will still do it in a selfish way of feeling, and with extreme cunning, marvelous self-deception, and deception of others. But the consequences of fake love are almost invariably destructive, because they build up resentment on the part of the person who does the fake loving, as well as on the part of those who are its recipients. (This may be why our foreign-aid program has been such a dismal failure.)

Now, of course, you may say that I am being impractical and might ask, “Well, do we just have to sit around and wait until we become inwardly converted to learn, through the grace of God or some other magic, how to love? In the meantime, do we do nothing about it, and conduct ourselves as selfishly as we feel?”

The first problem raised here is honesty. The Lord God says, at the beginning of things, “Thou shalt love the Lord thy God with all thy heart, with all thy soul, and with all thy mind.” What appears to be a commandment is actually a challenge, or what in Zen Buddhism is called a koan, a spiritual problem. If you exercise yourself resolutely, and try to love God or your neighbor, you will find that you get more tangled up. You will realize increasingly that the reason you are attempting to obey this as a commandment is that you want to be the right kind of person.

But love is not a sort of rare commodity—everybody has it. Existence is love. Everybody has the force running. Perhaps the way in which you find the force of love operating in you is as a passionate like for booze or ice cream or automobiles or good-looking members of the opposite sex, or even of the same sex. But love is operating there. People, of course, tend to distinguish between various kinds of love. There are “good” kinds, such as divine charity, and there are allegedly “bad” kinds, such as “animal lust.” But they are all forms of the same thing. They relate in much the same way as the colors of the spectrum produced by the passing light through a prism.

We might say that the red end of the spectrum of love is Dr. Freud's libido, and the violet end of the spectrum of love is agape, the divine love or divine charity. In the middle, the various yellows, blues, and greens are as friendship, human endearment, and consideration.

Now it's said that selfish people "love themselves." I would say that that belies a misunderstanding of the whole thing: "yourself" is really something that is impossible to love. One obvious reason for this is that one's self, when you try to focus on it to love it or to know it, it is oddly elusive.

Let me illustrate why. Once there was a fish who lived in the great ocean, and because the water was transparent, and always conveniently got out of the way of his nose when he moved along, he didn't know he was in the ocean. Well, one day the fish did a very dangerous thing, he began to think: "Surely I am a most remarkable being, since I can move around like this in the middle of empty space." Then the fish became confused because of thinking about moving and swimming, and he suddenly had an anxiety paroxysm and thought he had forgotten how. At that moment he looked down and saw the yawning chasm of the ocean depths, and he was terrified that he would drop. Then he thought: "If I could catch hold of my tail in my mouth, I could hold myself up." And so he curled himself up and snapped at his tail. Unfortunately, his spine wasn't quite supple enough, so he missed. As he went on trying to catch hold of his tail, the yawning black abyss below became ever more terrible, and he was brought to the edge of total nervous breakdown.

The fish was about to give up, when the ocean, who had been watching with mixed feelings of pity and amusement, said, "What are you doing?" "Oh," said the fish, "I'm terrified of falling into the deep dark abyss, and I'm trying to catch hold of my tail in my mouth to hold myself up." So the ocean said, "Well, you've been trying that for a long time now, and still you haven't fallen down. How come?" "Oh, of course, I haven't fallen down yet," said the fish, "because, because—I'm swimming!" "Well," came the reply, "I am the Great Ocean, in which you live and move and are able to be a fish, and I have given all of myself to you in which to swim, and I support you all the time you swim. Instead of exploring the length, breadth, depth, and height of my expanse, you are wasting your time pursuing your own

end.” From then on, the fish put his own end behind him (where it belonged) and set out to explore the ocean.

Well, that shows one of the reasons it’s difficult to love yourself: Your “spine isn’t quite supple enough.”

Another reason is that “oneself,” in the ordinary sense of one’s ego, doesn’t exist. It seems to exist, in a way, in the sense that the equator exists as an abstraction. The ego is not a psychological or physical organ; it’s a social convention, like the equator, like the clock or the calendar, or like the dollar bill. These social conventions are abstractions which we agree to treat as if they did exist. We live in relation to the external world in just exactly the same way that one end of the stick exists in relation to the other end. The ends are indeed different, but they’re of the same stick.

Likewise, there is a polar relationship between what you call your “self” and what you call “other.” You couldn’t experience “other” unless you also had the experience of “self.” We might say that we feel that one’s “self” and the “other” are poles apart. Oddly, we use that phrase, “poles apart,” to express extreme difference. But things that are “poles apart” are poles of something, as of a magnet, or a globe, and so are actually inseparable. What happens if you saw the south pole off a magnet with a hacksaw? The new end, opposite the original north pole, becomes the south pole, and the piece that was chopped off develops its own north pole. The poles are inseparable and generate each other.

So it is in the relationship between the “self” and the “other.” Now if you explore what you mean when you say you “love yourself,” you will make the startling discovery that everything that you love is something that you thought was other than yourself, even if it be very ordinary things such as ice cream or booze. In the conventional sense, booze is not you. Nor is ice cream. It becomes “you,” in a manner of speaking, when you consume it, but then you don’t “have it” anymore, so you look around for more in order to love it once again. But so long as you love it, it’s never you. When you love people, however selfishly you love them (because of the pleasant sensations they give you), still, it is somebody else that you love. And as you inquire into this and follow honestly your own selfishness, many interesting transformations begin to occur in you.

One of the most interesting of these transformations is being directly and honestly “selfish.” You stop deceiving people. A great deal of damage is done in practical human relations by saying that you love people, when what you mean is that you ought to (and don’t). You give the impression, and people begin to expect things of you which you are never going to come through with.

You know of people to whom you say, “I like so-and-so, because with him or her, you always know where you are.” It’s impossible to impose on people like that. On the other hand, if you say, “Can I come and stay over night with you?” and they don’t want you, they’ll reply, “I’m, sorry, but I’m tired this weekend, and I’d rather not have you.” Or “Some other time.” Well, that’s very refreshing. If I feel the person hasn’t been quite honest with me, and I accept their hospitality, I’m always wondering if they would really prefer that I wasn’t there.

But one doesn’t always listen to one’s inner voice: we often pretend that it’s not there. That’s unfortunate, because if you don’t listen to your inner voice, you are not listening to your own wisdom and to your own love. You are becoming insensitive to it just as your hosts are trying to suppress the fact that, for the time being, they don’t want your presence. Likewise, let’s suppose that you are married and have an unwanted baby. It is profoundly disturbing to a child to have false love pretended to it. To begin with, the milk tastes wrong. The smell isn’t right. The outward gesture is “Darling, I love you,” but the smell is “You’re a little bastard and a nuisance.”

Very few of us can accept the idea that we don’t love our children, because it seems to be unnatural. We say that mother-love is the most beautiful and natural thing in the world. But it isn’t. It’s relatively rare, and if you don’t love your child, you confuse him or her. The child will respect you much more if you say, “Darling, you’re a perfect nuisance, but I will look after you because I have to.” Well, at least then everything is quite clear!

I found in personal relations of this kind a very wonderful rule: that you never, never show false emotions. You don’t have to tell people exactly what you think “in no uncertain terms,” as they say. But to fake emotions is destructive, especially in family matters and between husbands and wives or between lovers.

It always comes to a bad end. This, on the occasions when, for personal friends, I perform marriage ceremonies, instead of saying, “I require and charge you both that you shall answer in the dreadful Day of Judgment, etc.,” “I say, “I require and charge you both that you shall never pretend to love one another when you don’t.” This is a gamble. It is likewise a gamble to trust yourself to come though with love.

But there is really no alternative.

Now to trust oneself to be capable of love or to bring up love—in other words, to function in a sociable way and in a creative way—is to take a risk, a gamble. You may not come though with it. In the same way, when you fall in love with somebody else, or form an association with someone else, and you trust them, they may as a matter of fact not fulfill your expectations. But that risk has to be taken. The alternative to taking that risk is much worse than trusting and being deceived.

When you say, “I will not trust other people, and I will not trust myself,” what course remains? You have to resort to force. You have to employ stacks of policemen to protect you, and have to hold a club over yourself all the time, and say, “No, no. My nature is wayward, animal, perverse, fallen, grounded in sin.” What then happens? When you refuse to take the gamble of trusting yourself to be capable of love, you become, if you will excuse this extremely graphic but nevertheless relevant simile, like a person who cannot trust himself to have bowel movements. Many children learn this from parents who do not trust them, and think they ought to have these movements in rhythm with the clock, which is a different kind of rhythm from that of the organism. People who cannot trust themselves to do even this take laxatives endlessly, as a result of which their whole system gets fouled up.

Exactly the same thing happens with people who can’t trust themselves to go to sleep. They have to take all kinds of pills. And so also with people who can’t trust themselves to love, and have to take all sorts of artificial and surgical measures to produce the effect of love for saving face. They become progressively more incapable of loving at all, and they create turmoil and misunderstanding and chaos in themselves and others and society.

In other words, to live, and to love, you have to take risks. There will be disappointments and failures and disasters as a result of taking these risks. But in the long run it will work out.

My point is that if you don't take these risks the results will be much worse than any imaginable kind of anarchy.

In tying up love in knots or in becoming incapable of it, you can't destroy this energy. When you won't love, or won't let it out, it emerges anyway in the form of self-destruction. The alternative to self-love, in other words, is self-destruction. Because you won't take the risk of loving yourself properly, you will be compelled instead to destroy yourself.

So, which would you rather have? Would you rather have a human race which isn't always very well controlled, and sometimes runs amok a little bit, but on the whole continues to exist, with a good deal of honesty and delight, when delight is available? Or would you rather have the whole human race blown to pieces and cleaned off the planet, reducing the whole thing to a nice, sterile rock with no dirty disease on it called life?

The essential point is to consider love as a spectrum. There is not, as it were just nice love and nasty love, spiritual love and material love, mature affection on the one hand and infatuation on the other. These are all forms of the same energy. And you have to take it and let it grow where you find it. When you find only one of these forms existing, if at least you will water it, the rest will blossom as well. But the effectual prerequisite from the beginning is to let it have its own way.

Love of Waters

Do you mind if I talk for a while about something I love? About water and the ocean. Ever since I can remember anything at all. The light, the smell. The sound and motion of the sea has been pure magic. Even the mere intimation of its presence, gulls flying a little way inland. The quality of light in the sky beyond hills which screen it from view. The lowing of fog horns in the night. And if ever I have to get away from it all, and in the words of a Chinese poet, wash all the wrongs of life from my pores, there's

simply nothing better than to climb out onto a rock and sit for hours with nothing in sight but sea and sky. Although the rhythm of the waves beats a kind of time, it's not clock or calendar time. It has no urgency. It's timeless time because I know I'm listening to a rhythm which has been just the same for millions of years. And it takes you out of the world of relentlessly ticking clocks. Clocks for some reason or other always seem to be marching. And armies never march to anything but doom. But there's no marching rhythm in the motion of waves. It harmonizes with the breath. It does not count our days. Its pulse is not in the stingy spirit of measuring marking out how much still remains. It's the breathing of eternity, like the Brahma of Indian mythology, who inhales and exhales manifests and dissolves the worlds endlessly forever.

As a mere conception that sounds appallingly monotonous. Until you listen to the breaking and washing of waves. Just in the past few weeks, I've come to live right on the edge of the water. I have a studio, library, place for writing, in an old ferryboat, tied up on the waterfront of Sausalito north of San Francisco. I suppose it's the nearest thing in America to a Mediterranean fishing village. Steep hills, clustered with little houses. And below, along the rim of the bay, the forest of masts, rocking almost imperceptibly against the background of water and wooded promontories. In some ways it's rather a messy waterfront, not just peers and boats but junk yards industrial buildings. And all the inevitable litter of our culture. But somehow the land and sea scape absorbs and pacifies the mess. Sheds and shacks thrown together out of old timbers and plywood, heaps of disused lumber, rusted machinery, rotting hulls. All of this is transformed in the beneficent presence of the sea.

Perhaps is the quality of the light, especially early in the morning and towards evening, when the distinction of sky and water becomes uncertain. When the whole of space becomes opalescent, the sort of pearly luminous grey and the rising or setting moon is straw yellow. In this light, all the rambling mess of sheds and junkyards is magical. Blessed with a white cries of gods. And with the passions of masts and ropes and boats at anchor, which put me in mind of landfalls a long way away. And of all the voyages of which one has dreamed. I look out now as I talk to you across a wide space of nothing but water and birds, ending in a line of green slopes with

clumps of trees. Right over the edge of the boat, the water contains, seemingly just under the surface, a ceaselessly moving network of reflected sunlight, through which the school of very tiny fish passes delightfully uncaught. And yet only a few yards from where we are moored, tackle shops sell the marvelous salmon and crabs with which this particular area abounds. This is the paradox of the ocean. Sand, flying spray. Pebbles and shells. Driftwood. Sparkling water, space incredibly luminous, with cloud banks along horizons, underlying skies and which one's imagination can reach forever.

But under the surface of both sky and water, there's the grim business of praying. Men and birds against fish, fish against fish. The torturous process of life continuing by the painful transformation of one form to another. To creatures who don't anticipate and reflect imaginatively upon this holocaust of eating and being eaten, it's perhaps not so terrible. But poor man. Skillful beyond all other animals by being able to think in time, and knowing the future, he dies before he's dead, he shrinks from the sharks teeth before they bite him. He dreads the alien germ, long, long before its banquet begins.

Here is a gull that has picked a crab from a tide pool. Sprawled now upon the sand, the crab shrinks from the walls of its shell, resigning to the tap tap top of the gulls beak. Who's that knocking at my door? I suppose the shell of the crab, the clam, or the muscle, is the boundary of its universe. To put ourselves in the position we should have to imagine a knocking sound louder and louder that doesn't come from anywhere in particular from the door of the walls or the ceiling on the floor. Think of a knocking that comes from everywhere. That beats against the boundaries of space and consciousness. That comes as the intrusion of an utterly unknown dimension into our own familiar world. Let me in, let me in, I love you so much I could eat you. I love you to the very core, especially the soft juicy parts, the vitals most tender and alive. Surrender to this agony and you will be transformed into me. Dying to yourself you will become alive as me.

We shall all be changed in a moment in the twinkling of an eye on the morning when the last trumpet sounds. For behold I am He that stands at the door and knocks. There's no way of getting around it is there. The gull isn't rapacious or greedy, it's just that his being alive at all is the same thing

as eating crabs. Sea birds are transformations of fish men or transformations of wheat chickens and steers. And a love for the food is the agony of the food. To object to this inseparability of pleasure and pain. Life and Death. Is simply to object to existence but of course we cannot help objecting when the time comes. Objecting to pain is pain. So far as we know the gull and fish don't philosophize. They enjoy life when they're eating it and hate it when being eaten. They don't reflect upon the process as a whole and say how rough it is that we have to work so hard for a living or is just hell having to wash out all the time for those gulls.

I'm sure that in their world, this is something that just goes along with life like having eyes off eat. But man, with his astonishing ability to stand aside from himself and think about himself. In short, to comment on life. Man has done something which confuses his only existence down to its roots. For the most sensitive he is, the more man finds the very act of living in conflict with his moral conscience. Upon reflection, a universal range that there is no way of living except by destroying other lives. Seems to be a hideous mistake. Not a divine but devilishly creation. Of course, there's the myth that once upon a time things were quite otherwise. That there was no death at the Lion lay down with the lamb. But that since then that has been a fertile vast area which is corrupted the whole of nature. All that must have been eons ago. Perhaps in some other galaxy, where the conditions of life are quite different. Or perhaps the ghastly mistake was just that step in man's evolution, which made it possible for him to comment, to reflect upon life as a whole. In being able to stand aside from life and think about it he put himself outside it and found it alien.

Perhaps thinking about the world, and objecting to its whole principle I think the two aspects of the same mechanism. The very words suggest don't they. Perhaps we must object to everything that becomes an object. But aren't there also times when We speak of something that we know as a subject. The subject of this book the subject I'm now studying. Would it be possible to subject to life instead of objecting to it. Is this playing with words or does it possibly mean something? Now if the gulls or the fish don't philosophize, they have no consciousness of life being either good as a whole or bad as a whole. So when we philosophize and pity the poor fish. That's just our problem. From its own standpoint, the world of animals and

insects doesn't find itself problematic at all. There's not the slightest evidence to suggest that. On the contrary, I'm inclined to feel that all these creatures really swing, and go around living up to the very moment when the game is no longer worth the candle. I'm quite sure they don't lecture each other about their duties. Or worry about where they're going when they're dead.

Isn't it then rather an enormous relief for us men to see that the plant and animal world is no problem to itself and that we are wasting intellectual energy in making moral judgements about it? But of course we can't return to the unreflective consciousness of the animal world without becoming animals. To be human is precisely to have that extra circuit of consciousness, which enables us to know that we know. And thus to take an attitude to all that we experience. The mistake that we've made and this if anything is the fall of man. Is to suppose that that extra circuit that ability to take an attitude to life as a whole, is the same as actually standing aside and being separate from what we see. We seem to feel that the thing which knows that it knows is one's essential self. That in other words our personal identity is entirely on the side of the commentator. We forget that self-consciousness is simply a subordinate part and instrument of our being a sort of mental counterpart to the finger thumb opposition of the human hand. And which is you, the finger or the thumb? Look at the stages of differentiation. First, the organism from its environment and with this knowledge of the environment. Second, the distinction of knowing knowledge from knowledge itself. But all of these, like the finger thumb opposition is a difference which does not divide the thumb isn't floating in the air along side the rest of the hand at the roots that joining. At our roots we are joined to the whole subject of nature. Of course you may say that nature or the universe is just a big abstraction, but tell me, is an orange just an obstruction from its component molecules.

I think our difficulty is that our consciousness is too superficial as if all our sensation were in the tips of the fingers and not in the palm. Are common sense life are insufficiently balanced, by the clear sensation that what we are talking about is ourselves. And our selves in a sense far more basic and real, than that extra circuit which knows knowing. Are we misled by the fact that we move freely on the earth and are rooted to it in the same way as trees to

the ground and fingers to the hand? Were we, as a distant from the earth as one atom of an orange from another. I suppose we should be somewhere out by the moon. Now we know, that the atom, molecule, cell or subordinate organ of any particular organism is what it is by virtue of its place and its membership in the pattern of the whole. Blood in a test tube is rapidly ceasing to be the same thing as blood in veins. In the same way, man must beware. Lest in, cutting himself off psychically from the work that he sees, and so isolating the subject from the object. Lest in doing this he rapidly ceases to be man.

So I think this is why I love the ocean. It's the most difficult part of nature to mess up. With emblems and symptoms of man's dissociated consciousness. It's an environment. In which the awareness of our roots kind of awakened. In which space so real because of the light and color can be seen to be joining things instead of separating them. Yes. And I've just discovered that knocking on the wall of space and consciousness was my own heart beating.

Game of Yes and No

Now it has been announced that I would speak this evening about the I Ching. I should just say then briefly, that the Book of Changes, is thought to be the oldest of the great Chinese classics, and to date from perhaps as early as thirteen hundred B.C. Although perhaps the figures of which this classic is a discussion may be much earlier than that they may go back to the earliest phases of human thought, because I Ching really is the ground plan of the way in which the Chinese think and not only the Chinese. It's almost a mapping of the thinking processes of man. And it may surprise you to know that the system of arithmetic, which is used by digital computers. Came from the I Ching. We have a binary system of arithmetic, in which all numbers may be represented by zero and one in various arrangements. Is you is or is you ain't? So there's a sudden money expected a link between the most sophisticated mathematical machinery and a book originating at least thirteen hundred B.C..

But what the I Ching really goes into is this question is you is or is you ain't?. It sounds terribly simple. Black or White. And we keep saying to

people you know. Life isn't just black and white or black or white there are many shades of gray. True. But against some backgrounds, Gray is dark. In another context grays light. And really all colors, in fact all information whatsoever. Can be translated into terms of yang and yin. For example, when you look at color television, the signals are broadcast to your set as a stream of pulses. They could be put on magnetic tape, in terms of an arrangement of pulses. Indicating either yes or no.

This technique has reached such the sophistication that with the aid of a laser beams, we can translate a physical object; let's take a complicated one, let's take a dandelion flower gone to seed, a dandelion clock. You take a dandelion clock about so big. It can be turned into a formula, passed through channels, enlarged to any size say this big, and with laser beams cut in solid plastic in a matter moments. Third you can get this reproduction of a three dimensional object. But the transition between the two was handled simply in terms of pulses. So likewise the nervous system, is so constituted that the neuron carry a message, either fires or does not fire. as all of us not five. If it is fire or if its activated, that registers as a yes if it is not fire the absence of firing is represented as a no. And so you could say that all your perceptions. In all their variety and all that color and made up of a vast composite of little yeses and and little nos. In every conceivable variation. So after these two come everything.

Yang means the positive and even the negative. Yanni is identified with the South or sunny side of a mountain. Yin with the North or shady side. And note, this mode that you cannot have a one sided mountain. Imagine. And this then is the crucial thing that one must understand about the yang/yin philosophy. And it is represented in the symbol of a circle crossed with an ask one side of which is black and the other side is white. And so they're like two fishes. And in the head of the Black Fish is a white eye and then the head of the white fish the black eye. These two sides are interdependent because the black one is outlined by the white one and the white one is outlined by the black one. And they chase each other in the form which is really the double helix the pattern of the Spiral Nebulae, and also the pattern of love making between many many kinds of creatures. The spiral folding into itself. Black chasing white, white chasing black. Now obviously white and black out as different as different can be. When we say

of someone that he is a awful liar and a conman, he said why he could prove to you that black was white. But strangely enough black is white in a certain sense and white is black if you take the copulating word 'is'. To mean implies. Because black implies white and white implies black. All positive implies negative and negative implies positive, because you can have the one without the other. So to put this into words. We can say explicitly black and white are different, but implicitly that is to say by implication, they are one. So exoterically, outwardly. The positive and the negative of life are very different. Life is different from death and good is different from evil. But the secret is that they are. As God says through the prophet Isaiah 'I am the Lord and there is none else I follow the light to create the darkness I make peace and create evil I the law do all these things. But that if information is not normally handed out from the book. So we have to begin then seriously considering Yarran and he and black and white.

First of all if I have a black background. Somehow I am tempted to make it white mark. If I have a white background, I'm tempted to put a black mark on it. Because if there was nothing to see but black. That would be tantamount to being blind. Because there would be no difference. Nothing would matter nothing would make a difference so there wouldn't be any. Likewise if everything were white. It would be as good as being blind. For there would be no difference. It's only by contrast. When black and white have put together that we know black is black and white is white.

However now, when I look at a small white circle or discover a black background. Or a small black disk on a white background I once get this in my thought which is positive and which is negative. Does black represent the negative because it's dark. Like night. But when I look at the black dot on the white background I think the black dot is the same there so that must be positive. It was put on. And therefore the white represents negative because it suggests nothing. Now Mark like white paper behind the print blank blush the English blank in the French blanche with means white it's a blank, negative. Isn't this mysterious You see that both white and black can play the negative role. But then let's think of white as light. And it's playing the positive role and when we think of black as the think the mark. Then it's playing a positive role see both can play the negative in both the positive.

But still you can't have one without the other. I look at the black with a white dot. And I say is that a white glowing sun in the night or is it an old through a wall? In which case the black will be the thing and the white the absence. I look at the black dot on the white background and say, Yes obviously the black dot is the thing, but all the other hand it may be a picture of a white box with a hole in it. You see, there reversible.

Therefore some reflections about these. It isn't easy for a human being, the way we've been trained, to notice that you can't have one without the other because our attention has difficulty in seeing both sides at once. You know that Gestalt image where you get to faces in profile. And they are drawn as black silhouette. So you get two faces in profile about to kiss. But then look again and you notice the white ground between them and it is a cup like a chalice. What have we got here kissing faces or chalices. People have difficulty in seeing both together you must have one or the other either will do not make your choice. It's like you are going to be a boy or a girl either will do but you have to choose one of them. And yet bodhisattvas are always represented to some Africa. As being the as it were bisexual, transcending sexual differentiation, because after all everybody who exists is the result of a boy and a girl. Boys can't be boys without girls and girls can be girls without borders. They are very different. If lot if they are. But, by reason of their interdependence, they're one.

Talking of the bees and the flowers, where there are bees as there must be flowers. And where there are flowers there must be some sort of insect equivalent. And this implies that the bee on the flower are really one organism. The head of the body looks very different from the feet just as the bee looks different from a flock. But a complete body requires both head and feet. So the head and the foot are obviously one organism is less obvious with the bee in the flower but they are an organism.

What is very difficult for us to see however, is that solids are all of a piece with spaces. Now here comes with thing you see take a situation in which we say of a given figure ground relationship that the black is the thing, the black letter on the white page. We say yes it's the black letter that's a ball that's the thing. But supposing it's a white letter on a black page. Still, we said the letters the thing. That's a ball All right so. He said we look out of

the sky at night and we see the stars and the planet as. We say that's what's there. That's the space around them as darkness and nothingness, corresponding to the area of the magnetic tape which is magnetized which delivers no message and therefore the message zero. That you see does deliver a message. Absence speaks, nothingness is important. But we are brought up we are so brainwashed we are so bamboozled we are so ignorant. That we don't know that. That's the whole trick that we play on ourselves, we don't know that nothing is something. But it's important!

Lao Tzu put it this way. The usefulness of the vessel is not so much in the place around but in the empty space in which something can be carried the usefulness of the window is not so much in the frame is in the empty space through which light can be see. It sounds odd and paradoxical and almost a little contradictory but nevertheless there it is. The space is after all not nothing. I had an argument with Buckminster Fuller about this. And he had to grant me that I was theoretically correct. Because he said so far as I'm concerned space is just negative event. Just negative or the fallacy wasn't in the word negative event that's a beautiful phrase it was in the word just only. This space could be dismissed. And so in exactly the same, when we don't recognize that side of life people complain all kinds of tricks on us. The main trick is, I can scare you with death. You won't be. I can remove you are. You going to get removed anyway these days you just won't be all that people off. Now you just aren't. You know as a person you won't be will be nobody to realize how terrible it is. This is the thing that this is one of the great tricks of life and you have to be watching this as people use it they, because they've all been taught to use it through the fall of man was not recognize the other side. So that everything that we think of as nothing space, empty space, death. Sleep. Dissolution, decay, any sort of weakness. Anything that goes against structure that is against the same that we think is bad bad bad, and we're trying to get a world where that finally things is rendered impotent. Nothingness. Must no longer constitute a threat to something. In other words we want to play black and white. And if we call white the light the positive White must win.

That's the game we're trying to play, not realizing that there cannot be winning without losing. If whiteness when blackness lose. But if black loses we can congratulate black for having helped white to win. Because unless

black loses white one. You can translate this into the difficult ones only question of race relations how would you know you were free white and twenty one. How could you prepare our being a white man that's what black. You wouldn't know you are living on the right side of the tracks unless there were people living on the left side tracks. You know as an I.Q. thing it says up is to down as blank is to left. Or left is to black. As opposed to fill in. I would put taken. Anyways, taken and left. Right and left, right and wrong. These opposites get tricky. But the point is people are afraid afraid of the negative one. Don't be negative. The Power of Positive Thinking. That's all nonsense. The negative is the source of the positive. This is of absolutely fundamental to the I Ching. This is why in the Hexagrams of which is the the I Ching is about, there's about sixty four combination of six black and white symbols. Actually, they use an unbroken line for the positive and a broken line for the negative six such lines there are sixty four combinations of groups of six hexagram. And in all those there is not one bad one. There is no sign of the I Ching which you can draw and the oracle will tell you this is just plain bad. Because you can get to the very end of the night, the blackest pitch black and it is precisely at that moment that the yang, the positive element, is reborn. Because you see, it is recognizing that energy is waves, energy is pulsation. Now you can't have a pulse without a vibration. It sounds if I go "OHHHHHHHHHHMMMM." Something without nothing.

But actually if you listen very closely to that sound you hear. You'll hear pulse. Because without that region which is a past nothing happens so this table which is level and solid and philosophers are always talking about tables because there was a table's environment clusters. That this thing is going to. Have to talk about it kept inside. And I always look at us. And we find that there are cellular structure in wood. Analyze that molecules and my we found to our amazement; if you take a molecule out of this table and it's about the size of my fist. Blow it up with that the next moment you will be while we're with the other side of the room. At that level of magnification. What's in the molecules? Atoms. Take an atom the size of my fist, this where the next Monday I'm in Los Angeles. I mean you know I was talking fancy shapes and figures and they were a long way what's inside the AM. Electrons protons may sound so it's utter and they the size of my fist We don't even know if they're particles or waves, it's difficult to

talk about this, but they are on a long way from each other so we suddenly find that in the solid table there's more space than there is anything solid. Is a little bit of thought but as you VERY did our new go step, step down, it's like approaching a limit in mathematics when you have a curve sweeping towards an axis posing it's an asymptotic curve, it's always getting nearer and nearer and nearer to that axis but never actually collides with it. So we get nearer and nearer as we study substance, nearer and nearer to finally what is the shell around the emptiness near it we never quite catch it. Solid disappears. Into space as at this level of magnification the spaces disappeared into the solid. See, if I just have one thing I better illustration is like a lighted cigarette in the dark I just got one point but I was it around and you see a continuous circle that's how you see a solid table. Because they're in gangs are so fast that your eye can catch the spaces between. Too little, too quick. Zip!

So, looking at things from one point of view we find a lot of emptiness looking at them from another point of view we find a lot of solitude. But what you have to realize is that the solid is based on the emptiness just as much as the end in this is based on the solid so don't be afraid of nothing. It can't bite you. It's only something that can bite you. There's nothing to be afraid of in nothing. And yet mysteriously nothing is the source of something. It's like the womb and the and the seed.

So, yang and yin go together. But, through not seeing that, our life is, as I said geared to the thought that we might be able to make the yang side win. And so, in every thought of human enterprise, we are trying to have white without black. And this connects with what I was trying to get across this afternoon. When you talk about improving the world, you are meaning presumably that you want it more white than black, or whichever one you call the good one. If you think the black is the good, it's all right, it doesn't make slightest difference. You know which side are you going to take in the game of chess the black and white doesn't make much difference except white gets first move. And now I always wait to see what you're going to do. We think, could we get rid of the other one? Now as you know in all matters of practical living. It never works. You think now, I've been miserable all this time as I have enough money. I never know whether I make the payments on the car. I never know whether, you know, it's going to be sickness. And if only I have a little more money I'd really feel great.

So you get it. And in the transition from one stage to the other, you feel very elated, because you feel elated you're going up. Five thousand dollars a year say, it makes a difference. When you've gone up then of course you're on level again. And no longer do you have to worry about making payments. But you get a new worry. Supposing I get sick. And die of it. Supposing someone robs me. They rob me, takes it away from me, you can worry about that. You say oh I feel so much happier if I have a medical examination. And you go to a fancy doctor, and he says I can't find anything wrong with you. Then there might be burglars, so you get an alarm system a new locks file you go to the hours patrol and get a private guard watch you that makes you feel better for a while except that it begins to nag you she five homes, patrolmen out there they all know I've got something. Maybe I'm going to have to manage.

So it grows. You worry. Because you found out that you didn't get yang without yin. You got a new area began instead of the formal little one you haven't you got a big yin with it. It's no joke getting rich. It implies a great deal of responsibility, and you've got more worry about. Don't envy rich people. Great mistake. Don't envy anyone. So in the same way Chuang Tzu puts it, he's Lao Tzu's successor. People who speak of having good government without its Corella to misrule. All right without corroborative wrong. Do not understand the basic principles of the universe one might just as well speak of having Yang without yin, and such people must be either knaves or fools. Because our we know we were wise unless they were knaves and fools.

But here it is, you see. You cannot beat the game. You can have the temporary illusion of winning. But by compensation you will ever so often have the temporary illusion of losing. When you go down a step. From yang to yin, you'll feel I've lost something. When you go up a step from yin to yang, you'll feel I've gained something. How would you know gain without loss? How could you have the sensation of more and less in relation to the sensation less fortunate station is simply. Awareness of contrast. That's what life is.

Now if we realize that we get the same feeling of frustration as I wanted to give you this afternoon. In trying to make it clear that so far as the

improvement of ourselves in the world is concerned, absolutely nothing we can do about it. And this is simply another way of saying the same thing you cannot have more yang than you have yin. You cannot play a game which is win a no lose or a game in which everyone wins. You're stuck with it. Now in just the same way if we recognize that applying yang and yin to all possible situations of life we get this awful feeling of so what's the use. I mean what do you expect me to do, jump into the river and drown? Why at that point do we get the feeling of a what's the use. Simply because we found that our favorite game won't work. And we think that is the only thing for which there isn't a use is the game in which whiteness when. But why not turn, change them around is not a good game has a boing boing boing boing boing, like this, goes in and out is the undulation of a wave, crest and then the trough, you go or you every kid likes a rollercoaster ride. So having both is the game, see there's no game there what we think is the game isn't a game in order. To win all the time when we're winning there's no game. Because the game is always the hide and seek. Now you see, now you don't. The game is the story in which the villain might win and the whole idea of the drama is to make it seem to the audience that it is the villain absolutely must win. There's no way out and then suddenly for whom the secret thing is revealed and the hero wins. Or if you want to good cry have a tragedy and the villain wins.

But don't you see, there is no vitality unless there's that negative element, the one without the nothing the death the art you've lost finish by our. Quits. See, if that's not there, then the other one isn't there. And you all always winning doesn't you know you said I with a wife and you play cribbage. Lots of married couples try to forget holy deadlock by playing games. And if one partner, be it wife or husband, always wins at cribbage, the game ceases to be of interest. Because every good player likes or sprightly opponent who sometimes wins, wins just a little bit less than me mind you, but wins a great deal of the time it's it's OK as the little bit. So, if you don't have the unknown space, death, darkness, negative you don't have the light. So they are life consists of something else than trying to make white win. You didn't sit down because somebody tells you you can't make white when all the time forever and always so the black doesn't exist. Because black my very nature is darkness and it doesn't exist. You're trying to make it not exist. Is there around the very fact that it doesn't exist as our.

Non existence is the necessary condition for existence, just like you have to have a front before you have a back. Or back before you have a front. They come into being together, just like existence and nonexistence. So what a friend got. In trying to get rid of nothing which is already got rid of.

So we think, but surely this is rather monotonous, it goes up and down and down up and down see saw, life, death life, death, or birth, death, birth death. Isn't there some way, I mean must we play this game? It's like a game of one upmanship I showed you earlier this afternoon can't get out of it they're always playing and if you say I want to play it means I got a more interesting game than the odds. Which is just the same game all over again. Would be a way somehow to transcend black and white. So we got black and we got white, that makes it even. When the something else, couldn't be tertian quid. A new new possibility so we can have a three basis instead of two places. Somebody comes up and says. All right you're black and white and beaver constitute the two ends of the base of the triangle I'm the apex How about that? Well you'll say that's odd. Because it's odd because the first two or even. I mean when something happens that's odd, and that's not say it's odd that anything should have happened. During our it's clear ,would have been easier for there to be nothing. And then something happens or said that's odd then they recognize it as something and nothing and then they said all right that's that's right we're even so this is our fellow comes along and says Now what about they say you're our I havenot. You stand over against us, that makes two. We're even, and you're odd. Right so that makes two out of three me three goes to we're together we two we recognize we're black and white. You can't have one without the other so we're together and you say you want to be different. Ok that makes Black and White different from whatever you say you are, so we've got a new yang and yin. You can get out of it make fall in this same all over again make five years same all over again. This was how Liebnez reason and arithmetic you could read it represent any number using just zero and one. Damn. Can't we get out of this? Hey what would it be if you were allowed five minutes with God, and you're allowed to ask one question. What do you want to know? Because you know, you've thought this over now you know less about the opposites about the yang and the yin. And you know you can ask God and say it had to Hey, will you give me a tip to be the game. One. Work. And watch and I ask God. So you can think of all the

things you might ask for. You know an electric guitar. A million dollars. And you know that wouldn't millions because that would be any you would be a beginner along with someone. And I don't know what I ask.

So you go in and say God, beyond positive or negative, what is reality? God says, my child, your question has no meaning. You think oh there it is, got my one chance lost. Using. It a friend of yours say hey look you could. Tell me what he says you ask him what question should I ask. Because it says. Oh God what question should I ask you. God says so you do want to problem. Well you've got one. You thought it up, you wanted to if you want to game in which white only when there's your problem. You may not but you had to have to have that problem. Because otherwise you don't have a problem, you wouldn't know you were here. It's like you carry yourself without something you call other. I want you know you were you were less somebody else or somebody else altogether. In other words, the sensation of I, here, living sensitive the light beaking out beady eyed out of my skin. In time is it with reference to something over that which isn't me I don't want it is but it did was all by itself and this is a pretty is going up and there is and I can have this feeling without that feeling. There's the same hocus pocus going on. If I can't feel me without having other, that's exoteric. Esoteric, that means I am the other. They're inseparable. How can you have self without having to be other without self. You either are me and self on yourself I self on me and other on you.

But you can't as it says you can't have one without the other. Yang and Yin. So in the same way I say well. This other I'd like to manage it, I'd like to control it. And I know these people are are messing up my life. I don't want them to be that much other. I'm going to fix you. And I get on a power kick and there are all kinds of power kicks, let me warn you. It's not just politics and economics and business. The worst power kicks are spiritual. Like astrology you like to know the future. Which you really. It's a power to get to know the future so if you can control it no surprise. If you know the future it's already past. But if you want to know something and add knowledge then there must be the unknown. Just if you want self you must have other. So the future is always the unknown, the past is the known. And what we witness as our present is the magical appearance of the known from the unknown. You know what's going to happen the next second, I

mean there might be another big earthquake right I mean. Any minute now. Or the Russians might decide to release the A bomb. Any the minute we have a heart attack rocked it. You know what's going to relax. And watch watch watch this thing. It's incredible. Just watch it. You, it, self out of its vibration you know. You are using also now wait a minute so often either that means voluntary it versus involuntary. What I do and what happens to me.

Now, what do I do. When I walk, I think, I talk I move my hands. I can be nice to you and I ask you to you I would regard both as my doing. But what about my blood circulation. I normally think that that happens to me. I mean if my heart would stop, I wouldn't say I'd done it, I would have said it happened to me. A Buddhist will say your heart stopped, that was your karma. And karma means nothing else except doing if you're doing your job stop. You know it doesn't mean don't take it literally in a superstitious way because you spat in someone's face in a past life, you know having a heart failure is a punishment for it this time around the universe is not geared to be a kind of judicial system. I mean, a lot of priests figure it that way in order to frighten people.

But karma means simply, if you die in a plane crash or die in a heart attack, it's your doing. Now I've already proved to you that black is white. And I'm going on prove to you that what you do. Is what happens to you. And what happens to you is what you do. Because you can't tell the difference between doing, you can't tell what you mean by doing, unless something happens to you to contrast it with. And visa versa, you can't have family that happens to you unless it feels different from something you do, now let's take a look at our breath. Are you doing it or does it happen? If you do breathing exercises, you can feel I'm doing it, just I'm breathing in, just as I raise my hand. But after a while I breathe out. I feel I'm breathing out, and I forget all about it and goes on and it happens to me. That's why any other which means Yoga means Union joining same as the Latin ungerere. Why in yoga you breath, breathing is the main thing in yoga because it's to teach you that there's no difference between what you do with what happens to you. You learn that through breathing. You can make the very best breath. See, we are in the good Christian terms here, the Holy Spirit, Spirit means breath see. Spiritus in Latin class man and require pretty big. Breath. Now

there's ordinary breath. When you [pants]. You know most people's normal breathing. Or forced breath, you know with people trying to say in their their voices for lost. And then the next breath is called Holy Spirit, Holy Breath, as when the breath is no longer forced, happens when it's nirvana breath blow out same thing as I was very. And then that you see that unforced. [chants]

You go on and on. So that's why when monks chant are devotees of any time chant they have the idea that I am a flute. And the breath of the prana, the spiritus of the divine flows through it, that's what it's is all about. Make yourself a tube for The Divine Wind. But that also means realize. The unity of the voluntary and the involuntary that's really what's meant by doing the will of God. Do the will. It's one reason why we get confused in English as to whether we mean shall. I will drown and no one shall save me.

So, think, behind what you call voluntary, you decide, having reviewed the evidence, I decided it would be best to buy this brand of detergent. I made a decision. How did you make a decision? Now I review the evidence sided uprise I can within an hour I know all that how did you work the machinery. The computer in your hand you know you pushed all these buttons but what's underneath about it. Well I don't know, I haven't had a look. So you see that involuntary growth called the brain underlie underlies your voluntary decision. Because you when you decide you don't first decide to decide. And decide to decide to decide. You just decide that means there's something else beyond. Where you think that's terrible, because if what I do happens to me and it isn't really doing it all that I'm in a fatalistic thing is that I said on the other hand what happens to you is what you do. It works equally that way. You know, you have an earthquake and the thoughts in your head drift about like clouds in the sky. You can't do anything. So in the same way, this old strain, the futility of the strange men white women to improve the world that entire futility. The frustration of it is what you mean by 'I.' Now it goes, it won't work and they are I collapse is everybody is terrified of this happening. Suddenly finding out that you don't have an ego. And heaven forbid, I've been building up this personality of mine all these years I've been very carefully nurtured this personality you tell me doesn't exist. No, because your personality is a phantom even more insubstantial

than your body. Personality is a work of art it's like music which vanishes as soon as it's played.

The Smell of Burnt Almonds

Some time ago, I received a visit from a woman who as a result of listening to these talks, was wondering if I could help her to regain and experience what she had had while undergoing a surgical operation. As is generally known, anaesthetics sometimes induce, peculiarly vivid and unusual states of consciousness. And every now and then a person under anesthesia will undergo a specific and particular experience which is of the utmost fascination. It's the kind of experience which I suppose we would ordinarily call mystical or spiritual, and which, while it lasts, carries the most powerful sensation of understanding with complete clarity and certainty what is the mystery and meaning of the world. This occurs sufficiently often to have been made a subject of experimentation.

Perhaps you know the story of the investigator who took doses of anaesthetic for this purpose and equipped himself with pencil and paper to record, at the moment of awakening, what ever revelation might have been given to him. Fortunately, the expected experience took place, and for a brief period the investigator had the vivid conviction of complete comprehension of this universe, of life and death. He regained waking consciousness with the tail end of the sensation still upon him, grabbed the pencil, and swiftly recorded the essential content of the experience just before it faded. After several minutes during which his mind returned to its normal state, he looked at what he had written. And there upon the paper was the following immensely profound observation: Everything in this universe is the smell of burnt almonds.

And I suppose that all sensible and hard headed people would agree that this is just the sort of inanity to which all these mystical revelations ultimately boil down. In the clear cold light of rational consciousness, the seemingly inspired and utter convincing knowledge, of Dreams, drug delusions, and of mystical experiences comes down to just this sort of idiotic anticlimax. Masked in the poetic or exotic obscurantism of such phrases as "All is Brahman" or "the divine unity beneath the multiplicity of

the world.” It may sound for a moment it as if it meant something. But the essential nonsense of these feelings and the purely subjective character of the sense of insight which they involve at once becomes obvious when Brahman or the divine unity is replaced by the smell of burnt almonds. We might settle for this conclusion, if some of us had not had the same sensation. Not under drugs or hypnosis but when very wide awake. And I for one will not quarrel with the smell of burned almonds as the key to the mystery. I like it much better and feel it makes much more sense than Brahman or the divine unity. And for its very banality, its very inconsequential silliness, brings out the real significance of the experience in question. For the importance of the mystical revelation does not lie in the precise nature of what everything in this universe is. It can be God or Brahman or burned almonds or applesauce or anything you like. Its importance lies rather. In the simple sensation of wholeness in the part of the sentence which runs. Everything in this universe is. No matter what.

For the conviction which has come to the experiencer, is that his habitual sensation of isolation from his environment from the rest of the world is an illusion. And that as a corollary, his own deeds and misdeeds fortunes and misfortunes are the same process as the changing seasons and the circling stars. And unreasonable as it may seem, this gives him the sensation that his whole life, past present and future, is somehow perfectly natural and in order, and that he himself is not just the mind enclosed in the skull. But the total process of the world.

The significance of this experience, and does not I think, lie in any consequences or conclusions which might be drawn from it. It is not an important experience in the sense that it is useful for some other purpose. It's simply like playing or listening to music, which is obviously phony in the very moment that we do it for some ulterior motives such as to appear cultured or to convey an ideological message. Its significance for human beings is not like that of say the Second Law of Thermodynamics, but like that of the Mozart sonatas or the arabesques on a Persian rug. The significance of useful knowledge like the Second Law of Thermodynamics, is precisely that by applying it. Human beings may be enabled to go on experiencing such things as music or love or mystical insight, but what could I say to the woman who under anaesthetic, had once had this

experience and wanted it again more than anything else in the world? Go and have another operation. Get yourself some ether. Mescal in lysergic acid or take up yoga. Or get thee to a nunnery. There are still other and much too pat answers to this question, as that she is failing to revive the experience by the very act of seeking for it. As well tell a starving man, that his very hunger is what prevents him from finding food. For once a person has had an experience of this kind, he is gone. It's easier to get rid of an addiction to heroin. Or to choose something more natural, to get rid of the love of the opposite sex. No I could better say something like this. The answer is in the very experience which you have had. Didn't you know then, for certain, with utter clarity, that your whole life past present and future, was somehow as you yourself put it part and parcel of that universal harmony which the Chinese call the Tao.

I feel sometimes that phrases like universal harmony are so hackneyed, so almost slushy and sentimental, that it's terribly difficult to begin to find the right word for this kind of thing without sounding like Voltaire's Mr. Pangloss, without sort of jumping on this. Best of all possible worlds business. Because the thing isn't like that at all. It's very very much stronger than the feeling that this is the best of all possible worlds. And the curious thing about it it isn't that it glosses over anything. But it makes the most awful things seem that way too, without at the same time making them cease to seem terrible. It's very peculiar.

Well, she had seen then, for certain, at the time of that experience seen with total clarity. That our whole past present and future life. Was in some way part and parcel of what we are perforce driven to call the universal harmony of the. But what one doesn't seem to understand them. Is that this still remains true of what one is today. You are in the stream when seeking for what you have lost and when feeling perfectly ordinary no less than when you were in ecstasy. You are not feeling the experience and your striving to regain it is as a matter of fact the very future which you saw to be in such perfect accord with the process. Let me remind you of a celebrated tale that was told by Sri Ramakrishna. Story of one of his disciples who had learned from the master that all the multiplicity of this world is the illusory outward form of the one eternal divine Brahman underlying the entire process. And having sat and listened to this exposition, the disciple got up and went his

way. And in passing down a rather narrow street, he saw an elephant coming towards him and Marketa riding on top of the elephant. Well the man who saw the disciple wandering down the center of the road and shouted at him “Hey you, get out of the way. This elephant isn’t very nice.” But the disciple thought now the master Ramakrishna has told me that I am Brahman and that everything is Brahman and therefore the elephant is Brahman and therefore it will be perfectly all right if I walk straight along, the elephant will do me no harm, since I realize this to be true. So he ignored the warning of the mahoot. And approached the elephant and the elephant swung his trunk and swatted that disciple hard and threw him into the ditch where he was scratched with the brambles. Well he was very upset, and he came crawling back to Sri Ramakrishna and said “Master, you have deceived me. I understood that everything is Brahman. That I am Brahman and all other creatures, is that not so Master?” and The Master said “yes it is so.” When he said “I was walking out in the road and I saw this elephant coming towards me and it didn’t seem to me to be necessary to get out of the way when the market riding the elephant wanted me to do so because I figured that I was Brahman the elephant was Brahman and I could come to no harm.” “You stupid man,” said Krishna. You didn’t realize that the voice of the mahoot was also Brahman and you should have heeded that too.

So also in this case, the one who is trying to regain the vision is the disciple. And the vision they’re trying to regain is the elephant. But the way you are actually feeling now. And which you are ignoring because if you’re going to feel some other way. That is the voice of the mahoot. And that too is Brahman. Nine times out of ten, an observation of this kind will mean nothing. And will fall as flat as being told that everything in this universe is the smell of burnt almonds. But the tenth time, it will dawn upon you as a statement of total and luminous clarity. I do not think we need have any fear that this tense time will never come. For in other circumstances, it has come again and again. Think back to school days. When with the utmost care your teacher explained over and over, the mysteries of percentage or sentence structure or Daylight Saving Time. And you consistently failed to see the point. And then suddenly something clicked in your mind. And the principle became clear. There is a Chinese poem as “Words do not make a man understand. It takes the man to understand the words.”

Spiritual Alchemy

Now today, we are living in an age which is quite peculiar, because in the world of science, there are no longer any secrets. Because the method of science requires that all scientists be in communication with each other. And therefore, that every scientist, as soon as he has discovered something or got a good idea, he rushes into print. And it's important for him to do so because some other scientists somewhere else in the world might be thinking about something on the same lines and would be stimulated in his work by this man's speculations even if not by discoveries.

And so the whole scientific world tries to remain in communication, and for this reason, it was an absolutely impossible to keep atomic energy a secret. In former ages, that might have been managed because there were many secrets once upon a time. And people were not admitted to these secrets, unless they were in some way tested and found capable of handling them without running amok. We live in such a dangerous age because all the secrets are out in the open and anybody can run amok with them. And that's just the situation we have to face and that is just the situation we have to handle. It is too late to stop it, because that would be as they say, locking the door after the horse has bolted.

The vice president of an extremely important corporation in the United States, very progressive and very vital, a few months ago said "There are two major forces operating in the world today, for good or for evil: one is Red China, the other is L.S.D." And there is a certain reason why such a thing as a certain chemical, which is capable of opening people's minds in a certain way, should be something extremely disturbing. Because this particular chemical, in common with a number of others that have been known for centuries, but have been rather played cool through those centuries, is capable of doing something which simply cannot be tolerated. That is to say, capable of letting probably prepared individuals, or sometimes improperly prepared individuals, in on a secret which is very closely guarded, and which is, as a matter of fact, the deepest and most fundamental of all our social taboos. I have just finished writing a book which I have had, with a sort of tongue in cheek attitude, had the temerity to

call The Book. And it is subtitled The Book, you see on the taboo against knowing who you are. Because that is really the thing that cannot be let out.

Ask yourself this, for what reason would a person be considered hopelessly insane. What sort of claims. Must a person simply not make. Well there is one. And that is if anybody claims that he is God. That simply isn't done. Certainly not in our culture although it's very frequent in India. But in our culture that is simply not allowed because we are most of us from a Christian background and it's not that from a Jewish background and there's a great deal in common because both Christians and Jews are deeply concerned about somebody called Jesus Christ. Both Christians and Jews are in a way followers of Jesus Christ in different ways. He is a problem to both. Because he was the man who came out and discovered he was God. And that simply is impermissible, the Jews handled it in one way. The Christians handled it quite as effectively and another way the Christians handle Jesus perfectly even more tactfully than the Jews. By putting him on a pedestal and say this was the only man who ever was God and nobody else was really so before and certainly nobody can be so afterwards. Stop right there. Put him on the altar, bow down to him, worship him, so that everything he had to say will be null and void.

And it works beautifully. But you see the trouble about deep secrets is they can't be repressed indefinitely. As a certain president of the United States wonder of months remarked. You can fool some of the people some of the time but you cannot fool all of the people all of the time. And we human beings have been systematically fooled by ourselves it isn't as if there was some deep dark conspiracy it was somebody else to blame for quite a number of centuries into the notion that we are strangers in the universe. That the world that lies beyond the border of our skins is not ourselves. And it's something quite alien mechanical contraption into which we arrived. And from which we will disappear. And we really have nothing very much to do with it it's something about which we can take an objective point of view, we can look at it, we can measure it we can calculate it but it all turns out in the end to be some sort of stupid-stupid mechanism in which we are involved because as bodies we are part of it.

But it is common sense for most individuals that they themselves aren't even their bodies. They are alienated spokes. Which have bodies like people have cars. And in which they go around. And confront the external world. As if it was something in which you were trapped. And children can say to their parents, I didn't ask to be born. Just because of your funny love affairs and all that I got mixed up in this world and you are responsible. And we don't even think that we had anything personally to do with the fact that our fathers once had an evil gleam in their eyes. But that evil gleam was you coming on. Only you see by this idea of our own identity that we have we're able to disclaim responsibility for all kinds of things. And say "No it was my parents. See it as a fellow taken in juvenile delinquency and he knows a little Freud. He can say "Well I had to couldn't help it because. I was psychoanalytically fouled up when I was a baby even before perhaps I was born my mother had all sorts of complexes." And then if it gets away with that people in the press say for juvenile delinquents, the kid should not be punished but the parents and the parents say "Hey, wait a minute we got fouled up by our parents and we-we're pretty bad parents we had met but our parents before us brought us up in a certain way that we are hopelessly neurotic and we can't really raise children but we have to. So everyone can pass the buck all the way down the line. The woman that thou gave is me she tempted me and I did eat. And then when God Where goes finger at the serpent. Serpent didn't say anything, because the serpent knew the answers. And he knew the thing which must not be admitted. That the left hand goes with the right hand.

That black goes with white and that you wouldn't know what white was unless you knew what Black was. And that you know it wouldn't know what is was unless you knew what isn't is. And you wouldn't know what here is, unless you knew what there is, and you wouldn't know what you meant by self unless you knew what was meant by the other. And that is so simple. But everybody contrives to ignore it.

Now here's the problem, you see that there are certain processes. Some of which are what you might call spiritual exercises. Others are simply chemicals others are just tossed sense. Whereby one comes to see very clearly indeed that black goes with white and self goes with other. And as this becomes clear to you, it's rather shaking. Because look, if what you

define as you are is inseparable from everything which you define as not you, just as front is inseparable from back, then you realize that deep down between self and other there is some sort of conspiracy. If these things always occur in combination. And look very different from each other and feel quite different. Nevertheless the feeling of difference between them, allows each one to exist. And so underneath the opposition all the polarity between self and other all between any other pair of opposites you can think of, there is something in common, as there is for example between figure in the background. You can't see a figure without a background. You can't have an organism without an environment. Equally, you can't have a background without a figure or an environment without organisms in it or without things in. You can't have a space, which is unoccupied by any solid you can or cannot have solids not occupying some space. This is absolutely elementary and yet we don't realize it. Because for example the average person thinks that space is nothing. But is a just a sort of not-there-ness, in which there are things.

And we are slightly afraid that not there notice that nothingness that darkness that the negative poles of all these oppositions will win. That they will eventually, swallow up every kind of being and every kind of thereness. But when you catch on to the game you realize that that won't happen. Because what is called not existing is quite incapable of being there without the contrast of something called existing. It's like the crest and the trough of a wave. You can have a wave that is all trough and no crest just as you can have a wave which is all crest a no trough. Such a thing is never been manifested in the physical universe. They go together. And that is the secret, there really is no other secret than that. But it is utterly repressed.

And therefore we are all educated to feel. That we've got to fight for the White. Because the black might win. We've got to survive. You must survive. That's the great thing, we're all working on and pounding it out day after day in anxiety. Because this is a description of anxiety and anxiety is the fear that one of the pair of opposites might cancel the other. For other. And if by any chance by any means you'll find out that that is not so. You have an entirely new attitude to what human beings are doing. Which may be very creative but which also maybe the dangers. You see through the game. The game call white must win. Because you know. That neither black

nor white are going to win. Because they belong to each other. So one of the problems of the various chemicals which can. Change the human mind in certain ways so that it becomes apparent that inside and outside go together is that they do rather give the show away and people who take these chemicals and see through the human game, cannot be trusted. They may decide to be a good sport. And go back into the game and play it as if it were for real or they may not. And if they don't. What's going to happen? Wowwee, that's pretty serious. Now you see what is let me speak specifically for a moment I said the subject of this is L.S.D.. L.S.D. is one such chemical, that does produce this curious effect of making you aware of the polarity of things. It does lots of other things. It does lots of rather an essential and trivial things and these of course and all the publicity in the various national magazines about L.S.D. get throughly emphasized. In other words when somebody says something's real psychedelic they mean bizarre. And when the national magazines try to illustrate the effect of these chemicals with various photographs they come on with blurred photographs of all sorts of things higgledy- piggedly, messed together naked girl seen through prison. And people don't like this. In Life magazine that all series of photographs of people like this you turn over a few pages in the air with a wire so the astronauts in front of the television when their husbands are out there in space they were again at this total so. You couldn't tell any difference if you didn't read the headlines.

Well that's absolutely nothing to do with it. If you want it some sort of appropriate illustration for a Life magazine article on the effects of L.S.D. you would have one very simple solution. You would publish the most gorgeous color reproductions of Persian miniatures. And of a Moorish Arabesques and of the illuminations of Celtic manuscripts that would give you the story. So far as changes in human sensation are concerned. But there would be one thing very difficult to put across in pictures because the people who looked at them, if they didn't get the point of view wouldn't see it. And that is what I will call the sensation, as well as the intellectual understanding of polarity. That is to say that the inside and, the outside the subjective, and the object of the self and the other. Go together. In other words, what there is a harmony, an unbreakable harmony I'm when I'm using the word harmony I don't necessarily mean something sweet. I mean absolute concordant relationship between what goes on inside your skin and

what goes on outside your skin. It isn't that what goes on outside is so powerful that it pushes around and controls what goes on inside. Equally so, it isn't that what goes on inside is so strong that it often succeeds in pushing around what goes on outside. It is very simply that the two processes the two behaviors are. What you do is what the universe does. And what the universe does is also what you do. Not you in the sense of your superficial ego. Which is a very small little tiny area of your conscious sensitivity, but you in the sense of your total psychophysical organism, conscious as well as unconscious. This is not something that arrived in the world from somewhere else altogether that confronts an alien reality. What you are, is the universe and that in fact the works, what there is and always has been and always will be for ever and ever performing an act called John Doe. And this is such a subversion of common sense. But is a fact matter of fact something if you stop to think about it that is completely obvious. Only everything conspires to prevent you from seeing that obvious thing. Because when you were babies practically. All your parents and your teachers and your aunts and uncles and your older brothers and sisters got together and they told you who you were. They defined you as Johnny. Was just Johnny a no no no and don't you come on too strong Johnny because. You know you've got elders and betters around. But you're responsible! You're a free agent! You'd better be. And so when you are told from childhood. That you are expected and commanded to behave in a way that will be acceptable only if you do it voluntarily. You remain permanently mixed up. That, if anything, is permanent brain damage.

But that's the idea you see because that's the game we're playing you started it I did. Hahaha that's the game we play and we can make all kinds of complexities out of that and really in a way have enormous fun. But once anybody sees through that. Well what we're frightened. Once you get the sense of polarity of your inside being the same process as your outside and your ego being one and the same process as the whole universe going on, then we are afraid that people may say. Well good equals bad. And we can do anything we like and we didn't in any way be further subject to the ordinary rules of human conduct. And we can wear what clothes we like or no clothes at all. We can have what sexual life we like we can do anything and we are going to generally because the world is being rather presaged

the waters challenge the whole thing and run amok and a lot of people are doing just exactly that.

So I want to introduce into this whole problem some ancient wisdom. I have really two things to talk about. How cultures which always did know in some way, or among whom a large number of people always did know the secret. Handled it and then I want to make some observations about how we are trying to handle it and how it's not going to work. Among the Hindus and among the Buddhists. This view of the real identity of a human being has always been known. At least by a very influential minority. The central doctrine of the Hindu way of life, I call it that rather than a religion is, in Sanskrit *tat tvam asi*, you're it. To put it in a kind of colloquial way you're it. And it is the which then which there is no which or which they call the Brown or the up man with a capital A meaning the self. You are only just kidding that you're just poor little me, see the function of a guru that is to say a spiritual teacher in India, is to look give you a funny look in the eye. Because you come to him and say, "Mr guru I have problems. I suffer and it's a mess and I can't control my mind and I'm miserable and depressed," and so on and it gives you a funny look. And you feel a bit nervous about the way he looks at you because you think you know he's reading your thoughts and this man is a great magician, he can read everything that's in you he knows right down into your unconscious and you know all the dreadful things you've thought and all the awful desires you have and you are rather embarrassed that this man looks right through you and sees them all. That's not what he's looking at. Hes giving you a funny look for quite another reason altogether. Because he sees in you the drama the Godhead, just claiming it's poor little me and he's going to eventually buy all sorts of subtle techniques that are called in Sanskrit. That in politics means chicanery and in spiritual education means skillful pedagogy. He is going to try and kid you back into realising who you really are. That's why it gives you a funny look. And why he seems to see right through you. As if to say Shiva ol' boy Don't kid me I know who you are but you're coming on beautifully in this act. That they're just somebody else altogether. And I congratulate you you're doing a wonderful job. Playing this part which you call the person my person you know a person is a fake it the book the word means a mask so if you read books on how to be a real person or reading books on how to be a genuine fake. The word

persona as you know means a mask worn in Greek or Roman drama. So if you I said come on to the Guru and say well if you ask you who you are Sri Ramana Maharaji, when anybody came to him and they said to him it's people do who was I and my last incarnation or will I be reincarnated again he always replied who's asking the question. And everybody was irritated because he wouldn't give them answers about what they were in their former lives to decide who are you. And he looked at you if you looked at photographs of this man I keep a photograph of him close by because of the humor in his eyes they're looking at you with the dancing twinkle saying come up. Now that. In these Asiatic traditions it is well recognized. That people who get the knowledge that you're it. May very well run amok. And therefore they always couple any method of gaining this, whether it is yoga whether it is smoking something or drinking something or whatever is the method they always couple it with a discipline.

Now I know the word discipline isn't very popular these days. And I would like to have a new word for it, because most people who teach disciplines don't teach them very well. They teach it with a kind of violence. As if a discipline was something that is it going to be extremely unpleasant and you're going to have to put up with. But that's not the real secret of discipline. I would prefer to use the word skill. And discipline is a way of expression. Say, when you want to express your feelings in stone. Now stone doesn't give way very easily/ It's tough stuff, and so you have to learn the skill of the discipline of the sculptor in order to express yourself in stone and so in every other way whatever you do you require a skill and it's in no. Honestly important especially for American people to understand that there is absolutely no possibility of having any pleasure in life at all without skill. Money doesn't buy pleasure. Ever. Look, if you want to get stoned drunk, and go out and get a bottle of bourbon and down it you can't do that except for people who have practiced the distillers art. You can't even make love without art. Where I live in Sausalito, we have a harbor full of ever so many pleasure craft, motor cruises sailing boats all kinds of things and they never leave the dock. All that happens with them is their owners have cocktail parties there on Saturdays and Sundays, because they discovered having bought these things that the discipline of sailing is difficult to learn and takes a lot of time. And they didn't have time for it so they just bought the

thing as a status symbol. So in other words you can't have pleasure in life without skill. But it isn't a unpleasant task to learn a skill.

If the teacher in the first place gets you fascinated with it. There is immense pleasure in learning how to do anything skillfully. To make carpentry things, to cook, to write, to calculate anything you want it can be eventually pleasurable to learn and at the discipline. And it is completely indispensable. Because look, you may be a very inspired musician. I am not a musical technologist, you see, and I regret it but I'm a word word technologist. But I can hear in my. Head all kinds of symphonies and all kinds of marvelous compositions but I don't have the technique to write them down on paper and share them with somebody else. Too bad, maybe next time around. But you see, so far as words are concerned, I can express ideas because I have studied language. And I work very hard not that I didn't like it I intensely enjoy the work of writing a book although it is difficult. But it's fascinating, to say what could never possibly be said.

So, we do see what's happening what you have to do you have inspiration but then you have to have technique to incarnate to express your inspiration. That is to say to bring heaven down to earth. And to express heaven in terms of earth. Of course there are really one behind the scenes. But there's no way of pointing it out unless you do something skillful You see we are all at that moment absolutely, in the midst of the it is a vision. We are all one with the define or something I don't like that sort of wishy washy language. But, we are all of that but we're so much of there are that we like fish in water they don't know they're in water like the birds don't know they're in the air because it's all around them and in same way we don't know what the color of our eyes is I don't mean where you got blue or brown eyes but the color of the lens of your eyes you call that transparent no color see because you can't see it but it's basic to being able to see anything.

So in order to find out where you are there has to be some way of drawing attention to it. And that involves skill. Upaya in Sanskrit skillful means. So, it's all very well anybody can have ecstasy. Anybody As a matter of fact can become aware that he is one with the eternal ground of the universe. But since that what's what you are anyway I'm going to ask so what.

When a hero goes on an adventure and he leaves his people and is going to a strange land he can go away and just hide himself around the corner in an obscure house, and then appear a year later and say I've been on a heroic journey and tell all sorts of tales and they said prove it. Because they expect him to bring back something something which nobody has seen before then they believe you've been on a journey. So in the same way exactly anybody who goes on a spiritual journey must bring something back. Because if you just say oh man it was a gas. Anyone can say that. Now this is why in the doctrines of Buddhism, there is a differentiation between two kinds of enlightened beings. They are both forms of Buddha which is to say the word Buddha means somebody who has awakened who has discovered the secret behind all this that in other words all this thing we call life with its frantic concerns is a big act. Which you in your unconscious depths are deliberately setting up.

So you can do one of two things when you discover that you can become what's called a practical border that means a pratyekabuddha, who doesn't tell anything. Or you can become a bodhisattva. Pratyekabuddha goes off into his ecstasy. And never seen again. But is sad but is come one who comes back and appears in the everyday world and plays the game of the everyday world by the rules of the everyday world but he brings with him Upaya, he brings with him some way of showing that he's been on the journey but he's come back and he's going to let you in on the secret too. If you if you'll play it cool. And also come back. To join in the everyday lives of everyday people. Because this is the rule. If the world is dramatic if the world as the Hindu say is a big act put on by the divine self, one of the rules of coming on stage is that you don't come on as yourself. You come on as the part that you're going to play. It's very bad form if an actor always acts the same way. That's what's called a star as distinct from an actor. A real actor can become anything. And so, but in private life, well he's just Mr Jones, and, but he doesn't come on the stage that way so in the same way if you know that behind the scenes in the depths, fundamentally you are it you don't come on that way it always comes on to something else. That's the rule of the stage. Because without that there wouldn't be a play and it would only be reality. No illusion. And the whole point of life is illusion. From the word Latin, Luder, to play. Show biz. The show must go on so don't give it away.

But a truth has a way of leaking. Gets out. But then the important thing is you see when the truth gets out. Those who will catch hold of it. Must find a way of staying in contact with what society calls reality. That is to say, if you have a radio you don't only need an antenna you also need a ground. So what happens in the world of mysticism of a psychedelic visions and so on needs to be grounded. So there are always two directions in which such a discipline works. One, preparatory. In other words those who taught disciplines for awakening in the Orient were always careful to screen, first of all to screen those who applied, and then after screening them to make them sensible. So that they knew how to handle the game of ordinary human existence and played by the ordinary human rules. In other words, that they had strength of character. And were not the sort of people who would be wiped out because they had no strength of character by an overwhelming experience. Then they let them in. But there are certain disciplines such as Zen where you'll get into the essential secret very early on in the discipline. And after that they are concerned with much more training in showing you how to use it, how to use the power to use the vision which you have acquired. And so it is with the current, what we would call L.S.D. scene, that is raging through the United States. It unfortunately lacks discipline. And I'm not trying to say this in a kind of severe, authoritarian, paternalistic way, but only that it would be so much more fun if it had it. In other words, when people try to express what they have seen in this kind of change state of consciousness. They show five movies going on at once. Projected upon torn bed sheets, with stroboscopic lights going as fast as possible at the same time and eleven jazz bands playing. And they're going to blow their minds baby.

When ever everybody else who hasn't seen this thing look around and say well it's a mess I don't like the looks of it. Let's suppose that while you were very very high on L.S.D. you looked into a filthy ashtray and you saw the beatific vision. Which is of course the case because wherever you look if you I your eyes are open you will see the face of the divine. Then you come out of your ecstasy it with a dirty ashtray and say to everybody here it is. No. There is a possibility if you are an extraordinary list skillful painter or even photographer. After presenting the dirty ashtray so that everybody else will see almost what you saw in it. But you will have to have a technique which will translate every grain of ash into a jewel. Because

that's what you actually saw. But that requires mastery of an art. And I'm afraid people think that all it's necessary to do is just throw out any old thing because under that transform state of consciousness any old thing is that is the works. But nobody else can see it if they haven't shared that point of view.

So then, this becomes for us in the United States an extremely important social problem. The cat is out of the bag. We are living in a scientific world where secrets cannot be kept. And anyone, anytime, can pick up something which will be short circuit all the ancient religious techniques yoga practice meditation and etc, etc this all very embarrassing but it will happen not for everybody but for a lot of people and they will see what all those sages and buddhas and yogis and prophets saw in ancient times, and it will be very clear.

So what. So you see, you can say, look at all these people. Who haven't seen it. This is a temptation. Look at them all going about their business earning money. And grinding it out at the bank or the insurance office or whatever it is every day and how serious they look all about it and they don't really know it again. And you can narrow you can cultivate a certain contempt for people like that. But it's a very very bad to do that. Because of course don't forget they have a certain contempt for you. You see always the nice people in town, who live in the best residences. They know that they're nice because there are some people on the other side of the tracks who are not nice. And so at their cocktail parties they have a lot to say about the people who are not nice, because that boosts their collective ego. Would be no other way of doing it, you don't know that you're a law abiding citizen, unless there are some people who aren't. And if it's important to you to congratulate yourself on being law abiding. You therefore have to have some criminal classes outside the pale of course of your immediate associates. On the other hand, the people who are not nice, they have their pariest. And they don't lose their collective ego by saying that they're the people who are really in. Whereas these poor squares who deliver the mail faithfully and who will carry article responsible jobs, they're just dupes. Or when they earn their money all they do is it by Toy rocket ships with it and go roaring around and so on and that's they think that's pleasure. So the people who are not nice boost their collective ego in

that way. Neither of them realize that they need the other just as much as a flower needs a bee and bee needs a flour.

So you when you see the people who you think are not in on the secret. You if you really understand you have to revise your opinion completely her and say that the squares are the people who are really far out, because they don't even know where they started. See an enlightened Hindu or Buddhist looks at the ignorant people of this world and says, my respects. Because here I see the divine essence having altogether forgotten what it is. And playing the most far out game of being completely lost. Congratulations, how far out can you get? So if you understand that you don't start a war with people you might say are square. Don't challenge them, don't bug them, don't frighten them. The reason is not because they are immature or because they are babies and you mustn't scare babies, it's nothing to do with that you mustn't frighten them because they are doing a very far out act they're walking on a tightrope miles up. And they've got to do that balancing act and if you shout they may lose their nerve. So that's what we call the responsible people of the world are doing it is an act it's a game just like a tightrope walker, but it's a risky one, and you can get ulcers from it, and all sorts of troubles but you must respect it. And say congratulations on being so far out.

Ways of Liberation

On Buddhism

I want to start by reemphasizing the point that what are called the religions of the east the ones we're discussing Hinduism Buddhism and Chinese Taoism are not what we in the West understand as religions. They don't involve that you believe in anything specific. And they don't involve any idea of obedience and to commandments from above. And they don't involve any conformity to a specific ritual. Although they do have rituals, but their rituals vary from country to country and from time to time. Their objective is always not ideas, not doctrines, but a method a method for the transformation of consciousness.

That is to say, for a transformation of your sensation of who you are, and I emphasize the word sensation because it's the strongest word we have for feeling directly. When you put your hand on the corner of a table, you have a very definite feeling, and when you are aware of existing, you also have a definite feeling. But in the view of these methods or disciplines, the ordinary person's definite feeling of the way he exists and who he is is a hallucination. To feel yourself as a separate ego, a source of action and awareness that is entirely separate and independent from the rest of the world somehow locked up inside a bag of skin, is seen as a hallucination. That you are not a stranger in the earth that comes into this world either as a result of a natural fluke, or being a sort of spirit that comes from somewhere else altogether, but that you in your fundamental existence, you are the total energy that constitutes this universe, playing that it's you. Playing that it's this particular organism. And even playing that it's this particular person. Because the fundamental game of the world is a game of hide and seek. That is to say that the colossal reality, the energy that is everything, that is a unitary energy, that is one, plays at being many. At manifesting itself in all these particulars that we call you and you and you and you and you and you and you and you and this and that and all around us. And it's fundamentally a game.

And you can say that this goes really for all the systems that I'm talking about. It's the basis of Hinduism, of Buddhism, and of Taoism, this intuition. Now today we're going to talk about Buddhism. Buddhism is an offshoot of Hinduism. You could in a way call it a reform of Hinduism or Hinduism stripped for export. It originates in northern India, close to the area that is now in a Nepal, shortly after six hundred B.C. There was a young prince by the name of Guatama Siddharta, who became the man we call the Buddha. Now the word Buddha is not a proper name, it's a title. And it's based on the Sanskrit root Budh. B-U D-H.. Which means to be awake. And so you could say the Buddha is the man who woke up. From the dream. Of life as we ordinarily take it to be. And found out. Who he was, who he is. It's curious. That this title was not something new. There was already in the whole complex of Hinduism the idea of Buddhas. OF awakened people, and curiously they are ranked higher than gods, because in the view of Hinduism even the gods, or the angels, the Devas, are still bound on the wheel of the sort of squirrel cage of going round and round and round in the pursuit of success. And the idea is that if you pursue. Something that you can call success, pleasure. Good. Virtue which originally of course means strength magical power. All these positive things. You are under illusion, because the positive cannot exist without the negative. To be, you only know what to be is, by contrast with not to be, so if we say now there is a coin in the left hand, there is no coin in the right. And from this you get the idea of to be and not to be. And you can't have the one without the other So if you tried to pursue to gain the positive and to deny get rid of the negative it's as if you were trying to arrange everything in this room so that it was all up and nothing was down. You can't do it, you said just self an absolutely insoluble problem. Because the basis of life is spectrum. I'll consider the spectrum of colors. When you think of a spectrum in what form do you think of it most people think of it as a ribbon with red at one end and purple at the other. But the spectrum is actually a circle. Because purple is the mixture of red and blue. It goes right round, and so in this way all sensation, all feeling, all experience whatsoever, is moving through spectra. You don't only have the spectrum of color, you have a spectrum of sound. You have various complex spectra, of texture, of smell, of taste. And you're constantly operating through all the possible variations of experience. And it implies that you can't know one end of the spectrum without also knowing the other. So if you wanted to say

your favorite color is red. And you wanted only red. And you had to exclude therefore blue and purple. Without blue and purple you can have red. Behind of course, all the various colors in the spectrum, is the white light. And behind everything that we experience, all our various sensations of sound, of color, the shape of touch, there's the white light. And I'm using the phrase the white light rather symbolically. I don't mean it literally.

But there is common to all sensations, what you might call the basic sense. And if you explore back into your sensations, and reduce them all to the basic sense, you are on your way to reality. To what underlies everything to what is the ground of being, the basic energy. And to the extent that you realize this and know that you are it, you transcend, you overcome, you surpass. The illusion. That you are simply. John Doe. Mary Smith. Or what have you. So then, the Buddha, as the man who woke up, is regarded as one Buddha, among a potentiality of myriads of Buddhas. Everybody can be a Buddha, everybody has in himself the capacity to wake up from the illusion. Of being simply this separate individual. The Buddha made his doctrine very easy to understand. Because in those days there wasn't very much writing being done, and people committed things to memory, and so he put his doctrine, or method, in various formulas which were very easy to remember, and I'm going to explain it in those terms so that you can remember it just as well. He of course practiced the various disciplines that were offered in the Hinduism of his time. But he found in a certain way that they had become unsatisfactory. Because they had over emphasized asceticism. Had over emphasized putting up with as much pain as you can. There was a feeling you see that if the problem of life is pain. Let us suffer. And this is the root of the ascetics you see who lie on beds of nails who hold a hand up forever and ever and ever, who eat only one banana a day, who renounce sex, who do all these weird things because they feel that if they head right into pain, and don't become afraid of it but suffer as much pain as possible they will by this method overcome the problem of pain. And they will set themselves free from anxiety. There's a certain sense in that as you can obviously see.

Supposing for example you have absolutely no fear of pain, you have no anxieties, you have no hang ups. How strong you would be. Nobody could stop you. You would have ultimate courage.

But the Buddha was very subtle. He is really the first historical psychologist. The great psychologist, psychotherapist. He is very subtle, because he saw that a person who is fighting pain, who is trying to get rid of pain is still really fundamentally afraid of it. And therefore the way of asceticism is not right. Equally, the way of hedonism, of seeking pleasure, is not right. So the Buddhist doctrine is called the middle way. Which is neither ascetic nor hedonistic.

So it summed up in what are called the Four Noble Truths. And the first is called Dukha. Dukha means suffering in a very generalized sense. You could call it chronic frustration. And it is saying that life as lived by most people is Dukha. Is an attempt in other words to solve insoluble problems. Try to draw a square circle you can't because the problem itself is meaningless. Try to arrange the things in this room so that they're all up and none of them dumb it is meaningless such a problem cannot ever be solved. So try to have light without dark or dark without light. It can never be solved. So the attempt to solve problems that are basically insoluble and to work at it through your whole life that is Dukkha. Now he went on to analyze this that there are what we call three signs of being. The first is Dukha itself, frustration. The second is Anitya. And this means the the letter A in Sanskrit at the beginning of a word is often the equivalent of our non. So nitya means permanent, anitya means impermanent, that every manifestation of life is impermanent. And therefore our quest to make things permanent, to straighten everything out, to get it fixed is an impossible and insoluble problem, and therefore we experience Dukha, or this sense of fundamental pain and frustration as a result. Ald of trying to make things permanent. And the third sign of being is called an Anatman. Now you know our from my talk on Hinduism that the word Atman means self. Are not man means therefore non-self. That there is in you no real ego.

Now I've explained that already I've explained in talking about Hinduism that the idea of the ego is a social institution. It has no physical reality. It is simply, the ego is your symbol of yourself. Just as the word water is a noise which symbolizes a certain liquid reality so the idea of the ego, the role you play, who you are, is not the same as your living organism. Your ego has absolutely nothing to do, with the way you color your eyes. Shape your body, circulate your blood. That's the real you, but it's certainly not your

ego. Because you don't even know how it's done. From the standpoint of your conscious attention. So the idea of Anatman is firstly that the ego isn't real there isn't one.

Now then, this then as the first truth there is the situation that we have to of frustration because we are fighting the changing-ness of things, and because we don't realize that the ego, the I, is unreal. The second of the four noble truths then called Thrishna. Thrishna is a Sanskrit word again and is the root of our word first. And it's usually translated desire. But it is better translated clinging, grabbing. Or, there's an excellent modern American Slangy word, a hang up. That is exactly what is the hang up. Thrisha now is clutching. As for example what we call smother love. When a mother is so afraid that her children may get into trouble that she protects them excessively. And as a result of this, prevents them from growing. Or when they when lovers cling to each other excessively and have to sign documents that they will curse and swear to love each other always they are in a state of fish not. And this is the same thing as holding on to yourself so tightly that you strangle yourself. Now the second truth then about Krishna is that the cause of Dukha is Trishna. Clinging is what makes suffering. If you don't recognise that this whole world is a phantasmagoria. And amazing illusion. A weaving of smoke. And you try to hold on to it, you see, then you start suffering, seriously suffering. Krishna is in turn based upon. The same negative. Avidya. From the root vid means knowledge, as in the Latin video and the English vision. Avidya, therefore is ignorance. Gnosis means of course, to know, it is the same thing as good Gnosis in Greek. To know so this is not to know to ignore. To overlook. And I explained in the first talk in the series how we ignore all kinds of things because we notice only what we think noteworthy. And therefore our vision of everything is highly selective. We pick out certain things, and say that's what's there, just as we select and notice the figure rather than the background. Sometimes I draw this on the blackboard. Now ask the question, what have I drawn? What would you say, What have I drawn? The circle and the other suggestions all oh. Yeah you're getting the point. I'm drawing a wall with a hole in it you see, but ordinarily—you've been reading my books—but ordinarily people see the ball the circle the ring or whatever and never think of the background. Because they ignore the background. Just as one thinks that you can have pleasure without pain. You

want pleasure, the figure, and don't realize that pain is the background. So Avidya is this state of restricted consciousness, restricted attention, that moves through life unaware of the fact that, to be, implies not to be. And vice versa. So now the third noble truth is called Nirvana. This word means blow out. Nir is a negative word again like 'a', vanna is blowing. So it's a kind of out blowing.

Now, in breathing, you know that breath is life. The Greek word, you may pronounce it pneuma or pneuma, is the same as a spirit. And spirit means breath. In the book of Genesis, when God had made the clay figurine that was later to be Adam, he breathed the breath of life into its nostrils. And it became alive, because life is breath. But now, if you hold your breath, you lose it. He that would save his life will lose it. So Breathe in, Breathe in, Breathe In get as much air as you can and Trishna clean. And you lose it. So Nirvana means breathe out. What a relief that was. The sigh, really let it go. Because it will come back to you if you let it go. But if you don't let it go. You will just suffocate.

So a person in the state of nirvana is what we might call a blown out person. Like blow your mind. Let go, don't cling, and then you're in the state of nirvana. And I reemphasize the point. This is not, I'm not preaching, see, not saying this is what you ought to do. So me pointing out a state of affairs that is so. There's no moralism in this whatsoever is simply pointing out like [that] if you put your hand into the fire you'll get burned. You can get burned if you want to. That's OK. But if you so happens that you don't want to get burned. And you don't put your hand in the fire so in the same way if you don't want to be in a state of anxiety all the time, and again I emphasize, if you like to be anxious it's perfectly all right. If that's what isn't never how is anyone and they say you've got all eternity through which to live in various forms. And therefore you don't have just one life in which you've got to avoid eternal damnation. You can go running around the wheel in the rat race and play that game just as long as you want to, so long as you think it's fun. But if there comes a time when you don't think it's fun. You don't have to do it. So I wouldn't say to anyone who disagrees with me and who says Well I think we ought to engage the forces of evil in battle and put this world to right and so on and so forth, and arrange everything in this world so that it's all up. Try it, please, it's perfectly OK,

go on doing that. But if you see that it's futile, then you can let go. Don't try to cling, relax.

And if you do that, you're in the state of nirvana. And you become a Buddha. And of course it means that you become a rather astonishing person. You may of course be subtle about it, and make like you're a very ordinary person. So that you don't get people mixed up. Because if you are a very astonishing person, everybody wants to be like you. And they use you as an object of Thrishna, of clinging. They rely on you, you get a transference on everybody comes running around says please help me I'd like to be like you are. And then you have to get rid of them. See that's the difference between a doctor and a clergyman I shouldn't say things like this but doctors try to get rid of their patients. Clergymen try and try to get them hooked on the medicines so that they will become addicts to the church, and that's too bad because there is a saying in ancient Christianity. Crux est mundi, which means the cross, the medicine of the world. But you don't make medicine a diet. And so, in Buddhism, the Buddha explained that his doctrine, his method, was a raft. It's sometimes called a Yana, Y-A-N-A, means a vehicle a conveyance. And when you cross a river on a raft. And you get to the other shore you don't pick up the raft and carried on your back you leave it behind. But people who are what I would call hawked on religion, are always on the raft. They are going back and forth back and forth back and forth on the raft so that Clergymen tends to turn into a fairy man. Who is always on the raft and never gets over to the other shore himself. Now there's something to be said for that because how are we going to get the raft back to the first shore to bring over the other people see somebody has to volunteer to take the back journey. But he must be awfully careful, to realise that the real objective is to get the people across and set them free. If you dedicate yourself to ferrying people across, don't ask them to come back on the raft with you, because you get overcrowded, and people will think that the raft is the goal rather than the other shore.

So when are I find this in in actual practice that when clergyman do not ever ask for money. And it's all right you know like a doctor who simply charges a fee says, 'You come to me, you pay me so much.' But the clergyman says he doesn't say pay me so much he says 'We would like your pledge of voluntary contribution.' And then nobody knows what to

give. And but he has to go calling around all sorts of places. He becomes a fundraiser for this big project, the church. And it's a bad scene because if any church were really successful in liberating people, there would be no problems of economics at all. Because people would keep coming soon as you got rid of people like a doctor a doctor who gets rid of people becomes famous. Because they're cured. And so if they know a certain church scene, people are cured and they all therefore leave the church more come in there's a potential tide of more people so you get a huge overturn turnover. And that's the way to work it. That's the idea of the raft.

Now then the fourth noble truth. It's called Magga. This word means path. And the way of Buddhism is often called the Noble Eightfold Path. Because there are eight phases, I won't say steps, because they're not sequential. They're all simultaneous. Once upon a time, there's a very very great Japanese scholar, D.T. Suzuki., who was giving a lecture at the University of Hawaii on Buddhism, and was explaining, he'd come to the fourth noble truth. And he said, 'Today we come to for that noble truth. Called a noble eightfold path. First step of a noble eightfold path called Shoken, Can he was using Japanese name shoken can mean the right view. Or of Buddhism, is right view. Right you mean no particular of you. Know fixed view. Or Buddhism Shoeken, right view, second step of Noble Eightfold Path, oh I forget the second step, you look it up in the book.' This man was one of the most terrific scholars in Chinese, Sanskrit, Tibetan, Japanese and so on. So I'm not going to bother you with the individual steps of the eight fold path it. All of them are subsumed under three headings of which you can say the right view. Which in Sanskrit is Samyak. And Samyak is a very curious phrase, it doesn't mean right in our sense of correct some is the same really as our word some. Total, complete. All inclusive. We might say we might use the word integrated, as when we say a person has integrity. That a person who has integrity, we mean is all of a piece, is not divided against himself. So in this sense of Samyak, there is, his is related to the word. Darshan which means a point of view of viewing when you go to visit a great guru or teacher you have Darshan, you look at him. And you offer your reverence to them. [There are] many senses of it, but it means simply to view look at the view. So the summing up Gulshan is the complete view. For example let's take the constellation called the Big Dipper. We look at it from a fairly restricted zone in space. And it always seems whatever the

season of the year because we're so far away from it that the stars in the Big Dipper in the same position. But imagine looking at it from somewhere else in space or together, and those stars would not look like a Dipper. They would be in another position. Now then what is the true position of those stars. Don't you see there isn't one. Because wherever you look, the position alters. You could say that the true situation of those stars is how they are looked at from all points of view, all possible points of view. Inside the constellation looking outwards, outside the constellation looking inwards, from everywhere and everywhere. But you see there is no such thing as the truth. The World, in other words, is not existing independently of those who witness it. Because the world is precisely the relationship between the world and its witnesses. Just as the sound of a drum is the relationship between a striking hand and the skin. If there's no skin on the drum, it doesn't make any sound.

And so if there are no eyes in this world, the sun doesn't make any light. Nor do the stars. So what is, is a relationship. You can, for example, prop up two sticks by leaning them against each other and they will stand. But only by depending on each other. Take one away and the other falls. So in Buddhism, it is taught that everything in this universe depends on everything else. That we have a kind of a huge network and this is called the doctrine of mutual interdependence. All of it hangs on you and you hang on all of it, just as the two sticks support each other. And this is conveyed in a symbol, which is called Indra's net.

Imagine a multidimensional spider's web, in the early morning covered with dew drops. And every drop contains the reflection of all the other dew drops, and in each reflected dew drop, the reflections of all the other dew drops, in that reflection and so ad infinitum. That is the Buddhist conception of the of the universe in an image. The Japanese call that jijimuge, means a thing-event. A happening. So between happening and happening, mu, there is no ge, separation. Jijimuge.

Now, or so, the first phase of the Eightfold Path has to do with one's view, understanding, of the world. The second phase has to do with action. How you act. And here we get the Buddhist view of behavior. A Buddhist doesn't base his ethics on the idea of commandments, of orders from a

higher echelon of authority. Buddhist idea of ethics is based on expediency. If you are engaged in the way of liberation. And you want to clarify your consciousness, doing that is inconsistent with certain kinds of action. So every Buddhist makes five vows. Five precepts. And you may perhaps have heard the Buddhist formula of taking what is called conscious which five precepts. And they take what are called the sadhana the three refuges and the five precepts the refuges are the Buddha, the Dharma, the doctrine, and the Sanga, the fellowship of all those who are on the way. So the priest of the bikkhu, the Buddhist monk, and the laypeople will chant the formula. [sings] Those are the three refuges the border the Dharma and the Sanga, then they take the five precepts. [sings]

So they take these five precepts, I depart, I undertake the precept to abstain from taking life.. I undertake the precept. To abstain from taking what is not given. I undertake the precept to abstain from exploiting of the passion. I undertake the precept to abstain from falsifying speech. I undertake the precept to abstain from being intoxicated by Surya, Mariya and Majipayana, mother tongue or whatever they were. I presume tardy which is alcohol. I don't know I don't know what else it was nobody does know. Because if you see if you start killing people. Or taking life you're in trouble you set up an opposition and you've got to become involved in taking care of it. If you start stealing you worry people you upset people's orientation in life because if you suddenly come into the back home for dinner and find somebody stolen your table where you going to serve dinner. If you explode your passions. It means that when you are when you feel bored. And somehow that life is a little bit empty you say well our what are we going to do this evening that's go and get stuffed. A lot of people who suffer from obesity are trying to simply fill their empty psyche by stuffing themselves with food. Well it's the wrong cure. So, likewise most of Arda if you start telling lies to everybody you know what happens when you start telling lies you have to tell extra lies to cover up the first one and you get into the most hopeless misunderstanding. Speech collapses, and of course the intoxication is the same problem as the exploitation of the passions.

So there's a purely kind of practical, expedient, utilitarian approach to morals. There's another side to this which doesn't enters into the into the

precepts which I will explain later. So that's the third phase of the Eightfold Path then, no, the second phase. Then the third phase has to do with your mind, with your state of consciousness. And this has to do with what we would ordinarily call meditation. There are the two final, the seventh and eighth, aspects of the path. Are called Samyak Smriti, and Samyak are some of the reedy means recollection. That's the best English word for it now do you understand the word recollect. Is to gather together what has been scattered. What is the opposite of remember? Obviously dismember. What has been chopped up, and scattered becomes re-membered. So in the Christian scheme, do this in remembrance of me. You see the Christ has been sacrificed. Chopped up. But the mass is celebrated in remembrance. One of the old litigious says 'The wheat which has been scattered all over the hills and grows up is gathered again into the bread.' Remembered. Go back to your Hindu basis. The world is regarded as the Dismemberment of the self, the Brahman, the Godhead. The one is dismembered into the many. So remembrance is realizing again that each single member of the many is really the one, so that's re-collection.

Introduction to Hinduism

Now today I am going to go into the very fundamental guts of Hinduism. But what I want to do is to begin with certain documents that are known as the Upanishads, and these documents constitute what is called Vedanta. V-E-D-A-N-T-A. and that is compounded of two words, Veda, Anta. Anta means end or completion or summation. Veda, of course is related to the Latin video, to see. Veda is the fundamental revelation of the Hindu way of life, contained in its earliest scriptural documents, which are generally dated in the period between fifteen and twelve hundred B.C.. The Upanishads, as being the summation of the Veda, found from over a long period of time, beginning perhaps as early as eight hundred B.C. Some of the Upanishads are much much later than that.

The basic position of the Upanishads is that the Self is the one and only reality without a second, that all this universe is finally Brahman, and appears to be a multiplicity of different things and different events, only by reason of Maya, which is illusion. Magic. Art. Creative power. So then, it is basic to the Vedanta that Brahma, this intangible Nama objective ground of

everything that exists, is identical with the ground of you. And this is put in the formula tat tvam asi, t-a-t, tat, same as our word that. Tvam, T-v-a-m. Same as the Latin tulips, thou. Asi, art. We should translate that into a modern American idiom as 'You're it'.

This of course is a doctrine which is very difficult for those brought up in the Judeo Christian traditions to accept, because it is fundamental to Christian and Jewish theology that whatever you are you are surely not the Lord God. And Christians feel about the Hindu doctrine that we are all fundamentally Masks of God, that it's pantheism. And that's a dirty word in Christian theological circles, because of the feeling that if everything is God, then all moral standards are blown to hell. Because it means everything is as good as everything else everything that happens is really God in this must include the good things and the bad things. And that seems to them a very dangerous idea. Actually all religious doctrines contain very very dangerous ideas.

However we won't worry about that for the moment, because what the Hindu means by God when He says Brahman is not at all the same thing as a Jew means by The Lord Adonai. Because of the Jew and the Christian means the boss. To whom divine honors a view as above all others. The Hindu, on the other hand, does not mean the boss. He doesn't mean, the king, the lord, the political ruler of the universe. He means the inmost energy, which as it were, dances it's the whole universe. Without as it were the idea of author of governing some intractable element that resists his or its power.

So, if a Christian or a person in a Christian culture announces that he has discovered that he is God, we put him in the loony bin. Because it's unfashionable to burn people for heresy anymore. But in India if you announce that you're the Lord God, they say 'Well of course. How nice that you found out.' Because everybody it. So then, why the great problem arises does it appear that we're not? Why do we think why do we have the sensory impression that this whole universe consists of a vast multiplicity of different things, and we don't see it all as one. Well, what would you think it would be like to see it all as one. I know a lot of people who study oriental philosophy hear about attaining these great states of consciousness.

Nirvana, Moksha which they can do is use liberation Satori, Zen Buddhist word for enlightenment or awakening I what would it be like to have that what how would you feel if you saw everything is really one basic reality.

Well, a lot of people think that it would be as if all the outlines and differentiations in the field of vision suddenly became vague, melted, and we saw only a kind of luminous sea of light. But rather advisedly, the Vedanta philosophy does not really seriously use the word one of the Supreme Self. Because the word and the idea one has an opposite many, on one side and another opposite none, on the other. And it is fundamental to Vedanta, that the Supremes Self is neither one nor many. But as they say non-dual, and they express that in this word. Advaita is a negative word, like non divine is from the same as the man. So Advaita is non-dual. And this a fast far western US is a difficult conception. Because you naturally as a Western magician would say the non dual is the opposite of the dual, therefore it has an opposite. True, but the Hindu is using this term in a special sense it's like this. On a flat surface I have only two dimensions in which to operate so that everything drawn to the man. To the man. How therefore, on a two dimensional level can I draw anything but two dimensions how it logic in human rationality can I possibly think except in terms of opposites. All rational discourse is talk about classification. The classification of experiences of sensations, of notions. And the nature of a class is that it's a box and if a box has an inside, it has to have an upside, is you is, or is you ain't, is fundamental to all classification and we can't get out of. It's almost as if you see whatever we see to be different is an explicit difference on the surface. Covering an implicit unity.

Only, it's very difficult to talk about what it is that unifies black and white. Of course in a way the eyes do. Sound and silence are unified by the ears. So you can see, can't you, that, if you can't have one without the other, it's like the poles of a magnet, North Pole and South Pole. You can have a one-pole magnet. True, the poles are quite different ones north of the other south. But it's all one magnet. And some such idea is that is what the Hindu is moving into when he's speaking of the real basis or ground of the universe as be you will. Take it, the fundamental opposition that I suppose all of us feel, between self and other, thou and it. There is something that is me there's an area of my experience that I call myself and there's another

area of my experience which I call not myself. But you will immediately see that neither one could be realized without the other. You wouldn't know what you meant by self, unless you experience something other than Self. You wouldn't know what you meant by other, unless you understood self they go together. They arise at the same time you don't have first self and then other office other and then self. They come together. And that shows you see the sneaky conspiracy underneath the two, more or like the magnet between the two different poles.

And so more or less that, sort of what isn't classifiable but which lives between all classes. The class of elephants, opposite the class of non elephants, has as it were, the walls of the box joining the two together, just as your skin is an asthmatic membrane that joins you to the external world by virtue of all the tubes in it and the nerve ends, and the way in which the external energies flow through your skin into your inside and vice versa. But, we do, don't we see and feel and sense all we think we do. The world as divided into a great multiplicity a lot of people would. Think of the universe as a collection of different things a kind of cosmic flotsam and jetsam washed together in this particular area of space. And prefer to take a pluralistic attitude and don't see anything underlying. In fact, in contemporary logical philosophy, the notion of any basic ground or continuum in which all events would be considered meaningless, for obvious reasons. If I say that everybody in this universe every star every planet is moving in a certain direction of a uniform speed, that will be saying nothing at all, unless I can point out some other object with respect to which they are so moving. But since I said the universe, that includes all objects whatsoever, therefore I cannot make a meaningful statement about the uniform behavior of everything that is going on. True. But on the other hand, every sound you hear on the radio, whether it be a honking horn, a Bach sonata, or a newscast, is the vibration of the diaphragm in a loud speaker. The radio doesn't tell us this, the announcer doesn't come on first thing in the morning and say, 'Ladies and gentlemen, from now until closing time all the sounds you will hear will be vibrations of the diaphragm in the speaker.' That is taken for granted and ignored.

So, in the same way your ear drum is basic to all that you hear. Your lens in your eye, the retina is basic to all that you see. What is the color of the lens

of the eye? We say it is no color, it is transparent, in the same way as a mirror has no color of its own. But the mirror is very definitely there, colorless as it may be. The eardrum, unheard as it may be, is very definitely basic toward hearing. The are transparent as it maybe is very definitely basic to all seem so therefore if there were some continuum in which everything that is going on and everything that we experience occurs we would not notice it. We would not be able, really, to say very much about it, except perhaps that it was there. It wouldn't make any difference to anything, except the one all important differences, that if it wasn't there there wouldn't be any differences. But you see philosophers nowadays don't like to think about things like that. It stretches their heads and they would rather preoccupied themselves with more pedestrian matters.

But still you can't help it if you are a human being, you wonder about things like that. What is it in which everything is happening? What is the ground? But you say, obviously it's not a part because I think that is a part is a classifiable thing, and so very often the Hindu and the Buddhist will refer to the ultimate reality as no-thing. Not nothing but no special thing. Unclassifiable. Can't put your finger on it, but it's you, what you basically are, what everything basically is. Just as the sound of a automobile horn on. Radio is in one way an automobile horn but basically it is the vibration of the diaphragm. Okay, so you are all in the Hindu view vibrations of the entire cosmic diaphragm. Put it like that, that's analogy, one using sudden a language or cataphatic language from the point of Christianity. The best language to say nothing! But to experience it. How can you experience it that's the whole thing? As I pointed out, last time the nub of all these oriental philosophies is not an idea not a theory not even a way of behaving but it's basically a way of experiencing a transformation of everyday consciousness so that it becomes quite apparent to us that that's the way things are, but you, when you it when it happens to you it's very difficult to explain it.

So in exactly the same way, when somebody has that sort of breakthrough which transforms consciousness and it happens all over the world it's not just a Hindu phenomenon when somebody suddenly realizes it's all one, or technically non-dual. And really, all this coming and going and all this frantic living and dying, grabbing, struggling, fighting, suffering all this is a

fantastic phantasmagoria. He sees that, but when he trying to explain it he finds his mouth isn't big enough. Because he can't get the words out of their dualistic pattern, to explain something non-dualistic. But why is this so? Why are we under this great magnificent hallucination?

Well, the Hindus explain this in Saguna language as follows. Very nice explanation, a child can understand. The fact of the matter is that the world is a game of hide-and-seek. Peek-a-boo. Now you see it, it becomes very obvious. If you were the supreme self, what would you do? I mean, would you just sit there and be blissfully one, forever and ever and ever. Well, obviously not. You would play games. You would in other words for the very nature of the fact that I said no energy system is an energy system unless it lets go of itself, so you would let go of yourself. And you would get lost. You get involved in all sorts of adventures. And you forget who you were. Just as when you play a game, playing poker. And although you are only playing for dimes off the chips you get absorbed in the game. And you move, nothing really important to win nothing really important to lose and it becomes fantastically interesting, who wins and who loses. And so, in the same way it is said that the supreme Self gets absorbed, through ever so many different channels which we call the different beings, in the plot, just like an artist or a writer gets completely absorbed in the artistic creation of what he is doing or an actor gets absorbed in the part in the drama.

At first, we know it's a drama we go to a play. And we say 'It's only a play.' And the Proscenium Arch tells us that what happens behind that arch is not for real. Just a show. But the great actor is going to make you forget it's just a show he's going to have you sitting on the edge of your chair he's going to be crying he's going to be trembling because he almost persuades you that it's real. And what would happen, if the very best actor, was confronted by the very best audience. Why, they'd be taken in completely, and the one would confirm the other. So, this is the idea of the universe as drama. That the fundamental Self the Sarguna Brahma, plays this game, gets involved in being all of us and does it so damn well, it's so superbly acted that the thing appears to be real. And we're not only sitting on the edge of our chair, but we start to get up and throw things. We join in the drama, and it all becomes whatever it is that's going on here. Then of course, at the end of the drama, because all things have to have and end that have a beginning. The curtain

goes down and the actors retire to the green room. And there the villain and the hero cease to be the villain and hero, they're just that they actors. And then they come out in front of the curtain and they stand in a row and the audience applause of the villain along with the hero the villain for having been a good villain here over having been a great hero. The play is over, and everybody heaves a sigh of relief. Well that was a great show, wasn't it.

So the same idea the green room is the Narguna Brahma. That behind the whole show, where there are no differentiations of I and thou, subject and object, good and evil, light and darkness, life and death. But within the sphere of the Sarguna Brahman, all these differentiations appear because that's out in front that's on the stage. And no good actor when on the stage performs his own personality. That's what's wrong with movie stars they try to cast a person to act a role which corresponds to his alleged personality. But in a great actor, can assume any kind of personality, male or female, can suddenly convert him self right from the audience into somebody who takes you in entirely. But in the green room, he's as usual self. So Hinduism has the idea that it's all the conventions of drama, go right along with it, that all this world is a big act. The play of the supreme Self. And it's therefore compared to a dream, to a passing illusion. And, you should not therefore, take it seriously. You may take it sincerely perhaps, as an actor may be sincere in his acting but not serious, because that means it throws you for a loop. Although that of course is involved. We do take it seriously, but you see one of the great questions that you have to ask yourself, when you really get down to the nitty gritty about your own inmost core, is are you serious? Or do you know deep within you, that you're put-on.

On Taoism

This afternoon, I'm going to talk to you about Taoism, which is one of the principal forms of Chinese philosophy. As it were, the opposite number of Confucianism. For these two ways of thought lie at the roots of Chinese civilization. Both of them having a kind of common origin in the attitude to life expressed in the Book of Changes, or the I Ching, which maybe as early as about thirteen hundred B.C. Everybody today seems to be reading the I Ching. It's a very strange book. It is a commentary on sixty four symbols. Which are made up of broken and unbroken line, it's the unbroken line, like

this, and the broken line like this. And this unbroken line is called Yang. Yang. And the broken line is called yin. And if you make a figure in which there are six lines. You can obviously have sixty four variations. And this is ostensibly a method of decision making. When you flip a coin to make a decision you've only got two choices heads either heads or tails, but imagine having a sixty four sided card the flip to help you make decisions. Is rather an interesting idea because when we do make decisions we are always eventually reduced the flipping a coin. However well you think it through, you don't have time enough to think it all the way through. You know that there are always possibilities that you didn't take into consideration or couldn't take into consideration, and although you plan and wonder and work out the data, it eventually comes down to the point where you flip a coin because you've got to make up your mind.

But in some respects, you see, a sixty four sided coin would be more suggestive shall we say than a two-sided coin. Well anyway, these hexagrams as they're called in the I-Ching are made up of fundamentally two symbols, yang, the positive and yin, the negative. And the words yang and the yin seem to refer originally to the south and north sides of a mountain. The south side is the sunny side, the north side the shady side. And note that you cannot possibly have a one sided mountain. And therefore it's always understood that the yang and the yin are the explicit differences of an implicit unity. The Poles. Yang is called male, yin is called female, and another way in which they're represented aside from these two lines is in this familiar symbol, in which one tadpole is black, and the other white with the eye of the tadpole, the opposite color. And so they constitute a unity. Behind this unity, is sometimes something represented by an empty circle. Which is called. Tai-Chi. The great ultimate. The word Chi refers to the ridgepole of a roof on which of course the two sides of a roof depend. On which they are propped together like the two sticks that I talk to you about which support one another. Take one away, the other collapses.

So underneath the whole philosophy of China there lies this recognition of the polarity of the universe. That the opposites go together or as Lao Tzu puts it in the second chapter of his book The doubt it. When all the world understands beauty to be beautiful there is already ugliness, when all the world understands goodness to be good there is already evil. For to be, and

not to be arise mutually. And this interesting Chinese remark. To be, also means to have. Not to be, and also means no, nothing. Arise mutually. And neither one is before that or after the other. They come into being together. And this has to do then with the yang this is yang and this is aeon.

So now when it comes to Taoism, this is a point of view. That becomes explicit in Chinese history. Probably in the neighborhood of four hundred B.C.. It used to be said that Lao Tzu, L-A-O T-Z-U was or was originally thought to have been a contemporary of Confucius who lived between six and five hundred B.C. But the general weight of scholarly opinion today is that the Lao Tzu book is about four hundred. And the book is called the Tao Te Ching. If there were an apostrophe after the T, you would pronounce it Tao, but if there is no apostrophe you pronounce it Dao, because our scholars made up a way of Roman eyes in Chinese which only they could read and they could have spelled it or do you know W. but they didn't want the laity to be initiated. The next word is done because again there's no apostrophe after the T. so it's pronounced and Jing there is no apostrophe after the C.H. So if there were, it will be pronounced changed but it's Jing, like a J.

And so Ching, in Chinese, means a classical book, a scripture. Tao is usually translated the way. But I would prefer to call it the course. The course of nature. And Te means virtue but in the sense that we use the word virtue when we say the healing virtue of a plant. It has a magical connotation, or a connotation of power and peculiar skill. Of Tao and Te, and it is written by Lao Tzu, which means the old boy. The legend, of course, is that Lao Tzu was the librarian of the Imperial Court. Who when he became an old man and sick of the intrigue of court life, decided to vanish into the mountains but he was detained at the city gate by the captain of the God who said 'We cannot lose you without your leaving behind some record of your wisdom.' And so he prevailed upon him to sit in his gate house and write down this book which is a very short look conical book. And it is divided into two main sections one about dower and one about the. He was followed in due course by a number of successes of which the most important is somebody called Chuang Tzu. And this man is really marvelous. He's one of the very few philosophers who have ever lived who is a great humorist.

And if you get the Modern Library edition of The Wisdom of Lao tzu, translated by Lin-Yutang, you will find in that lots of Chuang-Tzu, translated as a commentary on Lao Tzu. And he is really delightful, he's a delicious person to read. Because he has a kind of humor wherein he caricatures his own philosophy and takes it to observe extremes just for the joke of it. And he puts a lot of his philosophy into the mouth of Confucius just to confuse everyone. He's a really witty man and he, you must read him. So then, what I want to do is to discuss the main ideas of Lao Tzu, and of course naturally we have to start with Tao. This word in Chinese is made up of this part of the character here, is called the radical. And it means, it is connected with motion, going on and stopping, or rhythmic motion. On and off. And this other part of the character here means intelligence. So you've got intelligent motion, the course of nature. But the character also means to speak. And so it's rather like the Greek Logos.

The first verse of Lao Tzu's book starts out by saying something that you really can't translate so you have to see it in Chinese. It says Tao, and this character means can, can do, can be. Again Tao. The Tao which can be Tao. Not this character means regular or eternal now. And so we normally translate this the down which can be spoken is not the eternal Tao. It could mean also the way which can be wayed, traveled, is not the regular way. But in most commentators agree to the first translation. The Tao which can be described is not the eternal Tao. Then why go on to write a book about it. Well consistency is a virtue a small mind. So you have in the idea of Tao. The flow of life, the flow of events, the world considered as a stream. And water is very often used by Lao Tzu, to give the idea of Tao, because water always takes the line of least resistance. Water is very soft and yet one of the strongest things in the world. You can chop water with a sword but leave no wound. You can't squeeze it, you can't compress it. Wonderful stuff. Elsewhere he says, man at his birth is supple and tender but in death he is rigid and hard that's suppleness and tenderness are the marks of life and rigidity and hardness the marks of death. Tao is always gentle, you see, always yielding, it is feminine in a way. Lao Tzu says although you may be a male always have a certain feminine quality and thus he will become a universal channel that has particularly to be learned by men in the United States who tend to overcompensate masculine. To be ashamed of

gentleness, and to emphasize a kind of ra-ra-ra-ra attitude to life. Which usually indicates a fear of incipient homosexuality.

And as a result we have a lot of misunderstanding between men and women because each one is so busy being their particular sex that they have nothing in common. So this idea then, is the strength of gentleness. And of course, it is ultimately on this philosophy that the Japanese worked out the science of Judo. Do is the way the Japanese pronounce Tao. Ju means gentle, judo, the gentle way, whereby a strong man is alarmingly defeated by the use of his own strength against himself. And the analogy is of course of the pine tree in the willow tree. The pine tree is a muscle man. And when the snow piles up and piles up and becomes icy the pine tree branch cracks. But when the willow get snow on it, after a little while the branch drops and the snow falls off from the branch springs up again. That's Judo. They teach you in Japan a mysterious science called Aikido. Again do meaning Tao. Aikido is the inner or the esoteric aspect of Judo, and they can teach you for example to hold out your arm in such a way that no one can bend it. However strong. But it all depends on your not using effort to hold it out, you must not resist. There is a certain way of doing that.

So this Tao cannot be defined. That's basic. Just because it is the flow of nature, you can't capture it, you can't shut up wind in a box and expect it to be wind. You can't catch flowing water in a bucket because the minute it's in the bucket it's no longer flowing. Now Tao then is means what roughly what we would mean by the basic energy of the world. But there are two things to be said about it. And the first is that it is not a governing energy. Here we clearly come up against the principle or a concept of nature in which there is no government. This is an anarchic view of the universe. Not in the sense of chaos, but equally not in the sense of what we mean by order. The Tao does not rule Lao Tzu says, the great Tao flows everywhere, goes to the left and to the right it loves and nourishes all things but does not lord it over them. And when merits are accomplished that is good things are accomplished it lays no claim to them. In fact the Tao is always self-effacing, always disappears, always indefinable, always behind the scene. And so in a way the Lao Tzu's book is written as a manual of advice to rulers. And his idea of a good ruler, is one who is never in evidence. Do you know for example in Hindsale the name of your sanitation chief? I bet you

don't. These are very, very important officials. And Lao Tzu would advise the president of the United States to behave like the chief of sanitation. To be unobtrusive. And to generally leave things alone. Let things take their course. And not in the sense of—well it's like this, it's the difference between rowing and sailing. When you row, it's a relatively stupid method of propulsion, because you have to use effort. When you sail, you use the wind. But you don't have to go the way the wind is blowing you can tack. And tacking in so as to go in an opposite direction to the wind is the art of Taoism. Anyone who really understands sailing understands Lao Tzu. So the next thing is that the Tao has a kind of order, but it's not quite what we mean by order when we speak of order we usually tend to think of something symmetrical. Of something like a library you know, where all the shelves the rectangular. But the Chinese have a word for order, for the order of the universe. Which is this. They pronounce it Li. Now this sign has the original meaning of the markings in Jade, or the grain in wood. Or the fiber in muscle. So now, when you look at a cloud, or foam patterns, or at grain patterns in wood, you know for some reason or other that you're not looking at a mess. You're looking at something decidedly wiggly, but aesthetically pleasing. But you can't figure it out, there are no rules which it follows. This word it has been translated, the principle or rationale of nature almost the law of nature, but the Chinese have no word for the law of nature. They do have a word for law, the word Zu. And this word Zu. Was originally written and that represented a cauldron, an iron cauldron with a knife beside, it the scratching on the cauldron because in very distant times certain emperors had the laws of the land written on the sacrificial cauldrons to which the people brought offerings so that when they offered the sacrifices, they could read the laws. But certain sages said you should never do that, because if you write the laws down, people will develop a litigious spirit, and they will always be yakking over what it means, and therefore lawyers will have to define them are carefully, and then other lawyers will drive a carriage with six horses right through that, and then other lawyers must again define the laws more carefully. And that's the state we're in today, where we are utterly hamstrung by law.

So the Tao is described as being. Wu-Tzu means is this character non-Legal. The Tao is non legal in its nature but it is this it is Li and that means orderly in a way that cannot be defined. Just like your own nervous system

is certainly orderly but nobody has been able to figure out the principle of it. But you know it once, without being able to say how, the difference between Li, rigidity and Li, mess chaos. So what you might call. The best way of translating Li into English is to call it organic patterns. That's what it is. But we don't really know what that is because we are it we are organic patterns and just as we can't bite our own teeth we cannot define our own organization. We are it and that's all we need to be, because the teeth don't need to bite themselves, a sword doesn't need to cut itself, the sun doesn't need to illuminate self. So then this is the principle of Tao, but it is not law. If it were a law of course the Tao which could be spoken would be the eternal Tao. But it can't be uttered. So Tao then is the principle of nature. And in Chinese nature is called really spontaneity.

We use the word nature for the Chinese expression Tzu-Jan. Tzu-Jan, they pronounce J like a sort of unrolled R. I mean, that's the scholars, did this to confuse you. Tzu-Jan, means of itself so. Self-so. Almost our word automatic, except that automatic has a mechanical sense and this doesn't. When you have belly rumbles or hiccups, you don't intend to have them it happens of itself. In the same way, you don't intend to beat your heart, it happens of itself you didn't intend to get born it happened of itself this is done. And so this means nature died of the Japanese pronounce it Shizen is roughly when they point to all the things happening around us that's done and you see that Tzu-Jan that that which is so of itself implies no boss.

So in the same way they would look at the human body. Chuang-Tzu discusses the human body and says which organ do you prefer? And shows there is no chief organ. There could be an argument between the brain and the stomach. One school of thought would say, well obviously the stomach is the most important organ because that's where the food goes and is distributed to everywhere else. And stomachs came first. Then later, on the upper end of the input channel to the stomach there were evolved ganglia of nerves to enable the stomach better to scratch around for things to put into it, and therefore the brain serves the stomach. The other school of thought would say, well no, it isn't that things which come first are necessarily the most important. The stomach is to the brain as John the Baptist was to Jesus. The stomach is there but to nourish the brain, the stomach is the servant of the brain, which is of course preoccupied with higher things that we call culture.

But you see both arguments will stand up and both will fail. Because the stomach and the brain have a mutuality between each other, they arise mutually. And there is no way of deciding which of the major organs of the body is top dog, because the body is a sort of democracy. In which, by mutual cooperation things happen without any preconceived plan. We think in the West that the order of nature has a plan underneath it. That there was, as it were, the original blueprint in the mind of God. Which is the logos, the Second Person of the Trinity. But the Chinese don't think that way. They would agree with a limerick—well I mean they wouldn't—but they would agree with the humor of it there was a young man who said 'Damn it certainly seems that I am a creature that moves indeterminate grooves I'm not even a bus I'm a tram.' But the Chinese do not think of any rails laid down as it were, or rules laid down upon which nature has to travel. They think simply that it organizes itself. But doesn't know how. Again we're back to the centipede which manages one hundred legs without thinking because thinking would embarrass it. That sort of thing is called in Chinese, putting legs on a snake, you see, a snake needs no legs. And explaining the universe by a governor who dominates it is called legs on a snake. It's like saying we have an instinct to do this that and the other. When people talk about instincts watch out, they're invoking ghosts. When we say we have an instinct to survive, it means simply, that we do survive in fact until we don't. And if you want to explain the curious fact that people seem to want to survive you call it an instinct to survive. And this is learned gobbledygook there was a time sometimes when you showed a physician or a scientist some peculiar thing which he didn't understand, he would look at it, put on his spectacles examine it and various points of view and make a few notes and then say it is Eleusis Natori. And it was a wonderful in those what it is Eleusis Natori, but it means it is a game of nature. A freak. And you will find that many many medical people practice this sort of gobbledygook you have a pain this. It's neuritis. It means simply that neuritis means your nerves hurt.

So, it's always good to translate medical language back into English and you begin to get some idea of what's happening. Now the next thing to take up is the word Te. And as I said this means virtue, power, sometimes magic. When we say a person is a virtuoso. We have something of the meaning of Te in it. Marvelous accomplishment. And in opening the section under Lao

Tzu says superior virtue is not virtue and thus is virtue inferior virtue cannot let go of virtue and thus is not virtue. Or we might say, a person who really has virtue is not striving for virtue, and thus really has it. A person of inferior virtue is so trying to be virtuous that is not virtuous in other words when the person is trying and striving for virtue he is being self-conscious and artificial and we say well so and so is very good, but he is the rather forced. Isn't he a bit phony. And it's so often the case that people who are reputedly very virtuous are very boring. You'll feel that sometimes people are so good that you are sitting on the edge of your chair in their presence and that you can't relax with them or let your hair down, because they are full of judgment and disapproval. Because they're always judging and disapproving of themselves. A really virtuous person doesn't show his virtue. He is like, well there's a poem in Chinese which says, entering the forest he doesn't disturb a blade of grass, entering the water he doesn't make a ripple. He looks very ordinary. And so his virtue can't be detected. He doesn't stink of that virtue. So Te then, is the virtue. Of the great artist, say, or craftsman, who creates marvelous works of art but, always as if he was making no effort. And so we say of great art that it's, artless. That it seems to come naturally. That he does it as if he were falling off a log. Now of course we know that it isn't that simple. But nevertheless it does seem to be.

So what everybody wants to know then is how to acquire that great naturalness in everything. So that we in our human lives manifest the Tao. Tao manifested through man is Te. How do you do it? So the transitional word, which shows The Way from to realize Te in one's life. (I don't need to write the character again because it's already here.) And then this is pronounced Wu and and this one is wei. Wu-Wei. Wu-Wei means to act, to strain, to strive, or to interfere. And so the Taoist manner of life is wu-wei. Don't force it. Always go with the stream. You may need to use a rudder, but don't ever go against the stream. If you are swimming, and you're caught in a very strong current, you will be lost if you try to swim against it you miss swim with it an edge to the side. That's Wu-Wei. This is been very well understood, even by the samurai in Japan. Who when they became very great real masters of swordsmanship. Always found out and belong to the no-sword school. Because the real master of the sword never uses one.

There is a story. That there were in Japan in ancient times two master swordsmen. And there was a great debate as to which of them was the better. So some soldiers took a sword made by each master and decided to test them out. They first took a sword made by the man who in general opinion was perhaps a little inferior. And they went to a stream, and they dipped the sword in the stream with the edge of the blade facing upstream, they dropped a piece of paper on the stream. And it floated towards the sword, and as it floated the sword simply divided it into two pieces of paper joined together on the other side and went on down the stream. They then took the blade of the man reputed perhaps to be the greatest master and thought well they'll be pretty difficult to improve on that. But we'll try it anyway, so they gave the same test. But as the piece of paper approached the sword, it moved over to one side skirted it altogether and went on. So the true master will never have to be in a fight. And for that reason Aikido, as an athletic technique, is learning how to be unattackable. Is to always avoid the fight. And so however hard people strike at you, they will always be hitting the air. That Te, you see, that's a magical power. But it all comes about through not using effort, not straining, at anything, never straining, like you never force a key in a lock you just bend the key you jiggle and jiggle and jiggle until it turns smoothly. Or put oil on it, or something, but never force it. Same way, when you use your eyes don't stare at anything in order to see it clearly, because you'll just tie your eyes and make the image fuzzy. If you want to see the time on a distant clock. You close your eyes, you imagine black and relax your eyes, then look at the clock lazily, and you'll see that the detail is clearer.

So when you sing, you mustn't force your voice. Once upon a time, a great choirmaster was in the presence of William Temple, one time Archbishop of Canterbury, teaching a group of slum children how to sing. And he asked them first the singing some song with which they were all familiar and wanting to impress the archbishop. They sang it very lastly in a fast way and it sounded terrible. Now he said I want to show you something. There was present on this occasion a trained choir. And he said now we're going to sing with this choir a song you people don't know. But listen to it and the choir sang it very professionally. The choir master then turned to the group and said now look. When you sing this song, the one thing you must not do is to try to sing it. You just think of the tune and let it sing itself. And they

sang and did it very well. And he turned to the archbishop from whom I had the tale, and said that's good theology isn't it your grace.

Now that's Taoism, that's Wu-wei. And so now there's another story with which I will exemplify this. A later than Lao-Tzu there was another Taoist sage called Ye-Tzu. And he had the reputation of being able to ride on the wind. Of course that's metaphorical. We say walking on air. Walking on air, never a care, something is making me sing. And so when Suzuki was asked what it's like to have the experience of Satori or enlightenment, he once said It is like ordinary everyday experience except it's about two inches off the ground. Where you don't feel burdened by your own body, you don't feel you were something that you have to lug around and hold a club over and generally boss. So the sense of lightness, that's the meaning of being able to walk on the air. But he told a story of how he managed to do it. He said he went to a great guru. And this guru paid no attention to him. So he just sat outside the door of his hut. And a year went by, and still this man paid no attention to Ye-Tzu went away disgusted. But then he thought it over a bit and realized this man had a terrific reputation and that if perhaps he'd been a little bit more patient. He would have had some teaching. So he went back. And the great sage looked at him and said, 'Why this ceaseless coming and going?' So he sat down again at the entrance of the heart and for a further year attempted to control his mind in such a way as never to think of profit or loss or advantage or disadvantage. And then at the end of that year, the teacher looked at him.

For another year he practiced, and at the end of that the teacher invited him to come in the hut and sit on the mat. Then for the next year however, he did something quite different, and he says this. I let my eyes see whatever they wanted to look at. I let my ears hear whatever they wanted to hear. I let my mouth say whatever it wanted to say and I let my mind think whatever it wanted to think. And at the end of that year I didn't know what was subject and what was object. I didn't take any account of time. I was riding on the wind but I didn't really know whether the wind was riding on me or I was riding on the wind. And this was when he got to float, you see. But seeing as how what he did he finally did. He allowed democracy to prevail. He said to his eyes, I'm not going to try and control you. You know how better how to see than I do to his ears I'm not going to force you to listen to

anything you know how to hear better than I can direct you and so on to everything he trusts his own brain he trusted his own organism. And so this is wu-wei. So in exactly the same way if you practice meditation. Don't try to meditate like the choir was told not to try to sing, don't force it. When you meditate let your lungs breathe the way they want to breathe. Let your mind think anything it wants to think about. Don't try to repress thoughts. Let your eyes see whatever they're looking at. And let your ears, your ear drums vibrate to any oscillations there may be in the air. Let go. You think that's very risky. It isn't. It really isn't. It's like a ship in a typhoon, they always shut the engines off, and drift. Because if the propellers are going and the tail end of the ship is thrown up so as to be above the water level, the whole ship will vibrate and be shaken to pieces by those revolving propellers. So in a big storm, and life is a big storm all the time, you let it go and you become like a cork on the water or a ping pong ball in a mountain stream.

So that's that's the art of Taoism. That's the whole thing, that's wu-wei. Chuang-Tzu has the funniest tales about this. He often says 'People who are trying to help things along are a nuisance.' All the Do-gooders. He has a conversation between Lao-Tzu and Confucius in which Confucius is prating about charity and duty to one's neighbor. And Lao Tzu to him this is nonsense he is just binding things on to people putting burdens on them with charity and duty to one's neighbor. He says to Confucius look now at the universe. The trees grow up words without exception. The stars always follow their courses and the migrating birds of the various seasons always cluster with complete regularity, but they don't say anything, they don't have any religion. And your idea of eliminating yourself is a positive manifestation of self. You have brought much confusion to the kingdom, because you are like one who beats a drum in search of a fugitive. Or we would say like the police driving to a raid with their sirens on. And of course when the fugitive hears the drums he conceals himself and so when you sound all sorts of drums and promise to be virtuous and make resolutions to be virtuous, you're in for trouble. Because the devil hears you coming.

Now this is something that's very important. There is a Zen story which describes a woodcutter working in the forest chopping down trees. And he

suddenly noticed in a bush over there an animal that was watching him and this animal is a Satori animal. And he thought I'm going to get that animal for lunch. But the animal could read his thoughts. And the animal said to him 'You think you're going to catch me don't you?' And the woodsman looked around in the made for it, and the animal vanished. And then appeared at the opposite end of the clearing laughing, saying 'You can't catch me.' He thought the next time I see that animal I'm going to move to the opposite end of the clearing from which it appears get it that way. And the animal said you're thinking to aren't you to go to the opposite side of the clearing for me to see me. And for a while the man tried by going in various directions with his axe to catch this animal all to no avail. He got disgusted and went back to chopping the tree. And the animal laughed at him again and said 'So you've given up.' And just that moment. The axe head flew off the axe. And killed the animal. You see. He had to get it without intention to do so. That's what's called purposelessness and Taoism which is a form of wu-wei. And Taoist texts says, 'When purpose has been used to achieve purposelessness,' the point has been grasped.

So it's the same problem we have in India you know there's a superstition that if you think of a monkey while you're taking medicine the medicine won't work. So you are in the predicament of trying not to think of the monkey while taking medicine. And that happens to us whenever we try to be natural. Everybody can see it's it's forced, it's faked. And so you think then, ,how can I be genuinely natural. How can I really slow with the course of nature? How can I let my mind think whatever it wants to think? Because the moment I start doing that I realize I'm doing it with an ulterior motive. I'm trying to meditate, I'm trying to grow spiritually. And that ruins the whole thing.

Well, when you've tried for a long time to get the right attitude, and you find that all the attitudes you get are phony ones, then you come to the realisation there's nothing you can do about it, it really doesn't make any difference. And again the principle that I've emphasized all along you give up. And in so, doing gain the strength and energy that you were looking for. You see it's like trying to live in the present. Gurdjieff used to set his students the exercise he called Self- Remembering. That is constantly, all day long, be completely aware of what you're doing. Has your mind always

on the immediate moment. When it's tough, tough, tough, tough to do that you get distracted all. To one fine day you realize to your astonishment there is no way. At all of having your mind anywhere else but in the present moment. Because even when you think about the past or the future you're doing it now aren't you? And that results in a very curious transformation of consciousness. You feel that you are that the present moment is flowing along and carrying you with it all the time just like the flow of the Tao the flow of the Tao is as it what we would call the flow of the present. And you're with it, there's nowhere being anywhere else the journey on the boat called or the unwobbling pivot says the doll is that from which one cannot deviate. That from which one can deviate is not the Tao. Or to put it into the form of a Zen story, the Master Jo-Shu said to Nanzen and 'What is the Tao?' Nanzen replied, 'Your everyday mind is the Tao.' Jo-Shu asked, 'How do you get into accord with it?' Nanzen replied 'When you try to accord you deviate.' So, that's the principle, and this, although we're again in the paradox, you see this sounds like a completely laissez faire, spineless attitude to life but it is precisely Taoism which underlies in common with Buddhism in conjunction with Buddhism it underlies the greatest achievements of Chinese art and culture. It underlies judo, it underlies the Zen arts of Japan, calligraphy, architecture, gardens. It is the form of Chinese philosophy which in subsequent years became most interested in science and in the study of nature. The Confucians never had any interest in science because they were bookish people. They were all absorbed in texts. They were essentially scholastics. And never open the book of nature. But the Taoists were always observing natural phenomena, how they worked. They were interested above all in manual skills. And using the Tao to perfect manual skills. And therefore these lazy people achieved the most interesting results, because they were like water, which is lazy and always seeks the line of least resistance. But that is almost the same thing as intelligent.

Way of Liberation

When I was a small boy I used to haunt that section of London around the British Museum, and one day I came across a shop which had a notice over the window which said 'Philosophical Instruments'. Even as a boy I knew something about philosophy, but I couldn't imagine what philosophical

instruments could be. So I went up to the window and there are displayed where chronometers, slide rules, scales, and all kinds of what we would now call scientific instruments. Because science used to be called natural philosophy. Because as Aristotle says 'The Beginning of Philosophy is wonder.' Philosophy is man's expression of curiosity about everything, his attempt to make sense of the world primarily through his intellect. That is to say, his faculty for thinking. And thinking, of course, is a word used in extremely many ways and is a very vague word for most people but I use the word thinking now in here after you must understand this in a very precise way. By thinking, as distinct from feeling, or emoting or sensing, I mean the manipulation of symbols, whether they be words, whether they be numbers, or whether they be other such signs as say a triangle, squares, circles, astrological signs or whatever. These are symbols. Sometimes a symbol is a little bit more concrete and less abstract than that as when you get a mythological symbol, like a dragon. But all these things are symbols in the manipulation of symbols to represent events going on in the real world is what I call thinking.

So, philosophy in the Western sense, means generally and exercise of the intellect, and the manipulation of symbols is very largely until we come to poetry and music, an exercise of the intellect. But what philosophy has become today in the academic world is something extremely restricted. By and large in the academic world of both the United States and England, Germany, France to some extent, philosophy is falling into two other disciplines mathematical logic on the one hand, and linguistics on the other. And the departments of philosophy throughout the academic world have bent over backwards to be as scientific as possible as William who was Professor of Philosophy at Northwestern University said in an essay called Notes on the death of a culture, that an academic philosopher today must above all things avoid being edifying. He must never stoop to lying awake nights considering problems of the nature of the universe in the destiny of man because these have largely been dismissed as metaphysical or meaningless questions, so unworthy of a scientific philosopher who arrives at his office at nine o'clock in the morning dressed in a business suit carrying a briefcase and does philosophy until five in the afternoon at which point he goes over to cocktails and dinner, and dismisses the whole matter from his head and William Earl adds, 'He would wear a white coat to work

if you could get away with it.' This is of course a little exaggerated, but this by and large is what departmental academic philosophy has become, and Oriental philosophy is simply not philosophy in that sense.

These things Hinduism, Buddhism and so on, are sometimes also called religions. And I question the application of that word to them. Because I like to use the word religion rather strictly. I'm not going to be so bold as to venture a definition of religion which is supposed to be true for all time all I can do is to tell you how I use the word religion and I want to use it in an exact sense from its Latin root, which really means a bond or rule of life. And therefore, the most correct use of the word religion is when we say of a man or woman that he or she has gone into religion, that is to say has joined a religious or Monastic order, and is living under a rule of life living a life of obedience. For religion if Christianity is a religion, if Judaism is a religion, if Islam is a religion, they are based on the idea of man's obedient response to a divine revelation. And thus religion as we understand it in these three forms of religion consist really of three things. We will call them the three C's. The Creed, the code, and the cult. The creed is the divinely revealed map of the universe. The nature of things, the revelation of the existence of God, of our Allah or Yahweh, or as we say God. And his existence and his will and his design of the universe, the creed. To this we add, the second C, the code. The divinely revealed law, or exemplar, which man is supposed to follow. In the case of Christianity there's a certain variation in this because the principal revelation of the code aspect of things in Christianity as well as the cult is not so much a law as a person. God is said in Christianity to be supremely revealed in the historic Jesus of Nazareth. And so the code here becomes really, the following of Jesus of Nazareth. Not so much in a obedience to a law as through the power of divine grace. Then finally the cult. This is the divinely revealed method or way of worship so that man relates himself to God by prayers, by rights and by sacraments, which in these particular religions are not supposed to be so much man's way of worshipping God as God's way of loving himself, in which man is involved. So in the Christian religion, say in the mass, we would say that we worship God with God's own worship following the saying of Meister Eckhart, that great German mystic, "The love with which I love God is the same love wherewith God loves me." So too in the when monks in a monastery recites the divine office, using the Psalms as the basis

of it the Psalms are supposed to be the songs of the Holy Spirit and so when using the Psalms The idea is that you worship God with God's own words, and thereby become a sort of flute through which the divine breath plays.

Now, neither Hinduism, Buddhism nor Taoism can possibly be called religions in this sense. Because all three of them significantly lack the virtue of obedience. They do not conceive the Godhead as related to mankind or to the universe in a monarchical sense. For you see, there are various models of the universe which men have used from time to time. And the model which lies behind the Judeo-Christian tradition, if there really is such a thing, is a political model. It is based on, it is a kind of using the metaphor, of the relation of an ancient neareastern monarch to his subjects. And he imposes his austerity and his will upon his subjects from above by power, whether it be physical power or spiritual power. And so it is thus that in the say the Anglican Church when the priest that morning prayer addresses the throne of grace he says 'Almighty and everlasting God, King of Kings, Lord of Lords, the only ruler of princes, who does from the throne behold all that well as upon earth most heartily we deceived the with favor to behold, our sovereign Majesty Elizabeth the Queen and all the royal family.'

Now, what are these words? This is the language of court flattery. And the title King of kings, as a title of God, was borrowed from the Persian Empress. The Cyrus of Persia, the kyros, hence kurieos. Lord have mercy upon us is a kind of image drawn from things earthly and applied to things heavenly. God as the monarch, and therefore between the monarch and the subject there is a certain essential difference of kind. What we might call an ontological difference. So that God is God. And all those creatures whether angels or men or other kinds of existence which God has created are not God. There is this vast metaphysical Gulf lying between the two domains. That gives us as citizens of the United States some problems, because as a citizen of the United States, you have believed and do believe that a republic is the best form of government. How can this be maintained if the government of the universe is a monarchy? For surely in that case a monarchy will be the best form of government. And many of the conflicts in our society arise from the fact, that although we are running a republic many of the members of this republic believe all believe that they ought to

believe, that the universe is a monarchy. And therefore, they are above all insistent upon obedience to law and order. If there should be democracy in the kingdom of God, that would seem to them the most subversive idea ever conceived. Now I'm exaggerating the standpoint a little bit just for effect, because there are some subtle modifications which one can introduce theologically, but I won't go into them at the moment.

Now there are at least two other models of the universe which have been highly influential in human history. One is dramatic. Where God is not the skillful maker of the world standing above it as its artificer and King. But where God is the actor of the world as an actor of a stage play. The actor who is playing all the parts at once. And this is essentially the Hindu model of the universe. Everybody is God in a mask. And of course, as you know, our own word person, is from the Latin persona. That through which comes sound. And this word was used for the masks worn by actors in the Graeco-Roman theater which being an open air theater required a projection of the voice so the actors wore masks with megaphonic mouths. And so the word person, has however in the course of time come to mean the real you. There was a very serious mistake made in translation from Greek to Latin, when one began to talk about the three persons of the Holy Trinity. The three Masks of God wasn't quite the right idea, because the Greek word was apostosis, says not prosopon a word in which would have meant properly translated person, apostosis is a very difficult word to translate. You could say that ice, water and steam were three 'apostosises' of the same thing. And that would be a little better analogy,[but] not too good.

But in Hindu thought, every individual as a person is a mask, but fundamentally a mask of the Godhead. A mask of a Godhead, who although the actor behind all parts, the player of all games, is indefinable for the same reason that you can't bite your own teeth. For the same reason that you can't look straight into your own eyes. You can never get at it, because it's the middle of everything. The circle whose center is everywhere, and whose circumference is nowhere. Then a third model of the universe, which is characteristically Chinese, is that the world is an organism. And the world which is an organism has no boss. Even no actor. Because you see in any organism. There isn't really a boss or top organ. We are accustomed of course in our culture to think of our heads as ruling the rest of the body, but

there could well be an argument about this. I'm going to put up a case that the stomach is chief. Because the stomach, the sort of alimentary tract with a digesting process in it, is surely anterior to brains. There may be some sort of rudimentary nervous system attached to a stomach organization, but it's the the the more primitive you get the more you get a little creature that eats, see, it's a sort of tube and then go things at one end and out the other. And that because that way as the tube out the tube finds means of reproducing itself to make more tubes so that this process of in and out can be kept up but in the course of evolution, at one end of the tube is developed a ganglion which eventually develops eyes and ears and has a brain in it the better to scrounge around for food. And so the stomach point of view is, that the brain is the servant of the stomach to help it scrounge around for food.

But the other argument is this: true, the brain is a later development than the alimentary tract but the alimentary tract is to the brain as John the Baptist to Jesus Christ the forerunner of the big event and the reason for all this scrounging around and stomach and stuff is eventually to evolve a brain. And man shall eventually live primarily for the concerns of the brain, that is, for art and science and all forms of culture and the stomach will be servant. Now cynical people, like dialectical materialists say that's a lot of hogwash, it's really all history is a matter of economics and that's a matter of the stomach. It's a big argument and you can't decide it because you can't at this stage have a stomach without a brain or a brain without a stomach. They go together like a back in the front. So the principle of organism is rather like this: an organism is a system of—a differentiated system—but it has no parts. That is to say the heart is not a part of the body in the sense that a distributor is part of an automobile engine. Because all those surgeons are trying to treat the body as a machine with replaceable parts but the difficulty is. That these are not parts in the sense that they are screwed in, in other words when the fetus arises in the womb the mechanics in there of were lugging in the hearts and stomachs and things and fitting them together and screwing them to each other. An organism develops like a crystal in solution, or a photographic plate in chemicals it develops all over at once. And there isn't a boss in it. Because all of them act together in a strange way. It's a kind of orderly anarchy. And this is the Chinese view of the world fundamentally. This principle of organic growth they call Tao.

That's pronounced 'dow,' if it had an apostrophe after it, it would be pronounced Tao, but 'dow' is more or less the right pronunciation for that word. This Chinese word is usually translated the course of nature, the way. The way it does it. The process of things. And that again you see is really very different from the Western idea of God the ruler of the Tao, Lao Tzu says the great Tao flows everywhere, both to the left and to the right. It loves and nourishes all things but does not lord it over them, and when merits are accomplished it lays no claim to them. And so the Chinese expression for nature becomes a word which we will translate some so on. You know on what happens of itself like when you have hiccups. You don't plan to have hiccups it just happens. When your heart beats, you don't plan it it happens of itself. When you breathe, you can pretend that you are breathing but most of the time you're not thinking about it and your lungs breathe of themselves so the whole idea of nature is something happening of itself without a governor. Is the organic theory of the world so you see we have these two others that we're going to consider in this course on oriental philosophy the dramatic theory and the organic theory.

And therefore I feel that the ways of life which use these models are so unlike Christianity, Judaism or Islam that we cannot really use the word religion of these things. Now what is there in western culture that resembles the concerns of Buddhism and Hinduism and Taoism. Because the trouble is from the outside they look alike. In other words, you go into a Hindu temple or especially a Japanese Buddhist temple, and you'll be pretty convinced you're in church. In sort of a Catholic church, at that, of course there's incense chants, bowings, gongs candles, rosaries and all the things that one associates with a theistic monarchical religion. And yet that isn't what's going on. There isn't the factor of obedience. Even though the image of God or maybe sitting on a throne covered with a canopy and royal honors being done. There's still something different.

Well I suppose that a long shot probably the nearest thing to these ways of life in the West is perhaps psychotherapy in some form. Not all forms of psychotherapy. Because the objective of psychotherapy is as you might say, to change where your head's at. Is to change your state of consciousness. If you in other words you are horribly depressed, if you're terrified if you're under hallucinations you see a head shrinker. And he tries to change your

state of consciousness. And so fundamentally these disciplines, these oriental ways, are concerned basically with changing your state of consciousness. Only here we part company. Psychotherapy is largely focused on the problems of the individual as such. The problems peculiar to this individual or that individual. These Asian ways of life are focused on certain problems peculiar to every individual. On the understanding. That the average human being, and the more civilized he is the more this is true. That the average human being is hallucinating. That he has a delusive sense of his own existence. And it is thus that the very word Buddha, in Buddhism, is from a root in Sanskrit word Budh, which means to awake. To awaken. To awaken from the illusion is then to undergo a radical change of consciousness with regard to one's own existence. It is to cease being under the impression that you would just poor little me. To find out who you really are, or what you really are, behind the Mask.

But we saw, didn't we, you can never get to see what the Self is basically. It's always forever elusive. And so if I ask you. Who are you really? And you say 'Well I'm I'm I'm John Doe.' You think so. John Doe tell me, How do you happen to have blue eyes? Well he says 'I don't know, I didn't make my eyes.' Oh you didn't? Who else? Well I have no idea how it's done. Do you have to have an idea how it's done to be able to do it? After all you can open and close your hand perfectly easily. And you say I know how to open my hand and I know how to close my hand, because I can do it but how do you do. 'I don't know I'm not a physiologist.' Well, a physiologist says he knows how he doesn't become good any better than you can. So you are opening and closing your hand not you you don't know how you do it maybe you blue-ing your eyes, too. You don't know how you do it. Because when you say 'I don't know how I do it,' all you are saying is I do know how to do it but I can't put it into words. I cannot in other words translate the activity it galled opening and closing my hand into an exact system of symbols into thinking. That's all. And actually a to translate the opening and closing of your hand into an exact system of symbols would take forever. Because trying to understand the world purely by thinking about it is as clumsy a process as trying to drink the Pacific Ocean out of a pint beer mug. You can only take it one mug at a time. And so when thinking about things you can only think one thought at a time when after another in series thinking is a linear process, like writing. One thought after another as we

say you can only think of one thing at a time. But that's too slow for understanding anything at all much to slow. And our sensory input. Is much more than any kind of one thing at a time, and we respond with a certain aspect of our minds, to the total sensory input that's coming in. Only if we are not consciously aware of it, but nevertheless you're doing it but what kind of you is this certainly isn't John Doe and that little ego freak. So there's something a lot more to you than you think there is. And that's why the Hindu would say that the real you. Is the self, capital S. The Self of the universe. Because at that level of one's existence one is not really separate from everything else that's going on.

So you see, we have something here which I will call not philosophy, except in the most ancient sense of basic curiosity. I prefer to call these disciplines ways of liberation. Ways of liberation from Maya. And the following of them does not depend on believing in anything, in obeying anything, or on doing any specific rituals although rituals are included for certain purposes. It is a purely experimental approach to life. It is something like a person who say has defective eyesight and is seeing spots and all sorts of illusions. Going to an ophthalmologist to correct his vision. Buddhism is therefore basically a correction of psychic vision. To be disentranced by the game of Maya. Not incidentally, to regard the Maya as something evil, but as a good thing of which one can have too much. And therefore get spiritual and psychic indigestion, from which we all suffer.

On Yoga

I have been emphasizing all along, that the central core of the kinds of Oriental Philosophy that we are talking about is not theory but experience. And the trouble here is that so long as one attempts to communicate this philosophy in words, we remain in the area of theory and do not necessarily transfer over into experience. It is then for this reason that in addition to the scriptures or verbal teachings of Hinduism, there is a discipline whose object is to enable an individual to realize what the words are about. I would use so strong a word for Realization as sensation, because the Realization of the *tat tvam asi*, the Upanishadic proposition that you're it., comes over you if you do have the experience not so much as you feel convinced that the earth goes around the sun, even though you don't

actually see this happen. It's not so much like that as it is like an immediate sensation of the thing which the proposition *tat tvam asi* is trying to say. And so this entering into the experience which is the heart of Hinduism is the function of a discipline called Yoga. The word yoga. Y-O-G-A. Don't say, as many people do *yogi*. *Yogi* is one who practices. And a *yogini* is a female practice of yoga. But yoga is the same word as yoke, Latin *ungere*, to join. And English, union. The yolk between two oxen may be regarded equally as a discipline and as a joining of the two oxen.

So the basic meaning of yoga is something like Union. The realization, in other words, of the union of what we call the separate individual with the ultimate ground of being, Brahman. We don't know how early yoga is in India, but there are statues found in Mohenjo-daro in the Indus Valley dating from at least two thousand B.C.. of figurines in the posture familiarly associated with yoga. The *Padmasana*, or the full lotus posture, in which all almost all Buddhas are seen to be sitting, with the legs crossed, and these feet up on the thighs, soles upwards. It apparently then is something quite ancient, and was in some way absorbed and assimilated to the Aryan civilization which invaded India from the north somewhere between fifteen and twelve hundred B.C.. Yoga was apparently like everything else in those days, handed down as an oral tradition, and was not committed to any kind of written record, until there appeared a book called *The Yoga Sutra*. *Sutra* really means thread, but I suppose through the idea of threaded leaves – ancient manuscripts in India were written on palm leaves – came to mean the scripture or book Sacred Book. And the *Yoga Sutra* is associated with a gentleman named Patanjali. P. A T. A N. J A L I. And is of uncertain date. It may be as early as two hundred B.C. It may be a bit later. But this is the standard text on the practice of yoga.

There are Chinese forms of yoga which probably originated independently at the same time out of the Taoist way of life, and they subsequently had considerable influence on India as did the Indian ways on the Chinese. Now it's important to study the *Yoga Sutra* from its opening, or second to opening phrases second verse. His first verse says now yoga is explained. And the commentators attach particular importance to the word 'now.' Because the assumption is that something else has gone before all. In other words, you are expected to be a reasonably sensible rational mature human

being before you engage on this particular path. In the same way as I pointed out to you in the last session. That the Hindus have the view that a man should fulfill the duties of the householder before he engages upon the spiritual life. So in the same way, there are certain preparations before you start out on yoga. And those preparations usually involve having mastered whatever the disciplines of your culture may be. The essential disciplines of your culture, so that you know how to handle them, so that if you get into the higher states of consciousness which yoga brings about you won't run amok. Because not being able to distinguish between good and bad from a social point of view. The next verse says, in Sanskrit, I'll write it down because it's, important to look at each word. Yoga-citta-riti-miroba. This means yoga is. Chitta is a very difficult word translated into English because in Sanskrit there are about five words for mind. There are one. Or we have nine we have consciousness we have awareness, thought, but they're all very vaguely defined and we use them interchangeably Citta is a more precise word. And I would say awareness. Probably. Griti means to come from a root which means to turn. Turn around. And so you get the idea of turbulence. Vicious circling, whirl-pooling, wavering. Anyway going round and round and round. So your goodness awareness. Turbulence. Stopping. There it is, all in one sentence. You can take this sort of analogy which is used by yoga teachers. Take it that awareness is something like a pool. Of water. When the water is quite still, you can see in it the reflection of the sky, and everything in the bottom of the pool. When it's muddy and turbulent, you can't. So in the same way, your awareness of the world is like reflecting pool and if it's turbulent. You don't see clearly you're not clearly aware you don't have a mind like a mirror. You have a mind like a distorting mirror, which keeps wiggling.

So, yoga then is the art of stilling the mind. There are various schools of thought about what is a still mind is. According to one school of thought, the goal of yoga, is Samadhi. Well, everybody agrees that Samadhi is what it's all about. What is this word Samadhi? It refers to a state of consciousness which is sam. Don't say san, that's different. Sam, related to our word sum. From the Latin, eventually Sanskrit sam. Complete. Total. Also related to the word same. Looking on everything equally, having an equal mind towards all events, Samarasa. In Sanskrit, equanimity, calmness. Having as it were the same attitude in victory and defeat. Also same, in the

sense of the knower and the known are the same. There is no further division between myself on the one now, and what I'm aware of on the other. It's all one. Samadhi.

In yoga, there are differentiated differentiated two kinds of samadhi. One is called the vikalpa. And the other is called nirvikalpa. The word vikalpa means an idea or concept. So it could be samadhi with an idea of some kind of concept. Nirvikalpa would mean without a concept, or somebody produced by way of the gimmick. The technique and the ideal somebody. Look ma no hands. No gimmick. But some schools, as I was saying, there are different opinions about what this all means. Interpret nirvikalpa samadhi as being a state in which there are is such a degree of absorption, or of trance, that there is no awareness left of the physical world. You are completely, well if a psychologist looked at you he would say you were catatonic. Sitting in that posture, immobile absorbed rat. And this is held by one school of thought to be the highest attainment of the human mind. I don't agree with this point of view. I follow another school of thought, which has a different idea of Nirvikalpa samadhi. And this, in my view and that of others, it is not the total sensation of sensory input, but simply the sense at the cessation of conceptions. Of thoughts about what you are experiencing. And therefore that the meaning of citta, vridi, naroda. Is not as the other school interprets it getting a perfectly blank mind. But it means two things, in my interpretation: one, a mind that is not going in vicious circle, and two, the mind free from the hypnotic influence exercised by thoughts, ideas, words.

So then let's consider first of all what is a mind in the group of vicious circles. Well one of the most obvious instances that we all know is the phenomenon of worry. The doctor tells you that you have to have an operation. And that has been set up so that automatically everybody worries about it. But since worrying takes away your appetite and your sleep, it's not good for you. So the doctor tells you not to worry because he wants you on the operating table in a state of good health. Well rested, etc. But you can't stop worrying, and therefore you get additionally worried that you are wearing, and therefore will not be in the right shape to be on the operating table. And then furthermore, because that is quite absurd and you are mad at yourself because you do it you are worried because you worry because you

worry. That is a vicious circle. Another form a vicious circle is when a person is convinced that they ought to be unselfish. And are so convinced for selfish reasons. I would like to think of myself as an unselfish person. Because that sort of person I'm supposed to be. So therefore, I have a selfish reason for wanting to be unselfish and because of that no amount of effort will ever succeed in making me unselfish but will only succeed in sending me around in circles. I'll be proud that I'm humbled. Etcetra. That is citta vriti, pretty turnings of the mind, see.

So now, yoga is initially stopping that. Can you allow your mind to be quiet? Isn't it difficult? Because the mind seems to be like a monkey jumping up and down and jabbering all the time once you've learned to think you can't stop. And an enormous number of people. Devote their lives to keeping their minds busy. And feel extremely uncomfortable with science. When you're alone., say in a doctor's waiting room, which may be very uninteresting. Nobody saying anything, there's nothing to do. This is good this worry this lack of distraction I'm left alone with myself and I want to get away from myself I'm always wanting to get away from myself that's why I go to the movies that's why I read mystery stories, that's why I go after the girls or anything that you do or get drunk or whatever I don't want to be with myself. I feel queer feel like you know it is when you run your fingernails up a blackout on a cold. Creepy.

So well, why do you want to run away from yourself? What's so bad about it? Why do you want to get this, why you want to become absorbed? Because you are addicted to thoughts. This is a drug will dangerous one. Compulsive thinking going on and on and on all the time. It's a habit. Cause you keep telling yourself where you are, who you are, what's going on, how good it is, how bad it is. Reading the newspaper of your mind you know a lot of people they get hold of a newspaper and the newspaper reads them they don't read it. Newspapers designed to read you type of rivers the layout people very carefully calculated how to carry your eye from one end of it to another. So there's a difficulty about stopping. That activity and you really have to stop it if you want to be sane. Because, if I talk all the time, I don't hear what anyone else has to say. And then I'll end up in the situation of having nothing to talk about that my own talking. Or so, in exactly the same way, if I think all the time, I won't have anything to think about

except thoughts. And that's the academic fallacy. See when you add words to the library, the great many of the books that are added to the library of books about books. They're not necessarily books about life, some of them are, but most of the books especially Ph D. dissertations are books about books about books about books. And that doesn't really get us very far.

So in order to have something to think about, there are times when you simply must stop thinking. You can learn later on in yoga. How to be in the state of samadhi and think at the same time. But first of all you have to learn how to stop thinking. Well how do do that? The first rule is don't try to, because if you do, you will be like someone trying to make rough water smooth with a flat iron. And all that will do will stir it up. So, in the same way as a muddy turbulent pool quiets itself when left alone. You have to know how to leave your mind alone. It will quiet itself.

There are certain things however which help. And the yogis tend to use two techniques for assisting their minds to become calm. One is breathing. That is called pranayama. Prana means breath or the vital force of the body, pranayama, the discipline of breath. And the other is called mantra It's all, it's connected with pranayama, with breathing but it's chanting, chanting sounds. And both of these have a slightly auto hypnotic effect which helps one to quiet thoughts. These days many hippies go around wearing beads. Any of you got beads on? What do you wear beads for? If you know why you are you know what beads are for? Beads are for yoga. This is a Tibetan rosary has been blessed by the Dalai Lama. And they wear them on their hands rather, they carry them around the neck, but they usually use them in the hand. And they will do for time you got your yoga practice. Of the day and so many rounds of the beads will time you. And either you use the beads for breathing in-ut on one bead. in out on the next bead, in out on the next, and so. Now they have essentially the breathing in yoga is not forced, you don't do the kind of breathing exercises in a forced way. You have first of all, to find out how your lungs want to breathe. Let them do that, and count your breath, with your fingers, rather than using numbers try and keep away from concepts and numbers are concepts that's why you use your fingers on the beats instead and for every in breath and out breath you use one bead. Just experiencing breathing and experiencing the sensation of the beads passing your fingers. Don't think about it, don't try not to think

about it, but the bead and the breathing will distract you from thinking. And you will find that in due course the breath will automatically become slower and slower and slower with great ease, until it seems that you are hardly breathing at all, it's so slow.

Now for some people that is not so easy to concentrate on. So it makes it easier to concentrate if you add to the breathing a mantra. And so, the mantra means, the chanting of certain syllables. Which, although they do have a meaning in the end they are maybe the names of the divinity. They very soon cease to have a meaning as you use them. So, the Tibetans use such a mantra as ommmanipadmeuhm. Or Hindus use sometimes those would be "RamRamRamRam...". More complicated ones "OmRama Srirama..." or many varieties of these mantras. And if you keep doing that, you find you're getting into another state of consciousness. You're not thinking in the ordinary way. As the Word says take any English word. Take the word yes. We know we think we don't yes means we means yes, I will. It's a set up. yes yes yes yes striking we use that funny noise yes yes yes yes yes yes and after a while it stops meaning anything has become synonymous. That's the way you through using thought symbols, you free the mind from thought. It's like using a thorn, to pick out a thorn that's stuck in the skin. And so yoga uses those and breathing to help the mind to become quite still.

Now those who see are not the vikalpa in that they are gimmicks. So through breathing and mantras and so on you get samadhi and it's samdhi, samadhi, samadhi, with gimmicks. And that means that you have a crutch. For your religion, it depends on some kind of an extraneous device, but the ideal of yoga is called of the natural state. Which in Sanskrit is sahaja. To be in the state of realization without having any religious gimmickry. What's Spiegel of Stanford used to call the religion of no religion. Again, it's 'Look ma no hands.' So that you don't need to do anything special or to think any special thought or to say any special prayer out or have any particular ritual. On which YOU to pad for getting into the realize state of consciousness but you're in it naturally all the time that's nirviKalpa Samadhi And this means then, that you could seem to the outsider as living a perfectly normal life. That you eat when you're hungry, and sleep when you're tired. And you go about your business. And nobody can tell you

from just anyone else, unless they know you very well. And that's considered in all Hindu and Buddhist thinking very, very fine achievement. It's compared with a bird flying through the sky and leaving no tracks. Or with geese flying over a lake. And although they are reflected in the lake they don't disturb the water. They leave no trace.

So, one might say that the ideal of yoga, is to go through religion and get rid of religion. Because religion is a medicine. And it should not be a diet. That you see is a fundamental difference between physicians and clergymen. A physician tries to get rid of his patients. He gives them medicine in the hope that they will go away and not come back. But unfortunately, the clergyman tries to get you hooked on the medicine so that you'll come to church every Sunday and pay your contribution. To pay off the mortgage. That's a very serious problem with churches. The investment in buildings and such liabilities. But the doctor you see, although they have these hospitals, they hope that the turnover will be big enough. To pay for it. And they can't get a big turnover, unless they're successful in getting rid of patients but the patients who have been successfully got rid of gone recommend this doctor to other patients and so they keep coming through because they're always sick people. And the Hindu in a way and especially the Buddhist take very much this view of religion. Religion is not something to get hooked up on. A person hung up on religion or hung up on yoga is felt to be still in bondage. So yoga is to get rid of yoga. And come to the final state here called Nirvikalpa samadhi, where you are in the realized state naturally. Now of course, the doctrine of you Upanishads is that everybody is in the State of Union of yoga of union with Brahman, whether you know it or whether you don't. And so, trying to have that state naturally, is really and truly doing something redundant. You are trying to be where you are to become what you are. But that's because you don't know you're there. And we can see if we go back why you don't know that you're there. Because if you are the Brahman, you in the beginning of things, deliberately pretended you weren't. Only you did it so well that by now you've forgotten you did. And so to wake up again, you have to press on trying to get back although that's unnecessary. You will only learn that it's unnecessary to trying to get there. Sort of making a fool of yourself. Trying to get what you already have. So that in a way, I've been told that there are idiots who sit in padded cells trying to catch their thumb. You

know, you put your hand around your thumb like this, here's your thumb we're going like that and then you say we're still trying to capture one that went away. Nope, see you can't catch it. Because of course it's the thing you're trying to catch is the catch up.

So in the same way when you set out to realize that you are the ground of be the Brahman you're doing just that. You're trying to catch your own thumb, see. And it doesn't work. And you think. Oh dear this is becoming a very difficult task. I must ask my teacher about it. I must be sure he's a good teacher, because I've set myself this very very tough problem. But it's a silly problem, only it in most cases it takes years of sweating at it to see how silly it is. That's all it amounts to. Basically.

So, what happens in the yoga is that you get a set of hurdles disciplined hurdles to go through. And I'm only giving you a very, very sketchy account of this because I could go into all kinds of technicalities. But you can read those in the books. All about the chakras up the spine, and the complicated ways of breathing to awaken the different chakras, or levels of consciousness and all that jazz. But all that is Jazz over certain fundamental principles. What I want to be sure of is that you get the fundamental principles. That in other words, you have lost your sense of harmonious coherence with the whole domain of being. And you're puzzled as to what's the right thing to do, what's the wrong thing to do, how I ought to be, how to control my mind how to do this that and the other. And everybody has contradictory advice for you. He who hesitates is lost. Look before you leap, many hands make work light, too many cooks spoil the broth. New Religion everything wisdom is full of contradictory advice. So they say to you in the end, ahh but you see it, it takes a wise man to know when to do which. Well they say you say how do you become wise. Well it's a matter of experience. Like you apply for a job and they say "Well how much experience do you have?" You say, well I haven't had a job before. "Well you must get one and then we can give you one to him that hath should be given. And that's the same way all these people talk. You ask a question, and the Guru answers "When you know the answer you want to ask the question." That's pretty obvious. All this frustration. But you see the real meaning ins. The question you're asking is a false problem. You're asking, in other words, why do people inquire into religions, why do they go to

teachers, why do they want spiritual exercises and practices? Because they feel unhappy. Because they feel they're not really because they feel, because they think. When you feel unhappy, that's one thing. But when you think you feel unhappy that's much more of a problem. Because you keep repeating over and over and over to yourself "Gee, I feel depressed. I feel just so put down." And you wrap your tongue around that like you know when you've got a filling out of a tooth you can your tooth keeps wandering into the heart I mean your tongue keeps wandering into the hollow left by the filling and you fuss with it. The same piece you get an itch or something you keep scratching it. Some people if they get a pain in a certain part of the body keep moving it's of the pain is there. They want to still there and they cannot do it.

So in this way we talk ourselves into problems. And so all this kind of thing starts up. But actually, the problem is an attempt to solve an impossible conundrum. That's the most frustrating problem of all see all sensible questions have sensible answers. How do you cook swordfish state, problem. Well someone could tell you, it's quite simple. How do I draw a square circle? The question doesn't mean anything so naturally there's no answer to it. So how can I get myself into a state where I'm always happy. How can we arrange things in this room so that they're all up? Silly question, so was the other one. How can I attain peace of mind? Was a Zen story about that, where the master says "Bring out your mind and I'll pacify it." And the questioner says, "But when I look for my mind I can't find it. He said there, it's pacified." And so that's the sort of thing that's going on in yoga you know you think you're a problem to yourself and so the guru says, find you.

There was this great sage in India Sri Ramana Maharshi. And people used to— with he lived in modern times— it's not the same as the Mahrishi which you know about from recent times. ramón. He was a wonderful man the most beautiful big humorous eyes and always sat half naked with a little loin cloth around him, and he would sit in a kind of patio or compound, and read the newspaper. And sometimes he'd meditate, sometimes he'd sleep, and sometimes he would answer questions and throngs of people came from all over the world and sat in this compound just to watch and the chickens around scratching and mothers feeding their babies and dogs and so on and

you took very little notice of it all they just wanted to sit in his presence. And they would come to him and say oh Maharshi, "Who was I in my past life?" And he'd come back and say "Who wants to know?" Maharshi, "How many years will it take me to attain liberation?" He will say "Who wants to attain liberation?" Always he had so every question back on the source of the question. "Who are you?" But that something is you can't get hold of. That's this thing City Wow Well I can't get it. So the yoga teacher sets you to doing this as fast as you can get you go as ruthless that is really that who are you find out when you breathe what is Green find out what you know what is know you Get to the root of the matter! Ask, ask, ask, and enquire, enquire, enquire. And one day, it all becomes clear. And it's so simple, that it's the most difficult thing in the world explained. It's like, you just see, well this is it, this is the way it is. There is no problem about it. Death. Suffering. These aren't problems. They're awful, if they are problems, the worst kind of suffering is that if you think there might be a way out of. When you know there isn't it is easier to bear. So, in this sense of it all being perfectly clear and simple and transparent. This experience now that you're having at this moment is what it's about. This is the beatific vision, this is cosmic consciousness, this is where it's at it. And it just becomes clear like that. But you see when you say that to someone or may not have had such an experience, they say, mmm, so what? Do you mean it's just it's just what's going on now? I would say why do you use the word just for what's going on now. Because that means you're only half awake. If awake at all. You are bolting your life, like some people both the food, and you think you've experience now. What you say I have now after now after now after now after now I'll look up in the dump book that was done book that goes down but that was not the still feel hungry I want a good one I hope that somewhere down on the end of the line in the future it's going to be a sudden now experience which will be noowwwww, that's the thing I wanted! But tomorrow never comes.

Intro to Oriental Philosophy

The very fact that you are here, at all, to listen to this sort of thing, indicates as all philosophy indicates, that there is some unrest. That to be a human being is in some way problematic. That there is such a thing as a life problem. And different people have different ways of expressing it. But

there is the reality of what is called in Buddhism, dukkha, a very comprehensive word generally translated “suffering”. But which might more accurately be called chronic frustration.

And I first of all want to try and identify what this human problem is. And we start out from the fact that most of us have a puzzle with ourselves. Not so much with other people, but oneself. Lots of people say that they do various things, like go to the movies, or get absorbed in work or read novels in order to forget themselves. It’s very commonly said “I want to get away from myself.” And when we are left alone with ourselves in silence and there is no distraction civilized people- whether they belong to the Eastern cultures or the Western cultures tend to feel uncomfortable. This is especially true of Americans who like to live in an environment of constant noise. And to keep their minds busy. What is so much the matter with oneself that you can’t stand it? Well first of all we don’t know what it is, your self is the most difficult thing to get a look at. Because in just the same way that you cannot bite your own teeth. But you cannot look straight into your eyes without the aid of a mirror. That you are not apparently directly aware of your brain. For all this reason your self is too close to you for you to look at. And it always remains an unknown, a kind of of a blind spot in the middle of everything. What color is your head to your eyes? Most people have a vague impression that the high in the eyes there is a blank- It isn’t black, It certainly isn’t white, and you can turn around for all your worth and never see it. What is behind the eyes? We don’t know. But we have ideas about it. And the dominant idea which most people have is that there is something called “I”. When you use the word I, to what sensation do you refer? In what way do you experience “I” as something existing.

Well I’ve made a great deal of inquiries into this. And looking at it from the way most people talk. They think of “I, myself” as a center of awareness and of action- about halfway between ears and a little way behind the eyes. Most people don’t identify myself with their whole body. Because we say in popular speech, “I have a body.” We are not liable to say “I am a body”. We don’t feel that certain things that go on in our bodies are things for which “I, Ego” am responsible. We don’t say “I beat my heart”. We don’t say “I grow my hair,” because we experience the beating of the heart and the growing of the hair as something that happens to us. We feel our bodies are vehicles,

like cars, which were given to us by our parents, and into which at some point in our development, the ego was deposited. Pop. When did you begin to be you? All sorts of theories about that.

But generally speaking, I think of myself as the source of voluntary action and of conscious attention. And therefore outside myself as I both inside the body and definitely outside the skin everything else is experienced as not I, as other, as being very largely beyond control. And as in a way alien to me. In the words of the poet Housman "I, a stranger and afraid in a world I never made." And here lies the root of problems. Because it appears that "I" isn't really very permanent. At least it's messed up with or mixed up with a body that grows old and gets achy and inconvenient and finally dissolves. Then what's going to happen to me? Maybe I'm not afraid of actual death, especially if I believe that death is simply extinction- total unconsciousness is nothing to be afraid of in that. But it's the process of dying that so inconvenient. One is so hard to get rid of.

And so why? I mean why am I trapped in this situation? I didn't ask to come here. We say in popular speech I came into this world. We experience this world as other than ourselves in the sense that we say you confront reality, out there, you must face facts, out there and facts are always of course hard facts, nobody ever talks about soft facts but there are lots of them. So this is a sensation of we could call it generally of alienation from the universe. Now of course, it isn't true that you came into this world. You came out of it, as leaves come out of a tree. As a baby comes out of the womb. You're a symptom of the world, in the same way that when a tree produces apples you call it an apple tree. And a world that produces people is a world that peoples just as an apple tree apples. In fact our whole situation, of feeling that we are strangers in the earth is a hallucination. And a rather dangerous hallucination, because it moves us to act upon the external world, both of people and of things in a hostile spirit. So that we talk about the conquest of nature. And this general feeling of resentment, of being involved in a world where there are such things as death, disease, accidents, strife, war; we feel put upon.

So, the various forms of Asian philosophy address themselves directly to this problem. But they are not like philosophy in the West and they are not

like religion in the West. If religion is something like Judaism or Christianity. Then Buddhism is not a religion. If philosophy is something like this speculations of Kant or Heigel, or even modern philosophers such as Kair and Reichenbach, then Eastern thought is not philosophy. The nearest thing to eastern philosophy in the West is psychotherapy. Because the objective of psychotherapy is to change the way in which people feel. It is, in other words, a technique for changing one's state of consciousness. And so in exactly that way these systems that I'm going to talk you about: Hinduism, Buddhism, and Taoism are primarily methods for changing one's state of consciousness. If, for example, the person is crazy and feels that he is the center of an enormous plot to persecute him, the object of the psychotherapist is to disabuse him of this illusion and get rid of his state of fear.

So in a rather similar way, let us suppose that normal people are simply sharing a collective insanity which because it's normal they think is the ordinary way to be. It is perfectly clear I think, that the world is insane. That we are on a collision course. And that therefore there is something to be said for the idea that the normal person's state of consciousness might do with a change. Especially if it's hallucination. And especially if the way we feel our own existence is in flat contradiction to the way our existence would be described by a scientist such as a biologist, or an ecologist, or a physicist. You know I think ecology is a very important science having to do with the relationship between organisms and their environments. Now, when an ecologist or a biologist looks at a living organism, the business of science is to describe what's happening. And he describes the living organism. He finds out a very funny thing. He cannot describe the organism, defined as something bounded by an epidermis, without also describing its environment. See science describes behavior: what is going on. The man behind the microscope has this advice for you: instead of asking what it is just ask what does it do. So the behavior of an organism cannot be described without also describing the behavior of the environment. If I describe somebody in the act of walking and I say nothing about the floor or the area or room or whatever in which he's walking all I'm describing is a body in empty space dangling its legs. That's not walking. To describe walking I have to describe the other behaviors or processes going on around the organism. Well what does that tell me when I

find that out? It tells me that what I am talking about is not the organism alone, but something for which we've got only the clumsy term "organism environment". Because you see that's what you are. Imagine how could you feel the existence of yourself unless at the same time you felt something other?

How could you aspire any kind of figure, shape, form unless at the same time you saw its background? Supposing the outlines of my body were co-terminus with your whole field of vision. You wouldn't see me. You'd see the microphone, the neck tie or pattern on the shirt that would be the thing you were looking at because you can only recognize anything if it goes along with a background. Which is telling us that figure and ground are inseparable. They are different, yes. You have to get the crucial idea of things being different but inseparable. As for example, the two poles of a magnet are inseparable. You can't have a one pole magnet. But they're different the two sides of a coin are different but inseparable. And so there is a word that I've coined called "go-with". There are certain things that go with each other. And the organism goes with the environment. And incidentally the environment goes with the organism- that's harder for us to see but I shall explain it in due course.

A go-withness is a transaction. For example, when we buy and sell that is a transaction- now obviously you can't buy unless somebody is selling. And you can't sell unless someone is buying. The operations are different. Buying is different from selling, but they're inseparable. And that suggests a certain kind of conspiracy between them. They're explicitly different operations buying and selling but they're implicitly one. You and everything you call "other" are explicitly different. But since you always find these two aspects of experience together there's a there's a kind of something fishy about it. That isn't noticed, that's been overlooked. And that is that they're implicitly one. But you see in the ordinary course of events, as I've explained, we are not aware of this. And we think that everything not-self, Or in other words "other" is not merely different from us- but separate. And therefore have this sense of not really belonging in this universe, of finding nature a problem and that's compounded by the current superstitions of the modern world- the mythology of 19th century science which is everybody's common sense today- that the world itself is stupid. That it's a huge system

of electronic energy buzzing, mindlessly. In which we exist by virtue of some statistical flukes.

You know that if a million monkeys sat with a million typewriters for a million years in some course, in some day they would type out the Encyclopedia Britannica. They'd eventually have to get around to it, by just chance. so there's the feeling among many people that what we are at this moment is just such an event. And that therefore if we are going to maintain the human order, our values, our reason, our civilization, we've got to fight the world to maintain it. Because the world is stupid. So in the philosophy of science in the nineteenth century, you hear people talking about energy lying behind matter as blind energy. Freud defines psychic energy as the unconscious and furthermore calls it libido which means blind lust- it's stupid, the unconscious is stupid, it wants pleasure. And has no sense of reality. And therefore Freud would oppose the pleasure principle to the reality principle. And therefore civilization is always thought of as being against pleasure because if you let people enjoy themselves too much they'll fall apart. Because the pleasure principle the pleasure urge is stupid, by definition.

So you see then we have the sensation of living in an alien world. All this is further complicated by other factors which I must now go on to explain. The feeling of insularity, of being "I, alone and separate" has something to do with the way in which we pay attention to life, and with the way in which we think about it- and these two things go together. The task of any school teacher with little children is to increase- isn't it- their attention span. Little children are allegedly, although this isn't always true, little children are supposed not to pay attention to anything particularly for very long. They run from one thing to another, they look out of the window, they pick their noses, they moon around and so the teacher has to rap the desk and say "pay attention!". And all the little children know exactly what's expected of them. That is to wrap their legs tightly around the legs of the chair and stare at the teacher with a slight frown- that is paying attention. It has nothing to do with paying attention, it is simply an act. But what it does suggest is that we feel that paying attention or concentration involves a certain strain.

And [it] actually has nothing to do with it. Concentration is hindered by strain. But we all say ‘try to pay attention’, ‘try to think’, ‘try to understand what I’m saying’; you don’t have to, your brain will do it for you beautifully if you just give it a chance. Your brain isn’t a muscle. You need effort, yes, to lift something heavy. But you don’t have to make an effort to think a complicated thought, if you do the effort will get in the way of the thinking, that will distract you. But everyone thinks that that’s what you have to do. So what you call “I”, the sensation of I, is among other things a chronic sense of mental strain. And it is physiologically located between the eyes. It’s been found out that if you relax all sense of tension between the eyes you will change your sense of your own existence. But that’s where it is. And that’s why the frown comes. And that’s why of course Buddhas are always depicted with a bright jewel between the eyes. A sign of openness, of illumination. The next thing is you see when you pay attention, don’t we say in ordinary speech that you can only think of one thing at a time? What do you mean that? It raises two questions. Why can we only think of one thing at a time? And what is a thing? I love asking children “what do you mean by a thing?” And they will say “an object” which is another way of saying a thing, it doesn’t help at all. One very smart child once said to me “a thing is a noun”. And she’s quite right. Because you can’t think. And to think and to thing of the same process without using words or notation of some kind. You can think in words, you can think in numbers, and you can think in simple images like squares triangles crosses as when we think in terms of road signs that mean certain things.

But thinking is the process of calculus. It is examining the world bit-by-bit, in series, one after another one bit after another. It’s as if we were looking at a dark room with the aid of a narrow beam spotlight and tracing it out all over the room and then in memory piecing together the bits, the series of bits over which this beam passed, and then we construct from that what sort of a room this is. A floodlight would of course be quite different. With a floodlight like this we see the whole room in a glance and we don’t have to bit it. But we see actually an enormous amount of things of which we never pay attention to. For example, if someone were to say about a particular woman at this gathering: “was Mrs So and So there this morning?” I say “yes she was there she sat opposite me,” “what was she wearing?” Well I tell you I have no idea. I saw it, but I didn’t notice it. Why didn’t I notice it?

Because I wasn't interested, I might have been interested in a face but I wasn't interested in what she was wearing. Therefore I had no notation for it because it wasn't noteworthy. Now you see then when we use notation what we do is we select we pay attention to those features of the environment which we have been taught to regard as significant, important. And then we stick a label on them. That label is a word, a symbol of some kind or number. And in this way we fragment the world into bits called things. Or events, things are represented by noun-labels and events are represented by verb-labels. And so we come to imagine that the world really does consist of separate things and events. And it doesn't. And that's a very difficult idea for people to grasp. The reason is you see that we've found this method of thinking about the world so useful for predicting what will happen, for remembering what did happen, and in order to predict what will happen- it is based on remembering what did happen- that it's run away with us.

And as a species we are seriously in danger of being completely fooled by our own thinking processes. I can give some very simple illustrations of this. One of the main symbols which all civilized people use is money. It's a very convenient symbolism because it gets rid of the necessity for barter. Of having to go down to the store with a truckload of eggs in order to buy some clothes. So we use money instead. And when you go to the supermarket, and you roll up to the cashier a great cart full of goodies and the girl goes tickity tickity tickity this long tape comes out and she says thirty dollars please. Most Housewives feel slightly depressed at parting with thirty dollars. Whereas they've got the real wealth in the cart. That's what you've got. You've got rid of some paper. But you've got edible goodies in the cart. Something's wrong with you. And we are witnessing right now a major crisis economically because of so stupid a thing called Gold. Which has some use for filling teeth and making jewelry but when hoarded in vast vaults and fortresses it is completely useless doing nothing. But the superstition you see that gold is wealth. Or that money is wealth is the confusion of the symbol with the reality. Take it far enough and people will start eating menus instead of dinners. And as a matter of fact are so doing. Our bread, for example, the bread we eat in the ordinary way that you buy in the ordinary grocery, is symbolic bread. It is a purely nothing but squishy styrofoam injected with allegedly nutritive chemicals.

This is a conglomeration of plastic bubbles, which had some vague original connection with wheat. It is it is pure rat poison. The only trouble with it is that it isn't large enough or permanent enough to be used as a bolster. But this is being eaten all over, in the superstition that this is this is food, it's symbolic food. It's an imitation of what mama's new bread used to look like and feel like, you know when it first came out of the oven it was a little squishy. That's what everybody was looking for, but they've been fooled. Same with the car. The average American car looks as if it were a streamlined thundering rocket. Now it isn't, because a an engine of that kind is not streamlined unless it's streamlined underneath as well as on top. And all it is is a fake, imitation of streamlined plunked down with an open bottle on a chassey. They even have Cadillacs have fake rocket exhausts on the backs where the little vents as if there were an engine right somewhere in that thing as a jet engine is in a capsule on a plane. They see the thing is, the thing is front, it's a pose it's it's a- it's a fake. So you see, what is happening to us and is the ability to think has gone to our heads. And we have to go out of our minds to come to our senses.

It's like this has happened in the past in the course of evolution, there was a prehistoric animal called titanithea[sic]. Which was a sort of forbear of the rhinoceros. And it had a nose horn which was of course a very useful weapon. But this thing kept developing the nose horn because it was so useful until it got bigger and bigger and bigger and at last the creature couldn't hold its head up and it became extinct- too much of a good thing. The dinosaurs, became too big, they found bigness was an advantage over other animals but they overdid it- they had to have one brain in the head and another in the rump. So that some caveman you know has a pet dinosaur and when he goes to bed at night he takes his club and bangs it on the tail and it screams in time to wake him up in the morning. So it became extinct. So the human being can become extinct through overdoing his head, by thinking too much.

The very fact that you are here, at all, to listen to this sort of thing, indicates as all philosophy indicates, that there is some unrest. That to be a human being is in some way problematic. That there is such a thing as a life problem. And different people have different ways of expressing it. But there is the reality of what is called in Buddhism, dukkha, a very

comprehensive word generally translated “suffering”. But which might more accurately be called chronic frustration.

And I first of all want to try and identify what this human problem is. And we start out from the fact that most of us have a puzzle with ourselves. Not so much with other people, but oneself. Lots of people say that they do various things, like go to the movies, or get absorbed in work or read novels in order to forget themselves. It’s very commonly said “I want to get away from myself.” And when we are left alone with ourselves in silence and there is no distraction civilized people- whether they belong to the Eastern cultures or the Western cultures tend to feel uncomfortable. This is especially true of Americans who like to live in an environment of constant noise. And to keep their minds busy. What is so much the matter with oneself that you can’t stand it? Well first of all we don’t know what it is, your self is the most difficult thing to get a look at. Because in just the same way that you cannot bite your own teeth. But you cannot look straight into your eyes without the aid of a mirror. That you are not apparently directly aware of your brain. For all this reason your self is too close to you for you to look at. And it always remains an unknown, a kind of of a blind spot in the middle of everything. What color is your head to your eyes? Most people have a vague impression that the high in the eyes there is a blank- It isn’t black, It certainly isn’t white, and you can turn around for all your worth and never see it. What is behind the eyes? We don’t know. But we have ideas about it. And the dominant idea which most people have is that there is something called “I”. When you use the word I, to what sensation do you refer? In what way do you experience “I” as something existing.

Well I’ve made a great deal of inquiries into this. And looking at it from the way most people talk. They think of “I, myself” as a center of awareness and of action- about halfway between ears and a little way behind the eyes. Most people don’t identify myself with their whole body. Because we say in popular speech, “I have a body.” We are not liable to say “I am a body”. We don’t feel that certain things that go on in our bodies are things for which “I, Ego” am responsible. We don’t say “I beat my heart”. We don’t say “I grow my hair,” because we experience the beating of the heart and the growing of the hair as something that happens to us. We feel our bodies are vehicles, like cars, which were given to us by our parents, and into which at some

point in our development, the ego was deposited. Pop. When did you begin to be you? All sorts of theories about that.

But generally speaking, I think of myself as the source of voluntary action and of conscious attention. And therefore outside myself as I both inside the body and definitely outside the skin everything else is experienced as not I, as other, as being very largely beyond control. And as in a way alien to me. In the words of the poet Housman "I, a stranger and afraid in a world I never made." And here lies the root of problems. Because it appears that "I" isn't really very permanent. At least it's messed up with or mixed up with a body that grows old and gets achy and inconvenient and finally dissolves. Then what's going to happen to me? Maybe I'm not afraid of actual death, especially if I believe that death is simply extinction- total unconsciousness is nothing to be afraid of in that. But it's the process of dying that so inconvenient. One is so hard to get rid of.

And so why? I mean why am I trapped in this situation? I didn't ask to come here. We say in popular speech I came into this world. We experience this world as other than ourselves in the sense that we say you confront reality, out there, you must face facts, out there and facts are always of course hard facts, nobody ever talks about soft facts but there are lots of them. So this is a sensation of we could call it generally of alienation from the universe. Now of course, it isn't true that you came into this world. You came out of it, as leaves come out of a tree. As a baby comes out of the womb. You're a symptom of the world, in the same way that when a tree produces apples you call it an apple tree. And a world that produces people is a world that peoples just as an apple tree apples. In fact our whole situation, of feeling that we are strangers in the earth is a hallucination. And a rather dangerous hallucination, because it moves us to act upon the external world, both of people and of things in a hostile spirit. So that we talk about the conquest of nature. And this general feeling of resentment, of being involved in a world where there are such things as death, disease, accidents, strife, war; we feel put upon.

So, the various forms of Asian philosophy address themselves directly to this problem. But they are not like philosophy in the West and they are not like religion in the West. If religion is something like Judaism or

Christianity. Then Buddhism is not a religion. If philosophy is something like this speculations of Kant or Heigel, or even modern philosophers such as Kair and Reichenbach, then Eastern thought is not philosophy. The nearest thing to eastern philosophy in the West is psychotherapy. Because the objective of psychotherapy is to change the way in which people feel. It is, in other words, a technique for changing one's state of consciousness. And so in exactly that way these systems that I'm going to talk you about: Hinduism, Buddhism, and Taoism are primarily methods for changing one's state of consciousness. If, for example, the person is crazy and feels that he is the center of an enormous plot to persecute him, the object of the psychotherapist is to disabuse him of this illusion and get rid of his state of fear.

So in a rather similar way, let us suppose that normal people are simply sharing a collective insanity which because it's normal they think is the ordinary way to be. It is perfectly clear I think, that the world is insane. That we are on a collision course. And that therefore there is something to be said for the idea that the normal person's state of consciousness might do with a change. Especially if it's hallucination. And especially if the way we feel our own existence is in flat contradiction to the way our existence would be described by a scientist such as a biologist, or an ecologist, or a physicist. You know I think ecology is a very important science having to do with the relationship between organisms and their environments. Now, when an ecologist or a biologist looks at a living organism, the business of science is to describe what's happening. And he describes the living organism. He finds out a very funny thing. He cannot describe the organism, defined as something bounded by an epidermis, without also describing its environment. See science describes behavior: what is going on. The man behind the microscope has this advice for you: instead of asking what it is just ask what does it do. So the behavior of an organism cannot be described without also describing the behavior of the environment. If I describe somebody in the act of walking and I say nothing about the floor or the area or room or whatever in which he's walking all I'm describing is a body in empty space dangling its legs. That's not walking. To describe walking I have to describe the other behaviors or processes going on around the organism. Well what does that tell me when I find that out? It tells me that what I am talking about is not the organism

alone, but something for which we've got only the clumsy term "organism environment". Because you see that's what you are. Imagine how could you feel the existence of yourself unless at the same time you felt something other?

How could you aspire any kind of figure, shape, form unless at the same time you saw its background? Supposing the outlines of my body were co-terminus with your whole field of vision. You wouldn't see me. You'd see the microphone, the neck tie or pattern on the shirt that would be the thing you were looking at because you can only recognize anything if it goes along with a background. Which is telling us that figure and ground are inseparable. They are different, yes. You have to get the crucial idea of things being different but inseparable. As for example, the two poles of a magnet are inseparable. You can't have a one pole magnet. But they're different the two sides of a coin are different but inseparable. And so there is a word that I've coined called "go-with". There are certain things that go with each other. And the organism goes with the environment. And incidentally the environment goes with the organism- that's harder for us to see but I shall explain it in due course.

A go-withness is a transaction. For example, when we buy and sell that is a transaction- now obviously you can't buy unless somebody is selling. And you can't sell unless someone is buying. The operations are different. Buying is different from selling, but they're inseparable. And that suggests a certain kind of conspiracy between them. They're explicitly different operations buying and selling but they're implicitly one. You and everything you call "other" are explicitly different. But since you always find these two aspects of experience together there's a there's a kind of something fishy about it. That isn't noticed, that's been overlooked. And that is that they're implicitly one. But you see in the ordinary course of events, as I've explained, we are not aware of this. And we think that everything not-self, Or in other words "other" is not merely different from us- but separate. And therefore have this sense of not really belonging in this universe, of finding nature a problem and that's compounded by the current superstitions of the modern world- the mythology of 19th century science which is everybody's common sense today- that the world itself is stupid. That it's a huge system

of electronic energy buzzing, mindlessly. In which we exist by virtue of some statistical flukes.

You know that if a million monkeys sat with a million typewriters for a million years in some course, in some day they would type out the Encyclopedia Britannica. They'd eventually have to get around to it, by just chance. so there's the feeling among many people that what we are at this moment is just such an event. And that therefore if we are going to maintain the human order, our values, our reason, our civilization, we've got to fight the world to maintain it. Because the world is stupid. So in the philosophy of science in the nineteenth century, you hear people talking about energy lying behind matter as blind energy. Freud defines psychic energy as the unconscious and furthermore calls it libido which means blind lust- it's stupid, the unconscious is stupid, it wants pleasure. And has no sense of reality. And therefore Freud would oppose the pleasure principle to the reality principle. And therefore civilization is always thought of as being against pleasure because if you let people enjoy themselves too much they'll fall apart. Because the pleasure principle the pleasure urge is stupid, by definition.

So you see then we have the sensation of living in an alien world. All this is further complicated by other factors which I must now go on to explain. The feeling of insularity, of being "I, alone and separate" has something to do with the way in which we pay attention to life, and with the way in which we think about it- and these two things go together. The task of any school teacher with little children is to increase- isn't it- their attention span. Little children are allegedly, although this isn't always true, little children are supposed not to pay attention to anything particularly for very long. They run from one thing to another, they look out of the window, they pick their noses, they moon around and so the teacher has to rap the desk and say "pay attention!". And all the little children know exactly what's expected of them. That is to wrap their legs tightly around the legs of the chair and stare at the teacher with a slight frown- that is paying attention. It has nothing to do with paying attention, it is simply an act. But what it does suggest is that we feel that paying attention or concentration involves a certain strain.

And [it] actually has nothing to do with it. Concentration is hindered by strain. But we all say ‘try to pay attention’, ‘try to think’, ‘try to understand what I’m saying’; you don’t have to, your brain will do it for you beautifully if you just give it a chance. Your brain isn’t a muscle. You need effort, yes, to lift something heavy. But you don’t have to make an effort to think a complicated thought, if you do the effort will get in the way of the thinking, that will distract you. But everyone thinks that that’s what you have to do. So what you call “I”, the sensation of I, is among other things a chronic sense of mental strain. And it is physiologically located between the eyes. It’s been found out that if you relax all sense of tension between the eyes you will change your sense of your own existence. But that’s where it is. And that’s why the frown comes. And that’s why of course Buddhas are always depicted with a bright jewel between the eyes. A sign of openness, of illumination. The next thing is you see when you pay attention, don’t we say in ordinary speech that you can only think of one thing at a time? What do you mean that? It raises two questions. Why can we only think of one thing at a time? And what is a thing? I love asking children “what do you mean by a thing?” And they will say “an object” which is another way of saying a thing, it doesn’t help at all. One very smart child once said to me “a thing is a noun”. And she’s quite right. Because you can’t think. And to think and to thing of the same process without using words or notation of some kind. You can think in words, you can think in numbers, and you can think in simple images like squares triangles crosses as when we think in terms of road signs that mean certain things.

But thinking is the process of calculus. It is examining the world bit-by-bit, in series, one after another one bit after another. It’s as if we were looking at a dark room with the aid of a narrow beam spotlight and tracing it out all over the room and then in memory piecing together the bits, the series of bits over which this beam passed, and then we construct from that what sort of a room this is. A floodlight would of course be quite different. With a floodlight like this we see the whole room in a glance and we don’t have to bit it. But we see actually an enormous amount of things of which we never pay attention to. For example, if someone were to say about a particular woman at this gathering: “was Mrs So and So there this morning?” I say “yes she was there she sat opposite me,” “what was she wearing?” Well I tell you I have no idea. I saw it, but I didn’t notice it. Why didn’t I notice it?

Because I wasn't interested, I might have been interested in a face but I wasn't interested in what she was wearing. Therefore I had no notation for it because it wasn't noteworthy. Now you see then when we use notation what we do is we select we pay attention to those features of the environment which we have been taught to regard as significant, important. And then we stick a label on them. That label is a word, a symbol of some kind or number. And in this way we fragment the world into bits called things. Or events, things are represented by noun-labels and events are represented by verb-labels. And so we come to imagine that the world really does consist of separate things and events. And it doesn't. And that's a very difficult idea for people to grasp. The reason is you see that we've found this method of thinking about the world so useful for predicting what will happen, for remembering what did happen, and in order to predict what will happen- it is based on remembering what did happen- that it's run away with us.

And as a species we are seriously in danger of being completely fooled by our own thinking processes. I can give some very simple illustrations of this. One of the main symbols which all civilized people use is money. It's a very convenient symbolism because it gets rid of the necessity for barter. Of having to go down to the store with a truckload of eggs in order to buy some clothes. So we use money instead. And when you go to the supermarket, and you roll up to the cashier a great cart full of goodies and the girl goes tickity tickity tickity this long tape comes out and she says thirty dollars please. Most Housewives feel slightly depressed at parting with thirty dollars. Whereas they've got the real wealth in the cart. That's what you've got. You've got rid of some paper. But you've got edible goodies in the cart. Something's wrong with you. And we are witnessing right now a major crisis economically because of so stupid a thing called Gold. Which has some use for filling teeth and making jewelry but when hoarded in vast vaults and fortresses it is completely useless doing nothing. But the superstition you see that gold is wealth. Or that money is wealth is the confusion of the symbol with the reality. Take it far enough and people will start eating menus instead of dinners. And as a matter of fact are so doing. Our bread, for example, the bread we eat in the ordinary way that you buy in the ordinary grocery, is symbolic bread. It is a purely nothing but squishy styrofoam injected with allegedly nutritive chemicals.

This is a conglomeration of plastic bubbles, which had some vague original connection with wheat. It is it is pure rat poison. The only trouble with it is that it isn't large enough or permanent enough to be used as a bolster. But this is being eaten all over, in the superstition that this is this is food, it's symbolic food. It's an imitation of what mama's new bread used to look like and feel like, you know when it first came out of the oven it was a little squishy. That's what everybody was looking for, but they've been fooled. Same with the car. The average American car looks as if it were a streamlined thundering rocket. Now it isn't, because a an engine of that kind is not streamlined unless it's streamlined underneath as well as on top. And all it is is a fake, imitation of streamlined plunked down with an open bottle on a chassey. They even have Cadillacs have fake rocket exhausts on the backs where the little vents as if there were an engine right somewhere in that thing as a jet engine is in a capsule on a plane. They see the thing is, the thing is front, it's a pose it's it's a- it's a fake. So you see, what is happening to us and is the ability to think has gone to our heads. And we have to go out of our minds to come to our senses.

It's like this has happened in the past in the course of evolution, there was a prehistoric animal called titanithea[??]. Which was a sort of forbear of the rhinoceros. And it had a nose horn which was of course a very useful weapon. But this thing kept developing the nose horn because it was so useful until it got bigger and bigger and bigger and at last the creature couldn't hold its head up and it became extinct- too much of a good thing. The dinosaurs, became too big, they found bigness was an advantage over other animals but they overdid it- they had to have one brain in the head and another in the rump. So that some caveman you know has a pet dinosaur and when he goes to bed at night he takes his club and bangs it on the tail and it screams in time to wake him up in the morning. So it became extinct. So the human being can become extinct through overdoing his head, by thinking too much.

On Hinduism

In the last session of this particular course, which is an introduction to Oriental Philosophy, I tried to condense the fundamental principles of what you can call the central viewpoint of Hinduism, Vedanta. Not so much the

doctrine, as the experiential realization of what you are, is basically it is the same as the root of the ground of the universe. In other words in the Atman, the Self, is Brahman, the ground of being. Now today, I want to relate this way of playing hide and seek, with the very design of Hindu society. Because Hinduism is difficult to characterize as a religion, especially because we belong to a religion where in its institutionalized form, it can very well degenerate into a religion that's for Sundays only. That doesn't apply to every detail of life. In other words, when a Hindu brushes his teeth, it's a religious act. There is not such a thing as a Christian way of brushing the teeth. But in Hindu life, all the details of life, are Hinduism.

So then, underneath all the presuppositions of Hinduism, can be found a transition from one kind of culture to another from my hunting culture to an agrarian culture. And this explains a great deal about this way of life. Now in a hunting culture, which is a culture on the move. Nomadic. Every man knows the whole culture. In other words, you do not get a high specialization, division of labor. A man who is a hunter has to know how to make clothes how to skin animals, how to cook them, how to shoot them, how to train them. He has to know everything kind of skill, because he's often alone. And in a hunting culture, you do not get a special division, of priesthood from ordinary people. Every man, in his own way, is capable of being a priest, but some moreso than others, not by virtue of any ordination all schooling that they have received, but by their receptivity. Because the priest, or holy man of a hunting culture is called a shaman. A shaman is an individual who separates himself from society for a certain period, and goes alone into forests all mountains to commune with what he will usually call the ancestors. That is to say, with his basic origins. And he will find something, by way of a spiritual experience, for himself, not through any teacher, not through any previous authority. He finds it genuinely on his own. And the shaman therefore goes into solitude, to find out who he really is. Because in society everybody is busy telling you are, and you rely on others to see yourself but to find himself in other words to find out what all this really is all about, the spiritually minded man of the hunting culture goes alone. And so the culture of the American Indians, is to a very large extent hunting culture and you will find the spiritual man of the American Indians is a shaman.

However, when the hunting culture becomes settled, it becomes agrarian, there arises farming, looking after the land, and then you get a completely different kind of society. Let me suggest that it's something like this: where do agrarian communities settle? Where do they build a village? Usually at a crossroads, especially if roads be crossed with water. A river. And where the crossing meets, the agrarian village settles itself and protects itself by building a pale. We say a person 'is beyond the pale.' That means he's an outcast, he lives outside that he's a pariah. But in the village notice that the pale having been built around the crossroads, it divides the village into four sections. And oddly enough, there are four divisions of labor, in all fundamental agrarian societies.

And these consist of one, the priests. You know the word clever, clerk, cleric, and clear, are all the same word. It meant, someone who was literate. Clever, or so clear, put it down a clear, you can't do that unless you're literate. And so, if you're a literate person, you're a cleric, and clergy is the same word as a clever in Old English. 'Much conceit of clergy' is an old English phrase meaning, 'he's intellectually snobbish.'

So, that's your process number one, cause number two, warrior, or incidentally, ruler. Three, merchant, or craftsman, and four, laborer. Unskilled. So now what are these? They are four castes, or four roles, and say in society, where the division of labor because an agricultural society is more complex than a hunting culture. We immediately get a division of labor, and we all play different roles. That is to say, we assume different masks, for purposes of living in this kind of community all of you you see are essentially our essentially clerics. You are what the Hindus would call Brahmen pals you are all being trained in the university.

So the Hindu name for this class is Brahmana, for this class Kshatriyas, for this class Vaishyas and for this class, Shudras. So those are the basis for the four castes. And so if you are in the pail, if you belong to the community, you have to be typified. They say 'Is you is, or is you ain't?' into which of these do you fit? And you must fit into one of these. Now caste is something, of course, which has got a very bad then from the modern point of view both modern form the view with us, and with the modern India. Because they say once you get into a caste, you are stuck, if you have gone

to it there are a laborer you must be. If you are born to a warrior, you must be a warrior or a ruler you will never become a character. And we think that's pretty terrible. Because in our culture we work under the assumption that you as an individual are free to choose whatever occupation you will follow.

But unfortunately, this involves going to school. And for certain purposes, going to school is one of the worst things you can do. For example, if you want to become a completely fantastic expert carpenter, you have to begin the trade at the age of seven at the latest. And your father if he is a carpenter is obviously the best teacher you can have. In a very ancient form of agrarian culture, as in India or as in Japan or China. A young man who was son of a carpenter would become fascinated with his father's occupation, and that would mean a very special relationship would grow up between him and his father which does not grow up in our product because most of us do not know what off of the doing. They go away to a mysterious office all factory where they do something called making money, as an incidental, as the main reason for the incidental occupation which they pursue there. But the children on the wife have no active part in that occupation whatsoever. They know Papa only as a kind of clown, who returns home in the evening having made money, and one dad's money is the same as another dad's money it makes no difference except that everybody wants more. They don't give a damn how he gets it, so long as he doesn't complain too much. So the child, instead of learning and participating in his close father relationship in learning an occupation or a trade, is sent off to an impersonalized institution, to be taught to be everything and nothing. And therefore doesn't learn early enough any craft so as to become a true master of it. What is happening, for example in Japan, where a father can no longer apprentices some seven years old to become a carpenter, because he has to send him away to school, to learn to be an insurance salesman. He can't teach his child and then comes high school and then with a kid gets out of high school is interested and girls. And it takes him until he's about twenty-two to be able to settle down and on top of this today. Too late to attain real mastery, because a great Japanese cop and never uses a plan, he doesn't need to draw does it all by. And can fit the most complicated joinery together. By eye. And it's the same with the arts of weaving textiles,

that making superb ceramics, jewelry, any kind of gorgeous craftsmanship, depends on beginning it as a child.

And so, we can't buy it anymore in this country. There is not, on any kind of commercial basis great craftsmanship available here. We have to go abroad to get, to or so-called primitive societies. We must be content with plastics in the way. So it is something to be said for the castes of them I just wanted to present the other side of it. Now however, in going through this system, there are certain stages, whatever class you're in. There are three stages of life, which are called Ashramas. Which really means abode. A Center for Spiritual study for practicing yoga will be called an Ashram, but an ashram also means an abode in the sense of a stage of life. And the three stated in are one, called Brahmacharya That means, the stage of being a student. Two, Grihastha, householder. And the third stage, Vanaprastha, that means forest-dweller. Isn't that funny? Grihastha, householder, Vanaprastha, forest-dweller. Because you see, in this order of society, you come into society and you go through one of its acts as a Grihastha, householder. But when you arrive at a point in life where you have got a son. By Beth from yourself all by the marriage of your oldest daughter and a son who will take over your work. You give up being a householder, and you become a forest-dweller. In other words, you go outside the pail and back to the forest, with the idea of finding out who you really are. While you were in the community, you were playing a role one of the four roles, or its subdivisions and you came on as tinker, tailor, soldier, sailor, richman, poorman, beggarman, thief.

But that wasn't the real you, that was one of the masks of the Brahman, the true Self behind everything. To find out the Brahman, who you really are, in order to get ready to die, you become Vanaprastha. Go back to the jungle, having fulfilled your work with the world. Now in practice in India, this means that the head of the house often moves to a cottage in the backyard. You know it because the time everything sort of becomes going through the motions. But the original idea, was that he became Sramana. From it's almost the word shaman. A Sraman is a person, who's gone back to live in the forest, and therefore he isn't a god to society and up our There also log out. It's those of the Aborigines. The people living in India before the Aryan invasion. Who later became the untouchables. They are not even

Shudra, that outside caste together. Like the Indians in the United States. They are true untouchables in our cost system, and their plight is so much worse than the negroes its unbelievable. But they are costs so with the same thing happening. But the upper outcast is a man who goes wild. And in India society, you have the right to do that, you are respected if you voluntarily abandon the caste, and of course in doing so you give up your name. And you take another name.

Now taking a new name is taking a new identity. An Indian in society may be Mr. Mukupacharya. And that would be a family name indicating membership in a family. When he becomes a Sramana however, he will take a name such as Brahmananda. Bliss of God. He takes a divine name. And the original idea of a Christiannname, when you were baptized, is that you gave up the name. Julius as you might be a Roman, and took on instead the name Mathew. One of the Apostles one of the divine beings of the Christian religion or you might take the name of an angel, named Michael. Or in Spain or Mexico even, Jesus. Jesus Maria would be perfectly reasonable for a man in Spanish culture. But you take on a divine name to indicate a transformation of your identity. But in this case, when you give up caste you see, and return to the forest, you become a nobody. And therefore you take one of the names off that which is no longer, namely the Brahma the supreme Self, because it's no one in the sense that it's all one. And therefore in itself nobody.

So you abandon caste and you abandon name, you give up property and you give up, both the responsibility and society is allowed to give up responsibility for you. If they give you alms if they support you that's for gravy. They don't have to do it, and you don't figure that they go to. But this of this kind of society has a profound respect for people who leave it. And they feel that a society cannot be healthy unless it somehow pays respect to people outside the pail. To non-joiners and outsiders, who have indeed fulfilled some responsibility within society and then abandoned it. They would I think be a little uptight about hippies, who would abandon society before having fulfilled their responsibility in it. But in a sense, every Sramana is a sort of elderly hippie. Now of course, our hippies have a different problem in that they are critical of the very structure of the society in which they are asked to enter because they feel that it is a rat race, a

game which has lost its quality. They might even prefer a caste-like society of this kind, in that it might have a bit more quality. Because you see, in our society one works, not as a vocation, in this scheme of things, every vocation you perform is called svadharma. And this word, the word dharma has many meanings. It means function, in one sense. It means, the thing that is right for you. Here, sva, is the same as the Latin source and so it is one of your own. What we would call your vocation. Svadharma. As we say doing our own thing. That's svadharma.

And so, you have to find your own thing. As it were, a good thing out a job which you do purely for money can never be called svadharma. Because you're doing it for another end, to make money which has a purely symbolic value but when you do a certain work because that is what is your thing to do you want to be a doctor, because you're fascinated with medicine and all its problems and you just you like people so much that you want to heal them from the diseases. Or for the same reason, you might want to be a nurse. But you might be fascinate with problems of law and so become a lawyer or fascinated with religion and so become a minister then you've got a vocation, because you would do that thing whether it paid you very much or whether it didn't, because that's the one thing you have to do. If you're a painter, you have to paint, if you're a writer, you're one of those crazy people who just has to write. I'm a writer! I have to write. Whether it makes me money or whether it doesn't, I would still have to be a writer. That's a svadharma.

And every possible vocation in caste is supposed to be YOUR thing, your svadharma. But we feel in our culture, you see, that we have such a tremendous choice of svadharma, that sometimes it's what the French call on but embarass des richesses. It's like embarrassment of riches when you're confronted with one of those enormous menus in a restaurant which has some of the things on it you can't make up your mind which to pick.

Well now, then you see as a person passes out of this he gives up social. And becomes a nobody he then in that sense he goes back to the forest. He goes back from the organization, the role-playing of the agrarian culture, to the solitude of the hunting culture, to find out who he is alone all by himself. And so he becomes in that sense the upper outcast. The man who is

respected by those people who are still in caste, because they say without this kind of person we should lose our sanity. We should become confused with our roles, unless there's always the homage in the forest to remind us. That man is not his problem that is something deep with him. And that the true end of man is to play the game of hide and seek for a while and to get lost in these roles, but then to return back to nature, back to the way of the forest. And in later life, as distinct from infancy, with all other experience behind [them]. Find out again who you really are so that when death. What a funny thing will happen. Death comes, and will find no one to kill. For while you are identified with your role, with your name, with your ego, there's someone to kill. But when you are identified, with the whole universe, death finds you already annihilated, and there's no one to kill. The problem is, we speak first of all of the unity of life, and then suddenly define the social orders as one, two, three, four, and the stages of life as one, two, three, of course. Because the whole thing about The One is that it pretends to be many. Here, that's, that's the gimmick. The game of hide and seek is dismemberment, falling apart. Losing control. Losing unity. Let's disintegrate. And then, after you've been dismembered, let's remember. And come back to oneself, and know who it really was all the time. So the one implies the many, and many imply one, and so it goes in and out it's the systole and diastole, in-breathing and out-breathing that goes on and on now you see it, now you don't. Can the whole know itself as one? Yes. You suddenly get to the extraordinary state where you see that all the variety in front of you. You know, I look out in this room and it's a great variety, it's a wonderful patchwork of all sorts of different people and colors and things. But you get to the point where you see that that variety means one. Things, the more different everything is, the more it proclaims its basic unity with everything else. It just shouts it. In other words, when I see a bright patch of orange next to a bright patch of blue. The brighter that are in. The more it manifests the unity underlying everything. Now that sounds paradoxical but that's the way I feel it. If all of you wore khaki, olive drab or something, I would feel uniformity rather than unity. I would say well that's a drag. Everybody trying to look the same. That's fake unity. It would feel like a in a plastic champagne glass. Horrible. You know it warms the champagne instead of that cold crystal. And say that fake unity, away with it. But when everybody comes on himself, you know, in a natural way then I see true unity in through the variety.

See in this society, we are exposed to so much information. Radio, television, newspapers, magazines, books tell us all sorts of attractions about things that other people are doing and we're always wishing we were in somebody else's shoes. Because we know so much and we're informed so much. But in this kind of culture, everybody is settled for the fact that one day is just like another, and there they do what has to be done. What is in the course of things, and we don't approve of this because we say it's lacking in friskiness, adventure and get up and go. But on the other hand they turn round to us and say, you are completely unstable. You are so frisky yourself nervous you can't stay still. For two seconds you can't stick to a job you can't do anything stable your utterly unreliable, and you will probably blow up the planet.

And it's legitimate, for the simple reason that technology is getting rid of the need to earn a living. And many of us will soon have to be paid not to work, at which point we can become Vannaprastha right away. So, as technology develops that means the leisure society, and we're going to have to find ways of living in which one self-respect does not depend upon one's productivity.

In Europe, we have the same caste system in the feudal system Lords spiritual, Lords temporal. Commons and serfs. Now, by becoming—anyone from any of the lower caste can become a priest or a cleric. And the minute you became a priest cleric monk or whatever you were at an angle to all the other costs. You could mix with the others. Yes and what about this problem, of the separation of ages in this kind of culture. Well now, it is a little easier for them because the rate of social change is not what it is with us. In a settled agrarian culture, the essential way of living remains the same for centuries. And only violent change occurs when technology is introduced and then everything is blown wide open. But in an Indian village today, they are doing all the essential processes of life exactly the same way they were done a thousand years ago. And for this reason, the tension between the generations is very small. The son and the daughter expect, and know no other alternative than doing what father and mother have done. And of course this brings them close together, especially where the son of the daughter is constantly all day long associated with the work of father and mother. Now you know, that little children today, little boys under the

school age, little girls under the school age, are always interested in what their parents are doing and want to join in. But are not allowed to do so because they can't go to the office with their father and the mother is always in a hurry, because instead of having spent most of the day preparing dinner in the kitchen, she's been up to the coffee klatch, the League of Women Voters, or some such dissipation and comes back and then she's in a hurry and she doesn't want some little girl buzzing around, having to teach her, how to boil an egg or how to bake a cookie. Unless she's patient, unless she gets time for that kind of thing. But little girl is very very eager indeed to find out how to do what mamma does. But she mustn't, because she might make a mess. So instead of that, little girl is given a toy. A toy cooking stove and a toy baby to look after. The child is annoyed that the cooking stove doesn't really work that the toy baby doesn't wee-wee properly, even though they've tried to make it that way, and the little boy is even more annoyed that the toy gun doesn't kill anything.

So every day by about five o'clock in the afternoon, just before the father of the family returns, the entire house is littered with broken plastic and smashed toys have been torn apart in fury. So that develops a knock down drag out battle between the mother and the children to throw all that stuff into a bottom of a closet, mixed up with sucked lollipops, and half chewed bubble gum before Daddy comes home. And because she wants the house to look like a nice home for him. So this awful drama occurs in which the children are addled and have to be gassed with television, and the mother is in no fit mood to be the loving Cook of a superb dinner. So she gets some frozen up stuff that can be thrown together in a hurry, fixes pop or a couple of martinis so he won't know what he's eating anyway. And I don't know if I answer the question. I have got sidetracked.

I think we've got to realize that children benefited by being exposed to a considerable number of adults. And that, in default of the old family relation, households, where, in other words, a mother and father have a grandmother and a grandfather living with them, several aunts, uncles and cousins and it's a big household based on blood relationship. It's very difficult to do that today because the speed of social change makes it difficult for one generation to live with the tastes of another. But what we

are going to do is all couples of the same generation will join together and they will have separate dwelling quarters round a central service area where they have common washing machines, common kitchen, common recreational facilities, and any set of children can be exchanged with any set of parents. So if your children get sick of you they can go to live with somebody else's parents. And I remember as a child that is some of the most educative periods of my life were when I went to live with other families. And we often, you see, as kids we invited other kids to come and stay with us and share our family life I suppose that goes on here just the same but still those are very productive periods. When you find out how another family lives. So, and although this solves the babysitting problem, it's solves the problem of having to own too many cars, too many dishwashers, and all that sort of thing. Your— your dishwasher or your laundry machine is idle most of the day. Why isn't somebody using it?

Zen and Meditation

The Controlled Accident

This morning, I was discussing with you some of the basic ideas and feelings of Chinese philosophy and in particular Taoism, which underlie the development of Zen Buddhism, and which underlie the whole Chinese attitude to life to nature and to art. And I suppose of all these ideas that are discussed with you in the morning, the most important was the one of the mutual arising of things. That is to say, that you and your world go together in the same way as bees and flowers. But that we are not brought up in, at any rate our culture, to feel this. We don't have a sensation of it we have instead a sensation of confronting the world of nature something alien something outside into which we come rather than out of which we come. But it's possible, so to change our everyday consciousness, that you feel yourself. As something that the universe is doing. It's as if you changed your center of gravity. Your center of operations, from that little man inside the head all the ego to the whole works doing it.

Now then, what I want to do this afternoon is shift from Taoism. Later on in time to the introduction of Buddhism into China and the birth of Zen, and to see what Chinese Zen is. We do though first have to have a short look at what Buddhism is. As a product of India. It has been well said that Buddhism is Hinduism stripped for export. See Hinduism is a way of life that goes far far beyond what we in the west call religion. It involves cookery, every day family life house building just everything it's the whole Hindu way of life. And so you can't export it just as you can't export Shinto from Japan. And belongs to the soil and the culture but there are essential elements in it that can be transmitted outside the culture of India. And Buddhism is one of the ways of doing just that. So one might say simply this to try and sum up what Buddhism is about. The word Buddha is derived from the root word and Sanskrit B U D H. which means to be awake. So the Buddha is the the awakened man, the man who woke up. What does he wake up from? Obviously a dream. And what kind of a dream is this. Well I

would call it a state of hypnosis. And the state of hypnosis, although I'm using hypnosis in a rather archaic sense of the word is a state of being entranced. Spellbound. Fascinated. And this is called in the Sanskrit avidya, A V I D Y A. Video is knowledge in Sanskrit. And it is the root from which we get the dairy in Latin to see and so vision in English. So are they putting the A in front of it means not non. Avidya, not seeing ignorance ignoring us I was discussing that this morning where. You see but you ignore. Everything that you're not looking at when you put the beacon of a chicken on a white chalk line and the chicken is fascinated with that we can get away from the chalk line that's avidya.

So in the same way our beaks were put on a sharp climb when we were hypnotized into the notion. Of attending to life by conscious attention alone. By the spotlight to the exclusion of the floodlight. And so we began to imagine that we were separate individuals. What is called in Buddhism [] the view of separateness. And Buddha is one who has overcome that. He has awakened from that illusion from that state of hypnosis and he knows. That... Well I can't put what he knows in any positive terms. This is the special thing about Buddhism. Everything in Buddhism sounds negative. Let's put it this way. Let's suppose you engage yourself in a. Relationship with the, with the Buddha. All with one. I mean there are hundreds of brothers. And one we call Guatama is just the historical bit of that everybody knows about but no one but it leads to another because as a result of his relationships with people you does them in the borders to awaken people you meet one of these people and he's going to give you a rough time. But one of the Buddhas running around these days is Krishnamurti and krishnamurti absolutely destroyed everybody's religion. He came why do you believe this why are you hanging on to that why do you want to insist that this idea is so, see? And he shows you that all your fixed formulations all the ideas to which you cling are spurious. And then you suddenly get into a kind of vertigo dizziness that you feel suddenly that you're no longer standing on the firm ground but that the universe has suddenly turned into water or worse air. Or worse still, empty space there's nothing to hold on to. I see often when one discusses religion with people they say well I learned I need a religion because I need something to hold on to. But that's the way not to use a religion. Because if you are using religion as something to hold on to, your religion is an expression of

unfaith. Faith is where you let go not where you are wrong. When a cat falls off the tree the cat relaxes hissy and so the cat lands with a soft sob. And doesn't get hurt, because the cat has faith. But if the cat in mid-air were to submit to grab itself with all four feet and tighten up see it would be hurt. And that's what people do when they say Rock of Ages care for me let me hide myself and be there they want someone to hold on to see, and that is unsafe.

So the method of Buddhism. It's called the Dharma. Doesn't mean the law, it means the method the method is to knock the stuffing out of you to take away everything to which you cling to cleanse you completely of all beliefs or ideas all concepts of what life is about. So that you are completely let go. So Buddhism has no doctrines at all that you have to believe in. I don't care what background you come from whether you're a Roman Catholic or one extreme or a logical positivists that the other. Both are clinging to something. See? And so the method of Buddhism is to knock out the underpinnings. And say well we're just not only do we not believe in anything we don't even believe in not believing in anything. You know you crawl into a hole and pull the hole in after you. But in this case, you do the exact opposite of that that's a defensive move to crawl into a hole in this way you crawl into a great space and then pull a space out after you. And, to go through this is pretty pretty rough. Because you can do it on what seems at first to be a merely intellectual level. So you can engage a group of people in the discussion and you can start whenever they propose an idea that is their sort of guiding principle of life you demolish it show that it doesn't hold water. And step by step you on Earth by talking with them what are the fundamental ideas they're operating on everybody is. Everybody is a philosopher everybody has metaphysics. All of it may not know what it is so I've never examined it but by this method you bring it out and you demolish it. And this suddenly what seemed like a very nice intellectual discussion turns into sheer murder. People get really anxious they develop all the troubles in the symptoms of extreme anxiety. And so they finally say to the dealer to the the guru to the teacher well heaven sakes what do you believe it is not proposing anything. I didn't set anything up. Well how do you navigate? How to how do you... How do you exist? This is what's the problem. Because you see, what we're moving from and as I suggested a moment ago. We are moving from a state of affairs where we

are accustomed to navigation on land, to a state of affairs where we are in the water. And this is very critical for today because the impact of modern science on Western culture has been very similar to this. Say, in Christianity we sing hymns like how firm a foundation and Rock of Ages and first the book The Mighty Fortress is our God we've something to stand up for the church is one foundation is Jesus Christ her daughter No and it's. This firm thing right suddenly all that disappears or becomes implausible. And we find ourselves winning or sinking. Now, when you find that you're living in the region mystically universe of relativity but there's nothing you can hold on to You gotta learn how to swim. And to swim you've got to relax and stop, stop grabbing.

So this is what Buddhism does. When it says it's the art of let go of non-attachment non-attachment doesn't mean that you lose your appetite for dinner. It means simply that you stop grabbing. You get rid of stickiness. Stickiness in the sense of for example, when a wheel has it at an axle it's too tight and it sticks want to loosen it up a bit you don't want it to lose the money floppy. I a lot of people when they tell them to do it to relax they become like a limb brag it's not relaxing. Relaxing is having still tone. But it's a certain, it's a middle way. So this is what this is entirely what Buddhism is about. It's about learning for example, if I may put it in a vivid way when you were born you were kicked off a precipice. And you are there's nothing that can stop you falling, and although there are a lot of rocks falling with you with trees growing on them and all sorts of things like that you can cling to one of those rocks if you like as it goes down with you for safety but it's not safe. Nothing is safe. Everything is falling apart. Everything is in in a state of change. And there's no way of stopping it. And when you are really resigned to that and when you really accept that then there's nothing to be afraid of. And when there's nothing left to be afraid of and you've given everything up and you know that even you know a lot of people in religion cling to suffering because they know they are right as long as they hurt. And why bless the good Lord for my boils for my mental and bodily pain. For without them my faith all congeals and I'm doomed to Hell of ne'er ending flames. You know a lot of people who know that their rights are long as they suffer but that's an illusion too. Even suffering offers no security. Even suicide offers no security in Buddhism you say. There is

no security at all. You simply have to face the fact that everything is in flux and go go go with it.

And so, the question then is simply, how to convince people of this? If anybody wants to be convinced you know it's not sort of thing you shove down people's throats. You don't convert them to this because if they don't want to be converted they won't let go. So therefore involves a very special relationship between the questioner and the person to whom the question is addressed. The pupil of the teacher. And now then, Buddhism came to China as early as 60 A.D.. But didn't at that time make a very great impression. It was not until about the year four hundred that a very great Sanskrit scholar about the name of Kumara Jiva and started teaching Chinese scholars Sanskrit. And they worked with him to translate Sanskrit into Chinese. And they translated the Buddhist scriptures they didn't of course do them all at that time because the Buddhist scriptures occupy about as many as much space as the Encyclopedia Britannica, in fact a little more. The Indians are great talkers. Well anyway, they found that when they translate this into Chinese, [they] had to find equivalent Chinese words for the Sanskrit ideas and they found these from the from the Taoist philosophy that I discussed this morning.

Well, slowly then, Indian attitudes began to be modified by Chinese attitudes because the Chinese read into these translations Taoist meanings. So things got a little altered. Now here came the alteration that is crucial. First of all in Indian Buddhism has very little humor. But Chinese life is full of humor. The greatest philosopher of Chuang Tzu, or you know, is the only philosopher who is in I think in the whole world who is profoundly humorous there's a book in the modern library. Published by Random House called the wisdom of Lao Tzu, and this is translated by Lin Yutang and he includes along with the translation of huge sections of trance are. And this is absolute. It's fascinating. Because of the humor of it. Indian Buddhism had very little humor some years but very little. Next, it was all tied up with celibacy, which to the Chinese was absolutely incomprehensible. Because in and Chinese civilization is rigged around the family. To a far greater extent than ours is. Which is saying something. And, they just couldn't see any point or any wisdom in celibacy. When Buddhism came to China it still retained a certain element of celibacy. But

for different reasons than than Hindu. The Chinese way of celibacy is not that sex is naughty but it's terribly convenient not to have a wife. In other words the ideal of the uninvolved life. Has a certain appeal but they could never never get through into their heads the notion that sexual desire was bad. Which plays has always played a fairly strong role in Hindu thinking. And not in the same way as it has in the West. They don't have of the Hindus don't have a guilt take on it. But they think that it it dissipates your spiritual energy energies. And you see the in yoga they envisage the idea that at the base of the spine there is what is called the kundalini, the the serpent power of the force of psychic energy and so long as it. Mains at the base of the spine this force is dissipated in sexuality. Now, yoga is to suck this thing up the spine and get it into the head. And so then you withdraw from the manifestation of this energy all the dissipation of it in sexuality and it's put on a higher level only, which end is up? You can do it the other way too they have what's called the right hand way of doing it on the left hand where doing and I'm not going to go into that now.

But the Chinese didn't see it that way. They couldn't see that it was a dissipation of energy. So what they wanted to aim at was a way of living Buddhism and being awake but at the same time remaining active in the ordinary life of the world. It's what's called in their phraseology being king on the outside and the sage on the inside. Managing practical affairs completely involved in whatever life it is but at the same time inwardly living on top of a mountain. Being cloud-hidden whereabouts unknown. So Chinese Zen is the preeminent expression of this because it is the mixture of Indian but ism and Chinese Taoism plus a certain Confucian practicality. Zen developed out of the work of Kumara Jiva, came into China as I said for four hundred or a little before. He had two disciples who began to work on Buddhism from a Taoist point of view. And they were actually the originators of Zen. Then apparently about. The shortly before five hundred as the dates now check out another Indian came to China whose name was Bodhidharma. And Bodhidharma was the person who touched off the Zen as a specific movement. Bodhidharma had a pupil by the name of Aka. And Chinese. It caused Japanese pronunciation like Zen is the Japanese pronunciation of the Chinese Chan. And the story is that when Akan came to Bodhidharma. Bodhidharma refused to accept him as a student all zen masters do this. They reject you. And this stimulates you see to come back

stronger if I mean if you're going to learn it all. And a car came back stronger and stronger and stronger and Bodhidharma resisted him strong and strong and finally he cut off his left arm. And presented it to Bodhidharma and said Look here's my left arm given to you as a token that nothing can win the world matters for me except to find out what you're all about. All right he said. What you want to know? Akan said I have no peace of mind please pacify my mind. In Chinese mind is. This word pronounced Sion. And Shane is here. Shane as the heart mind it's the psychic center. And so Bodhidharma said Bring out your shin here before me and I will pacify. A car said when I look for it I can't find it Bodhidharma said then it's pacified. And Akan immediately understood what all the thing was about that's the experience of Satori in Japanese, Wu in Chinese Mandarin and the Cantonese dialect [grunts]. It's what we call in our modern psychological jargon they are half anonymous the a-ha phenomenon. A-ha! Now I see.

Well now, what was all this? This Zen, which in Chinese is this character. [Zen] is a translation of the Sanskrit word jnana. And so this is being pronounced Chang in Chinese. And then in Japanese is Unfortunately untranslatable in English. It designates a certain state of consciousness. That is sometimes called meditation. But that won't do it all contemplation isn't really the point the Chinese have a different word for concentration. And sometimes one pointedness of mind. I would prefer to translate this word. Within notion of total presence of mind. When we say a person is crazy we often say they're not all there. Now go to the opposite of that and visualize the person who is completely there or who is completely here. A person who lives totally and absolutely now. That doesn't mean he's incapable of thinking about the past or the future because thoughts about the path and about the future are included in the present you have them now. But imagine a kind of person who is not distracted. Who, when he talks to you, he really gives you his whole being. Who doesn't as it were look over your shoulder and wonder after something else. Somebody who first of all he's completely here and he's so much here that you can't phase him. Now this idea of phasing is crucial in them. You see, I referred a moment ago to attachment that Buddhism is living free from attachments and I have made the point that this is not abandoning a sense of a good appetite for dinner. But it's stopping sticking in psychological jargon you

don't block. I mind of no hesitation it's sometimes called in Chinese the phrase mo chir chu is used, you know, going straight ahead. So supposing somebody walks up to you on the street and says I You say. Now most of us who are intelligent people feel embarrassed by such a question. You know was this wretched Salvation Army person or job was witness during asking me whether I'm saved or not and we're all a bit you know what do you do with a nut like that.

So what is in Zen This is a perfect moment to respond see to the most embarrassing question are you sane? But then comes back in a very funny way. In Zen, one doesn't give a philosophical answers to a question like that. You get practical answers. I had a boiled egg this morning. Because whenever you are asked about matters sacred, theoretical and philosophical you answer in terms of things earthly and practical. But then on the other hand when you are asked about things earthly and practical you answer in terms of things religious and philosophical. Is dinner ready? You know. Who's asking this question? Who are you? So, this is then the flame. Sam. Is. You know a Bodhidharma. Is supposed to have meditated so long with his legs cut off, and he's usually drawn this way something like this.

It looks like a Shmu. But in Japan, you buy these toys that are dharmas and they are so weighted in here that you can never knock them over you can bet it on the floor batted this way bat that way but it always comes up again. And so the poem says seven times down, eight times up. Such is life. So this is the principle of not being phased not being attached. So to play the game, you can't phase me. And this is very important in the art of lifemanship. Fundamental gamesmanship, because you see, when the Zen monks moved into Kyoto, they took over the best part of town. Simply fantastic how this happened the beautiful hills that I was talking about this morning were occupied by the Brigands who later became the Japanese nobility. The great Daimyos, the toughest characters. And the Zen monks played a game of them. Which was that you know you possess all these lambs and you're powerful and so on but so what it's all falling apart then what will you do. Well they said that's too bad we don't know. And the Zen monk said. You know you haven't got the hang of the things. So, they found that they couldn't terrifies Zen monks. That they played all sorts of tricks but the Zen monks were better masters at it. Supposing you say to

somebody. Look I'm not afraid of you you can do anything like you can kill me or anything else to talk well if I go to kill the fellow who says this are never find out whether he was afraid or not. So, they out-faced these people and said you did you need we have a secret you see that you don't have and we'll teach your. Your servitors to be great warriors because they'll learn the secret too and they won't be afraid of anything and this is what they did and so they daimyos, the nobleman. Built a great monasteries for these and masters and monks on their best land the finest artists of Japan made gold leaf screens. For homicide every room in the place and although nobody owns anything individually the community owns it collectively with the protection of the daimyos, and they had a tremendous scene going.

Now to us that sounds extremely weird. Even immoral you don't expect religious people to do things like that. You know I know you don't care if the religious people are self-righteous and have no human. But these people didn't go around pretending that they were specially good. They didn't do themselves. Yes. They were people who understood what human nature is that in every one of us there is an element of irreducible rascality. In Jewish theology this is called the yetzer hara. Yezer hara. The element of irreducible rascality, which was created by God because God has one too. And that's why when you are really affectionate with somebody else. When for example, men I don't know what women do in their private lives between each other but men. As we all know say to someone they're very fond of why you all basket. You know. Just like that you know there's a certain way of saying to a person there's a certain glint of recognition. And so there's a Zen poem which says when to Zen masters meet each other on the road they need no introduction. When a thief meets a thief, they recognise each other instantly. And this goes back you see again into the heart of Chinese philosophy. That human nature is considered to be basically good. And even the rascally elements of it are good, they have a sort of salt in the human stew. There has to be this little thing that human passions and that the the natural contentiousness and green or whatever that we have is an essential element in our makeup. And that when people lose sight of that they go mad. Nothing for example, is more dangerous than a saint. That is to say, an unconscious saint who thinks that he is right. And. Who endeavors to live an absolutely pure life. And to eliminate all selfish thoughts. Somebody who undertakes that task is going to be a menace. To

all around. Because he loses his humor. He loses his real humility, which is knowing that after all since we are humans we have certain needs we are. We need to eat we need sex we need this that and the other, and this this sort of has a quality of humor to it. And so this is why in Zen Art, the sages are always drawn to look a little bit like bums. You know that put tie or Hotai as he's called what's called the laughing but of the fat but it with an immense belly. And carrying around an enormous bag of rubbish into which he indiscriminately puts anything he finds around and then gives it away to children. This is the sort of type which the Chinese call the old rogue. And the old rogue as a type of the poet, sage, monk and scholar you see is greatly admired he is the nonviolent Brigid. The Rolling Stone. The free man. Or in our words, the Joker. The Joker you see, is the card that can be played any role in the back. So then, Zen developed in China after Bodhidharma's time. And came to a sort of a golden age in the tongue and song dynasties. The Golden Age of Zen lies between seven hundred thirteen. A.D.. And approximately eleven hundred, twelve hundred. Eleven to twelve hundred. That's the great creative period. In which all the marvelous Masters emerged and during which zen exercised a profound influence on the development of Chinese. Poetry of painting calligraphy and scholarship.

Then, between eleven and twelve hundred, it shifted to Japan. And underwent a new development. Rather different in quality and in tone. And after it [had] done that for some curious reason which is very complicated historical question, it slowly faded away in China. So that as we find it today it is principally a Japanese phenomenon, and it is slowly fading in Japan. And slowly growing in the West. It's very funny thing. Now then, let me indicate what Zen training, what it's method is, how does it work. I said before, what is involved is a dialogue, an interchange between two people. One who has defined himself as a student. And has therefore defined the other as the teacher. There is no teacher until a student arrives. No problem until a question is raised. So students create teachers. It's very funny. We have a saying, anybody who goes to a psychiatrist thought to have his head examined. You can interpret that as you're an idiot to go to a psychiatrist because they're a bunch of charlatans. But the subtler meaning of it is, yes, if you can if you define yourself as being in need of help psychiatrically you need a psychiatry. They say exactly the same thing in Zen. If you ask a

question you get thirty blows with a stick. If you don't ask a question, you get that it blows with a stick. Because you simply, put yourself in satupa lari [sic]. You have defined yourself as having a problem. Now nobody really has a problem but the mire the game of life is to pretend that you knew. Going back to fundamental Hinduism the godhead of the self pretends it's all of us and so gets lost and so as a ball, dreams all this going on. So when you're on your way out from the dream it suddenly occurs to you that you have a problem. Life is suffering. You would like to get out of this, so one such student went to a Zen master and he said, we have to dress and eat every day. And how do we get out of all that. In other words, you might ask the question in this way we have to work to get up Monday morning go to the office do all this routine sell something and so on how do we get out of the rat race. So we have to dress and eat every day, and how do we get rid of all back. In the master said we dress, we eat. The student said, I don't understand how he replied if you don't understand put on your clothes and eat your food. I know there's this is the kind of dialogue so characteristic of plan. So the position is this. The master on being approached by a student about the problem of life. Says I have nothing to teach you. I'm a Zen master I have nothing to say Zen is not words. And furthermore, everything is perfectly clear. There was a Confucian scholar who went to a Zen master and said What is your secret teaching? And he replied, There is a saying in your own teacher Confucius which explains it all didn't remember when Confucius said to his disciples do you suppose that I'm concealing something from you I've held nothing back. And the scholar didn't get this. So a few days later, they were walking together in the mountains and they passed the wild laurel bush. And the Zen master said to the Confucian scholar do you smell it he said yes he said, You see, I'm holding nothing back. So the position of the Zen Master is, there is nothing to tell. There is no... because we're not offering you any panacea or any solution any doctrine any big big goodie. For the problem of life. Because the problem is an illusion. Well then the student under these circumstances thinks. Well this is some sort of a come on. He's testing my sincerity, and of course the nothing which he has the teachers that the mystery of the great void. Theory does not he doesn't take it as meaning just plain old ordinary nothing but the great void. And so, he persists, and the teacher makes him persist until he gets a way out on a limb. He has to persist so much that he practically dedicates his life saying just as a way to a car symbolically cut off his arm.

The students put in the position of dedicating his life to solving this thing and getting what that the chance. And of course there wasn't anything all along but he's been put in that position.

So then, once he's in start to put the Lhari. Once he becomes a student. He's put through all kinds of hoops. They make him learn to meditate to sit cross-legged practice doesn't and then they also add to the trouble by asking impossible questions which are called koan. And these questions are palpably absurd. What they're saying essentially, at least the elementary koans are all concerned with this requests for behavior on the part of the student that will be perfectly genuine. In other words, show me who you are. Now wait a minute I don't want to see any social definition of you. I don't want to know your name, your address, who your parents were. I want to see the absolutely authentic you it's like existentialist talk about authentic being. Or might be in the same way a contrast or father confession in a Christian sense would say, Now give me a really good confession. What is the thing bad bad thing you've really done? And you confessed to him and doubters and their son sacked religion blasphemies and cussing and so on and he says on come up those are only trivial sins. Come on now, what is there really awful thing you've done. And. This is the backwards way of doing exactly the same thing a Zen Master's doing. I think who you really. Are you anybody is anybody home. Have you got anything and they what they do things like. Making you shout see this word is very important word in Zen. Nothing moves out on the other side of the ball that's represented by the empty circle the word move in Japanese so they say now say it same move move you know the oil of your guts going into this and I don't know you you don't know how to say that come on that's feeble that's nothing that's really say it. They have every kind of trick like that. To show you that the more you make an effort to be genuine the more of a fool you become. And they tie you up in knots until you're desperate there was a server in Americans and student who was on a Fulbright and gave him a year to study Zen. And he started to panic because he'd only a month ago and he hadn't realized that. The only had to and he went to the said license the damage he said look I've got I'm going to get a month left the master said all right we'll have what we call a session or session as an intense meditation practice, where you only sleep three hours a night sort of thing and you meditate all the rest of the time let's go let's really do it! Do it! Do

it! And every day three times you come to me and present the answer to your zen problem your karma. And it got worse and it got worse and it got worse and he got more and more desperate that here was this for bright going to end and he wouldn't know what zen was all about. We're back to on the last day he suddenly saw there was nothing to singing. You know it's all right the way it is and this tremendous illumination this load off his head was of course what the Master was trying to make him do. And now in the ordinary way if you're not on a Fulbright and you learn. You can stay around church and the Master will then play a trick on you. And you say, well now that's wonderful. You've got your foot on the gate. You saw you realise there's nothing to realise you realise the void has nothing to cling to see the. No barriers, no blocks in any direction it's all transparent. But that is just the beginning. And many, many it's all a necessity now for you to discipline yourself much harder to make great efforts really to get through.

So, what are you going to do about that? The student may say well I don't know. I've had enough I think I realise what it's all about. And he goes away. Sometime later, he begins to worry, because you see the great emotional relief of this insight begins the where up. And life begins to look ordinary again. And then he said, well maybe I didn't miss something that was a very good master I went I better go back. So back he goes. And the teacher comes are very very tough. Answers you know you are no good you didn't stick with it why should I take you back oh master I'm so sorry I didn't realize I was young and inexperienced and I now I've come to my senses so the teacher finances all right all right all right you're on probation. Again, he starts another koan, and this one comes in from a completely different point of view. And he's got others that come from this way from this way and from this way from this way. And the point is always, so long as I can beguile you as a teacher into thinking that something you can get, you need to study with me. When I can no longer fool you into thinking that there's something to get out of life, you will know that your life you don't get something out of it you're it. But so long as. You could be fazed and you could be taken in by a teacher, you need a teacher. So in the end when the student no longer needs a teacher. And he sees that the old boy is fooled in the whole way through. He says at the same time, profound respect. And you wonderful rascal. There's a very strange thing in the I've poked around a good deal lately and down among Americans and students to find out

what's going on. And they tell me that the initial come on of a Zen master is very tough. And very authoritarian and paternalistic but as you move in, he turns into your older brother. And is the person you feel going right along with you beside you. Helping you in this thing full of friendship and compassion and everything. But occasionally, he will suddenly turn and bring on the authoritarian stuff. But they do in a very strange way. [There] was a Zen master who on a Saturday morning, when he should have been woken up at eight o'clock. Was woken up at seven. Or whatever the time was. No he shouldn't he should have been woken up at eight on Saturdays and seven on weekdays so this was a Saturday and his attendant Monk came and woke him up at eight he was immediately looked at the clock and absolutely furious it had been woken up an hour late because he didn't know it was Saturday so he's struck out at this monk in rage. And the monk said Master but it Saturday. He said all. Anger disappeared absolutely serene no apologies.

So you see the nature of this game is the zen game. And I seem to have given away the show to you told you, all the inside mechanics of it. But you would discover that if you tangle with the Zen master and you think you know from what I had told you what are the mechanics of it. And you stuck your neck out to put yourself in the position of being an inquiry. Everything I had told you would be useless. He would out with you completely. That's what consists in being a master he's not doing it because he wants to be superior and to put down other human beings he's doing it out of great compassion because he feels he knows something which...If you could find out, you would just be so happy. And would want to give it to everybody else but you can't give it away because everybody's got it but you've got to make them do is to see that they have it and that you don't give it to them. And that's the most difficult task.

Yesterday, I was giving you a general outline of the foundations of the Zen feeling for naturalness in art and life by describing the fundamental principles of the Taoist philosophy and then of the Zen discipline itself. And we saw that the roots of the idea of spontaneous living. Make this conception or rather doesn't accept such a conception as a doing something much more subtle than might ordinarily be imagined. A lot of people think that the spontaneous or completely natural life as it's understood by these Far Eastern philosophers is to act according to women. There was for

example a great Zen monk of lived shortly after 1000 A.D. who had a very peculiar way of painting he had long hair. And he would get very drunk on rice wine, and he had so his hair in ink and sloshing all over the paper. Then he would do a Rorschach test on it. And decide what kind of a landscape it actually was. And then put in the finishing touches. And suddenly, out of this apparent mess a great landscape would be evoked. For the whole art of the thing and then putting in the finishing touches. And also, that is a very curious thing. If a person who is untrained in painting makes a mess with the brush, it's liable to be just immense. Whereas if a person who has the feeling of painting in them for a long time and they make a mess with the brush or just do anything, it looks interesting. And that's why, if you try to copy the best. People in modern abstract, nonobjective painting you find it's very difficult thing to do. Because there is more to spontaneity than caprice and disorder. And I want to try and explain what that is. I mean wouldn't it be great if we could live absolutely on the spur of the moment. Not make any particular plans, not feel that...well, you might make plans because you can make plans spontaneously but. Not to worry about whether you had made the right decision whether your being good or bad selfish or unselfish, and not to hesitate in anything you see. In one of the great applications of Zen as I pointed out was to the art of fencing. And when you learn fencing...you see, you have to learn to be spontaneous because here of all places it is true that he who hesitates is lost. If you are engaged in combat you see, and you stop to think what sort of a defense or attack you ought to make of the enemies got you. So, the way they teach people spontaneity in fencing is very interesting.

When you first start into fencing school you of course live with the teacher he has a kind of. And a but you're given a janitorial job you clean up you wash dishes you put bedding away and things like that but while you're going about your daily business the master surprises you with a practice sawed which is made of four strips of bamboo, rather loosely tied together. And he hits you with this, surprisingly and suddenly, from nowhere. And you're expected to defend yourself with anything available with the bedding, with the broom, with the pots and pans the just anything to defend. But the student never knows when the attack is coming or where or what direction it's coming from and he begins to get tense. And he begins to go around everywhere on the sort of alert you see watching, watching, which

direction is coming from and if he goes down a certain passage feeling that the master's probably lurking around that corner and he's all set to go for him and that he gets that practice sword he suddenly gets hit from behind. So eventually. He gives up. There's absolutely no way of preparing for the attack and so he does wonders around feeling well if it is going to hit. And then he is ready to begin fencing because if you prepare for an attack from a space a specific direction and it comes from some other direction you have to withdraw from the direction in which you would expect it and send your energy in another direction and that takes time so what you do is you go around with a mind of no expectation that is called mushin, or monin. This is a very important Zen expression of motion it all means an empty mind. And this mu, know. The rub the in this. No Shin. You could also call it no heart, because the character shin means both heart and mind but it doesn't quite the same as our word heartless as we use it and it doesn't the same as the word mindless as we use it meaning stupid. To be in a state of mushin is to have a mind like a mirror. And all of this the taoist sage Chuang Tzu said the perfect man employs his mind as a mirror it grasps nothing it refuses nothing it receives but does not keep. And when anything comes in front of the mirror it reflects it instantly. The mirror doesn't wait to reflect it but they also say. When the moon rises. All bodies of water instantly reflect the moon I mean they they don't they don't bother with physics about the speed of light or anything like that is irrelevant. To say when you clap your hands the sound issues immediately it doesn't can stop to consider whether it will issue. And so sparks from the flint when it struck, they issue instantly. But to do this you can't try to be quick. So you have a Zen master corners you with a funny situation and he puts you in a quandary expecting spontaneous action from you, don't try to hurry. I know I watch the Zuki wait a whole minute before answering. But he doesn't hesitate. He's not entirely embarrassed by this wait. And he can answer with silence just as well as with a formal response. The point is, do something.

When two young Americans one of the studies then. They were taken by a Japanese monk to interview the master and act as interpreter. And one of them had had some practice and you know knew a bit about it and so after they had had tea together and just discussed formalities the master said in a very easy way well what do you gentlemen know about Zen. And one of these students threw his fan which he happened unfolded the families still

folded up he threw it straight at the Master's face. The master slightly moved to one side and the fan doing research and went right through the paper wall. And the master laughed like a child. That's the sort of game they get him. Once a master was going around through the forest with a group of students and he picked up a tree branch and noticed that one might pick up a tree branch and suddenly he turned to one of his students and said What is it? And he hesitated to hit it with a branch. And so another student was there and he told him which he said What is it he said give it to me I want to see it I'll tell you so the Master tossed the branch to him and he took it and put the money.

Now you may think dollars is kind of a rough stuff. But let me give you another story which is on a rather different level. And a certain then priest was having dinner at a big party and the party was being served by a geisha girl who was so elegant and so skilful in serving that he suspected she might have had some Zen training and so he decided to try her out. And he nodded to her and she immediately came to his place and sat down in front of his little low table. See everybody was would be seated probably in front of low tables all around the room and the geisha servants and people move up and down in the middle. And so she came down and sat down in front of him and bowed and he said I would like to give you a present. And she said I would be most honored. Now on the table there is there are. Which are little braces with charcoal and and you move the charcoal around with iron chopsticks he took a piece of charcoal out and I'm chopsticks an offered it to her. She had long long sleeves on acumen No I'm not she did was this she wound them all round our hands took the charcoal made it look up and went to the kitchen disposed of the charcoal changed her robe which had holes burned all the mobs all the way through the sleeves and came back. And she sat down in front of the master and bowed. And he said and she said to him I would like to give you a present he said, I would be most honored. And so she picked up the hunch up sticks and handed em the charcoal and he pulled out a cigarette and said that's just what I wanted, and lit the cigarette. Now here's a lesson. The master's spontaneity and being ready for that situation was the kind of quick thinking that a good comedian, who wouldn't completely unprepared way can make all sorts of jokes and turn any situation into a jest of some kind. That are of all sorts of people who do that. People who are experts and kind of like Dorothy

Parker. In that sort of repartee, but here it's been developed in a very fundamental way and to a very high degree.

Now the way in which it's developed you see requires a protected situation, because because if we all started to act on the spur of the moment without the slightest consideration or deliberation.[to cat] No. No, no c'mon kitty, shoe. If we all started to act on pure women everybody would think we were crazy. And that people would avoid us and call the police and things like that but what they do is this. They start you doing this in the context of a discipline situation where there are very rigid rules for most of the time but there are certain instance at which all those rules go hand. And you're in a community which understands the game. Because the point is this when you start acting spontaneously. You're not used to doing it and therefore your response is an unintelligent, and inappropriate. But when you become used to doing this and when it becomes second nature to you. To act in the state of motion. No mind or no deliberation, then your behavior has matured. And you find that you're accustomed to that respond quite appropriately as the Zen Master did in lighting his cigarette from the charcoal. So also, in learning the art of swordsmanship, when he has given up defending himself. When he...when he has given up defending himself and preparing his mind for attack then he has got a narrow mind. And this is also likened to a vessel of water like a wooden barrel. When you make a hole in the barrel the water instantly flows out of the hole because the water is always available to come out. It doesn't have to choose. And so you could also say that motion is what Krishnamurti calls choiceless ness. And because you see choice in this sense. Is not quite the same thing as decision choice means dithering. You know there are some people who before they start to write something down they they wiggle their pens a little. Pen delivers over the paper and then they start to write. And so in the same way, a lot of people in the constantly in the life situation they did that because that dithering is anxiety. To be are not to be that is the question Well there is no question about to be are not to be seen because to be are not to be go together as we saw there arise mutually.

And so, Kitty I don't think you're feeling very comfortable. Take care of it I don't want to get mixed up in the paper. So then in, the situation of the zen community. So. Safeguards are set up. In place within which. You can learn

how to act without deliberation which is you see in a sense going back to the State of the. Now it doesn't mean that you give up thinking. It doesn't mean that you become an anti-intellectual. You all can also learn and this is part of the later phases of Zen training. How to think spontaneously. How to deliberate spontaneously. The saying is you see stand or walk as you will but whatever you do don't wobble. So this is our difficulty because the human mind is a feedback system. Feedback as a peculiar susceptibility to nervousness. There was a young man who said though it seems that I know that I know what I would like to see is the I that knows me when I know that I know that I know. Say now, in this way we think about thinking. We worry about worrying. And then, when that really gets bad you worry because you worry about worrying. Now that is it analogous exactly to the kinds of vibration that are set up in certain mechanical systems. For example, if you...I did this trick on television once. I had the camera Man Turn the camera on the monitor. The monitor is the television set in the studio where you see what your doing. And so on this show I said Now I'm going to show you a picture of anxiety. Don't worry about your sets, this is not going to be anything wrong with the offset so don't turn it off now said Mr camera man would you please turn the camera on the monitor. He does that and what does he do? He's taking a picture of taking a picture. All in the same system. And as you do that the system starts going on young young man and an ad like that you see, it then makes a sense of kind of oscillation. And you see on the screen all these jagged lines dancing across. Now that's what's meant to see by hesitation, attachment, blocking all that kind of thing which the Zen discipline is designed to overcome. And because the human being is such a peculiarly beautifully organized nervous system and has this tremendously subtle cortex which is capable of all kinds of thinking about thinking. And you could turn yourself on in the most extraordinary ways by for example getting earphones which repeat what you say just a fraction of a second after you say it back to you they delay it and you can get an answer or scope tied up with your own heartbeats, and get feedback through in this way so that you suddenly begin to see yourself behaving. And it completely balls you up because you wait for yourself to go on but then he realizes you doing it but you can't wait on your heartbeat you can wait on what you say. And you'll get the sensation of going faster and faster and faster and faster until you just have to close the whole thing off. Or you'll go crazy.

So that's what we're doing, and our civilization and our social institutions reflect this in hundred of ways. And this would be true of any civilization because also relies ation is based on the development of consciousness and feedback that is to say, the property of self-control. Being self-conscious looking at what you have done. And then being able to criticize it and correct it. But who criticize it is the critic reliable when you criticize yourself. Who will criticize the critic. You see or to put it in the other way christus custodial ipsos custodes who will guard the guards themselves who will take care of the policeman. Who will govern the president? And that is the big problem. And when we get tied up in the problems the Chinese got tied up in it because they were simply of very high order of civilization so did the Japanese There has to be a break. Somebody has to start throwing things. Otherwise everybody will go insane. So,, Zen functions in that culture as a way of liberation. From the tangle of being too civilized now you see in Japanese culture, people are tremendously concerned with propriety with good manners. And with keeping up with the Joneses. One of the funniest things in the world is to watch Japanese people having a bowing contest. With a very frequent thing when friends meet or take leave they go. And they bow and they bow and they were behind the ticket back and forth, and see who gets the last one in because I'm more polite than you! And the worries about when somebody comes you know you would visit a family always bring a gift. And they start wearing is this gift suitable What is it anything as good as the gift they last gave us and is it right for the occasion have we thought about it enough is there some symbolism in this give that connects with this person the name of their birth they are something that that and think about the things ad terminum. And thus they cultivate in the ordinary culture. Has a great deal of social nervousness in it people giggle you often see girls who giggle and cover their mouths to try to say I'm not really giggling. All sorts of funny things happen because of this immense social awareness and nervousness.

Now as Zen breaks that up. Only it does it in a way that is as high artistry to it. So you see, in let's just take the aesthetic domain for the moment and you remember I was discussing yesterday one tivo. And you remember two. In the whole history of ceramics the Chinese developed some of the most elegant work imaginable. You are probably aware I don't see a specimen of the great work of the Sung and Korean Potters. Very often done in a jade

like green the most gorgeous texture. It looked practically as if it was carved out of Jade. Well that led on you see to the the Piat techniques of the Ming Dynasty with translucent porcelain, white clay. The most subtle design of all, and that style went also to Japan. And the very very rich people you read about here in say books like the tail of Genji, and you see a film of you must see it touche in Goa. This story of the forty seven Ronin. The lovely things they had around their houses were unbelievable. The lacquer, the boxes in pure gold. Oh, you know it was delicious stuff. About then, it was just like having too much. And ice cream and feeling mean young. Cooked archive am you know that French book who made everything look like an Oriental powers.

Now what happened? The people who practice Zen suddenly got an eye. For the beauty of the ordinary. There are two reasons for this. One was that they became fascinated with what happened spontaneously. What pattern a brush would make when handled roughly and the airlines were shown. They also because their practiced zazen, which is sitting quietly, not thinking of anything. Special but having a completely open mind. That puts you into a state where you get much better eyes and ears the new Ordinarily I have. And you start really seeing things. So you know that famous Haiku poem the old pond of frog jumps in, plop. And Japanese that plop is means the sound of the water. And there's a nother poem. Just like it in the dark forest a very drops. The sound of the water. But somebody suddenly realised you see, just the sound of the water it is marvelous. That's all. Or , they what we found that they were kept getting in very very cheap Korean rice bowls. The poorest cheapest kind of a presence to eat out of. And suddenly it struck one of the zen masters that that was an incomparably beautiful object. Nobody had seen this before. They also had the simplest wooden ladles. Bamboo and then a stick in it for use in the kitchen and one day somebody noticed that this ordinary everyday kitchen utensil was just lovely. And so in the same way, they found that it was quite a satisfactory, to listen to the kettle boiling as to listen to an elaborate concert. So what did they do. They started Throop. Typically a man called Senyo Rikyu to give part is. A very small get a few guests in shacks little or huts. In the garden made of. Very primitive materials such as a mud walls. And where they would go and sit and out of the simplest utensils, carefully chosen by a superb artist, they would simply sit and enjoy the uncomplicated life. And

so was born the tea ceremony. Now, look at that you see in the historical context that's terribly important it was they going back to the primitive. After people were sick of too much civilization. And yet, it was going on to the primitive rather than back. Because the people who selected all those things, they knew they knew the whole tradition of their civilization and their culture. They want barbarians. Once upon a time and then, you see when this became the rage. Rick you became. Attached to the court. The Shogun had tea with the Rikyu. Everybody started getting digging tea ceremony. And in due course, the whole thing became awful. Because what's happened today is this. Tea ceremony is essentially something to enjoy. And there are a few men left who know how to the ceremony. And it's an extremely congenial choir get together. For easy conversation simple and an ostentatious manners and really lovely things to look at.

I was present at a tea ceremony celebrated by is a Zen monk who happens to be an American. And he is a man who has done a lot of mountaineering. And he has therefore with him at all times the sort of equipment that you take on camping in the mountains because he does a lot of climbing in Japan. And I said to him one sure this afternoon with their nice to have a tea ceremony and you did it once before here and it was so pleasant would do so that again said Yes by on before he had served tea ceremony in the style that Zen monks do it which is rather simple and direct and much more comfortable than all these well educated ladies were on tittering about it and on tiptoe nervous I'm hoping they won't make a mistake and all that kind of thing is that dreadful. So he suddenly came in with a small Primus stove. Set that down then he had an old paint part. Which had inside it and aluminum Ugh he said that down. He then proceeded to take the aluminum market out pour water into the paint part and set that on the prime a stove but he ritually pumped up the primus stove he did everything in the style of tea ceremony but this was a dirty old Primus stove. And suddenly the thing began to flame like the god food Oh and. He mixed the tea in the traditional way with the whisk had all the perfect and lovely mammals handing us the aluminum cup. And we got into along with we it's a custom after the tea ceremony after drunk to pass all the utensils around for inspection and this is exactly what happened and we found that the aluminum Cup had the one nine hundred forty five stabbed on it which after it's. We got into a discussion about styles of aluminum copper speck the fact you thought you.

And it was the funniest thing but it was a complete make over of the tea ceremony into the modern idiom. Of course the tea drunk in tea ceremony is that powdered green tea. Which you don't steep like you may garden rooty you whisk it in mixed with a small amount of hot water into a froth and it's called Liquid Jade. And it's a bit of an acquired taste for most westerners. It tastes a little bit like a mixture of Matcha tea and Guinness. But when you get to know it it's very invigorating and very awakening and if you make up a strong mixture of it it's a good thing to use if you want to stay awake all night and do work. And so you see, the legend was that Zen monks started this interest in tea because they needed it to kids stay awake during the practice of meditation and it said that Bodhidharma, whom I drew for you yesterday and he's always drawn with eyes that are wide open why because he hasn't got any eyelids. Once, when he was meditating he fell asleep and he was furious and cut his eyelids off and as they dropped on the ground up came the first he plants that's why they have leaves shaped like eyelids and are all to be drunk ever thereafter staying awake so the plant of but isn't that teeny is the Buddhists drink just like wine is the Christian drink coffee is the Islamic drink and milk the Hindu drink. My religion as it's as it's drink. So then, around this kind of appreciation, born of stillness, and the delight in seeing how nature takes its course. Came the entire cult of Zen art with its special kind of activity. Its special ceramics its special calligraphic styles and its special gardens which are the controlled accident.

Now you see, as I showed you yesterday on that other tea bowl, this is a water jar. And. They leak they like to leave the bottom on glazed. You can really see that it's that way. But look you see how the Glazers been allowed to run. This that we would call not need at all. And you watch somebody make one of these. And I have watched a man just pick up the plate and as he applies the design of the glaze he just goes whoosh with the brush. And lets it drop on it. And it's done. There's another Man who blazes by wood smoke, and in his kiln you may put about eleven hundred pieces. And he wraps them in straw. And wherever the straw touches it leaves a splash of orange color against the purple background. Now you see, the straw arranges itself according to the nature of straw. It doesn't follow strict human direction. And the fascination is when they open up that kiln and bring the things out they look eagerly to see what is the straw down. So, this

principle of letting glaze run. To see what will happen is wu-wei, this is noninterference. This is mushin also no purpose or it can also be translated know a specific intent. And now of course you see, sometimes this doesn't work. And the master picks it up and says. That's not very interesting and rejected. What are the canons of taste which decide whether he will accept one of these accidents or reject it? Because here an additional principle of control enters say in the practice of calligraphy. A man may sit down with a huge pile of paper in front of him. And do a piece after piece after piece and if it isn't. Right he throws it away. So he eventually makes a selection comes out there's a famous story of a Zen master who was doing calligraphy and he had a very smart monk standing beside him who was his assistant and the monk said to each one as he did it you can do better than that oh now, oh come now you know much better than that this master got more and more furious but the monk had to go out to the bento to the toilet or mount and he thought quite what he's afraid. He did it and the Monk came back I looked and he said a masterpiece. I mean.

So there's this element of selection you see now what what determines that's. How do you know? Another example of this there was a tea caddy. Porcelain tea caddy not possible but clay. And when Senyo Rikyu was having tea ceremony he saw this tea caddy and made no comment on it and the owner. Was Dead disappointed that he smashed it. But one of his friends picked the broken pieces out of the trash can. And took them to a mender, and he said Look mend this with gold. And he put it there for gold cement and put this caddy back together and so it had all over its surface spidery lines of gold. And when Rikyu saw that he was just enchanted, and it became one of the most valuable caddies in the Japanese collections. Spidery lines of go following it just apparently a chance marks of a smash. There was a competition at the Art Institute in the University of Chicago in which there was a sculpture class and the competition was that each student was given a cubic foot of plaster of Paris. And they said now do something with it. Well the prize was won by a woman who looked at this cube and said it has no character. It doesn't want to be anything. So she flung it on the floor and smashed it all up. And she made dents in it and banged off the corners and but cracks a bit and things and she looked at again she said, Ah, now I know what it wants to be. And so she followed the grain in it as it were made by all these cracks and produced this marvelous piece of

sculpture. You have in this area a very ingenious sculptor but I am Donal Hord who is a master at following the grain in wood and actually making the grain the grain seems to suggest to him the muscles in the flow of the kind of body that he's making. Or that's the thing.

So, when a master decides whether the accident came off. What he wants is this. He wants the thing. To be the perfect harmony. Of Man and nature. Of order and randomness. Now this is a curious thing in the human mind. When we play games, we get most fascination out of those games which satisfactorily combine skill and chance. Games like bridge. Poker have a sort of admirable combination of these two elements, and we can go on playing those games again and again and again because you don't feel completely at the mercy of chance as you do with dice, unless you cheat. And you don't feel completely at the mercy of skill as you do with chess. Or specially with a game like three-dimensional chess. So there's a sort of up to the middle where order and randomness go together. Well that's what this man is looking for. He's looking for the optimal combination, you see, the things the artwork like a Persian miniatures or the jewelry of Cellini. And Chinese porcelain is too much skill. Too much order. It's like those houses you go into where you dare put an ash in the tray, because everything is so clean and everything is so tidy you don't touch it. One prefers a house you see that looks a little lived in it is more genial more comfortable somehow invites you to sit down and even put your feet on the table. Whereas on the other extreme, some kind of pad where everything is covered and filthy clothes are thrown in the corner and...you know, people are all paint all over them and so on. That's the that's the other extreme we don't want that. But that's that curious thing in the middle.

Now, the most difficult thing is to hold to the Middle. It's like walking a tightrope and that's why the path of Buddhism is called the razors edge. Because you see what happens. When this all this kind of work. In the course of history became fashionable. People began to affectation these styles. For example when Seshu The Great Master painter worked he would sometimes take a handful of straw. And paint with that instead of a brush in order to get the sort of rough effect that he wanted. But later on, there came people who could take an ordinary paint brush and so exactly ink that brush, that it would give precisely the messy effect that they had in mind.

They would also be able to ink a brush in such a way and this is terribly decadent they could dab grapes on the vine, and have dark ink where the shadow was supposed to be. And no into tall where the highlight was supposed to be as when they started getting mixed up with Western ideas about shadows and perspective. They didn't have that earlier. But they were so skilled in the handling of the ink, that they would do this sort of thing and they would imitate you see all the the so-called rough and natural effects of the greats and artists. And so, today in Japan a younger generation of artists has decided it's time to break all that up. If you imagine for example haiku parties, the writing of haiku poetry by show who is the great seventeenth century master of haiku said get a three foot child to write haiku. Because they're the sort of direct guileless things that children would say. But now that a magazine devoted to haiku poetry, wherein every issue there will be ten thousand haikus, written by people all over the country and they get so stilted and so affected that one which one had never heard of haiku. The same thing is starting over here. And you should see the entries we get in these haiku competitions that Japan Airlines and other people sponsor. But it all after a while becomes dated, stilted, and so somewhere again the new thing has to break out. Which is always coming up but there's no formula you see for fixing it so that you can do it again and again and again, because the moment you start doing it again and again and again it isn't it anymore that the the real thing has escaped. You remember, some time ago, there was a passion for having wrought iron fish does the outline of the fish some artist originate you know put this fish together and look great but then you suddenly found them in every gift shop and dime store and they look perfectly terrible. So this is the mysterious thing, where not only in the arts, but in life styles in everything. When you start saying what is the technique for getting this thing and people say well this is it. It's gone. Same in education. Same in music. The moment you start teaching something, what are you what question you are asking? How could we...is there some method whereby in our schools we could produce from the music department every graduation ceremony three music for musicians of the stature of Bach or Mozart? Now if we knew how to do that, that knowledge would prevent us from being surprised by the work of these people because we would know how it's done. And when you know how something is done it doesn't surprise you. That's why there's a Zen poem that says if you ask where the flowers come from even the god of spring

doesn't now. Suddenly the God of spring would be supposed to know where the flowers come from but the truth of the matter is it doesn't.

And so in the same way, if you ask the Lord God. How do you create the universe? He said I have no special method. And this, this is known in Zen as a very difficult this is the most difficult virtue to attain. So many of these things begin with mobile. Buji, it means nothing special. It means no business. No artificiality. In American, current, real cool. So buji is where something doesn't stand out like a sore thumb. But it is absolutely different. From being modest. A buji person may be immodest in the sense that if he knows he can do something where leader says he can. He doesn't go at all sorts of blushing violet techniques. Buji, you see is this mysterious quality of nothing special no special method. Because if there is that may repeat if we do know the method and we know it infallibly. It ceases to be interesting. There are no surprises left. And the moment the element of surprise is gone. The zest of life has gone. That you see is why it's very difficult to teach Zen to yourself. Because you can't easily surprise yourself. The essence you see of this kind of spontaneity is response to a surprise so the Master you don't know what he's going to do and he surprises you it's like trying to cure hiccups. Very difficult to kill yourself because when you patches on the back you know when you're going to do it so you're already for it but somebody else comes up and slams you on the back and that's a surprise and what you needed was a surprise. Or it's like jokes. What makes you laugh about a joke is the element of surprise in it. That's why jokes aren't funny after they've been explained. So in the same way, all these Zen stories. If explained, have no effect. They're intended to produce what I would call metaphysical laughter. But this has to be a surprise. And so, as to be surprised...well there's no way of. Premeditating it. So we'll see if you read for example there's a book out here called Zen by are you going to have a go who started archery many of you probably read this book by Herrigel. He had to learn to pull the bowstring in the manner of the Japanese Archer and let it go, but not on purpose. Is to have to let it go without thinking first I let it go. And then let go. He had to let it go. Not on purpose. Now that really bug Harreigel. How do you do something not on purpose Pashley If you're aiming at a target. Well the whole point is if you think before you shoot it too late. The targets moved. That's why we have a thing like beginner's luck. You see if you simply

point at something like that if your finger was a gun I would probably have hit the light switch. And so you get a person who is naive about a gun will pick a gun up and bang and the thing will be will drop did. I or never forget the first time I ever used a slingshot. Yes friend of mine was with me and he was aiming away and not missing and I did pick it up again and it hit and I couldn't do it again. You get a certain naturalness there.

So, there was a master by the name of Ikyu who was a great leg puller. And he had in front of his house a very now pine tree. One of those things contorted and I love this kind of thing and he put a notice up by said I Ikyu, will pay one hundred yen, which was a fair amount of money in those days, to anyone who can see this tree straight. Well soon there was a whole crowd of people around that tree line on the ground they twisting their necks and looking at every Also. There's absolutely no way of seeing the tree with a straight trunk. But if you had a friend who was a priest of another sect and a smart boy went over to see this friend and said what about this mistake use tree ower the output is perfectly simple he said You go and tell him the answer to seeing the tree straight is to look straight at it. So first found went over to Ikyu, and said I claim that it was he said he looked straight at it and if you looked in a funny way and said he was fucked out the Hundred Year and gave it to him I think you'll be talking to Rozin down the street.

Now in that way, just look straight at it. In otherwise, here's the bowstring let go of it don't. All this thimble-tambling, nimble-nambling, babbling jumble humble about. The right technique of letting go of it let go of it damn it. But that's very difficult. Because if as say to you now everybody let's be unselfconscious. And so finally, in desperation, you at last Learn to let go of the thing. Which was what you were supposed to do all the time. And then, one is as again as a child. This is original innocence. So, this is the meaning of the person who was asked what do you do here in the Zen institution, he said we eat when hungry and we sleep when tired. But he said that's been just like everybody else they all do that he said they do not. When they eat they don't eat. But they think of all sorts of extraneous matters and they tire they don't sleep they dream all kinds of dreams. So let's have an intermission, and then we can have a discussion.

Meditation

The art of meditation is a way of getting in touch with reality. And the reason for it is that most civilised people are out of touch with reality because they confuse the world as it is with the world as they think about it and talk about it and describe it. For on the one hand, there is the real world, and on the other a whole system of symbols about that world which we have in our minds. These are very, very useful symbols, all civilization depends on them, but like all good things, they have their disadvantages and the principal disadvantage of symbols is that we confuse them with reality. Just as we confuse money with actual wealth. And our names about ourselves our ideas of ourselves images of ourselves, with ourselves. Now of course reality from a philosopher's point of view, is a dangerous word. A philosopher will ask me what do I mean by reality? Am I talking about the physical world of nature, or am I talking about a spiritual world or what? And to that I have a very simple answer. When we talk about the material world, that is actually a philosophical concept. So in the same way, if I say that reality is spiritual/ That's also a philosophical concept, and reality itself is not the concept. Reality is [gong] and we won't give it a name.

Now it's amazing what doesn't exist in the real world. For example, in the real world there aren't any things, nor are there any events. That doesn't mean to say that the real world is a perfectly featureless blank. It means that it is a marvelous system of wiggles. In which we descry things and events in the same way as we would project images on a Rorschach blot. Or pick out particular groups of stars in the sky and constellations as if they were separate groups of stars. Well, they are groups of stars in the mind's eye in our system of concepts they are not. Out to them as constellations they're ready grouped in the sky. So, in the same way the difference between myself and earlier rest of the universe, is nothing more than an idea. It is not a real difference. And meditation is the way in which we come to feel our basic inseparability from the whole universe. And what that requires is that we shut up. That is to say, that we become interior silent. And cease from the interminable chatter that goes on inside our skulls because you see most of us think compulsively all the time. That is to say we talk to ourselves and I remember when I was a boy we had a common saying talking to yourself is the first sign of madness.

Now obviously, if I talk all the time, I don't hear what anyone else has to say. And so, in exactly the same way, if I think all the time, that is to say if I talk to myself all the time, I don't have anything to think about except thoughts. And therefore, I'm living entirely in the world of symbols, and am never in relationship with reality. Alright now that's the first basic reason for meditation, but there is another sense, and this is going to be a little bit more difficult to understand why we could say that meditation doesn't have a reason. Or doesn't have a purpose and in this respect it's unlike almost other things that we do except perhaps making music and dancing. Because when we make music, we don't do it in order to reach a certain point such as the end of the composition. If that were the purpose of music, to get to the end of the piece, then obviously the fastest players would be the best. And so likewise, when we are dancing, we are not aiming to arrive at a particular place on the floor. As we would be if we were taking a journey. When we dance, the journey itself is the point. When we play music, the playing itself is the point. And exactly the same thing is true in meditation.

Meditation is the discovery that the point of life is always arrived at in the immediate moment. And therefore if you meditate for an ulterior motive, that is to say, to improve your mind, to improve your character, to be more efficient in life you've got your eye on the future and you are not meditating. Because the future is a concept. It doesn't exist. As the proverb says, tomorrow never comes. There is no such thing as tomorrow there never will be, because time is always now. And that's one of the things we discover when we stop talking to ourselves and stop thinking. We find there is only a present, only an eternal now. So, it's funny then, isn't that one meditates for no reason at all, except we could say for the enjoyment of it. And here I would interpose the essential principle that meditation is supposed to be fun. It's not something you do as a grim duty. The trouble with religion as we know it is that it is so mixed up with grim duties we do it because it's good for you it's a kind of self punishment. Where meditation when corrected on has nothing to do with all that it's a kind of digging the present. It's a kind of grooving with the eternal now. And brings us into a state of peace. Where we can understand that the point of life the place where it's at, is simply here and now.

Well now, in the art of meditation there various props, supports. One thing that we are going to use as a means of stilling chatter in the mind is pure sound. And for that reason, it's useful to have a gong. This is a Japanese Buddhist gong made of bronze and shaped like a bowl. If you don't have one of these you can get the rounded end of an oxygen tank. Have a machinist saw it off roughly into the shape of a bowl and use that. Or you can use your own voice chanting. Another prop in meditation is the use of incense. And that is because the sense of smell is our repressed sense and because it's our repressed sense it has a very powerful influence on us and therefore we associate certain smells with certain states of mind. And so the smell of incense is associated with peace and contemplation and so it's advantageous to burn incense in meditation. The other prop is a string of beads. And these beads are used in meditation for an unconscious method of timing yourself. Instead of looking at a watch, you move a bead each time you breathe in and out, so that at a certain rate..You see, there are always one hundred eight beads on a rosary and when you get the slow breathing halfway around the rosary is about forty minutes, and that is the usual length of time for which one sits in meditation because otherwise you get uncomfortable and you get stiff legs and problems of that kind.

Now then, the other thing first of all that we have to go into is how. How does one sit in meditation? You can sit anywhere you want. You can sit in a chair or you can sit like I'm sitting which is the Japanese way of sitting, or you can sit in the lotus posture, which is more difficult, which is cross-legged with the feet on the thighs, soles upwards. And the younger you start that in life, the easier you'll find it to do. Or you can just sit cross-legged on a raised cushion above the floor or the point of this is that if you keep your back erect. I don't mean stiff like this, nor slumped like this, but just easily erect, you are centered and easily balanced and you have a feeling of being thoroughly rooted to the ground. And that sort of physical stability is very important for the avoidance of distraction and generally feeling settled. Here and Now, Je suis US does the French say, I'm here and I'm going to stay. Well now, the easiest way to get into the meditative state is to begin by listening. If you simply close your eyes, and allow yourself to hear all the sounds that are going on around you. Just listen to the general hum and buzz of the world. As if you were listening to music. Don't try to identify the sounds you are hearing, don't put names on them. Simply allow them to

play with your eardrums. And let them go. In other words, you could put it, let your ears hear whatever they want to hear. Don't judge the sounds. There are no as it were, proper sounds or improper sounds, and it doesn't matter of somebody coughs or sneezes or. Drop something. It's all just sound. And if I am talking to you right now and you are doing this, I want you to listen to the sound of my voice just as if it were noise. Don't try to make any sense out of what I'm saying, because your brain will take care of that automatically. You don't have to try to understand anything, just listen to the sound. As you pursue that experiment, you will very naturally find that you can't help, naming sounds identifying them, that you will go on thinking. That is to say, talking to yourself inside your head automatically. But it's important that you don't try to repress those thoughts by forcing them out of your mind. Because that will have precisely the same effect as if you were trying to smooth rough water with a flat iron. You're just going to disturb it all the more.

What you do is this: as you hear sounds coming up in your head thoughts you simply listen to them as part of the general noise going on just as you would be listening to the sound of my voice or just as you would be listening to cars going by or two birds chattering outside the window. So look at your own thoughts as just noises. And soon you will find that the so-called outside world and the so-called inside world come together. They are a happening. Your thoughts are happening, just like the sounds going on outside and everything is simply a happening and all you're doing is watching it.

Now, in this process, another thing that is happening that is very important is that you're breathing. And as you start meditation. You allow your breath to run just as it wills. In other words, don't do at first any breathing exercise, but just watch your breath breathing the way it wants to breathe. And the notice a curious thing about this. You say in the ordinary way, I breathe. Because you feel that breathing is something that you are doing voluntarily just in the same way as you might be walking or talking. But you will also notice that when you are not thinking about breathing, your breathing goes on just the same. So, the curious thing about breath is that it can be looked at both as a voluntary and an involuntary action. You can feel on the one hand I am doing it, and on the other hand, it is happening to me.

And that is why breathing is a most important part of meditation, because it is going to show you as you become aware of your breath, that the hard and fast division that we make between what we do on the one hand and what happens to us on the other is arbitrary. So that as you watch your breathing you will become aware that both the voluntary and the involuntary aspects of your experience are all one happening.

Now that may at first seem a little scary, because you may think well, am I just the puppet of a happening the mere passive witness of something that's going on completely beyond my control. Or on the other hand, am I really doing everything that's going along? Well if I were I should be God and that would be very embarrassing because I would be in charge of everything that would be a terribly irresponsible position. The truth of the matter as you will see it, is that both things are true. You concede that everything is happening to you, and on the other hand you're doing everything for example it's your eyes that are turning the sun into light it's the nerve ends in your skin that are turning electric vibrations in the air into heat and temperature. It's your ear drums that are turning vibrations in the air into sound and in that way, you are creating the world. But, when we're not talking about it, when we're not philosophizing about it, then there is just this happening this. And we won't give it a name.

Now then, when you breathe for a while, just letting it happen and not forcing it in any way, you will discover a curious thing. That without making any effort, you can breathe more and more deeply. In other words, supposing you simply breathing out and breathing out is important because it's the breath of relaxation, as when we say, whew, and heave a sigh of relief. So when you are breathing out, you get the sensation that your breath is falling out. Dropping, dropping, dropping out with the same sort of feeling you have as if you were settling down into an extremely comfortable bed. And you just get as heavy as possible and let yourself go. And you let your breath go out in just that way. And when it suddenly comfortably out and it feels like coming back again, you don't pull it back in, you let it fall back in. Letting your lungs expand, expand, expand, until they feel very comfortably full. And you wait a moment to let it stay there. And then once again, you let it fall out. And so in this way, you will discover that your breath gets quite naturally easier and easier, and slower

and slower, and more and more powerful, so that with these various aids, listening to sounds, listening to your own interior feelings and thoughts, just as if they were something going on not something you were doing but just happenings. And watching your breath as a happening that is neither voluntary nor involuntary, you are simply aware of these basic sensations, then you'll begin to be in the state of meditation. But don't hurry anything, don't worry about the future, don't worry about what progress you're making, just be entirely content to be aware of what is. Don't be terribly selective, particular, say I should think of this and not of that, just watch whatever is happening.

Now then, to make this somewhat easier. To have the mind free from discursive verbal thinking, sound, or chanted sound is extremely useful. If you for example simply listen to the gong. And let that sound be the whole of your experience. It's quite simple, it requires no effort. And then along with that, especially if you don't have a gong. We can use what are called in the Sanskrit language mantra. Mantra are chanted sounds which I use not so much for their meaning as for the simple tone. And they go along with that easy kind of slow breath. One of the basic mantras is of course the sound ohm. That sound is used because if you spell it out a-u-m, it runs from the back of your throat to your lips and therefore it contains the whole range of the voice. And for that reason, it represents the total energy of the universe this what is called the pranava, the name for the ultimate reality for the which then which there is no whicher. And so, in this way if we chant it... OHMMMMMM, and it's varied like this. AUMMMM [variation]. HUNNNNGGGG. And you can keep that up for quite a long time, and eventually you will find as you go on chanting that the words of the chant will simply have become pure sound. And you won't be thinking about it, you won't have any images about the sound going on in your mind, you will simply become completely absorbed in sound, and therefore you will find yourself living in an eternal now in which there is no past, and there is no future, and there is no thing called difference between what you are as knower and what you are as the known. Between yourself and the world of nature outside you, it all becomes one doing, one happening.

Now, in addition to those slow moving chants, you may find it according to your temperament easier to do a fast moving one. These have a sort of

rhythm to them that is absorbing say a chant that many of you have heard that goes. Krishna conditional Krishna. Hare Krishna Krishna. Hare Hare, Krishna Hare Krishna. Rama Hare, Hare.. And it doesn't matter what it means. Actually Krishna, Rama the names of Hindu divinity is but that's not the point. The point is just to get with that thing that is running, running, running. Any Krishna Krishna Krishna. Any and so on, and if you are a Christian or a Jew and you feel more inclined to use a meditation word that is more congenial to you, you can use say Hallelujah. Or if you're a Mohammed, you can use the the name of God. They have a way of doing it you know which gets very exciting goes, Allah, Allah, Allah, Allah...and it gets faster and faster you can keep it up for forty minutes. And you'll be out of your mind. But you see, to go out of your mind at least once a day is tremendously important, because by going out of your mind you come to your senses. And if you stay in your mind all the time, you are over rational. In other words, you're like a very rigid bridge which because it has got no give, no craziness in it, is going to be blown down in the first hurricane.

Zenrin Poems

Water not disturbed by waves settles down of itself. A mirror not covered with dust is clear and bright. The mind should be like this. When one big clouds it passes away its brightness appears. Happiness must not be so awful. When what disturbs passes away happened next comes of itself.

'At the sound of the bell now in the silent night. I wake from my dream in this dream world of ours. Gazing at the reflection of the moon in a clear pool. I see beyond my form. My real form. The song of birds. The voices of insects, are all means of conveying truth to the mind. In flowers and grasses, we see messages of the Tao. Of the Way of Nature. The scholar, pure and clear of mind, serene and open of heart, should find in everything what nourishes him. Men know how to read printed books. They do not know how to read the unprinted ones. They can play on a stringed harp, but not on a stringless one. Applying themselves to the superficial instead of the profound. How should they understand music or poetry? If you know the insignificance of things, the misty moon of the five lakes is all within you.

If you understand the activity of human phenomena, the heroism and nobility of the great man of all ages is in your grasp.

Walking alone, leaning on a staff in a valley of pine trees, clouds rise around my monkish robes. Sleeping with a book as my pillow by the window beneath the bamboos, I wake. When the moonlight steps on the floor clocks. A solitary cloud comes out of the mountain cave. It stays or departs without reference to anything else. The bright mirror of the moon hangs in the sky. It is aloof from both quietness and clamor.

The Zen says, when you are hungry, eat. When you are weary, sleep. Poetry aims at the description in common language of beautiful scenery. The Sublime is contained in the ordinary, the hardest in the easiest. What is self-conscious and ulterior is far from the truth. What is mindless is near.

The body is like a boat adrift floating along, or motionless in a deep pool. The mind is like a piece of burnt wood. What matters if it is that feeling of vanished with scented lacquer?

Reading the Book of Changes at the morning window. I rub a vermilion stick of ink in the dew that drips from the pine trees. Discussing the sutras with a visitor, the sound of the wooden copper is borne away on the wind from the bamboos. An ancient worthy says, 'The shadow of the bamboo sweeps over the stairs, but the dust does not know. The disc of the moon passes through the water of the lake leaving no trace.' One of our Confucians says, 'The stream rushes down swiftly but all is silent around. The flowers fall incessantly. But we feel quiet.' If you have grasped the meaning of this in all your relationships with things, you are free in mind and body.

If your heart is without stormy waves, everywhere are blue mountains and green trees. If our real nature is creative like nature itself, wherever we may be, we see that all things are free, like sporting fishes and circling kites.

When in the mood, I take off my shoes and walk barefooted through the sweet-smelling grasses of the fields, wild birds without fear accompanying me. My heart at one with nature, I loosen my shirt as I sit absorbed beneath

the falling petals, while the clouds silently unfold me as if wishing to keep me there.

Just as a whirlwind roaring down a valley leaves nothing behind it, so the ear is to have nothing to do with right and wrong. Just as the moon only reflects its light in a pool, so the mind, empty and unattached does not know itself from the outside world as two things.

When waves reach the sky, those in the boat are aware of the danger, but onlookers are trembling with fear. A drunken diner is swearing and cussing at the others but they are piled on and on and whereas those outside the biting that tongues and apprehension of a quarrel. Thus, with the superior man his body may be immersed in affairs, but his mind is above and beyond them.

Though my tea is not the very best, the pot is never dry. My wine is not exquisite but the barrel is not empty. My plane loot, though stringless is always into. My short flute, though a form of this one, suits me well. Following Buddhas, adapting ourselves to circumstances and our confusion acting in accord with one's position these two phrases are the life boy for us to pass over the sea of life. The paths of life our illimitable. If we desire perfection, all kinds of obstacles arise. But if we obey our destiny, we are free everywhere.

The following are verses from a book called Zenrin Kushu. Verses which are collected from ancient Chinese and Japanese classics, and which are used by a Zen monks to understand the spiritual discipline of the koan. That is to say, their understanding of the ancient dialogues between Zen masters and they're disciples. The translation of these verses is by Ruth Saki. From her book Zen dust. Published by Harcourt Brace and World.

'That cold kills you with cold. But heat kills you with heat. And there isn't a piece of tile to cover his head well there isn't an inch of US for him to stand on.

When the mind wants to speak about it Words fail. When the mind seeks affinity with it, thought vanishes. Sun and moon cannot eliminate it completely, heaven and earth cannot cover it entirely. Though we are born

of the same lineage, we don't die at the same lineage. When we are reviling one another, you may give me tit for tat. When we are spitting at one another, you may spew me with slobber. The Deer Hunter doesn't see the mountains. The miser doesn't see man.

Last year's poverty was not real poverty. But this year's poverty is poverty indeed. The Angels find no parts on which to strew flowers. The heretics secretly spying, find nothing to see. Last year's plum and this year's willow. Their color and fragrance, ours of old. At the limits of heaven, the sun rises and the moon sets. Beyond the balustrade the mountains deepen, and the waters become chilled.

He sees only the winding of the stream and the twisting of the path. He does not know that already he is in the land of the immortals.

He who would understand the meaning of Buddha nature. Must wash with the season. And the causal relations. Every Voice is the voice. Every form is the beautiful. The wild goose has no intention of leaving traces. The water has no thought of engulfing reflections.

The instant you speak about a thing, you miss the mark. How can the Mountain Finch know the wild swans aspiring. The eight-cornered mortar rushes across the sky. The Badger and the White Bull emit a glorious radiance. With no birds singing, the mountain is yet more still. In the spring beyond time the withered tree flowers. When the snowy Heron stands in the snow, the colors are not the same.

A pair of monkeys are reaching for the moon in the water. When pure gold enters the fire, its color becomes still brighter. Entering fire, he is not burned. Entering water, he has not drowned. A fish that can swallow a boat, doesn't swim around in a Valley Stream. I do not emulate the sages, I do not esteem my own spirit.

From the top of the solitary peak, I gaze at the clouds. Close by, the old ferry landing, I am splashed with mire. The fishermen, singing on the misty shore, all extol good fortune and honor. The woodcutters, chanting among the lofty trees, together rejoice in the air of peace. On the top of the solitary peak, he whistles at the moon and sleeps in the clouds. Within the vast

ocean, he overturns the waves and rouses the breakers. Not to take what heaven gives is, is to incur Heaven's calamity. Not to act when the moment comes, is to enter heavens misfortune. Enwrapped in billows of white clouds, I do not see the white clouds. Absorbed in the sound of flowing water, I do not hear the flowing water.

I take blindness as vision, deafness as hearing. I take danger as safety. And prosperity as misfortune. When I see smoke beyond the mountain, I know there's a fire. When I see horns beyond the fence, I know there's an ox.

When an ordinary man attains knowledge, he is a sage. When a sage attains understanding, he is an ordinary man. Though a cockatoo can talk, it is still just a bird. Though an orangutan can speak, it is still just a beast. But for the rule and the compass, the square and the circle could not be determined. But for the plum line, the straight and the bent could not be rectified.

The dragon hum in the dead tree. The eyeball in the dry skull. When you are really master of the myriad forms throughout the four seasons there's no weathering, no decay. A light breeze stirs the lonely pine. The sound is more pleasant from close-by. And now that I've shed my skin. Completely one true reality unknown exist.

Art of Meditation

A person who thinks all the time has nothing to think about except thoughts. So, he loses touch with reality, and lives in a world of illusions. By thoughts, I mean specifically, chatter in the skull. Perpetual and compulsive repetition of words, of reckoning and calculating. I'm not saying that thinking is bad. Like everything else, it's useful in moderation. A good servant but a bad monster. And all so-called civilized peoples have increasingly become crazy and self-destructive because, through excessive thinking they have lost touch with reality. That's to say, we confuse signs, words, numbers, symbols and ideas with the real world. Most of us would have rather money than tangible wealth. And a great occasion is somehow spoiled for us unless photographed. And to read about it the next day in the newspaper is oddly more fun for us than the original event. This is a disaster, for as a result of confusing the real world of nature with mere

signs, such as bank balances and contracts, we are destroying nature. We are so tied up in our minds, that we've lost our senses and don't realize that the air stinks, water tastes of chlorine, the the human landscape looks like a trash heap, and much of our food tastes like plastic. Time to wake up. What is reality? Obviously, no one can say, because it isn't words. It isn't material, that's just an idea. It isn't spiritual. That's also an idea a simple. Reality is this [gong]. You see. We all know what reality is, but we can't describe it. Just as we all know how to beat our hearts and shape our bones, but cannot say how it is done. To get in touch with reality there is an art of meditation, of what is called yoga in India, Chan in China and Zen in Japan. It is the art of temporarily silencing the mind. Of stopping the chatter in the skull. Of course, you can't force your mind to be silent. That will be like trying to smooth ripples in water over the flat iron. Water becomes clear and calm only when left alone.

So, will you try an experiment with me? Simply close your eyes, and allow your ears to hear all sounds around you. Don't try to name or identify the sounds, just hear them as you would listen to music. As when you hear a flute or a guitar. Without asking what it means.

And as and when I talk, just hear the sound of my voice. Don't bother about what it means. Your brain will take care of that by itself. Just let your eardrums respond as they will, to all vibrations now in the air. Don't let yourself, or your ears, be offended by improper or unscheduled sounds. If for example, the record is scratchy, OK. You wouldn't object if you were listening to it sitting by a fire of crackling logs.

[phone rings] Let em ring. It's just a noise. And keep your tongue relaxed floating easily in the lower jaw. Also stopped frowning. Allow the space between your eyes to feel easy and open. And just let the vibrations in the air play with your ears.

You must understand that in meditation we are concerned only with what is, with reality, nothing else. The past is a memory. The future an expectation. Neither past nor future actually exist. There is simply eternal now. So don't seek or expect a result from what you're doing. That wouldn't be true meditation. There's no hurry. Just now, you're not going anywhere, simply be here. Live in the world of sound. Let it play. That's all. In the world of

pure sound, can you actually hear anyone who is listening? Can you hear any difference between all these sounds on the one hand, and yourself on the other? Naturally, we use techniques and gimmicks to help the thinking mind to become silent, and one of them is the gong. It is a sound at once pleasing and compelling, it absorbs attention but watch what happens when it fades out. [gong noise] The one sound becomes the many. The single tone is transformed easily and gently into all other noises. And that's how the universe comes into being, out of the one energy underlying all events.

So if you don't have a gong, you can use your own voice, by chanting what Hindus and Buddhists call a Mantra. That is, a syllable or phrase sung for its sound rather than its meaning. Chief of these is the syllable ohm, or auhm, called the pranava, or the sound of God. Because it involves the whole range of the voice, from the back of the throat to the lips. Take the tone from the gong, and hum it with me.

Now, you can hear all sounds as ohm. There all at some point in the total range of sound, from the back of the throat to the lips, making a spectrum of sound as all colors are originally one white light. But, don't ask what the sound is, or what it means. Just hear it and dig it I'm with me again. Hum it again. [gong] Ohm.

Let me explain again what we're doing. We are going behind with names, numbers, beliefs and ideas, to get back to the naked experience of reality itself. And that this level of awareness, we find no difference between the listener the sound, the knower and the known, the subject and the object. Between the past, the present, and future. All that's just talk. What is really happening is. [gongs]

And you may wonder, how I can keep the sound going for so long in time. It depends on regulation of the breath, which is basic to the art of meditation, and I'm going to show you how to do this and why. To begin with, just as you have been letting vibrations in the air play with your ears, let your lungs breathe as they will. Don't as yet attempt any breathing exercise don't force anything simply breathing.

Now, is this breathing a voluntary or involuntary action? Or either? Just feel it without taking sides without words. And again, hear my voice as if it

wind in the trees of the sound of waves. Yes. Yes. Most of us are short of breath. We never really empty our lungs. But to make a long complete out breath you mustn't force it. Imagine there's a large ball of lead inside your neck. And allow it to fall slowly through your body to the floor. Pushing and easing the breath out as it drops, is the breath out just as you settle and sink down comfortably into a bed. And, when the ball reaches the floor, let it drop away as if to the center of the earth. Then, let the breath come back, back in as a reflex without pulling it. And then imagine another ball of lead in the neck. And again. Let it fall out, long and easy. And once again. You know how do you see what's happening. You are generating a great deal of energy without trying or forcing. Two things seem to be happening at once, first the outflow of breath is simply following, happening all by itself. Second, it's under perfect control.

So, from this practice, you learn to experience, to realize, that what happens to you, and what you do are one in the same process. There is no real separation between one thing called you, and another quite different thing called the Universe. When you stop talking and naming, they are quite obviously one. So again, let your breath fall easily out.

All the way. Let it come back on its own, and then out again. Whew. Let's put the sound on the next outflow. [gong] Ohm. And again, so that you have nothing in mind but [gong] ohm.

[afterword] Then, there is a very effective mantrum used by an important sect of Islamic mystics known as Sufis. Like all these different mantrums, they will be kept up for quite long periods say fifteen to twenty minutes or more, so what I'm giving you are only samples. You can easily do this one with me it goes like this. Allah, allah, all-Lah....

Why Not Now?

Before we begin our celebration, I want to talk to you for about half an hour and I apologize for this because I am for the elimination of sermons on Sunday mornings. But I need to explain both for you and for the radio audience what we're going to do. It has been announced as an Aquarian Age religious service. I did not invent that title. It has nothing so far as I

know to do with the Aquarian Age, If such a thing exists. And I don't like the word service. It's got all sorts of associations of sanctimoniousness. So I would rather call it a contemplative ritual. Period. Our purpose in doing this is to offer a suggestion to the churches. To the Christian Jewish and Islamic churches in particular, because for a long, long time, the kind of religious celebration which they have conducted has been impossibly loquacious. And didactic. Almost all our religious observances are nothing but talk. They tell God what to do, as if he didn't know. And they tell the people what to do, as if they were able to do it or even willing. And this throwing the book at people and telling them the Word.

I think we've had enough of it. Because the history of religion is almost equivalent to the history of the fair. Preaching. Since preaching is a kind of moral violence, which excites people sense of guilt, and there is no more uncreative sense than that. You cannot love and feel guilty at the same time. Any more than you can be afraid and angry at the same time. What seems to me to be lacking in our western religious observances is some sort of social ritual or liturgy, which gives an opportunity for spiritual experience. That is to say, for a transformation of the individual consciousness, so that in one way or another the individual is able to realize his oneness. With the eternal energy behind this universe which some people call God, and others prefer not to name or to conceive. The Western religions have from an official standpoint, being somewhat suspicious and leery of mystical experience. Because in the founder of Christianity, a mystical experience, led to the claim that he was God incarnate. Which was, to the Jews a stumbling block and to the Greeks foolishness. Because if you believe that God is a monarch. A beneficence tyrant in charge of the universe, anyone else claiming to be God is obviously committing an act of subversion. And would be suspected of introducing democracy into the kingdom of heaven. Which is supposed to be a monarchy and not a republic.

And I do not understand how we can be citizens of the United States, believing that a republic is the best form of government, but go on insisting that the universe is a monarchy. I feel rather the Jesus was a person who had this colossal mystical experience that we call cosmic consciousness, the experience that your real self is not that little superficial idea or image of yourself which we call 'I', but the total energy of the world flowing through

you and expressing itself in you. And that's the real you. And it was on that basis that he could say I am the Father are one. What the Christians did was to stop the Gospel cold by saying all right, Jesus was God but nobody else. And so for lack of the spiritual experience of Jesus, nobody has been able to live the religion of Jesus they have lived instead the religion about Jesus, which is a very different thing. Because he's been put up on a pedestal and worshiped at a distance and his example in life rendered ineffective, because you can't make the tail wag the dog, or the cart pull the horse. You cannot expect love in Action, unless there is what the Christians call grace underlying it and grace so far as anybody knows is a purely theoretical thing which you believe you have received but there is never been any indication of it, to speak of, except in exceptional individual lives that account rather occasionally.

So what I'm proposing instead of the ordinary kind of religious this is as I said a contemplative ritual. And the idea is not to have everybody shaken up and whooping around like Indians on the warpath. But to bring about a state of profound peace. So therefore I should say something in a preliminary way about meditation or contemplation as I prefer to call it. Usually when Western people hear that an Oriental practices meditation he asks What do you meditate on. And that question puzzles a Buddhist or Hindu. Because you don't meditate on anything anymore than you breathe on anything. You breathe, and in the same way you meditate. The verb is in a way intransitive. Meditation is the act of allowing one's thoughts to cease. As Patanjali puts it in the beginning of the yoga sutra, yoga meaning the art of meditation more strictly speaking, Yoga means union. The union of the individual in the universe. He says, after saying now yoga is explained he says she you know Gus pretty neat other which means yoga. Is stopping the agitation of thinking. Thinking is talking to yourself, or figuring to yourself. That's the way I use the word.

Now if I talk all the time I don't hear what anyone else has to say. Consequently if I talk to myself all the time I don't have anything to think about except thoughts. There is no Into go between thoughts. During which I can come into touch with reality, that is to say the world which thoughts represent as words represent events, or as money represents wealth. And so, if I'm never silent in my head I'm living in a world of total abstraction,

divorced from reality altogether. You may ask, what is reality? And people have various theories about what it is but you must remember that they're all theories those who believe that reality is material are projecting upon the real world, a philosophical theory about it and those who say that it is mental or spiritual are doing likewise. Reality itself is neither mental nor spiritual, nor any concept that we can have of it reality is simply [gongs] Nor anything else. Nonverbal and words are reality and so far as they are noises. But even that is saying too much.

Now therefore, to meditate you might think that we attempt to suppress thought. We do not do that. Because you cannot meditate. Let me put that in a more emphatic way you cannot meditate. You, your ego image, can only chatter. Because when it stops, it isn't there. When you are not thinking, you have no ego because your ego is a concept. The thinking behind the thoughts the feeling, behind the feelings and the think about Heine the thoughts is only a thought an idea of some reference point to which all our experiences happen. And that of course cuts us off from what we experience it makes a great gap or gulf between the knower and the known. And that creates the spirit of alienation to the world from which we suffer. Conflict. Hate. Domineering spirit arise from that basic division. So when you come to an end of thought, and you don't know how to meditate you don't know what to do with your mind nobody can tell you then thinking comes to an end naturally. And you just watch. You don't ask who watches, because that merely arises from the fact that in grammar every verb has to have a subject by rule. That is not a rule of nature, it is a rule of grammar. In nature, there can be watching without a separate watcher, just as there can be flashing without something called lightning that does it. The lightning is of course the flashing.

So when you realize that you come to your wits end, you can begin meditation. Or meditation happens and that is happening is the watching simply of what is, of all the information to conveyed by your exterior interior senses and of the thoughts that key. Chattering on about it all you don't try to stop those thoughts, you just let them run as if they were birds twittering outside. And they will eventually get tired of themselves and stop, but don't worry about it whether they do or don't just simply watch whatever it is that you are feeling, thinking, experiencing and that's it watch

it. And don't go out of your way to put any names on it. That's really what meditation is and you see you're not expecting any result. You are in meditation in an eternal present. You're not doing it to improve yourself, you found you can't do that your ego can't possibly improve you because it's what's in need of improvement. Your ego can't let go of itself, because it is a complex called clinging to oneself. That's what it is by definition. So it's just something that evaporates when it is understood that it is unable to achieve a transformation of consciousness mystical experience the vivid sense of union of individual and cosmos.

So one of the easiest ways to enter into the state of meditation is therefore listening to what is using the sense of sound. Sound is curiously enough a sense that bores us less easily than sight. And when you listen to sound, you listen to it, just the random sounds you know, that are going on in the room and the street. Is if you were listening to music. Without trying to identify its source or name it. All put any label on it at all just enjoy whatever sound may be going on whether it's in this hall or whether it's in the area where you're listening to the radio. That's what we shall do the proper part of the ritual, just listen. Now we can go on from that listening to making sound ourselves and also listening to it and instead of making sound we learn the knack of letting it happen through us. Once a great choirmaster in England Sir Walter Davies, was rehearsing a choir in the presence of the Archbishop of Canterbury. Who was then William Temple a great theologian. And this was a raw choir, he didn't really know much about singing. And he gave them a hymn to sing that they knew very well. And to impress the archbishop they sang it with gusto and it sounded forced and terrible. Then he had with him a professional choir and he asked them to sing a little known hymn. And sing it several times until everybody got the hang of the tune now he's says, 'I want you to sing this tune about there's one very important thing and that is that you don't try to sing it you mustn't try you must think of the melody and let it sing itself.' And they sang it very well, and he turned to the Archbishop and said Your Grace That's good theology isn't it. And it obviously was because William Temple told me the story.

So then, we get to what is in India called the use of mantra. And that is, that the chant words sounds chanted not for their meaning but for their sound. And thus everything that will occur. In the following celebration will not be

in the English language. It is not intended to be understood in a discuss of an intellectual sense you are asked only to dig the sound. And I use the word dig advisedly because it means something a little more than appreciate it means enter in to penetrate get right to the bottom off because when you are listening to sound and when you are letting sound hum through you, this is one of the most obvious manifestations of the energy of the universe. Shaba as it's called in Sanskrit is Brahman. Commonly said sound as Brahma, sound is God That's the real meaning of in the beginning was the word doesn't mean in the beginning was the chatter. In the beginning was the commandment, the orders, it means the vibration of the word and that's. So we concentrate therefore purely on the sound and you will find that although we have a chorus that has been made familiar with these Mantras. Some of them are so simple that you will all be able to join in with them. And please do so quite freely. It's a pity you see that the Roman Catholic Church which used to have a mantric service, the mass is dropping it and putting mass into the vernacular. And not very good vernacular that so far as the English translation is concerned. So that it sounds it's become terribly intellectual and often the somebody is standing by the altar at a microphone to explain what's going on. And therefore as Clare Boothe Luce put it the other day, it is no longer possible to practice contemplative prayer at Mass because you are being hammered out with information with exhortation with edification all the time. And the Catholic Church should realize that in giving up Latin it has lost its magic. Religion is not supposed to be understood. Religion is that which is past understanding. Understanding may lead up to it as a pedagogue but to express religion intellectually is using the intellect with something it can't do it is comparable to taking up the automatic telephone and dialing W H A T I S G O D, and expecting to get information as an answer. Although the telephone is very useful otherwise. You cannot find out the mystery of the universe through talk. Only through awareness.

And for that reason, we offer this as an example, and it's offered in this way. It is a ritual. And it has a certain order to it. But it's very easy to get together it doesn't require an enormous amount of dramatic rehearsal. And it's something that any group can do anywhere on the Do It Yourself basis any time. And I suggest that churches get rid of their pews, where everybody has heard it in like cattle to look at the backs of each other's

necks. And that they spread their floor with rugs and cushions. And that they have something in which people can approach. A, an ineffable, that means beyond words, a spiritual experience. And not be towed and forced into a particular pattern of thinking or mentation. So you see, for that reason I've only given the slightest suggestion of how one uses these mantras. All the silence for meditation you all have your own way of doing things like that do it your own way. All this is, is a vehicle, a support for contemplation. So now there will be an intermission in which I suggest you simply sit quietly and get settled. And then we will proceed to the contemplative ritual.

Intro to Contemplative Ritual

Before we begin our celebration, I want to talk to you for about half an hour and I apologize for this because I am for the elimination of sermons on Sunday mornings. But I need to explain both for you and for the radio audience what we're going to do. It has been announced as an Aquarian Age religious service. I did not invent that title. It has nothing so far as I know to do with the Aquarian Age, if such a thing exists. And I don't like the word service. It's got all sorts of associations of sanctimoniousness. So I would rather call it a contemplative ritual. Period. Our purpose in doing this is to offer a suggestion to the churches. To the Christian Jewish and Islamic churches in particular, because for a long, long time, the kind of religious celebration which they have conducted has been impossibly loquacious. And didactic. Almost all our religious observances are nothing but talk. They tell God what to do, as if he didn't know. And they tell the people what to do, as if they were able to do it or even willing. And this throwing the book at people and telling them the Word.

I think we've had enough of it. Because the history of religion is almost equivalent to the history of the fair. Preaching. Since preaching is a kind of moral violence, which excites people's sense of guilt, and there is no more uncreative sense than that. You cannot love and feel guilty at the same time. Any more than you can be afraid and angry at the same time. What seems to me to be lacking in our western religious observances is some sort of social ritual or liturgy, which gives an opportunity for spiritual experience. That is to say, for a transformation of the individual consciousness, so that in one way or another the individual is able to realize his oneness. With the

eternal energy behind this universe which some people call God, and others prefer not to name or to conceive. The Western religions have from an official standpoint, being somewhat suspicious and leery of mystical experience. Because in the founder of Christianity, a mystical experience, led to the claim that he was God incarnate. Which was, to the Jews a stumbling block and to the Greeks foolishness. Because if you believe that God is a monarch. A beneficence tyrant in charge of the universe, anyone else claiming to be God is obviously committing an act of subversion. And would be suspected of introducing democracy into the kingdom of heaven. Which is supposed to be a monarchy and not a republic.

And I do not understand how we can be citizens of the United States, believing that a republic is the best form of government, but go on insisting that the universe is a monarchy. I feel rather the Jesus was a person who had this colossal mystical experience that we call cosmic consciousness, the experience that your real self is not that little superficial idea or image of yourself which we call 'I', but the total energy of the world flowing through you and expressing itself in you. And that's the real you. And it was on that basis that he could say I am the Father are one. What the Christians did was to stop the Gospel cold by saying all right, Jesus was God but nobody else. And so for lack of the spiritual experience of Jesus, nobody has been able to live the religion of Jesus they have lived instead the religion about Jesus, which is a very different thing. Because he's been put up on a pedestal and worshiped at a distance and his example in life rendered ineffective, because you can't make the tail wag the dog, or the cart pull the horse. You cannot expect love in Action, unless there is what the Christians call grace underlying it and grace so far as anybody knows is a purely theoretical thing which you believe you have received but there is never been any indication of it, to speak of, except in exceptional individual lives that account rather occasionally.

So what I'm proposing instead of the ordinary kind of religious this is as I said a contemplative ritual. And the idea is not to have everybody shaken up and whooping around like Indians on the warpath. But to bring about a state of profound peace. So therefore I should say something in a preliminary way about meditation or contemplation as I prefer to call it. Usually when Western people hear that an Oriental practices meditation he

asks What do you meditate on. And that question puzzles a Buddhist or Hindu. Because you don't meditate on anything anymore than you breathe on anything. You breathe, and in the same way you meditate. The verb is in a way intransitive. Meditation is the act of allowing one's thoughts to cease. As Patanjali puts it in the beginning of the yoga sutra, yoga meaning the art of meditation more strictly speaking, Yoga means union. The union of the individual in the universe. He says, after saying now yoga is explained he says she you know Gus pretty neat other which means yoga. Is stopping the agitation of thinking. Thinking is talking to yourself, or figuring to yourself. That's the way I use the word.

Now if I talk all the time I don't hear what anyone else has to say. Consequently if I talk to myself all the time I don't have anything to think about except thoughts. There is no Into go between thoughts. During which I can come into touch with reality, that is to say the world which thoughts represent as words represent events, or as money represents wealth. And so, if I'm never silent in my head I'm living in a world of total abstraction, divorced from reality altogether. You may ask, what is reality? And people have various theories about what it is but you must remember that they're all theories those who believe that reality is material are projecting upon the real world, a philosophical theory about it and those who say that it is mental or spiritual are doing likewise. Reality itself is neither mental nor spiritual, nor any concept that we can have of it reality is simply [gongs] Nor anything else. Nonverbal and words are reality and so far as they are noises. But even that is saying too much.

Now therefore, to meditate you might think that we attempt to suppress thought. We do not do that. Because you cannot meditate. Let me put that in a more emphatic way you cannot meditate. You, your ego image, can only chatter. Because when it stops, it isn't there. When you are not thinking, you have no ego because your ego is a concept. The thinking behind the thoughts the feeling, behind the feelings and the think about Heine the thoughts is only a thought an idea of some reference point to which all our experiences happen. And that of course cuts us off from what we experience it makes a great gap or gulf between the knower and the known. And that creates the spirit of alienation to the world from which we suffer. Conflict. Hate. Domineering spirit arise from that basic division. So when

you come to an end of thought, and you don't know how to meditate you don't know what to do with your mind nobody can tell you then thinking comes to an end naturally. And you just watch. You don't ask who watches, because that merely arises from the fact that in grammar every verb has to have a subject by rule. That is not a rule of nature, it is a rule of grammar. In nature, there can be watching without a separate watcher, just as there can be flashing without something called lightning that does it. The lightning is of course the flashing.

So when you realize that you come to your wits end, you can begin meditation. Or meditation happens and that is happening is the watching simply of what is, of all the information to conveyed by your exterior interior senses and of the thoughts that key. Chattering on about it all you don't try to stop those thoughts, you just let them run as if they were birds twittering outside. And they will eventually get tired of themselves and stop, but don't worry about it whether they do or don't just simply watch whatever it is that you are feeling, thinking, experiencing and that's it watch it. And don't go out of your way to put any names on it. That's really what meditation is and you see you're not expecting any result. You are in meditation in an eternal present. You're not doing it to improve yourself, you found you can't do that your ego can't possibly improve you because it's what's in need of improvement. Your ego can't let go of itself, because it is a complex called clinging to oneself. That's what it is by definition. So it's just something that evaporates when it is understood that it is unable to achieve a transformation of consciousness mystical experience the vivid sense of union of individual and cosmos.

So one of the easiest ways to enter into the state of meditation is therefore listening to what is using the sense of sound. Sound is curiously enough a sense that bores us less easily than sight. And when you listen to sound, you listen to it, just the random sounds you know, that are going on in the room and the street. Is if you were listening to music. Without trying to identify it source or name it. All put any label on it at all just enjoy whatever sound may be going on whether it's in this hall or whether it's in the area where you're listening to the radio. That's what we shall do the proper part of the ritual, just listen. Now we can go on from that listening to making sound ourselves and also listening to it and instead of making sound we learn the

knack of letting it happen through us. Once a great choirmaster in England Sir Walter Davies, was rehearsing a choir in the presence of the Archbishop of Canterbury. Who was then William Temple a great theologian. And this was a raw choir, he didn't really know much about singing. And he gave them a hymn to sing that they knew very well. And to impress the archbishop they sang it with gusto and it sounded forced and terrible. Then he had with him a professional choir and he asked them to sing a little known hymn. And sing it several times until everybody got the hang of the tune now he's says, 'I want you to sing this tune about there's one very important thing and that is that you don't try to sing it you mustn't try you must think of the melody and let it sing itself.' And they sang it very well, and he turned to the Archbishop and said Your Grace That's good theology isn't it. And it obviously was because William Temple told me the story.

So then, we get to what is in India called the use of mantra. And that is, that the chant words sounds chanted not for their meaning but for their sound. And thus everything that will occur. In the following celebration will not be in the English language. It is not intended to be understood in a discuss of an intellectual sense you are asked only to dig the sound. And I use the word dig advisedly because it means something a little more than appreciate it means enter in to penetrate get right to the bottom off because when you are listening to sound and when you are letting sound hum through you, this is one of the most obvious manifestations of the energy of the universe. Shaba as it's called in Sanskrit is Brahman. Commonly said sound as Brahma, sound is God That's the real meaning of in the beginning was the word doesn't mean in the beginning was the chatter. In the beginning was the commandment, the orders, it means the vibration of the word and that's. So we concentrate therefore purely on the sound and you will find that although we have a chorus that has been made familiar with these Mantras. Some of them are so simple that you will all be able to join in with them. And please do so quite freely. It's a pity you see that the Roman Catholic Church which used to have a mantric service, the mass is dropping it and putting mass into the vernacular. And not very good vernacular that so far as the English translation is concerned. So that it sounds it's become terribly intellectual and often the somebody is standing by the altar at a microphone to explain what's going on. And therefore as Clare Boothe Luce put it the other day, it is no longer possible to practice contemplative prayer at Mass

because you are being hammered out with information with exhortation with edification all the time. And the Catholic Church should realize that in giving up Latin it has lost its magic. Religion is not supposed to be understood. Religion is that which is past understanding. Understanding may lead up to it as a pedagogue but to express religion intellectually is using the intellect with something it can't do it is comparable to taking up the automatic telephone and dialing W H A T I S G O D, and expecting to get information as an answer. Although the telephone is very useful otherwise. You cannot find out the mystery of the universe through talk. Only through awareness.

And for that reason, we offer this as an example, and it's offered in this way. It is a ritual. And it has a certain order to it. But it's very easy to get together it doesn't require an enormous amount of dramatic rehearsal. And it's something that any group can do anywhere on the Do It Yourself basis any time. And I suggest that churches get rid of their pews, where everybody has heard it in like cattle to look at the backs of each other's necks. And that they spread their floor with rugs and cushions. And that they have something in which people can approach. A, an ineffable, that means beyond words, a spiritual experience. And not be towed and forced into a particular pattern of thinking of mentation. So you see, for that reason I've only given the slightest suggestion of how one uses these mantra all the silence for meditation you all have your own way of doing things like that do it your own way. All this is, is a vehicle, a support for contemplation. So now there will be an intermission in which I suggest you simply sit quietly and get settled. And then we will proceed to the contemplative ritual.

Contemplative Ritual

[contemplative ritual, chanting sounds]

And that the song. Is. Don't give it a name. That's left. Your eyes. And go entirely into a world of sound. If I should say anything to you during this. Silence.

Just listen to the sound of my voice, and don't worry about the meaning of the words. Your brain will take care of that by itself. Which is playing with

your ears. Is also playing with your lungs. If you let your lungs breathe as they wish to, without helping. Watch what they do. When they feel like breathing out, let it go out but don't assist. When it feels like coming in. Let it come in but don't pull. Are you breathing or is it breathing you. Where the sounds come from. Judging with the areas. They seem to come out of silence out of nothing. What's the nothing? Can you feel it? Sense it without words without ideas. If you keep your tongue relaxed you won't talk to yourself so much.

Remember, there is no special state you are supposed to be. Simply let yourself be aware of whatever state you are in. Don't name it. Just feel. Now only is important. When there is no thinking. Where is yesterday? Where is tomorrow? Where is self? Where is other? Now would you gently allow. A sound to arise in your imagination, in the ear of the mind. The sound that is pleasing to you and which you would feel natural humming. Just your own sound. And letting your breath sort of fall out, easily and naturally. Hum the song out loud. Let it get louder...

The Self

The World as Self

The basis of all Indian philosophy—particularly the teaching of those books called the Upanishads, which are really the distilled essence of Hindu thought—the basis is called the Self. And this word, in Sanskrit, is *Ātman*, and that means ‘Self’ in the vastest possible sense, and the most inclusive sense of the word. It means ‘yourself,’ and it means also ‘self as such,’ ‘existence as such,’ the ‘totality of all being.’ And, of course, this is something that one cannot talk about in the sense of talking about it logically. You can’t talk about it. A poet can talk about anything, and the Upanishads are, very largely, poetry.

Of course, everything in the world—knives and forks, tables and chairs, trees and stones—are indescribable. Korzybski referred to the physical world as the ‘unspeakable world,’ which was really rather a funny name because it has two edges. It’s, of course, something you can’t say anything about—that is to say, it is ineffable—but it’s unspeakable also in the sense of the word meaning something taboo. And we shall see, as we go on, wherein that taboo consists.

But from the standpoint of logic we can’t say anything about everything, because in order to say something about something, and state it logically, you have to be able to put it in a class. Now, classes are intellectual boxes. When you play games like Animal, Vegetable, Mineral? you’ve got there three boxes. And when you come to think of it, you don’t know any one without another, because in order to have a box there must be what’s inside the box and what’s outside the box. And then, by this method of contrast, we can make a logical discussion about things. All words, therefore, are labels on intellectual pigeonholes.

But then, when you come to what fundamentally is, then you’re without a box and you can’t talk logically. Of course, you can distinguish ‘is’ from ‘is not,’ but only in a very limited way—as I can say, I have a pen in my left

hand. I do not have a pen in my right hand. And from this we abstract the idea of 'to be' and 'not to be,' 'is' and 'isn't.'

But when we consider Being—with a capital 'B'—this includes not only such 'is'es as celestial bodies, but also such 'isn't's as the space that encompasses them. And these two go together, as we shall see in more detail as the time goes on.

But now, a perfectly logical person would therefore say that the notion of the Self—the Ātman, as the fundamental reality in which everything else exists—is meaningless. And, of course, from a logical point of view it is. But at the same time, just because something cannot be put into a logical category does not indicate that it isn't real. The Self, you see, bears somewhat the same relationship to the world as the diaphragm of the speaker in this radio bears to the music you've just been hearing. None of the music was about the diaphragm and nobody said anything about there being a diaphragm. The diaphragm, as such, didn't come into the picture, and yet it was everything in the picture. All those different noises were vibrations of this thin film of metal. So, also, with your eardrum. So, also, with the apparatus of your eyes.

So one might ask, then—just as you say, Well, what is it on? What is the music on? Is it on tape, is it on a speaker, is it on a drum? Whatever the variations may be, we can ask the question, What are you all on? What is all this on? And the Hindus answer, It's on the Self—like we say, This one's on me. It isn't that there's only one Self in the sense that is taught in a philosophy called solipsism. Solipsism is the idea that you are the only person who exists and everybody else is your dream. Nobody can prove that this isn't so, except I'd like to see a congress of solipsists arguing as to which one of them is really there.

It isn't that; it's more complex than that. It's saying that the Self in each one of you is really, at root, one. Just in the same way that you have, all over your body, millions of nerve ends. Each one of those nerve ends is, as it were, a little eye—because all the senses are, fundamentally, one sense; they are various forms of touch. And the most delicate of the forms of touch is, of course, the human eye. Then the ear, and so on, down the list of the senses. Now imagine, then, every little nerve end is a little eye—and it gets

its impression of the world, but it sends it all back into the central brain. Well, in a somewhat similar way, every person, every animal, every—what the Hindus call—sentient being; and even rocks are regarded as sentient beings in a very, very primitive form, right down to the lowest.

So all those forms that we see may be looked upon as the eyes that look out of one central Self. Only, of course, in the body—in the human body—we can see the connections between the nerve ends and the brain. It's much more difficult to see the connection between one individual and another. If they're married that's a little bit closer. But just all us human beings rattling around, we're not even rooted to the ground—like trees—and therefore it's very easy for us to form the impression that I am only what is inside my bag of skin, and that my Self is a different Self from your Self. And we're all, therefore, fundamentally disconnected. And so your apparent disconnection—the fact that you are not tied to other people with umbilical cords, or some kind of wiring that gives you one mind—nevertheless, we do have one mind. In the sense that, for example, all of us turn out to be approximately the same shape. Two eyes, two nostrils, a mouth, two hands, two legs, and so on.

A haiku poem—Japanese haiku—says, A hundred gourds from the mind of one vine. And so it is with people, and so it is with everything in the world. That's just from a purely physical point of view. But going yet deeper, we find that it's somehow a necessity of thought that there be some sort of a something which is the common ground of all these universes, all these galaxies, and that ground is the Self—as Hindus understand it, the Ātman.

Now, that's quite [a] startling point of view, because what it's saying is, you see, that you are basically the works.

Now, the Hindus do say that the Self—the great Self—is consciousness. But of course, that does not mean consciousness in the sense of our ordinary everyday consciousness. Ordinary everyday consciousness is indeed a form of this kind of consciousness—shall we say, a manifestation of it?—but then there's also consciousness which doesn't notice, but nevertheless is highly responsive. The way your heart beats, the way you breathe, the way you grow your hair: you're doing it, but you don't know how it's done.

So therefore, just in the same way that conscious attention is not aware of all the other operations of the body, so in just that way we are not aware of our connection—indeed, our identity—with the fundamental Self. When the leaves die and fall off the trees, or the fruit drops—next year: more leaves, more fruit. So, in the same way, when you and I die: more babies later. If the whole human race dies, you bet your life there are all kinds of things that feel that they're human scattered throughout the multiplicity of galaxies. Because this universe is a peopling universe, just as an apple tree apples. But because we are unconscious of the intervals we are not aware of the Self with our conscious attention when conscious attention isn't operating. But still, just as you don't notice what your pineal gland, say, is doing at the moment, so in the same way you don't notice the connections which tie us all together—not only here and now, but forever and ever and ever and ever.

The difficulty, the basic reason why we don't notice the Self, is that the Self doesn't need to look at itself. A knife doesn't need to cut itself. Fire doesn't need to burn itself. Water doesn't need to quench itself, and a light doesn't need to shine on itself. So this is the fundamental problem of having some sort of awareness of the self. Nevertheless, it is the whole contention of Indian philosophy, especially what we call Vedānta, that it is possible—in a certain way—to become aware of oneself in this deepest sense; to know that you are the totality.

And this experience is the real substance of Indian philosophy as a whole, both Hindu and Buddhist. It is called mokṣa, which roughly means 'liberation.' Liberation from the hallucination that you are just poor little me. To wake up from that kind of hypnosis and discover that you are simply something—your organism, your physical body, your conscious attention (which is your ego)—that you are something being done by this vast, indescribable Self, which is out of time, which has no beginning, no end, it neither continues nor discontinues. It's beyond all categorization whatsoever, and so the Upanishads say, all we can say of it positively is the negative. Neti neti; 'it is not this, not that.' Anything, therefore, you can formulate—imagine, picture—will not be the Self.

So when you are trying to know the Self you have to get rid of every idea in your head. It doesn't mean, as some people seem to think, that you have to get rid of every sense-impression. It isn't as if you had to go into a catatonic state of total absorption. Of course that can be done, but the full mokṣa—the full liberation—is when you come back out of absorption and see this everyday world just as it looks now, but see as clearly as clearly can be that it is all the Self. You can become aware of this tremendous interconnectedness of everything, and that is what somebody who is mokṣa—who is liberated—sees. He sees, shall we say, that everything goes together.

And that is, in a way, what we mean by 'relativity.' Because relativity means 'relatedness,' just as fronts go with backs and tops with bottoms, insides with outsides, solids with spaces. So everything that there is goes together. And it makes no difference whether it lasts a long time or whether it lasts a short time. A galaxy goes together with all the universe just as much as a mosquito, which has a very short life. From the standpoint of the Self, time is completely relative. You can have, if you scale it down, as much time between two of those very rapid drumbeats as you can in eons and eons and eons, and it's all a question of point of view. Or—to use a scientific expression—level of magnification.

Change your magnification and you see molecules. And we know by other methods of observation that it can get smaller and smaller and smaller, and that the spaces between these minute units are so vast that they're comparable to the distances between the sun and the planets, in scale. So, also, with time. So, in this sense, there could be vast, vast universes full of empires, and battleships, and palaces, and brothels, and restaurants, and orchestras in the tip of your fingernail. And, on the other hand, we could be all going on in the tip of somebody else's fingernail.

It's very important to understand not only the relativity of size and of time, but also of what there is. Now, as you know, the human senses respond only to a very small band of the known spectrum of vibrations. We know, through instruments, of quite a vast spectrum, but we—as I say, with our senses—see only a little of it. If our senses were in some way altered we would see a rather different looking world. We can do this, of course—we

can put on special lenses to enable us to see heat, and then we see all the heat radiations coming out of people. And we say, Well, I never noticed that about you before! But so, in the same way, you see, there are infinitely many possibilities of vibration, and of organs sensitive to those vibrations, so that there could be world within worlds within worlds, spaces within spaces, just like the many, many wavelengths of radio and television going on forever and ever in all directions. The possibilities are infinite.

But having senses and noticing is a selective process. It picks out only certain ones, just as when you play the piano. You don't take both arms and slam down all keys at once, you select. And so perception is a kind of piano-playing; it is picking out certain things as significant—that is to say, as constituting patterns. And the whole universe seems to be a process of playing with different patterns. But whatever it does, whatever it plays, in whatever dimension, on whatever scale of time or space, it's all on the Self.

The Self is also known in Sanskrit as Brahman. This is a neuter word. Brahman is from the root brh, which means 'to expand,' 'to grow.' It isn't quite clear exactly why this word was chosen. Sometimes there's a still better word for the Self—which I like—is the word tat; almost like 'tit for tat.' Tat means 'that.' We get our word 'that' from the sanskrit tat. And so, when a baby comes into being first of all, the first thing it says is, Da! Da. The baby's pointing, Da, da, da! And it's saying, That! Look, isn't that marvelous? That, you see?

So that is the which in which there is no whicher, and so you get the formula in this Brihadaranyaka Upanishad: tat tvam asi, which means: tat: 'that;' tvam: 'that in,' you know, 'you;' asi: 'are.' 'You are that,' or 'that thou art;' 'that art thou.'

So in this sense, then, every self is modeled on—and is an expression of—the one Self, because you all feel, individually, that you're the center of the world. And everything else is seen in circles, circling out, sphering out from where you are. And that's, as it were—they called them 'microcosm,' the little cosmos. But then, in the same way, the macrocosm as a central self, although this is not central in the way we talk about centers in space. Do you see that? A center of a circle is in the middle of the circle and the circumference is away from it. But you could say—you could use a phrase

that the Christian theologians have used of God—that circle whose center is everywhere and whose circumference is nowhere.

You could speak of Brahman that way. It isn't in the middle of the universe, spacially speaking. You might ask the question, Where is the universe? Ever thought of that one? Where is it? Well, you can't say where because everywhere has to be in relation to something. There would have to be another universe to say where this one is. But then, since those two together would constitute 'the universe,' we wouldn't—still—be able to say where it was. It isn't anywhere.

And so, in that sense, the center isn't anywhere in space, locally—and furthermore, the kind of space we are dealing with is only one possible kind of space. It's the kind of space our physical organisms are attuned to. We are, you see, like the radio: we pick up what wavelengths we're on.

So, then, when inquirers used to come to that great modern Hindu saint Sri Ramana Maharshi, and they'd ask him all sorts of silly questions like, Who was I in my last incarnation? What will I be in my next one? he would always reply, Who is asking the question? Who are you? Find out, because that's the thing you need to know. As it were, dig down into the depths of your being and say, What is this that I call 'I'? That's one of the very fascinating questions. It's also—it teases us out of thought; to think about death in the sense of going to sleep and never waking up. Imagine that. And you find you can't—and yet, it's a thought that, although you can't get to grips with it, it remains fascinating.

Also, the question, How is it that suddenly you awakened into this world? Where were you before? In Zen Buddhism they have the meditation problem, the kōan. Before your father and mother conceived you, what is your original nature? And that's the same sort of weird question as what it would be like to go to sleep and never wake up. What was it like to wake up having not previously gone to sleep? It's very mysterious.

But as you go on and plumb this question you begin to develop the feeling that your existence is exceedingly odd. In many ways odd. Odd because it is here and it so easily might not have been. After all, if your father hadn't met your mother, would you be here? Of course, somebody would be here,

because he might have met somebody else. Would that be you? Of course it would. Don't you see? You can only be you by being someone. But every someone is you. Every someone is 'I.' That's your name. You say, It's me. I am here. And everybody feels that I in the same way. It's the same feeling, just like blue everywhere is the same color.

So I-ness being, as it were, the most fundamental thing in man is also fundamental to the universe. It, too, is 'I.' And our 'I' is a special case of it. Coming out from the "central eye," like so many tits from the belly of a sow, or so many spines from a sea urchin, so many legs from a spider. And that is, of course, why the images of the Hindu gods are shown with many arms or many faces: because it is saying that all arms are the arms of the divinity, all faces are its masks.

So, you see, there's really nothing to worry about because the important you is perfectly indestructible. It's what there is. Our comings and goings, our fortunes and misfortunes are a sort of mirage. The more we know about them, the more we know about the world, the more diaphanous it seems. And therefore everything in the world has the characteristics of smoke—you know, when you blow a cigarette, or pipe, or something, and a cloud of smoke, and you see it in a sunbeam and it's full of whorls and designs and all kinds of marvelous things going on, and then, slowly, it disappears. Well, everything's just like that.

Now, there are two attitudes you can take to that state of affairs. You can say sour grapes, it's all a lousy, wretched trap. And here I am, I'm given all these feelings of love and attachment and joy of life, and then I fall apart. My teeth drop out, my eyes become feeble, I get cancer or cirrhosis of the liver, or something, and then it all falls apart, and it's too bad! Therefore, therefore, don't become attached to things. Don't enjoy life. Treat it, holding it off—like that—just like a very, very firm person who's been jilted and says, Never again will I get mixed up with love, because love hurts.

But on the other hand, a weaving of smoke can be very beautiful, provided you don't lean on it. Provided you don't try to preserve it. Catch hold of it—then you destroy it. So, exactly the same way: there's nothing in the way

of form that you can lean on, that you can grasp. And if you see that, then the world of form is very beautiful. If you let it go.

To love people—you see, if you are husband and wife you must let each other go, otherwise the marriage is either going to break up or it's going to be hell. If you love a person you say to that person, Look, I love you—whatever that may be. I've seen quite a bit of it, and I know there's lots I haven't seen. But still, it's you, and I want you to be what you want to be. And I won't be happy if I've got you in a cage. You'd be a bird without song. And they're likely to go on loving each other. But if they wrap each other up with all sorts of ties and chains and documents and things, then they're not on a very safe basis. The very firm words of those documents belie the situation, because nobody curses, and swears, and kisses the Bible, and all sorts of things like that if he means 'yes.' If there's some doubt that he means yes, then he's asked to make all these rituals of cursing and swearing, signing on dotted lines, and see and some—indicates doubt right at once. It's just a fly in the ointment from the beginning.

So when the Hindu and Buddhist philosophers speak of detachment from all this apparent world of separate beings—detachment means 'going with' this whole thing and not resisting its change. And you can afford to go with it, you can afford to get mixed up in life, and to fall in love, and to get involved with all sorts of things. You can afford it if you know that it's an illusion. But this is not illusion in a bad sense of the word.

Here's this Hindu word—crucial—the world is called māyā. This word, māyā—yes, it means 'illusion,' it means 'magic,' it means 'art,' it means 'delineation,' or 'measurement'—and so from matr we get 'meter,' and we also get 'matter,' 'material.' Isn't it funny that the way we say 'material'—today, we mean something very real, but the root of the word is 'illusion.' So, you see—I mean, measurement is kind of an illusion. You don't find inches lying around; you can't pick up an inch. So, in the same way that hours and inches and pounds and dollars and so on are actually imaginary—they're elaborate systems of cosmic bookkeeping with their little scratches on paper, little hairlines on dials—so in exactly that way the distinction between things is māyā, is imaginary. But what an imagination! In a way, to say that the world is māyā is at the same time to say that what lies behind

māyā is immaterial. Look at the reversal of the word. Oh, it's immaterial, it doesn't matter. What matters is all this.

But that gets us to a deeper point yet. The Self—the real Self—doesn't matter, which is another way of saying it doesn't exist for any purpose. It doesn't need to exist for any purpose. What purpose would it exist for, when it's what there is! It won't find anything in the future, has nothing in the past that it has to go back and remember. It's now. An eternal now. And so, in that way it doesn't matter. But therefore, the most important thing in the universe is the one thing that doesn't matter. The one thing that's totally and completely useless, and that nobody can find anything for.

Once, a Zen master was asked, What is the most valuable thing in the world?

And he answered, The head of a dead cat.

Why?

Because no one can put a price on it.

So this Self, the Brahman, is like the head of a dead cat. But you see, if, then, you say, Mmm, I really ought to get that dead cat's head because... something spiritual about it and it'd be very good for me. After all, if I knew the Self I might be a better person. People might like me more. I'd be more constructive in society. I would do this, that, and the other. You see, that's putting the cart before the horse. That's trying to make the tail wag the dog.

The knowledge of Brahman, the Self, never does anybody any good if they're trying to make it do them some good. Only when they are not concerned with whether it does them any good or not does it do them any good. It's like when you relax and you go out and play. Americans, in particular, don't know how to do this because they always justify it. They always say, It's good for me. It's exercise. It's just a change from work, and that'll be able to make me work better. See? Everything they do is done for some serious reasons. It's the Protestant conscience. And so we never play,

except very exceptionally. Because play is that which is done just for itself—for fun.

So the Self—the Ātman, the Brahman—exists for fun. See, there is no reason to exist; it's completely useless. And it is—therefore, māyā is linked with the word līlā, and that means 'play.' Also, of course, the word 'illusion,' in English, is derived from the Latin ludere, 'to play.'

So the nature, you might say, of the Self is that it does no work, it only plays. Work is something serious, you now, that you do for a purpose because you believe that you've got to go on living; you work to survive, because you think you have to survive. That was one of the things they told you as a little child. You've got to go on, man!

You don't have to. This thing doesn't have to go on—that's why it does. I know that sounds paradoxical, but there's so many things in life that are like that. If I'm trying to impress people I usually don't. If you try too hard with anything you usually make a mess of it. And so this basic thing, then, is that the Self—the Brahman behind the world—is engaged in play. It is in this sense that the Hindu philosophers say, Brahman does not actually become the world. The meaning of that is: he's playing at being it—or it's playing at being it—as distinct from working at it.

And so, in certain Oriental countries, when one refers to noble people of high birth it is often said, Lord So-and-so has died. The Japanese would say he's played at dying. Or will he play at taking a journey to Tokyo? Also, remember this: although I have constantly used in this talk the word 'one' to apply to the Self—and 'central'—the Hindus don't use this word except speaking poetically and loosely. The Self is not one. The Self is called 'non-dual'—because, you see, the idea of one has an opposite. The opposite of one is many—or none. But the which then which there is no whicher has no opposite; there's nothing outside it, so you can't call it 'one.' Because 'one' is an exclusive idea, it excludes 'two.' So they call it, instead of 'one,' they call it 'non-dual,' which is advaita. This is from the word, you see—dva is the root meaning 'two;' the 'v' becomes 'u,' so we get 'dual;' and 'a' is the meaning—in Sanskrit, often—'non.' Non-dual, advaita.

And so it doesn't exclude anything. 'One' is an exclusive word. Advaita is meant to be a totally inclusive kind of unity. Now, of course, this word itself—when you look at it from a logical standpoint—is a dualistic word, just like 'one.' It's the opposite of dvaita. Dvaita and advaita. But the idea here, in Indian philosophy, is to use this word in a certain way. Now, you know that on a flat surface you can't draw three dimensions. Anything you draw will be in two dimensions. But why do we see three dimensions? Because of an artistic convention called one-point perspective, which will give you the illusion of a third dimension.

Now, in other words, a two-dimensional line is being used to imply a third dimension which can never be expressed on a flat surface. So, in exactly the same way, advaita is a word used specially to designate what lies beyond all logical categories.

Perhaps the simplest way in which one can express Advaita is this. Take a piece of paper, and it clearly has two different sides. Only by the elaborate joke of the mobius strip. In mathematical typology can you make a one sided piece of paper. But in all ordinary cases a piece of paper has two quite different sides. But these two different sides are inseparable. You don't have one without the other there is therefore shall we say a secret conspiracy between the two sides of the piece of paper always to be found together. Only what is this is when you get your boxes every inside has an outside and they go together. It's that going together that is non-duality. It expresses itself as duality but all duality is that we know go together and that is the non-duality that is the secret link between them.

This morning, I discussed the idea of the Self as the basis of the universe, and showed that this idea, which is fundamental to the central tradition of Hindu philosophy is not a logical idea. You could call it paralogical, metalogical or something like that, because logically, we can discuss only what could be classified and in logic only that which can be classified has meaning. Buddhist philosophy speaks of the four unknowns. Water to the fish, air out of the bird, enlightenment to the ignorant, and the mind to man. Because of what we are embedded in. What As I said we are on in the sense that something is on the radio, or on tape. Or on like a color transparency is on film what we are on is clean everything. It's like salt in the sea. And

therefore since it's in everything and in all directions. It never becomes an object. But that doesn't mean to say that there isn't some form of knowledge in which shall we say, its presence is apprehended rather than comprehended. So far Hinduism, and especially for its central philosophy called Vedanta. The of summation, the end of the Veda the the Veda being the traditional scriptures of Hinduism dating from perhaps about two thousand. B.C.. According to the Vedanta, realization of the Self is the goal of life. Moksha, liberation is when you know for sure. That you yourself is in a special case. Of the self. That, just as you are unaware of all your organic processes, just as the beam of a headlight doesn't shine on the wire that gives it power on the battery, but shines out in front so in the same way one is ordinarily ignorant. Or shall I say ignore-ant, of the root of one's own self as being the central self of all. Then I went on to discuss the production of a seemingly divided Universe of separate things out of the self, as Lila, a form of play. And this afternoon I want to develop that idea further.

So you must remember, of course, that the word 'play' and the word 'game' have many levels of meaning. We are accustomed to use the word 'play' in opposition to 'work' and to regard play as trivial and work as serious. Very largely, a game or a play is something associated in our minds with triviality. You're only playing with me, says a girl to a suitor, you're not serious. How serious do you have to be? When does one get serious in a flirtation? When do we say this is getting serious? When you're holding hands? Playing footsies under the table? Do you see? Petting? Sleeping together? Married and babies? Maybe that's serious.

But we also use the word 'play' in a non-trivial sense. I went to hear Heifetz play the violin. Was that a trivial matter? On the contrary—the very highest kind of artform. Still: 'play.' I say, too—when I do philosophy, like I'm doing with you—this is entertainment, but in the sense—perhaps, I hope—of your listening to someone play a musical classic. I'm not being serious, but I am being sincere.

The difference, you see, between seriousness and sincerity is that seriousness is someone speaking in the context of the possibility of tragedy; that there is a situation where things might go absolutely wrong, and then I put on the expression which is serious. That's why soldiers on parade are

always serious. They don't laugh. And when they salute the flag they put on a stern expression. That's why, in courts of law and in churches, people normally don't laugh—because all that we deal with here is very important, a matter of life and death.

But the fundamental question [that] must be brought forth: is God serious? And obviously the answer is no, because there's nothing to be serious about. I said, also, that the Self—as conceived, the supreme Self—was quite useless, that it was immaterial. Doesn't matter. Because it transcends all values of what is better or worse, what is upwards or downwards, what is good and bad. It so weaves the world that the good or the bad play together like the black and white pieces in the game of chess.

So play is—deeply—the sort of thing children like to do with deep absorption and fascination. To drop pebbles into the water and watch the concentric circles of waves. Or mathematicians. Mathematicians, you know—especially what we call higher mathematicians—are entirely lacking in seriousness. They couldn't give a hoot in hell as to whether what they're doing has any practical application. They are working entirely on interesting puzzles and working out what they call elegant and beautiful solutions to these puzzles. And they can go on and on like that in absorbed meditation, spend their whole lives doing it. Or consider the musician: practicing, working out interpretations; what is he doing? He's making series of interesting noises on instruments.

Now, what do people like to do when they don't have to do anything? Well, as far as I can make out as you look all over the world, they like to get together and do something rhythmic. They may dance, they may sing, they may even play games—because, say, in playing dice there's a certain wonderful rhythm to shaking the cup and rolling the dice out on the table. Or dealing cards: Tsu-tsu-tsu-tsu-tsu-tsu-tsu Wwrrrrrrtt! Crrrck! You know? All the things that people like to do and think about: these rhythms. Or some people like to knit, and this is a rhythmic thing, you see? Others just like to breathe. There are all sorts of ways in which we love to do this.

Now you see, our very existence is a rhythm of waking and sleeping, eating, and moving—and that's all we're doing. Just consider what we do every day. What's it all about? Does it really mean anything? Does it go

anywhere? It's just because we want to keep on doing this kind of a hoop-de-dah. So you can get a certain vision of life where everything is seen to be a complex pattern of rhythm. Dances. The human dance, the flower dance, the bee dance, the giraffe dance. And these are also comparable to various games: poker, bridge, backgammon, chess, checkers, et cetera, or to various musical forms: sonata, fugue, partita, concerto, symphony, or whatever.

And that's what this all is: it's jazz, you see? This is a big jazz, this world. And what it's trying to do is to see how jazzed up it can get, how far out this play of rhythm can go. Because that's what we all come down to, you see? We're going this di-di-di-di-di-di-di-di-di-di-di-di-di-di-di-di-di-DI-di-di-di-di in every conceivable way. So then that is why, you see, this fundamental view that the world is play.

Now, let's examine the rules of this game.

The basic form of the cosmic game according to the Hindu view is the game of hide-and-peek—or you might call it the game of lost-and-found. Or, again, now you see it, now you don't. In examining the nature of vibration we find a very peculiar thing. If you represent vibration as a wave motion you will notice that there is no such manifestation as half a wave. We do not find in nature crests without troughs or troughs without crests. No sound is produced unless there is both. Both the beat, as it were, and the interval between.

Now, this wave phenomenon is happening on ever so many scales. There is the very, very fast wave of light, the slower wave of sound, then there are all sorts of other wave processes—the beat of the heart, the rhythm of the breath, waking and sleeping, the peak of human life from birth to maturity and down again to death. And the slower the wave goes the more difficult it is to see that the crest and the trough are inseparable, so that we become persuaded in the game of hide-and-peek that it is possible for the trough to go down and down and down for ever and never rise again into a crest; forgetting that trough implies crest just as crest implies trough. There is no such thing, you see, as pure sound. Sound is sound-silence. Light is light-darkness. Light is pulsation, and between every light pulse there's the dark

pulse. And so the Hindu image is that the Self eternally plays a game of hide-and-seek with itself.

Hindus calculate time in kalpa units, and the kalpa is 4,320,000 years. And so they say that for a period of a kalpa the worlds are manifested—or any particular universe, not all universes, but let's say any particular galaxy or whatever it may be; world order of some kind. Don't take this too literally; don't take these figures as being some sort of divine revelation as to making predictions and prophecies. They're symbolic figures. So for one kalpa the world is manifested, and that period is called in Sanskrit a Manvantara. And during that time the Brahman plays 'hide,' and he hides—it hides—in all of us, pretending that it's us. And then, at the end of the kalpa, there comes the period called Pralaya, and that is also a kalpa long. And in that period the Brahman, as it were, comes out of the act and returns to itself in peace and bliss.

This is a very logical idea. What would you do if you were God? Isn't the whole fun of things, as every child knows, to go on adventures? To make believe, to create illusions—that is to say, patterns. And so, for some ways of talking in Hindu thought, this world is the dream of the godhead. The godhead is, of course, represented as—in a way—two-faced. With one face he dreams and is absorbed in the dream world. With the other face he is liberated. In other words, what you have to understand correctly is that from the standpoint of the Self—the supreme Self—the Pralaya and the Manvantara are simultaneous.

But put into mythological form for human consumption they are represented as being in sequence, following each other. But they really happen at the same time, so that one doesn't realize union with the Self after death; later than a certain time. All references to the hereafter should correctly be understood as the herein, as a domain deeper than egocentric consciousness—that is to say, when you get down to the bottom of the egocentric consciousness you get to its limit, which is, figuratively, its death. Then you go on, inwards—the Self deeper than the conscious attention. And in that way you go inwards to eternity, you don't go onwards to eternity. To go onwards is to find only time, and time, and time, and more

time, and more time, in which things go round and round and round for ever. But to go in is to go to eternity.

But in the ordinary way, when we are talking about this graphically and vividly in imagistic terms, we can talk about the everlasting game of hide-and-seek, which the Self plays with itself. It forgets who it is and then creeps up behind itself and says, Boo! And that's a great thrill. It pretends that things are getting serious, just as a great actor on the stage—although the audience know that what they're seeing is only a play—the skill of the actor is to take the audience in and have them all sitting in anxiety on the edges of their seats, or to be weeping or laughing, or utterly involved in what they really know is only a play. So you would imagine that if there were a very great actor with absolutely superb technique he would take himself in. And he, you see, would feel that the play was real.

Well, that's their idea of what we're doing here and now. We are all the Brahman, acting our own parts, being human, playing the human game—so beautifully that he is enchanted. You see what enchanted means? Under the influence of a chant. Hypnotized. Spellbound. Fascinated. And that fascination is *māyā*.

Now then, this works on a little plan. Let us consider the breakdown of a single kalpa. It consists of four yugas. Yuga: that means an “epoch.” Number one is called krita, or sometimes satya. And these names are based on the Hindu game of dice. There are four throws in their game, and krita means the perfect throw; the throw of four. Number two is treta, the throw of three. Number three is dwapara, the throw of two, and number four is kali—that's the worst throw, the throw of value one.

You will see that these yugas divide up a period of 4,320,000 years. I never remember numbers too well. So the first yuga is 1,780,000 years long. The second is 1,296,000 years. The third—the dwapara—is 864,000, and the kali yuga is 432,000.

Now, you see what's happening here? When the manifestation starts it's as good as possible; everything is just glorious. Because you know well that if you were dreaming anything you wanted to dream you would start out by having the most luscious dreams imaginable. Now when we get, you see, to

the treta yuga, something is a little bit wrong. Krita is “four square”—everything’s perfect, like the symbol of the square is an ancient symbol of perfection. Treta is the triangle—something’s missing; there’s a little bit of uncertainty, and danger now enters. By the time we get to dwapara, the forces of light and darkness are equal—duality, the pair. But when we get to kali, the force of darkness overcomes.

But now, you see, what happens is: if you take one third of the treta yuga as being on the bad side, half of the dwapara yuga as being on the bad side, and all of the kali yuga, and you add those figures up, you will get the bad side occupying only one third of the total time. So what’s going on here? It is not quite a situation, you see—it is not a view of the cosmos in which good and evil are so evenly balanced that nothing happens. ‘Evil’ is just troublesome enough to give ‘good’ a run for its money. It’s as if the game that is being played here is playing order against chaos, but you gotta have some chaos in order to play the game of order against it. But if order wins there’s no further game. If chaos wins there’s no further game. If they’re equally balanced it’s a stalemate. So what happens is this: chaos is always losing, but is never defeated. It’s the good loser. And that is a game that is worth the candle.

Let’s take playing chess. If you get an opponent who can always defeat you, you stop playing with him. If you get an opponent whom you can always defeat, you stop playing with him. But so long as there is a certain uncertainty of outcome and you win some of the time, then it’s a good game. And this is simply a number symbolism—as I said, again, not to be taken literally—of the way this thing works.

So the mythology says that we are now in the kali yuga, which started a little before 3,000 B.C.—so we’ve got a long way to go to the end of it, if you’re going to take this literally. But of course, people have a way of always being in the kali yuga. We can go back to Egyptian inscriptions from 6,000 B.C., which say that the world is going hopelessly to the dogs. That’s always been the complaint. But according to this mythology there are—you have to realize the Lord, the Brahman, in three aspects. One is Brahma, the creative principle; two is Vishnu, the preserving principle; and three is Shiva, the destroying principle.

And Shiva is very important here. Shiva is always represented in Hindu imagery as a yogi. He is the destroyer in the sense of being the liberator, the cracker of shells so that chickens can come forth. The breaker-up of mothers so that their children can be un-smothered. The liberative destruction. The bonfire. That's why devotees of Shiva like to do their meditations along the banks of the Ganges where they burn dead bodies—because through destruction, life is constantly renewed.

Shiva has a paramour, and her name is Kālī, but that is a different word than this kali (yuga); you mustn't confuse the two. And Kālī is much worse than Shiva. She's black, and she has a long, long tongue, and her teeth are like fangs—but she's very beautiful... otherwise; has a lovely figure, but she's black. And in one hand—her right hand—she carries a scimitar, and in her left she carries a severed head hanging by the hair.

And Kālī, who is Shiva's—you see, Shiva is normally considered wedded; all the gods have their paramours, and they're all examples of the one central Self—she's called Pārvatī. But that's her bright aspect. But her dark aspect is Kālī. And Kālī is the awful awfuls. The thing about all that men most dread. Kālī is outer darkness, Kālī is the end. She may be represented as a blood-sucking octopus, as a spider-mother that eats its spouse. And Kālī is the principle of total night. And yet, there are those in India like Sri Ramakrishna, for whom Kālī is the supreme mother goddess. Because she is two-faced. She is playful and terrifying, loving and devouring, destroyer and savior. And the cult of Kālī has as its importance helping one to see the light principle in the very depth of darkness.

I have some suggestions for meditation on Kālī, which you can all practice very easily. You go to the aquarium and you find out there the monsters of the deep that make you feel most uncomfortable, and you study them. So in this way, Kālī is studied by her devotees. And if you meditate on those, this will be like putting manure on the soil. And out of all this apparently morbid and dismal thinking, bright things will begin to arise—because you will realize that what Kālī is is the most far-out act that the supreme Self can put on. The symbol of complete alienation from itself.

So what happens, you see, is this: in the process of the game of hide-and-seek the supreme Self tries to see how far out it can get. Just like children

like to sit around and have a competition as to who can make the most hideous face. And so this gets worse and worse as the time cycle goes on, until—at the end of the kali yuga—Shiva puts in an appearance, and he's all black and has ten arms, and he dances a dance called the Tāṇḍava. And in dancing the Tāṇḍava the whole universe is destroyed in fire. But, of course, as Shiva—having done this wreckage—turns around to leave the stage, you find that on the back of his head is the face of Brahma, the creator. And it starts again.

VIII

WESTERN DIFFICULTY WITH HINDU MYTHOLOGY

Well now, you see, this involves certain ideas that are quite alien to the West. One, the idea of the world as play. Our Lord God in the West tends to be over-serious, and no great Christian artist has ever painted a laughing Christ, or a smiling Christ. Nothing that I've seen of any of the great masters. Always, this figure is tragic and has that sort of look in the eye which says, One of these days you and I have got to get together for a very serious talk. So, you see, there is some difficulty about the notion of the world as a dramatic play; for us.

There's another difficult notion here, and that is cyclic time. See, most of us live in linear time. This originated with Saint Augustine and his interpretation of the Bible. Now, I don't know how true this really is, but it's certainly a big fashion in modern scholarship to say that it was Judaism that gave us the idea of history. Hindus have no interest in history whatsoever—or, not until recent times—to the total exasperation of historians. There is no way of finding textual evidence of the age of most of the Hindu scriptures—because they aren't interested in history as such, they are only interested in human events as archetypal occurrences, as repetitions of the great mythological themes, over and over again. So if a document started out that a certain adventure happened to king so-and-so—whom everybody knew at the time—in the next generation they had changed the name of that king to the current king, because the story was typical anyway. They just wanted to say a king that everybody knew. They altered things in that way, and so they know no kind of chronology. And if you ask even

quite intelligent Asians about this, they have difficulty in understanding what kind of a question you're asking. What is this history thing?

Whereas, on the other hand—according to our scholars—the Jews were historically minded, because they remembered the story of their descent from Adam and Abraham, the great event of the liberation from Egypt, and then the triumphant reign of King David, and then things go sliding downhill as other political forces become stronger and stronger. And so they get a fix on the idea that one day is going to be the day of the Lord, and the Messiah will come and put an end to history. And there will be the restoration of Paradise.

But this is linear. They don't think of the world having been created many, many times before, and come to an end many, many times before. It's one clear ascent from start to finish, from alpha to omega.

Well, when Saint Augustine was thinking about this, he thought, If time is cyclic, Jesus would have to be crucified for the salvation of the world once in every cycle. But for some reason he had it firmly fixed into his head that there was only one historical crucifixion in time—what they call the one, full, perfect, sufficient sacrifice, oblation, and satisfaction for the sins of the whole world. Once is enough.

Now, of course, he got his hierarchies confused. It's true—there is one sacrifice, but that's on the plane of eternity. On the plane of time, eternal things can be repeated again and again and again. But so, as a result of that, we are handed down not a Greek—the Greeks also had cyclic time, like the Hindus—but we have been handed down linear time, and therefore we're always thinking of a progression that will take us steadily, steadily, steadily, faster and faster to a more and more perfect world. And it will get better and better and better and better all the way along—if we keep our heads.

Now, this shows—I think—a rather naïve view of human nature. Human beings tend to smash what they create and say, Let's do it again! There is that in man which is also in the child. Rub it out—what fun! And so it isn't really too realistic to suppose that human beings will simply get better and better and better and better and better, because they'll soon get tired of it. They'll say, Let's be as awful as possible. See, there was that element in

Nazism: how awful can you get? How brutal can you be? How destructive? And that—it isn't just Germans, you know, who have that. See? We are converting all the living world around us into excrement and pretending it doesn't happen that way. And we are the most marvelous vortices in this stream of food which whirls around as us and then disappears into excrements, which again fertilize the soil—and we keep on at it.

So you see, there is that thing in us—which is represented by Shiva-Kālī—and it's always there. But the Hindu looks at the world with very, very hard-boiled realism in this way and sees terror and magnificence, love and fury; those two faces of the same thing. And you could say, Well, is there any peace possible? after you've looked at this picture for a long, long time, and you've conceived the endless, endless cycles because this thing goes on always and always and always. *Per omnia secula seculorum*: world without end.

And the Hindu sometimes feels, Oh, Brahma, don't you ever get tired of it? No. Because Brahma doesn't have to remember anything—and you only get tired of things you remember. That's why, from the standpoint of Brahma, there's no time—only an eternal now. So the secret of waking up from the drama, the endless cycles, is the realization that the only time that there is is the present. And when you become awake to that, boredom is at an end and you are delivered from the cycles. Not in the sense that they disappear; that you no longer go through them. You do go through them, but you know—you realize—that they're not going anywhere.

Now then, supposing you liken the rhythm of these cycles to music—why, surely, you don't hurry it up. You don't say, Let's get to the end faster. You know how to listen to music only when you slow down time, and sit back, and let that be. And so, in the same way, you can see every little detail of life in a new way. You say, Oh my! Look at that! And so one's eyes are opened in astonishment by being, living—totally—here and now. Up to this point, I have been discussing the theme of the world as the Self from three points of view and. Number one. Discussing what the self means in Hindu philosophy. The Self which you feel yourself to be is an expression. And is in fact at root the same as the self. That is to say, the being. Which is the root and ground of the universe. We went on from that.

To see. How according to Hinduism the self manifests itself in the cosmological way. In the beathing in and breathing out, raising out all the manifested universes and then breathing in withdrawing the manifestation over vast periods of time of space vast in length as also vast in brevity. The third step was to see, the social order, the human order as a microcosm of this huge macrocosmic game or Lila of hide and seek.

And so finally we come to the last consideration. Which is the question. In what way and by what means can an individual who is under the impression that he is a separate individual limited by and interest in his bag of skin. How can such a person effectively realise that he is deep down the universal self, the Brahman. This of course is a curious question, which reminds me of the famous story of an American tourist in England who wanted to find a certain obscure village and he stopped a native Yokel and asked the name to this place. And this Yokel scratched his head and said all, 'Sir I do not know where it is, but if I were you I wouldn't start from here.' In a sudden way the question how do I realize the Self is the wrong question. Why is it the wrong question. Because it proposes a journey to the place where you already are. Now it's true that you may not know that you are there. But you are and if you take a journey to the place where you are you will visit many other places. Than the place where you are and perhaps. When you find through some long experience that all the places you go to are not the place you wanted to find. You it may or. Kirti you that you were already there in the beginning. And that is the. Dharma or method as I translated that word, which all gurus teachers of spiritual development use fundamentalists. They are all of them tricksters. But in the most beneficence sense of the word trickster. Why trickster? Because I do know it's terribly difficult in fact it's impossible to surprise yourself on purpose. And yet, to be surprised is a great thing. But you can't plan a surprise for yourself. Somebody else can do it for you. And that is why so often a guru or teacher is necessary in this process. But let me say right from the start that a guru there are many kinds of groups. First of all among human gurus, there are square gurus. And there are beat gurus. There are gurus like...well let's say a great Zen Master today let's take odor Roshi at DI Tokaji who is a square guru. And a very good one. But you go through regular channels. Then there is a guru like Mr. Gurdjieff, who is a rascal guru. Who leads you in by means that are very very strange indeed. Gurus may be situations. Certain kind of problem

or encounter even a book can to some extent be a guru. A friend can be a guru. I have often thought of writing a story about a man who is some sort of guru seeker and potential yogi who goes one day into an automatic and sits down at a table where there is another fellow and he sort of thinks that this man looks wise. And he projects on to him the idea that he is a guru. And he says I am to you so he says I feel that something special about him. And the man says, 'Oh really?' Actually there's nothing special about me I happen to be an insurance salesman. And this other fellow says Isn't that fascinating how modest two years. And then I want to develop the story step by step they keep meeting each other because they both eat at the same automat regularly for lunch and although they are the fellow really is an insurance salesman and doesn't know a thing about these things it in the end results in the indictment of the person who project it is a major part. There's something like that in a New Yorker article which was then in the art of tennis. Which you may remember.

So there are as I say, many kinds of guru. But the problem of the guru is to show the Inquirer in some effective way that he already has what he is looking for. A story is told of a great Hindu King called Yagnidata who one day woke up in the morning and in order to arrange himself for the day picked up the mirror beside his bed and looked in it and found he had no head the reason was he had a hangover and he looked in the wrong side of the mirror one side of an ancient mirror you know this polished copper of brass or something, and the other is got some designs on. He looked on the wrong side and couldn't find his head said Good Lord I've lost my head and it was a great search he instituted to find his lost head. So we are all in that position. We're looking at the wrong side of the mirror. We're looking for our head. Have you ever thought about that? What if there were no... You would never know what your head looks like. And try to be aware of your head. What color is your head, so far as your eyes it means? You look around and you can't find it it isn't that the something black here that's like darkness. That I enjoy it is that behind your eyes do you feel there's a darkness there is there something black no as you turn around this thing just doesn't have any color at all it isn't black It isn't white it isn't nothing. And yet to have that thing there which has no color. No quality of any kind that you can see is the condition of being able to see everything. Actually what your head feels like inside is what you see out in front of you. Because as I

said all that you see out in front of you is a state of the brain. It is the way it feels inside your head and the things you hear they are all in the way the brain feels. The brain in other words is a marvelous contraption to the extent that it is not present to itself it is present to everything else. Now, if you get a tumor in the brain, the brain starts to become present to itself, and you get feelings inside your senses that are all weird and don't seem to be right with the external world. And that is because something has gone wrong inside your brain. So too, when you see spots in front of your eyes, you are seeing your eyes but you can only see your own eyes when they are defective. When they are working properly, they are completely invisible.

Now, in Hindu traditions, the realization of who you really are is called basically sadhana. And sadhana means the discipline. The way of life that is necessary to follow in order to escape from the illusion that you are merely a skin encapsulated ego. And solder now comprises yoga. From the root yoga. Which means to join. And so from that in Latin we get Ungere, to join. And in English junction. And also yoke. And. Junction is also the word union you see. All this derives from the Sanskrit root [with] 'u.' Yoke is also a discipline. When you yoke oxen that is a kind of a discipline. Now strictly speaking in the various strictest sense Yoga means the State of Union the state in which the individual self hat is called. The man. Jivatman is approximately translatable as ego gene that man. Finds that it is ultimately up man which equals Brahman. The Supreme Self. So yoga is the state the strictest meaning of yoga is the state of Union and a yogi means one who has realised that union. But, we find that the word is not. Normally used in that way in that strict sense. Yoga in the normal way of use means the practice of meditation, whereby one comes into the State of Union, and the yogi means one who is a traveler a seeker who is on the way to that point.

But again, strictly speaking, there is no metho to arrive at the place where you are. And no amount of searching will uncover the self. Because all searching implies the absence of the self. The big self the self with a capital S. So that to seek it is to thrust it away. And to practice a discipline to attain it is to postpone realizing. There is a famous Zen story told of a monk who was sitting in meditation, and a master came along and said What are you doing he said I'm meditating to become a buddha. Whereupon a master

picked up a brick that was lying nearby and started polishing it. Rubbing it and the monk said What are you doing he said I'm rubbing this brick to make it a mirror. He said by no amount of rubbing could you ever make a brick into a mirror the master replied by no amount of zazen will make you become a Buddha. Zazen means sitting meditation. They react very bad or to the story in modern day Japan. An anywhere. What is important to see quite quite radically here is that the moment you embark, supposing for just let me put it in this way supposing that I say to you. Each one of you is really the great self and I'm the brunt. And you say well if all you've said up to now makes me fairly sympathetic to this intellectually. But I don't really feel it. What must I do to feel it really? My answer to you is this. You ask me that question because you don't want to feel it really. You're frightened of it. And therefore what you're going to do is you're going to get a method of practice so that you can put it off. So that I can say well I can be a long time on the way to getting this thing. And then maybe I'll be worthy of it, after I have suffered enough. You see, because we are brought up in a social scheme whereby we have to deserve what we get and the price that one pays for all good things is suffering. And people love to boast about how much they've suffered I find it quite sickening the people who go over to Japan or India and come back and say or Tibet or somewhere oh these awful things that their masters did to us they made to sit for hours with. Crossed legs so that when we got up we couldn't stand and we were aching and we were hungry and cold and shivering and we were hit over the head with sticks and things and all these things we endured my God wasn't that tough of us and they do all this you see and say look at this cars I have look at the wounds I got in the battle look at all my medals, see, for my valiant spiritual endeavors. But all of that is precisely postponement. Is because one is afraid, here and now, to see it. If you had the nerve you know the real nerve you would see it right away. Only that would be there when one feels you should have been like that why that would be awful that would be that that wouldn't do at all because after all I'm supposed to be poor little me. And I'm not really much of a muchness. And I'm playing the role of being poor little me, and therefore in order to be something great like a Buddha or a Jivamokta One liberated in this life. I ought to suffer. So you can suffer for it there are all kinds of ways you know it's invented for you to do this. And you can discipline yourself and you can gain control of your mind and you can do all sorts of extraordinary things. I mean you can

drink water in through your rectum and do the most fantastic things. But that's just like being able to run one hundred yards in nine seconds. Or to push a peanut up Mt Tam applies with your nose or any other kind of accomplishment you want to engage in wraps a looter nothing to do with the realisation of the self. The realisation of the self is fundamentally the means of coming off it. You know the sort of when we say to people who put on some kind of an act with our Come off it. And some people can come off it they laugh and say they suddenly realise you know they are making fools of themselves and they laugh at themselves and they come off it so in exactly the same way. The guru, the teacher, is trying to make you come off it. As he finds he can't make you come up it is going to put you through all these exercises so the jewels at the last time when you've got enough discipline and enough suffering and enough frustration. You'll give it all up and realise you were there for the beginning and there was nothing to realise.

But the guru is very clever these it's all right if this is the way you have to go this is where you have to if you ask for it. You came to me I didn't invite you is either going to as those you came to me and said I want to learn yoga. Well he said, Yoga is union you are, tat tvam asi, you know. You know that but now you say I'm sorry I don't understand that because I only get it intellectually I don't feel it always says you're one of those. So I see, I've got to satisfy you the customer is always right now I got to give you all this work to do. Because you can see directly that this is. But he's looking at you in a funny way to see the year the guru is always saying to you. You know what do you do you do me what's your game. Imagine for example a father confessor. And you feel terribly guilty. That you committed murders and robberies and adulterers and fornications and all kinds of arson and injury to people and financial shenanigans and you go to this man and say I am a terrible sinner. Since really he says I have murdered somebody is how many times. And you think oh good lot this man doesn't realize how awful I am your aside all these things he's perfectly calm. And then you say to him Well you don't seem to be very shocked he said you haven't confessed any serious sense. He said What do you mean by a serious sin. Well I said What do you think. Well you know I, I just feel wrong. I just feel that something in the basis of me that feels that tells me that I am not what I ought to be. Could it be that I am spiritually proud. That I'm egocentric.

There's no that's an absence very usual this is quite ordinary isn't. But he says, 'You are guilty of something. Something really terrible.' And bluster that leave. Idea our sins come on a month to. Go deeper What is the real sin committed. You don't want me I little me could do something worse than murder them worse than spiritual pride. Just little me. I mean. I'm a reasonably well-intentioned person. What could that be. And he looks at you in a funny way that you know. You know that's a kind of a casket esque situation where you're accused of a crime that's not specified and yet, the judge the accuser says you jolly well know what you've done because we can't mention it. Because now it's like there's laws that are on the books in the state of California and several other states, where people are accused of the abominable crime against nature. And nobody knows what it I mean I can't imagine. It's too dreadful to be talked about. So this guy does the same thing but it's in a different dimension you have done it. What did you do seek the real crime is that you won't admit you're God. That's false modesty. You won't admit that your other self in disguise see as such and such a persona such as a person you know the word person means mask that persona, that through which the sound flows and the mask in the classical. Drama of Greek or Latin drama was shaped like a megaphone so that the sound would be projected in an open air theater Sepang So now that through which the sound flows as the mask and now we use the word person which means fake or mask to mean the real thing Harry Emerson Fosdick wrote a book How to be a Real Person. If you translate that back into the original meaning it means how to be a real fake.

So the guru challenges you see he challenges you if you raise the breast and he doesn't go out and preach in the streets. I say come on everybody ought to be converted he said stop under a tree. And waits. And people start coming around and they offer him propositions he answers back. And he challenges you. In any way that he thinks is appropriate to your situation. Now. If you've got a thin shell. And your mask is easily dispatched with. He simply uses what we might call an easy method. Listen Shiva, come off it. Don't pretend you're this guy here I know you are. And the guy sort of twinkles a bit and says. Well I guess you're right. But there are people out like that that have very thick shells. And so he has to invent ways of cracking them. So here's how it goes. You what to do to understand yoga, you need to get hold of a good translation of Patanjali. The yoga sutra. I

don't know which is the best translation there are so many albums. You know that Hindu friend of mine recognise recommends the one in the Harvard Oriental series by Woods. It says it starts out now yoga is explained. First. And the commentators say now has a special meaning because it follows from something else that you're supposed to know. Beforehand, that you're supposed to be in other words, a civilized human being before you start out on yoga. We don't eat yogurt a baboon. And so you're supposed to have been disciplined in as I told you this morning are the karma and dharma. In a political sense, the totality. And Dharma, justice. And then you can start your book. Then the next verse is your gas cheat the Briton it'll die which means yoga is the cessation of revolutions of the mind. In other words, that...you can interpret that a many levels. Chipped our meaning consciousness like a pull like water like a reflecting pool. If there are waves on that it doesn't reflect it breaks up all the reflections. So stop the waves on the mind and it will reflect reality clearly get a perfectly calm mind that's one meaning of it. On another meaning I would start thinking. Eliminate all contents from the mind all thoughts all feelings all sensations everything.

How will you do that? Well, he goes on to say you do it by certain steps. First of all, pranayama, which means the control of the breath. Pratyahara, which means preliminary concentration. Tarana, a more intense form of concentration. Jnana, which is the same John or the Sanskrit present. And that means profound union between subject and object and finally Samadhi, which is way out. Now what's happening? Control your mind, first of all by breathing. Breathing is a very strange thing because believing can leave you both as an involuntary and as a voluntary action. You can feel I breathe, and yet you can feel it breathes for me. And they have all sorts of fancy breathing ways in yoga. They're very amusing to practice because you get very high on. That one you know where you swing down into this way. So, you know, you're sitting in a lotus pastor and bending down and then you can bring it in through the left nostril. Breath out the right. In through the right. Out from the left. At the same time, imagine that as you take the current in it goes into you it goes right the way down your spine and goes by eyeing on the base of your spine and then catches hold of that snake that's supposed to be cold up there and as you breathe out pulls it up up up up up up. Up Up Up and out. The snake all the time, the Kundalini, the

serpent power that lies at the center of sexual activity but has to be dragged up and put in the brain. So, they set you up these tricks. And of course, if you are bright. You may begin to realize some things at that point. If you are not very bright then you'll have to draw on. And so next they really get to work on concentration. Concentrate the mind on one point.

Now this can be an absolutely fascinating undertaking. I suggest that you try it this way if you want to make experiments. Select a highlight on some bright, some polished surface, copper or glass or something. Where there's a little tiny reflection. Say of a candle or an electric light bulb. Look at it and put your eyes out of focus so that the right spot appears to be fuzzy. A fuzzy circle. Now look very carefully at the design in the sizes are all. And see if you can make it out. There is a definite pattern of blur. And you are going to have a wonderful time looking at that. Then, go back and get your eyes into focus and look at intense light. And you can go into it and into it and into it like you will know your falling down a fun. And at the end of that funnel is an intense light. And go down go N N N N N It's the most thrilling experience. Then suddenly the guru wakes you up and says What are you doing that for. And all well because I want realisation why? Because we live in a world of if we identify ourselves with the ego we get into trouble, we suffer, we are in a mess. He says, 'You're afraid of that?' 'Yes.' So then, all that you're doing to practice yoga is based on fear. You're just escaping you're running or. How do you think you can get realisation through fear. There's one to think about. So you think well now I've got to go on with my yoga practice my concentration is my exercises but not for a fearful motive. And you know that guru you know is watching you and he's a very very sensitive man and he knows when you're doing no always knows what you'll note it is.

So he puts you on to the ticks are getting a pure motive. And that means a very deep control of the emotions I mustn't have impure thoughts. Right so you go alarm and you manage to repress as many impure thoughts as possible and then one day asks you why are you repressing these thoughts? What's your motive for trying to have a pure mind. And you find out that you had an impure my. For trying to have a pure mind. If you did it for the same all reason you started out the thing in the beginning because you were afraid because you wanted to play and get one up on the universe. And so,

eventually, you find out, you see, that your mind is what is called in Sankrit Mudha, Mudha, which means crazy. Because it can only go in vicious circles. Everything it does to get out of a trap puts it more securely in the trap. Every step in the direction of liberation is a new tie up. So that you started you know with molasses in one hand and feathers in the other. That was the original situation of man. The guru made you put them together like that and said Now pick the feathers off. And then order them are of a mess the whole thing gets. So you get involved, involved, involved then involve others pose and in the meantime she. Has been telling you yes you made a little attainment today but it was only the stage and there are sixty four all together. And you got to get that sixty-fourth stage, and he knows how to spin it out and. Drag it all out because you are ever hopeful. That you will get that thing. Just as you might win a prize or what, win a special job or a great distinction and dream somebody. That's the motivation all along only it's very spiritual. It's not for worldly recognition. You want to be recognized by the gods in the Angels. But it's the same story on a higher level. So he keeps holding up these baits. And as long as the people falls for them he says he holds out more baits. Until after awhile, the pupil gets the realisation that what he's doing is running faster and faster in a squirrel cage. That he's making an enormous amount of progress and getting nowhere like in Alice Through the Looking Glass when the Queen says here, you have to have run faster and faster to stay where you are.

And so he impresses this upon you by these methods very subtle. And at last you find out, that you, as an ego as, what you ordinarily call your mind, are a mess. That you just can't do this thing. You can't do it by any of the means that have been held out to you. You can concentrate Yes you've acquired a considerable power of concentration by doing all this but you find you're doing it for the wrong reason. And there's no way of doing it for the right reason see Krishnamurti does this. He's a very very clever group. Krishnamurti says to people now look, there is nothing you can do to be liberated because all. All your efforts in the direction of liberation are phony. They are based on your desire to boost and continue your ego and that will never lead to liberation all you can do he says is to be aware of yourself as you are without judgment. See what is. But then, if you can do that, you have no further problem. But if you try to do it, you're in the same mess all over again. So we have Krishnamurti followers, who are so busy

being aware of themselves and not doing spiritual practices they can't read any books except mystery stories they mustn't read any philosophical books, any spiritual books, they mustn't do any meditation exercises or anything like that they just have to be aware of themselves all the time. Gurdjieff played the same game, in a different way. You said the most important thing is self-remembering. Always, at every moment be aware of what you're doing watch yourself constantly and never never be absent minded. So all day when you know you pick up the piece of paper you realize I'm picking up this piece of paper. And I'm opening it. And I know I'm doing it this way so I'm not asleep, ordinary people can't open up piece of paper. And in this way where. Rally thing out of his grave.

And so all these people are doing this you know, watching. Now, where do they land up? I've told this story millions of times really excuse me but it's very important when they teach you in Japanese Zen. How to use a sword. The first thing that the teacher says to the student is now. You if you're going to be a good soldier you've got to be alert constantly. Because you never know where the attacks are going to come from. And so all soldiers have taught us, watch. Christian us. Peace brother in be sober be vigilant if your adversary the Devils Daucus around as a roaring lion seeking only native our own resists steadfast in the face. Be on your watch Christian dust out heed them on this holy ground how the powers of darkness prowl and power around enemies on every side. Christians seek not yet repose I got an angel say now out in the midst of whirls watch and pray so the soldier other sentry everybody is on the watch on the alert. And you know what happens to you when you try to be on the alert? You think about being alert, and then you're a hopeless prey to the enemy. Because you're not you're not alert you're thinking about being alert.

So in the same way, the poor boy who is learning fencing and as a teacher and he's doing duties around the house the teacher attacks and utterly unexpectedly at any moment. And so long as he is alert, he's a sitting duck. Because he's alert in the sense of staring he says it might come from there it might come from there let's check out every Let's check out individually every place in which the attack might come check this check that check the other thing it might be this way it might be that way while he's doing that or to get him from in a direction he's not thinking about. To be alert, you must

not think about any special direction from which the attack might come. You must be simply, awake and relaxed. And then, all your nerve ends are working. And wherever the attack comes from you're ready. They liken this to a barrel of water. The water is just sitting there in the barrel, but the minute you make a hole in the barrel the water immediately is ready to come out of that hole.

So in the same way, the mind, when it is in the proper state is ready to respond in any direction from which the attack may come. So this man is no longer alert in the sense of taut and anxious which right you could see, just sitting there. Like a cat sits there. And the minute anything happens here now. It's right there because it didn't have to overcome any set in a direction opposite to that from which the attack comes. If you're set for the attack to come from there and it comes from here, you have to pull back from there and go there but that's too late. So you sit in the middle. And you don't expect the attack from any particular direction. So in the same way, all this applies to yoga. You can be watchful, you can be concentrated, you can be alert. But all that will ever teach you is what not to do. How not to use the mind. Because it will get you into deeper and deeper and deeper binds. You have to let it happen. Just like you have to let yourself go to sleep, you can't try to go to sleep. You have to let yourself to just your food you can try to digest it. And so in the same way, you have to let yourself wake up. Become liberated. And when you find out you see, that there isn't any way of forcing it that for most people is the only way of getting them to stop forcing it. Because they won't believe it when you tell them in the first instance you got to do this without forcing it. They'll say well that it won't work, it won't happen because I'm Darian evolved I'm just an ordinary human being I was poor little me and if I don't force it nothing like happened I people who think that if they. Don't struggle and strain they won't have a bowel movement. Or whatever it is they think they've got to do that work. In order to make it happen. In other words, all that is based on lack of faith, not trusting life. And to get people to trust life who don't trust it, you have to trick them. They won't jump into the water so you have to throw them in. And if they're on very unwilling to be thrown in, they're going to take diving lessons. You see in which they're going to go all through they're going to read books about diving they're going to all the preliminary exercises for diving and are going to stand on the edge of the

diving board and inquire whether there's a right posture till something comes up from inside and kicks them in the butt. And they're in the water. And it's also with this, it really is.

So now there's an amazing must instructor about this because it's important that you should know and the most amazing gamesmanship goes on in the whole domain of yoga and spiritual practice. You would be astounded. Somebody whom I won't mention, but for whom I have a fairly considerable respect came up to me a few days ago. He's a...I'll just say it, he's a psychotherapist. And he said. You should work with me. You know all last night. You were going around like a zombie. And this isn't good because if you if you would be clear with my work you would be an incomparable genius. I said. That's OK. I'm very fond of you I said you know what you're playing games with me I was getting around like a zombie last night because I had too much to drink. So I mean, one of the games in all this is to find a little flaw or something everybody has a place where they can be jiggled a bit. Something they're a bit ashamed of and so they think does this person really know my secret he's not saying anything with the polite but does he really see through me and know that somewhere or the awful awfuls, and that I'm a little bit upset of all. This is all part of a religious competition. If you'll go to the Roman Catholics and you started you've been psychoanalyzed, you see. They'll say well that's fine but don't cos it's not nearly enough I mean that's all very well so far as it goes but. Or if you're a Roman Catholic and you go to a Buddhist outfit that says missionary basis they'll say yes of course through your Catholicism you've learnt some of the basic virtues but of course, Catholicism doesn't go anywhere near the heart of things it is it doesn't have an elaborate system of meditation like we thought. And then you go over to the Hindu school and they say as the Buddhists go to a certain point. But they do it tain a very very high stage of realisation but there is nevertheless something higher than that which they don't quite get.

And you'll find that all around the world. Everybody claiming to have that little special extra essence just that others don't have. And why are they doing that? Are they all frauds? Are they all charlatans all out to get you into their society sometimes yes but sometimes they're trying to see whether you fall for this testing you are this is all by skillful method. And if

you become falling for that little extra special thing that's just supposed to be around the corner. You know. Then they've got you. Or rather you've got yourself in the mix. And you have to work at that and work at that and work at that until you find out. That you were being made a monkey of. That you were being made a monkey of because you could be made a monkey of. You hadn't really arrived where you are. You weren't. You didn't have the nerve to be you. That is to say to be the Self. And so you had always to feel that there was something beyond that, a stage higher. Than so that's why for example Masonry is such a success it has thirty-three degrees. And you know, you can go up that ladder and get higher and higher status the more degrees the merrier. There have been things that invented hundreds of degrees. And they're an immense success. Because you can postpone it longer and longer like Achilles overtaking the Tortoise. He doesn't overtake it in the problem because we keep dividing and dividing. The space between Achilles and the top of us as he approaches the top of us. What delay is getting is overtaking the top. This is not a killer is that our calculations about how he approaches it we make the calculations more and more complicated as he gets nearer and nearer to the tortoise. That only the calculations that put it off a kill is in fact runs right by.

So in the same way you can calculate yourself out of liberation. You can put it off indefinitely by inventing new degrees and new stages. But actually, when you get it, you don't get it. You will suddenly see. It happens instantly. And near where it happens instantly whether you put in thirty years practice or whether you put it in three minutes. It's the same. Suddenly, it dawns on you that that's the way things are the time I see. Medieval society in the West, comparable to Hindu society. Allowed people to check out of the game. It is revered and encouraged its monks and nuns. Are various types of discipline. And even a person who die and there's this difference is see for the west and India. You couldn't giant the Brahmana caste the priest caste from some other caste but in the European caste system. By becoming a priest. Or a cleric of any kind you see a cleric I mean simply a look. Person the word cleric is related to the word clever. It's simply means you're literate in only the clergy. A live word clever cleric clerk clergy are all the same. And they're also related to the word clear as it was originally spell C L E R E. Now you could join the clerical caste from any other caste, and the function of the clerical caste in the West is that it

was a cross as it were a kind of diagonal caste. You could familiarize with any other caste, once you're in that one. And so it was a wonderful way of rising in society. You could go from being a serf. Go to being a priest to being an archbishop and consort with the nobility. It was the only way open to cross castes you see and from then because they were the literate people it was through literacy and through universities founded by clerics that our caste system began to break. And we got the idea of choosing your own vocation and not simply following what your parents did. And I want to make an observation here about checking out of the game. This is not encouraged in contemporary society. Because the Catholic Church and these say the Episcopalian church are very powerful minorities they can still support monasteries and even hermits. But you can't be one on your own without great difficulty. Firstly, because you're a poor consumer. See around here there are we have a number of hermits there's a guy out there building that boat and he's essentially a non-joiner, poor consumer and the community they live a lot along here and they're mostly they're not working class people. They are people who dropped out of college because they saw it was stupid and that sort of people we would call them perhaps beatniks. But you see the city doesn't like it because. They aren't owning the right sort of cars and therefore the local car salesman isn't doing business through them. They don't have lawns, and so nobody can sell them lawn mowers. They hardly use dishwashers, appliances of that kind they don't need them. And also, they wear blue jeans and things like that and so the local dress shops feel a bit put out having these people around and they are very little very simply. Well that you would mustn't do that. You've got to live in a complicated way. You've got to have the kind of car you know that identifies you as a person of substance and status, and all that. So there's a great problem you know in our society now why is that this problem. There's always a very inconsiderable minority of these non joiners or people who check out of the game. But you will find that insecure societies are the most intolerant of those who are non-joiners. They are so unsure of the validity of their game rules, that they say everyone must play. Now that's a double-bind. You can't say to a person you must play because what you are saying is you are required to do something which will be acceptable only if you do it voluntarily.

So everyone must play, is the rule in the United States and it's the rule in almost all Republican governments. I mean Republican in the sense of Democratic. Because they're very uneasy. Because everybody is responsible. You mean you may try not to be and avoid it and say oh let the senators take care of it or the president but theoretically, everyone's responsible now it's terrifying. It's all out when you know what's right there is an aristocracy there is the the clergy, and they know what should be done and they're used to really see but now you see it's in your hands you say well what are you what are we going to do. Well I think this way, and you think that way and he thinks the other way, and so we're all unsettled. And therefore we become more and more conformist individuals and rugged individualism always leads to conformism, because people get scared and so they herd together they were compounded with industrial society mass production etc. They all wear the same clothes. And they wear sensible clothes that don't show the dirt too much and. We get dollar drabber, with the exception of the Californian revolution. All the time you mean you go to New York and everybody looks as if they were about to attend a funeral Well part of the reason is the city is covered in filth murk descends, descends from the chimneys of Consolidated Edison it comes in at all the windows you can't shut it out so the girls wear black and pearls and even black underwear. Because it just doesn't show the diverse and all the men with sensible grey suits and black neckties and so on I mean the doesn't serve the dirt but it looks like a funeral or looks like an assembly of preachers. So, what, the reason for this is in a way that democracy as we have tried it, started out on the wrong foot. You see, in the scriptures of the Christian scriptures it says everybody is equal in the sight of God. Now, that's a mystical utterance. That means that from the standpoint of God all are divine. And are playing to function. And that is something that is true on a certain plane of consciousness. But to come down a step and try to apply the mystical insight in the practical affairs of everyday life and what do you get you get a parody of mysticism. You get the idea, not that everybody is equal in the sight of God but that all people are equally inferior. And that's why all bureaucracies are rude, why the police are rude, and why you are made to wait in lines and are obstreperous tax individuals and all that sort of person because everybody is a crook everybody is equally inferior so that becomes the parity of democracy and that kind of

society watch out for it it turns in a quick click into facets. And into, because of its terror of the outsider.

Now, a free and easy society loves outsiders. In fact, it's a little bad for the outsiders integrity because he becomes a Holy man see and people make salaams and give him food and all that they really take care of the outside, because they know that man is doing for us what we haven't got the guts to do. That outsider, who lives up there on the mountain is at the highest peak of human evolution his consciousness is one with the divine and great just there is someone like that around makes you feel a little better he has realized he knows what it's all about and so we need a number of those people. Even though they don't join our game they tell us you see what you're doing is only a game it's OK I'm not going to condemn you but it is only a game and we up on that mountaintop I watching you we love you we have compassion for you and but we excuse please we are going to join. So that gives the community great strength, because it tells the government in no uncertain terms that there's something more than government. That's why kings, wise Kings, kept not only priests but court fools. [A] court fool is much more effective than the priest. To remind the king. That after all is human. And you know, how in Richard the second where the fool is called the antics. The king says, 'Within the Hollow Crown that runs the model temples of the King keeps death his watch and there the antics it's scuffling it is stated grinning it is pumped allowing him a little time to monetise be feared and kill with looks that at last comes death. And with the pinballs through his castle wall and farewell King.' See, always this reminder of the priest or of the antics to the royalty to the government. You are going to die you are mortal. Don't give yourself and graces as if you were a god. As you are only a representative of God and there is a force, there are domains, way way beyond yours and way way higher. But it's very difficult for a Republican government to realize that. Because it's insecure. And therefore, in our present world. You cannot abandon nationality without the greatest difficulty. People who try to abandon nationality get constantly deported from one place to another. You must belong to this thing as Thoreau put it. However far into the forests you may go, men will pursue you and compel you to belong to their desperate company of oddfellows.

Play and Survival

So it is announced that the subject of the seminars play and survival. Are they in necessary contradiction? We're going to examine the subject in the context of Christian, Islamic, Buddhist, Jewish, Hindu, Taoist and scientific naturalism.

Living, it seems to me, is a spontaneous process.

The Chinese term for nature is one which means that which is so of itself.

That which happens very curious because because of our grammar that we speak in almost all standard average European languages.

We are unable to imagine a process which happens by itself because every verb must have a noun has its subject a director.

And we think nothing is in order unless someone or something orders it, unless there's somebody in charge. And so to us, the idea of a process of nature, which happens of itself by itself is frightening because there seems to be no authority. And therefore, in the United States, we are in a serious social and political conflict.

Because. We think that we ought to be living in a republic.

But the great majority of citizens believe that the universe is a monarchy. And you cannot be a loyal citizen of the United States unless you believe that a republic is the best form of government.

So we're always seeking for a monarch, for someone else upon whom to push the responsibility. I won't take it ourselves. We always complaining that where we are is the result of our past. My mother and father were neurotic, you know, and therefore they made me neurotic and their fathers and mothers were neurotic and made them neurotic. And so it goes back to Adam and Eve. And you remember what happened in the Garden of Eden.

God set a trap by saying there is that specific tree and you mustn't eat the fruit of it. If he had really not wanted them to eat the food, he wouldn't have said anything about it by drawing attention to it in this way. It was obvious they were going to eat it. So when he saw Adam looking guilty and he said,

Adam, hast thou Eden of the fruit of the tree where off? If I told the adoptions, not eat.

And he said, the woman you gave me. She tempted me and I did it. He looked very severely. He said, Eve, have you eaten of the fruit of the tree were off. I told you, thou shalt not eat. And she said, the serpent forgot passing about the same. And God looked at serpent.

This isn't written in the Bible, but they went to each other because they had planned long in advance.

The universe was not going to be a merely obedient arrangement. Well, I God say you shall do thus and so and you will automatically do it.

There would be no fun in that because of Venus prizes. So it is the Hebrew theology that God put into the heart of Adam at the creation, a thing called the yet Sahara, which means the wayward spirit.

Just the kind of little. Just like you. Well, when you make a stew, you put some salt in it. You don't want the whole stew to be salt, but just the touch thing.

So gone in creating Adam put just a touch of wickedness so that something surprising and different would happen, which God would not be able to. With MasterCard.

Now, this is very important.

You see, what we're going to talk about mainly is our sense of identity.

Our sense of alienation and the complications we put ourselves into by regarding survival as a duty.

These all connect together. You may not see the connection immediately.

But if you imagine yourself in the position of being God in the literal popular sense of God, the father almighty, it means you're a male chauvinist pig. And you're in charge of everything. You know, all pasts, you

know, all futures. You're completely in control of the cosmos. You have absolute power.

And you are bored to death.

So you say to yourself, man. Get lost. I want a surprise.

And here you are. Oh, you must admit it.

The whole mark of insanity is to know that your God.

That's absolute taboo, not only in the Christian religion, because Jesus got crucified for knowing that. And the Christians said, OK, OK, Jesus was God, but let it stop right there. Nobody else. But the gospel was the revelation to us all that the Hindus knew forever.

That's why Europe. And if Jesus had lived in India, they would have congratulated him for finding out instead of crucifying many people in India.

Who knew they would go out in disguise? Sri Ramakrishnan, Sri Rahman, the Maharishi Krishna himself, Buddha, everybody. They discovered it because it's not an exclusive claim. I alone am that you all are. As I look into your eyes, I see the universe looking back at.

So we're in a situation where it's a taboo.

We must admit that we know who we are.

So as to have the the thrill, that sort of self goosing effect of feeling lost, feeling strange, feeling alone of not belonging. And we say in popular speech that I came into this world. You did nothing of the kind. You came out of it just in the same way as the fruit comes out of the tree, the egg from the chicken, the baby from the womb. We are symptomatic of the universe. We are. It's nerve endings, just as in the retina. There are myriads of nerve endings. So all of us are nerve endings of the universe, and there are many of us. So that the universe is point of view of itself will not be prejudiced to be many sided.

And so fascinating things happen.

We want to find out what it is that's going on. And we do with telescopes to find the farthest out things. And with microscopes to find the farthest in things.

And the more powerful our instruments become, the more the world runs away from us. As our telescopes become more powerful, the universe expands as it's ourselves running away from ourselves. The more accurate our physics becomes and we investigate the nucleus. Some years ago, we thought we had it. We found a thing called the atom and that was that. Then groups than the electron turned up. Then bang, there was a proton. And then when we got those that came out, all kinds of things made songs anti matter. And it got worse and worse and worse because we got sharper.

And so we are a self observing system, which is like the snake, the rubber us that bites its own tail and endeavors to swallow itself to find out what it is. It's like the whole question of who am I? I would like to see me, but look at your head. Can you see? It's completely invisible and it isn't black. It isn't like that. There's a dark spot behind my eyes. It isn't even blurry. It's plain. No way. And thereby ending the tale. Most of us assume, as a matter of common sense, that space, this is nothing.

This is not important. It has no energy. But as a matter of fact, space is the basis of existence.

How could you have stars without space? Stars shine out of space. Something comes out of nothing.

And in just the same way, if you listen and then unprejudiced way with your ears to find out. You see, I've got the sense organs here and I'm going to trust them to find out what is going on. What really is a new.

And you hear all these sounds coming out of science. Silence is the origin of song. Just the space is the origin of stars. Just this woman as the origin of man. She is black.

Also, if you listen and pay real attention to what is.

You will discover that there is no past, no future and no one listening. You can't hear yourself listening.

So you live in the eternal now and you are that taught by Marcy.

That's really extremely simple. Isolated.

Now, then I started out by saying.

Survival going on living. Is a spontaneous process. Love is the same.

But the trouble is that when we our children. Our elders and betters told us that it was our duty to love. God said, thou shalt love the Lord, thy God with all our heart and with all my soul and with all my mind, my neighbor as thyself. And so our mothers said to us, you must have a bowel movement after breakfast.

Try to go to sleep. Take that look off your face. Stop pouting. Oh, you're blushing. Pull yourself together.

Pay attention.

And all these are commands. The basic rule is as follows You are required to do that, which will be acceptable only if you do it voluntarily.

That's the formula. You must love me. And it's a double bind and everybody is completely mixed up because of this. So, you know, this stupid story I often tell the husband says the wife. Darling, do you really love me? And she says, Well, I'm trying my best to do so. And nobody wants that answer.

They want to be told, I love you so much. At that age, I can't help loving you. I'm your hopeless victim.

And so we are under the compulsion to go on living.

You must go on living. It's your duty. Get tired of living and scared of dying. You must go on. Why?

Well, I have dependents. I have children, and I have to go on working to support.

But all that does is to teach them the same attitude. So they will go dragging along to support their children, who will in turn learned from them to go dragging along and fighting this thing up.

And so I watch with total amazement the goings on of the world, see all these people commuting, driving cars like maniacs to get to an office where they are going to make money. For what? So that they can go on doing the same thing.

And very few of them enjoy it. Sensible people get paid for playing.

That's the art of life.

But the whole idea of struggling and beating your brains out in order to go on living is completely ridiculous. Comes at the beginning of his book, *The Myth of Sausages* made a very sensible statement. He said The only real deep philosophical question is whether or not to commit suicide.

Must you go on? Because it would be so simple to stop the problem.

Nobody around to regret that it wasn't going on in the longer run. What is it like? Death. Go to sleep and never wake up. Oh, that's terrible to be in the dark forever. It wouldn't be like that wouldn't be like being buried alive forever. It would be as if you never had existed. And not only that, you never had existed, but did nothing at all it ever existed. And that would be just the way it was before you were born. Which is another way of demonstrating how something comes out of nothing. Nothing is the essential prerequisite of something like that. But back in front of the same kind as the Chinese, say, the young and the intimate. So like you have an invisible head.

Your ultimate reality, the ground of your being.

Sun Yat is the Buddhist called the Void.

Which is space. Watch his consciousness. Which is that in which we live in movement about being.

The Great Void.

And fortunately, there's no way of knowing what it is.

Because if we could know what it is.

We would be bombarded.

A little function of interest is a mystery. There was a great Dutch philosopher by the name Vanderbilt who said the mystery of life is not a problem to be solved, but a reality to be experienced. And fortunately, we see we have in the middle of all consciousness a perpetual problem, a perpetual question that we don't know what it is that is.

Therefore, life remains interesting. We're always trying to find out.

But it won't yield the answer because reality when you say what is reality? The only way to answer the question, what is by classification? It is you is or is you ain't you male, is you female? Are you a Republican or Democrat? Are you animal, vegetable or mineral? Tinker, tailor, soldier, sailor, rich man, poor man, beggar and thief. We put you in a class, but what it is that fundamentally is cannot be classified. So nobody knows what it is. And you can't really ask the question in a meaningful way. What is reality now? There are many theories, philosophical theories about what reality is. Some people say, well, reality is there material.

There's something called stuff. And philosophers with us, they're always lecturing in front of tables in the universe. You know, they always bang the table and say, now, does this table have reality or not? And they bang the table.

When Dr. Johnson heard about Bishop Berkeley's theory that everything is, in fact mental, he disproved it by kicking a stone. And said surely to every person of common sense. This stone is really material and physical.

Whereas on the other hand, more subtle thinkers say no. There is nothing material.

It's all a mental construction. The whole world is a phenomenon of consciousness.

When Bishop Berkeley's time, they didn't know much about neurology, now we know a great deal about neurology and we can state the same position in a much more sophisticated way that the structure of your nervous system.

Is what?

Determines the world that you see. In other words, in a world of no eyes, the sun would not be light. In a world of no tactile Nevins fire would not be hard. In a world of no muscles, rocks would not be heavy. In a world with no soft skin, the rocks wouldn't be hard. What's your relationship? So even there's the old question. When a tree falls in a forest and nobody is listening. Does it or doesn't it make a noise? The answer is perfect. Simple.

Noise is a relationship between vibrations in the air, in the air and the eardrums. Not if I hit a drum which has no skin on it. No matter how hard I hit, it wouldn't make a sound. So the air can go vibrating forever. But if there's no drum and no auditory nervous system, there's no noise because the noise is a relationship. So we, by virtue of our physical structure, evoke. The world from vibrations that would otherwise be void. So you're creating the world. But you're also in the world. Your body, your nervous system is something in the external world. You're in my external world. I'm in your external world.

So it's an egg and hen situation.

Passions fascinate, so we are from a very hard boiled neurological point of view, evoking the world in which we live.

And we are something that the world is doing. After all, what you are from the point of view of physics, the physicist will explain that you are buzzing

of electronic substances and processes just like anything else. It's all one jazz. But marvelous because it is aware of itself through you.

So.

Existence, however, has two aspects. You'll call one of them on the other off because all existence is a vibration.

If I am sitting next to a girl at the movies and I feel attracted to her and I put my hand on her knee and I leave it there, she will notice the first, but she will become unaware of it. If I don't move my hand. So instead of just leaving my hand, I start stroking that or patting I mean, saying.

Then I go on and off, on and off, on and off. And she realizes that I'm paying attention.

See, so everything that is happening to us is that young yak, yak, yak, yak, yak, yak. But this I'd take with that with the sense of sight, the vibration of light is so fast that the retina doesn't register the off.

It retains the impression of the arm. And so with our eyes, we see things as relatively stable.

But if we close our eyes and listen. We hear on and off.

Especially in the low registers of sound in the high register.

You can't hear the off, you hear the arm, but you get the low register.

You see here they are on and off the vibration. Actually, everything that is physically existing is a problem because it is positive and negative electricity.

Incidentally, read the article on electricity in the 14th edition of the Encyclopedia Britannica.

Just the first two paragraphs learned scientific article with all kinds of formulas and stuff, but it starts out with pure metaphysics. Electricity, says the author, is an absolute.

We do not know anything else that is like it.

A fundamental, you know, since talking pure theology and.

So that this is it. You see the thing it does on and off.

Male and female. Yeah. Now you see now dump.

We've been brought up.

To think that with our 19th century background, to think that this energy which goes on and off is inherently stupid, that it is a mechanical thing. Freud called it libido and take will call it blind energy.

And so therefore, we feel that we as human beings.

Are flukes a million monkeys working on a million typewriters for a million years?

Might statistically tied the Bible.

The cost thereafter, as soon as they got to the end of it, they would dissolve again into nonsense. But we feel we've been brought up to feel and see that we are flukes. In that sense, we are simply accidents.

And that is Aryan Nations. That is the great problem. And it seems to me completely obvious that we are not accidents. When we say, you know, you're nothing but a little bacterium that crawls around on a bowl of rock that circles an unimportant star on the outer fringes of the minor galaxy. Why do people say things like that until you what they want to say? I'm tough. I look at the facts, the hard facts.

The idea that there's somebody up there who cares is a little old ladies weaklings.

And I think this universe is a bunch of shit. So I'm a real realistic guy. But that's the message you get from these people.

Always look in a person's philosophy.

As to what he or she is saying about himself. Cause your philosophy is your role. We gave you put on. Now, I admit, you see, my philosophy is my game I put on my big ass. Well, I think if I'm going to put on a big act at all, I'm going to put on the biggest one eye and say up there with all that nonsense.

I know very well that although I'm in permanent, which is just the way I want it, because I wouldn't like to be preeminent on a board, that would be.

But I am an impermanent manifestation of the which in which there is no future of the route and grounds. The universe, which is St. Thomas Aquinas would say, is what all men call God Ottoman Brahma.

And I think it's fun to know that.

Not merely as a theory, but as a positive sensation, which you can actually feel. And so therefore, my function in conducting the seminar with you. Is, if at all possible that you should share this feeling.

Not need anymore psychotherapy would not need any more gurus and not need anymore religion.

Just take off.

Except, I mean, there is something called religion for quick for kicks.

My favorite church is the Russian Orthodox Cathedral in Paris, where they really live it up to.

They have gold, incense, icons, masses of candles and gorgeous music and priests come out from the secret sanctuary we know behind the royal doors. The Equinox diocese divides the the main church from the inner sanctum and the doors open. Somebody comes out looking like God, the father, you know, beautiful robes.

And you see all those little ghost more useful roles for all the choir goers also voting for me.

And it goes on and on and on. And when you get bored, you go across the street to a vodka shop where they sell vodka and caviar, bleaney to village, keep it on ski and everything, you know, and everybody lives it up and they go back to church again. That kind of religion is like dancing. It's a it's a joyous expression and it's not telling God what to do because all this thing is an old church Slavonic, which nobody understands. And it's just making great. And Doris knows that this is essentially music.

So.

Now, what I would like to suggest is that we have a brief intermission that you can stretch for about five minutes, and then I would instead of monologue in that you would like to talk all of your reactions. Questions don't feel that. You just have to ask questions if you want to react in any way.

The whole point of the seminar, incidentally, is that it is a free for all. Instead of the big public lecture.

Well, this has to be restricted so I can give as much of my self dues as possible, so please help yourselves.

Now, since we are dealing with play, our next step is there are two steps now to follow. We've got some more theoretical matter to go through. And after that, we get into nonverbal practical matter. But I want to talk about music for a while. Do you realize that music could be defined as the greatest vice and addiction in the country?

It's a colossal industry. People are utterly dependent on it. Lots of people can't do without music at all.

Either billions of dollars go into the making of records and to the artistry of playing instruments and all this kind of thing. And it's completely and utterly useless from a practical point of view. Everybody gets excited about people being alcoholics, being heroin addicts, being marijuana smokers, being this, that and the other. But you could say there is a disease called contagious and the core database is addiction to melodious noise. That's absolutely fascinating because when people they go to these concerts, you

know, where a most elaborate productions are put on and then compulsively they have to come over and say that we did it.

And herein lies one of the great mysteries of being. Because. Music like survival doesn't really have to happen.

Now let's look you see, therefore take music as a model of the universe.

Music.

Is a fantasy with no destination. Dancing is the same thing only in motion. And when we dance, we are not going anywhere except round and round. And the universe, according to the Hindu theories, is going round and round. But according to St. Augustine of Hippo, the universe is going along on a straight line.

And this was one of the most disastrous ideas that was ever visited upon internalization since Augustine said if that if time is cyclic. Jesus Christ would have to be crucified again and again.

And there would not be, therefore, that one perfect and sufficient sacrifice, ablation and satisfaction for the sins of the whole world.

And therefore, time had to be a straight line from the creation to the consummation to the last judgment, because then everybody stopped thinking as they didn't know what they were going to do when they got to heaven, they knew what they were going to do in hell.

And it's perfectly clear if you look at young Van Dyke's painting of the last judgment in the Metropolitan Museum, the superb work of art. Everybody in heaven is completely bored sitting there looking like the capital swallowed the canary. Rows and rows and rows of them. And the Lord God Almighty is presiding and looking equally bored.

But down below. There is a back winged start spreading out those ghastly wings, and they're all new bodies, writhing and being eaten by snakes and chewing each other. They're having an orgy. But all those stately people in heaven are in church forever, and that is the ultimate boredom. They also

observe Gustaf Duvets illustrations of Dante's demeanor comedian. He was a magnificent engraver. And while he's on the theme of the inferno is full of imagination in the Bogota trio, his imagination declines a little bit. And when he gets to the parody so it shot is all he has is ladies in White Knight is trailing in circles through the skies angels and he has no idea what an angel is. The only man who really understands angels is an Austrian artist.

What could be.

Yeah, who has fantastic imagination as to what an angel really looks like. So.

But they're very rare people. We'll have the Persian painters out a true vision of paradise.

Persian miniatures with their lovely gardens and jewel like trees and people sitting around smoking hookers and observing the birds. They. They really had it. But it is extraordinary that our idea of the paradise is weak. That's why I said earlier that students should write about their idea of heaven and to get the imagination going.

Well, anyway, the point is that we reach it and that's never been admitted. Is that heaven is the perfectly useless state.

What is God for what purpose is served by God? Obviously, none at all.

Imagine some use for God.

It's inconceivable.

Yes, but that again, you see, it returns to uselessness to say like every like everything else and like children when they're little.

And why is it a little let me give you a little a little about the community level, a little bit about it.

I know they love it. And adults say, stop that.

Behave yourself. It could be used for big purposes.

So but the universe is not. And here you see giraffes, hippopotamus, these ferns. Have you ever looked at high magnification of viruses?

They're insane. And of especially red radio. Lauria, which you'll find in the depths of the Indian Ocean, are the most magnificent pieces of jewelry that you could ever conceive. They have in the New York Museum of Natural History. Glass models of these blown up to be so big and you can't conceive anything so beautiful. There are tiaras.

There are spheres with spines coming out that look like, you know, the thing you always wanted and that you want to give your best girlfriend as a Christmas present. Gorgeous things. Why is it true that when human beings want to symbolize the ultimate, they will almost invariably pick a flower? Get the rose windows of the great medieval cathedrals. You get the Buddhist lotus is you get the mandolins. They are all flourish for Stella. Beings, we somehow look to the flower with more reverence than we look to the human face. That is odd. Because eyes are really, in my opinion, the world's most beautiful jewels.

You look in somebodies eyes. Really? Look, we always avoid eye contact in your own way because they're taboo. But if you really got some friend and you can sit in front of them and look deep, deep, deep into the eyes.

This is absolutely fascinating, but flowers all eyes. Iris?

And the circularity of the eye is the same principle as the circularity of the flower color. Beauty of the depth transparency my mother used to say showed me a morning glory. Doesn't it make you feel jazzy inside?

So. Find his them that the music.

Is life for its own sake?

Where we are living in an eternal now, when we listen to music, we're not listening to the past. We're not listening to the future. We are listening to an expanded present. Because to hear Melody is to hear the interval between tones. If you can't hear the interval, you're tone deaf.

So just as we have a field of vision which is so wide, so the present moment is not, as the talk indicates, a hairline that.

The present moment is a field of experience.

Which is not what we would call instantaneous. Much more than that, so that within the present moment we can hear intervals between tones and rhythms.

So we get the feel of a sequence going on.

So when I talk about the eternal now, please don't confuse it with a split second. It's not the same kind of thing. The eternal now is roomy, easy, lots in it. Rich. But frivolous. There's a wonderful tale that reminds me that there was a clergyman, Christ Church, Oxford. Who had terribly bad handwriting so bad he couldn't read it himself. He was preaching a sermon and he started out looking at his notes and said, oh, you who are frivolous.

Of course. Woo hoo, all frivolous, of course. Well, you. Followers of Christ.

But, but, but, but do you see the connection?

Consider the lilies of the field, how they grow. They know that there's been. Yet Solomon, in all his glory was not clothed like one of these. Do not be anxious for the morrow. You are frivolous, of course.

And the eyes told some one over lunch time, but G.K. Chesterton said angels fly because they take themselves lightly and say there is a divine frivolity, the love that moves the sun and other stars is frivolity.

And God, therefore, might be described as being sincere, but not serious. If I say there's some lady says to me, it's beautiful and attractive and she says, I love you. And I say to her. Are you serious or are you're just playing with me?

That's the wrong answer because I hope she's not serious and that she will play with me. So I should say to her, are you sincere or are you just toying with me?

So that playfulness is the very essence of the energy of the universe.

But I believe to be a level, a level, a level of activity. See, that's what's happening. It's music.

And bad music like written by Tchaikovsky has a meaning.

See, good music as written by Bach has no me. Bach is just making marvelous patterns of sound. Let's strike. Koski with the 1812 Overture is imitating the noises of the Napoleon retreat from Moscow and even what's his name, WC with this in gluttoned cathedral. This is tried to represent with music something other than the music itself. But the classical music, whether it be of the west, of the Hindus, of the Chinese, has no other meaning than its own sound. Now, words usually have meaning. Words are noises and they represent and point to something other than themselves in the same way as dollar bills represent wealth as maps represent territory. Words represent something else. Water. The sound water will not make you wet.

It's very important. You can't drink that noise.

Water, therefore, the word is symbolic and points to something other than itself. And so we say of words they have meaning. Now people get all fouled up because they want life to have meaning as if it were words. No gutter was hung up on those islands where Gaelic is nearing life.

All it is mortal is but a symbol.

See, confusing.

The reality with words. What does this mean?

What do you mean?

Huh? It's an insult to ask you what you mean, it's as if you had to have a meeting, as if you were a mere word, as if you were something that could be looked up at a dictionary.

You are mean. This is the point you say. That the meaning.

The good thing about life is exactly here and now we're not going anywhere.

Did you get this point of view? Go look out on the street and you will see people frantically thinking they're going somewhere, that they have important business and have a far look in their eyes and then there's a slick way out in front and they are going somewhere. They are on purpose.

They have something to achieve here. Now, sitting around here, we realize we don't have to go anywhere.

I mean, we are, in a way, a captive audience, but we don't have to go anywhere at all. With this group. And this is where it's at. That's why the Hindus call the true self of us all the ottoman. The man where it's at.

That's terrible.

It's horrible. Yes. It's I.

I'll tell you another one.

There is a being in Buddhist iconography called our local diaspora, who is also known as come on in Japanese and Indian and Chinese. Chen Raza in Tibet. And this is usually interpreted as the goddess of mercy that she is represented with 1000 arms.

Already dating because she is the cosmic millipede and the embodiment of compassion.

However, she is not completely a she. She is an aphrodisiac male, female, I have a low key dash for another low key test for a means, the watchful lord, one who is always caring.

And you can remember it because as the companies say, ever look at.

And that is good.

Take a look at it.

Have a look at. Language is simply fascinating. We could go into this and play all kinds of games with the with words and music and magic. But now here is the thing that we're getting at is that.

A culture which excludes frivolity. Hasn't lost the point of life, and this is where the Chinese communists are in extreme danger.

They are the most earnest, dedicated to survival. They were in an awful mess and it probably had to happen.

But the style of life in China and also in Russia is drab. Because they think that the point of life is to go on living.

And so long as you get by, no matter how horrible the food is, how drab your dress you're getting. And this is completely missing the point.

My spies informed me that I think they still have good food.

If your comments are now getting there, I think it's easy to wrap around.

All I have to go to do I have to go that and be persuaded.

But when I look at Mr. Mounts or don't.

Even Joe and Lai was obviously a fellow of enormous competence and brains. I wish there is more imagination.

We were talking about this just before it rolled out with this gentleman here, and I said I'd seen all the films I'd seen on communist China. The thing that impressed me the most was there was no humor.

That's the trouble that the mistake is on page two hundred and twenty four amounts of domes, red book realism. Now I tell you. Exactly. No, no, no.

I tell you the mistake where he says. It is essential to have a furrowed brow to think.

And that is the error I pointed out this morning to think that straining the muscles of the forehead has anything to do with clear thinking. That is

against louder. Who is the greatest of all the Chinese philosophers? The father of wisdom and so amounts, Adams says you must have a furrowed brow.

See, there's that little slip that.

I know my day, I don't want to pick and argue with an argument with you because you're beautiful, that you are so naturally without any effort. See how without a furrowed brow. See, nature does it.

I to think that was a great example of.

But it is really basic to psycho physical functioning.

You cannot make him make your mind, your nervous system efficient by straining. See, so he makes that mistake and that indicates an excess of seriousness. This is the point we're getting now. See that?

Life is not worth living if it is compulsive.

Why did so many people do that?

I mean, when you said at the beginning something about the big question is whether to commit suicide or not. The vast majority of people don't commit suicide. No. Why? Because.

Because well, the the answer to that question isn't simple. You have to answer within a in a in a kind of double way. The vast majority of people could be said not to commit suicide. A some of them enjoy going on. So, yes, some of them are terrified of committing suicide of death and feel therefore they must go on. That is it. It is an absolute necessity to go on as long as possible. While there is life, there is hope.

That's a terrible motto.

But some of us like to go on simply because we're enjoying the dance, even if we are not very rich and.

We live in a fairly simple way. Nevertheless, the companionship with other people, the sight of the sun, the stars, the grasses, the sound of water is its own explanation.

There's haiku poem says the long night. The sound of the water says what I. And therein we have this thing which I'm trying to describe as play play in Sanskrit is Leila.

Leila is our word lilt. And the universe is called Vishnu love the sport or play Vishnu, and we can go into that very deeply because when we talk about the play, we also talk about the theater.

And the theater is very curious phenomenon because it is defined by a stage in a proscenium arch. And behind the scenes is a green room is a green room. The actors dress up.

And they know who they are. In reality, before they assume their persona, the word pass sonar means a mask that through which sound passes their sonar. Because the masks worn in the open air theater of Greek or Roman drama had megaphone mouthpieces so that the sound would be projected in the out of doors.

So the person is the fake.

Your personality is your image of yourself, which is not you at all. Is your mask.

So the actors come on and they stratagem is that the actors want to convince the audience that it's real. What's happening on the stage? The audience knows by virtue of the proscenium arch and the kind of fencing off of the stage from the spectators, that what is going on on the stage is not really for real. The actors are going to act so well that they're going to have people weeping, laughing, crying, sitting on the edge of their seats and anxiety because they've almost persuaded that this show is for real.

Now imagine pushing this to a far extreme.

The very finest actors with the most appreciative audience.

And here we are. Yes.

See, we believe it through. And it's not.

And we take it seriously and therefore, because we take it seriously and we don't see through, we kill each other and I mean to each other and we exploit each other. No real reason whatsoever. If we understood we saw through that and we knew that this whole life was a joke. After all, what is the joker in the deck of cards? The wild card that can play any role.

The Joker is the symbol of God in the pack.

Now, fourth kings in ancient times would always have adjusted, of course. And what was suggested? The man was crazy. He was a schizophrenic who would make unpredictable remarks and everybody roared with laughter because he said things out of context.

Schizophrenics basically are in a way, liberated people because they don't give a damn.

You get a schizophrenic child and the schizophrenic child doesn't care whether it's knocked down by a car.

Whatever happens, happens. Liberals are positive that you're valuable. We must preserve you.

Charles and Co.

So they got these schizophrenics who are funny people. And they sat at least foot with the king's throne to remind the king.

Not to take himself seriously. You know, in Richard the second.

Within the hollow crown that rounds the model temples of the king keeps death his watch. And they're the antiques. It's the antique means the jester. They're the antiques. It's scoffing at his taste state and grinning at his pump, allowing him a little space to monetize. Be feared and kill with looks. And then at the last comes death. And with a little pin balls through his castle wall and farewell in.

Shakespeare is full of this kind of wisdom. The transience of life are rebels now are ended and these are actors, as I foretold, you were all spirits and are melted into into thin.

And like the baseless fabric of this vision, the crowd cloud cap towers, the solemn temples, the glorious palaces, the great earth itself, by all which inherit shall dissolve like this insubstantial pageant, faded leave, not a rack behind. We are such stuff as dreams are made on, and our little life is rounded. Obviously.

See the most fantastic things in poetry. Work on the theme of insubstantial, substantial reality of transience. It's all fading away. Everything we we are each one of us, not a substantial entity, but we are like a flame. And the flame is a stream of hot gas, like a whirlpool and a river. Every one of us is a flowing. Now, if you resist that.

You go crazy, you like somebody trying to grab water in your hands. And the harder you squeeze it, the faster it slips through your fingers. So the principle of the enjoyment of life is this is not a precept. This has nothing to do with my realisation. It has nothing to do with what you bought should, etc..

It is completely practical. Don't hang onto it. Let it go.

Birth, Death, and the Unborn

This seminar about birth, death and the unborn is going to be a discussion of the Buddhist philosophy of change.

And I'm going to start out by going into the very tricky and difficult question of the Buddhist view of birth and death and the doctrine which is ordinarily understood as reincarnation or rebirth, it's a curious thing. That many Westerners who become interested in Hinduism or Buddhism do so because of this idea of reincarnation.

They like it.

It gives a more satisfactory vision of individual. History and development. Then the two possibilities that would normally be open to Westerners to believe in.

On the one hand.

You've got the choice of the Christian view, which is that you live in this world once and in this fourscore years and ten, your eternal fate is settled. Or you've got the possibility of the materialistic view, which is that you only live once and when you're dead, you're dead. That's that. You're a flash of consciousness between two. Eternal darkness is. Intelligent people in the Western world have never felt very happy about either of these two prospects, and therefore there is a certain attractiveness about the idea, which seems to be the point of Buddhism and Hinduism, that you are a soul on a pilgrimage and that from some extremely obscure origin you began as some sort of animal kowl and worked your way up step by step through all sorts of forms of life. And finally, you have the privilege of appearing in human form. And once you've got there, you have an opportunity to develop to the highest spiritual position. You must remember that according to both Hindu and Buddhist doctrines, the human form is a very privileged position. For there are, according to both of them, because they share a common cosmology, six domains of beings.

And if you will visualize the wheel of life.

With its six divisions at the highest top division, there is the realm of the diva, diva is the word from which we get the word divine and equally the word devil diva means, though, originally a God or more correctly, an angel.

Angel is a better Western translation of diva than God. Immediately opposite the diva world at the bottom of the circle. There is the naka world of beings in torment of the absolute. This is the dimension of the world, which is the screaming meanies, which is experience in the form of horror. The diva world is the experience of being in the form of bliss.

And between these two poles, there are all kinds of ranges. There are, for example, the assures next to the divers going clockwise around the wheel

and the insurers are.

They are a wrathful beings, are sure is the incarnation of divine anger. They're next to the ashore, are going around are the animals or animals whatsoever. Then again, we get to the Naka at the bottom, the place of the purgatory, we'll call it then coming up again. Does the world of the proto who are frustrated beings and they're represented?

I cannot graphically as having very large bellies and very tiny mouths. That is to say, an immense appetite with very little means of satisfying it. There are sort of spiritual bottleneck. And then coming up between the predators and the devils is the world of the humans. And this is understood to represent a sort of middle position. You can be liberated from the human state because the dangers are too happy to be liberated. The assures too furious the animals to dumb, the narcos too tormented and the predators too frustrated. You need not take this as a literal. Account of various kinds of being in the universe. You can take them simply as a depiction of various states, of the human mind, of the moods you can go through. They're all really in your own head, as we shall see later on, about many other things. But these are the six worlds of Hindu and Buddhist cosmology, and the notion is that one reincarnate again and again through the six worlds. This is the popular idea. In other words, if you live this human life in a bad way and you become angry.

If you devote your life to fury, you'll be reincarnated as an insurer. If you devote your life to merely living for back and belly, you'll be reincarnated as an animal. If you are horribly cruel to people and so on, you'll be reincarnated as another cat. And so on all around. But on the other hand, if you do good things in the course of your karma, you will be reincarnated in the devil world or in better and better situations in the human world.

That's the popular understanding, and Westerners, many of them think, well, that's great. Cause this opens up vast vistas of future development. We can go on in future lives working out our destinies, and we can also love to think about who we were before. When you fall in love with somebody, did you meet before in some past life?

Is this the working out of a Columbine that is between you? And it's very interesting. But the funny thing is that Hindus and Buddhists who do believe in rebirth do so not because they like it, but because they feel they have to accept it as a hard fact. And the whole task of the work of sadhana or spiritual practice and discipline is to get out of it. So it always strikes me as very funny that Westerners take this up because they find it comforting. But Easterners are always trying to get away from being reborn. It was so funny once. Joseph Campbell told me a story that he was sitting with a Vedanta swami. One of these Vedanta societies, Swami. And the swami was saying, oh, dear me. He said, you know. Really? The idea of rebirth is so wonderful, said I, really. I think this is the most the most comforting notion. And Joe said to him, Swami, don't be a damn fool. What are you talking about? The idea of rebirth being so comforting. Don't you realize that that's what you're supposed to get away from? And the swami suddenly jumped, said. Oh, yes, of course.

It was like I once had a talk with a swami and he was arguing, you see that behind all the multiple forms of this world. There was only one single divine principle and he was going on about this. I said, Swami, you can't talk like that. You know very well that the Brahmin the ultimate reality isn't one, because one has an opposite, which is many, and Brahman has no opposite. Who should speak as Brahman as the non dual. And again, he said, did you talk just like a Hindu?

They are funny, you see, because these families have accepted an enormous amount of Western feeling and the British were responsible for that, for occupying India so long and perverting its traditions. Now, it is so curious to all of us because in Buddhism. That still prevails an idea of rebirth. Very strong among all Buddhist countries, and yet. Buddhism explicitly denies that there is any individual reincarnated soul.

You see.

In Buddhism, there is a doctrine which is called the three signs of being. And these three signs of of being, well, I should more correctly say the Sanskrit word is power B, HIV A, and that means becoming rather than being HAVA is from the basic root.

I think B H which is connected with the with growth. So Barber becoming the process of change has three signs. One is called Duca.

The U H K HK looker in Sanskrit means frustration.

Sometimes translated suffering. But I think frustration is a more general word, which is perhaps better.

It's Ducker is the opposite of Sucre. Sucre means sweet. Duka perhaps means sour. But in this in the way it's used, it means frustration as a basic characteristic of living beings.

Because for some reason or other that life is always eventually frustrating. You have what you desire more than you can ever get. You overreach the possibilities. And so to every being, death comes as a collapse.

And something unfortunate.

The next sign of being is called a ninja A and I T way in Sanskrit. Anita, which means impermanence. The opposite word being Nita.

Eternal. So Annika is everything is in flux.

And finally, I'm not on a an 18 million allotment, which means that nothing has its own, so.

Now, that's a. Sounds to a Christian. A terrible idea.

Because we use the word soulless or we say to a person, you have no soul, which means you have no finer feelings. You have no or you're not a human being. Because Christian theology did distinguish between humans and animals by saying that animals have no soul. Idiots have no soul. They've lost their soul. But you can see at once that there is a complete difference of the meaning. This is a to translate Ottoman as soul is ridiculous.

Apartment means basically that nothing exists.

Well, there's another word in Sanskrit. You have to nose fab, however, SGA, V.A., that means oneself or one's own.

Same as the Latin source because the V becomes the U so far. Viva, viva becoming again your own becoming. Or sometimes it's called your own nature or self nature. And so what it is saying is that you don't know that nothing has. Any real sub, however. Because no individual thing of any kind exists except in relation to all the other things. In other words, you are what you are. Only because of your relationships to everything else. And therefore, the whole universe is a system of interdependence. It's just as if, for example, you were to stand two sticks on the ground and lean them against each other and they will stand up and form an inverted V. Because they lean on each other. And this is an old thing that they teach children in Japan that these sticks leaning against each other form the Chinese character for man. And they say, therefore, man cannot exist unless we support each other. This is the basis, therefore, our brotherhood and of good social relationships.

But underneath that is the far more profound idea.

The universe. Cahiers. By everything, depending on everything else. And therefore, nothing. Exists alone. Nothing exists in its own right. And that's what that man means.

You do not have an indestructible, immortal soul, which is just plain you forever and ever and ever. And is independent of there being anything else at all.

Also, though, this does go along with the idea that there is not some kind of gaseous spook, some kind of etheric double astral body. What have you, which outlast the existence of the physical body and migrates to the next incarnation. So it has always been a puzzle for Buddhist philosophers to explain how they cannot once believe in reincarnation. And at the same time deny the existence of an individual spook, which is independent of the physical frame.

And the most subtle discussions in all Buddhist literature range around this puzzle. The most important text of early Buddhism is a book called The

Questions of King Melinda.

This is the Greek man under. He is a king in the succession of Alexander the Great, who ruled in Alexander's Eastern Empire and had long conversations with the Buddhist sage by the name of Magaziner. And Magaziner tries to explain to the king how there can be rebirth without anyone who is being reborn.

And so this is the problem to which we address ourselves. How can there be a continuing process without anything carried along by it? And you will recognize at once that the problem is very largely semantic.

Because it involves our whole idea of continuity. What, for example, do you mean by a wave?

When you see you throw a stone into the water and from the plop point where the stone goes in, a whole lot of rings emerge and they are waves and they go out. And you can, as it were. Look at one of them and follow it. And you say I am watching a wave. But what is a wave? You know very well that the water itself.

No. No volume of water, no specific volume of water is moving outwards from the place where you dropped the pebble.

If the water is staying quite still so far as lateral motion is concerned, but the water is moving up and down and these up and down movements create the illusion of a thing called a wave that goes along. Similar to the illusion, when you watch a barber's pole revolving, it seems to be a procession of something that keeps going up from the bottom of the pole to the top.

But actually, it's just going around.

Now that that appearance of something moving when there is actually the only thing that is going outwards is motion and motion is about as abstract as you can think. This is the whole route of the Indian idea of Maya of the world as Maya.

As a construct. Something which, shall we say, exists only in your mind.

Only we shall have to be very careful what we mean by that. And I'm going to come to that later on in the seminar.

So here. Here is here is the point. You are delivered from rebirth. This being the purpose of the spiritual disciplines of Hinduism and Buddhism. As soon as you are relieved of the illusion that something is going on. Continuity. This after this, after this, after this, all linking up together into a chain. In the famous Zen text call, the Platform Sutra attributed to Wayne on the Sixth Patriarch.

There is a passage that says if we allow our thoughts past, present and future to link up into a series, we put ourselves under restraint.

But on the other hand, if we just see that they are not. There is just this thought and then this thought and then this thought, you are liberated.

This is an idea which is taken up by T.S. Eliot in this poem, The Four Quartets. Where he could you come to the passage where he says that you are getting on a train.

And you settled down in the compartment with your newspaper and you're going on a journey. But the one who arrives at the destination will not be the same person who left the platform in the beginning. Because you sit here now. Are not the same as the people who came in at the door a little while ago.

Just in exactly the same way as the flame of a candle appears to be a constant flame, which we can identify as a thing, but as a matter of fact, it is a stream.

Hot energy. Which is.

Whatever particles, whatever gaseous molecules are here, are going like this the whole time, flowing upwards and disappearing the conflict, the flame is converting the candle wax into gas. And in exactly the same way as we can see that the flame has an identity. You say it is a flame. We have a noun for it. We're actually it is a process. It is flaming. And so in this in just

precisely that way, every human being is a process. Just as the flame is the conversion of wax into gas.

So you and I are the conversion of air and water and light and beefsteak and milk into. Shit, and which again converts into something else. You see, we are the flowing vibration through which all this goes. I'm not for one moment.

Are we the same?

So then the meaning of the Buddhist doctrine is that.

You who live today are never going to die.

Because the ones that are going to die will not be the, you know. And likewise, the one that's here now was never born.

It goes like this. It is explained by Dogan, who was the most fabulous Zen philosopher living around twelve hundred A.D.. When he said.

The spring. Does not become the summer and the summer does not become the autumn. No one would say that. Spring becomes the summer, there is spring and then there are summer.

He said in the same way, when you burn wood, there are ashes. But the wood does not become the ashes. There is wood and then there is ashes.

Each is, as it were, sufficient to itself. Their eyes were so steps. It's like vibrations wave crests. You see where.

The water doesn't move. You see what it doesn't move laterally.

So in this sense, by analogy, the spring does not become the summer. But by watching it, you in your mind impose motion on the up and down of the water. And so you say the spring becomes the summer. So likewise, you say the baby becomes the adolescent, becomes the man, becomes the crone, becomes the cops. And the Buddhists say no. These states follow in the same way as the apparent motion of a wave.

And so.

The the word to the wise is live the moment you're in. There is no other place to be. You will not die and you were never born. If you realize if you see through the illusion. Now, this may sound as if one were creating a theory of the universe, which is what you might call at a mystic. Discontinuous, it is saying the universe is nothing. But point instance.

And it all comes down to that. I see this as an extension of the Western philosophy of nominalism, nominalism as opposed to realism. The nominalists argue against the realists point of view, which is realists say there is such a thing as mankind.

Mankind is a reality, and every individual human is a special instance of a real universal substance called man.

The nominalists argue this is an abstraction and nonsense. There is no such thing as mankind. There are only individual people. And of course, this has become in the 20th century the ascendant point of view. There is not really such a thing as the United States of America. That is a political abstraction. There are just the people who live here.

But if you take nominalism to its logical conclusion, you'll get to the point where you don't exist at all a human being. There is no such thing as a human being. It's an abstraction. All there is is the molecules that are the cells which infest your bones.

And dissolve those further into the nuclear particles and you can say, well, that's all there is. You see there are just these things.

But then you suddenly begin to realize there is no end to that way of thinking because you can always give an imagination and given instruments of sufficient subtlety, subdivide any unit of existence, of motion of energy into further subdivisions.

Further units of measurement.

And say, well, that we get more real as we get smaller. You see that simply saying that the smaller things are, the more real things. Well, that's a ridiculous argument because you can play it exactly in the opposite direction. You can say, oh, no, no, no, no. Since all small things only exist relatively. That is to say, in relation to each other.

The only real thing is the big thing.

So all those small particles are relatively unreal. The only thing that is real is the whole universe.

And that's so big that nobody can conceive it.

So do you see all philosophical argument is a game playing with people, arguing with each other in words, playing up and down the scale of arguing as to which level of bits, collections of bits, all bits whatsoever.

Which one is real?

I've noticed a very funny thing in observing with my experiments with psychedelics that psychedelic conversations are absolutely perfect examples of what is going on and always has been going on in philosophy. People start talking with each other, having very animated conversations about nothing at all except the processes of grammar. In other words, let's imagine a conversation in which nothing specific is mentioned. No proper names are used. No proper nouns. Nothing is being referred to whatsoever.

But all the words that indicate more or less dimensions of quality, dimensions of quantity are all the operative words. Say words like to be.

To grow, to diminish.

To expand, to contract, all these are operant words which can be used with reference to all kinds of specifics, but they get into conversations where all specifics are dropped out and only operant words are used and they dance with each other. By using these kinds of words. And philosophers are doing exactly the same thing now. Philosophy is an intellectual dance of a game that we play just like it might be go.

It might be chess or checkers or poker where we take these abstractions, the set of cards 52 to the deck and we play numbers.

And orders against each other. See what philosophers do, just the same thing and all their arguments.

And you say, well, isn't that kind of silly? Well, maybe it isn't. Because life itself, biology is the same thing.

We have all these species that eat each other and come on in different shapes, in different forms and so on.

And there is a contest going on all the time to prove whether the cats are more powerful than the mice or the humans than the rats. And there's this constant thing is going on. But it is the same kind of bubbly, bubbly bubble only it takes instead of such a simple word as bubble, which is a vibration in the air.

It comes on as a mouse. And a mouse is a very complicated way of saying bubble.

So in all this, you see when when when you get it, when you get a game going of this kind, there comes the point of what you might call emotional investment. When you feel that the outcome of this particular feature in the game is urgent, this matters. And you do see that that's what we mean by matter. The words matter, meaning something substantial, something material also means important. It matters. And it's up to you what you think matters. We teach our children. What matters? What's important for them to learn? And we teach them basically that it's important to live.

You must go on. That's terribly important. When you get a schizophrenic child or a Mongolian, so-called Mongolian idiot, these children don't realize that it's important to go on and they don't give a damn. And they are very happy. But from our point of view, incompetent and adapted to society, useless because they don't understand why it's necessary to go on living. They're just going to have a ball where they are. And generally what we would say goof off.

And in a way, every being in this world is torn between going on and goofing off.

We feel that's that's the basis of our distinction between work and play. Play is everybody needs some time to goof off, but they must go back to work because you've got to farm and fish and manufacture and produce so that you can go on.

But when you see you have this terrifying urgency to go on. And field, you must. This is. This is important. This matters. We screen out of our consciousness the fact that this is our own volition and our own game. Because we are captivated by the illusion of the necessity and the importance of going on.

To keep other people going on, to keep children going on, to keep this thing up.

And the difficulty is that as we become disturbed and anxious about this.

It's more difficult to keep the game going.

In proportion, as we are frightfully concerned to survive, we start fighting other people. We start clobbering our neighbors were stealing our crops and whatever it is. All the old fights start. And it is these fights which more than anything else at the moment to see are endangering the entire human project. But all based fundamentally on the illusion that it's utterly important that we survive.

A little while before he died, Robert Oppenheimer said. It is perfectly obvious that the whole world is going to hell. It's going to blow up.

There is no way know that it can be stopped except that we don't try to stop it happening. Because you see the panic. What's going to happen if this bomb goes off? See, this more than anything else will make it go off. Because it's like a person who's looking down over a precipice. And starts to get unreasonable. He is terrified to fall over it and therefore suddenly all the strength goes out of his fingers and his legs get wobbly.

And he's ready to fall. Simply because of his fear of falling.

But you see in all this, what underlies is the illusion.

But that I am going on, that I constitute a real continuity. From this moment to the next moment to the next moment to the next moment. What are you afraid of losing when you die? Why all the capital you've acquired during your life, the experiences, the friends? The status. The skills. Everything that you remember. Would be destroyed. Ordinarily, when you die. And that's why, in other words, we are afraid of losing the past. Now, it's perfectly obvious to me that when you die. Yes. Everything that you've acquired as an individual and stored in your brain is dissolved and distributed.

But at the same time, it is equally obvious that you are not going to that when you die, there won't be following the moment of death.

Everlasting nothingness.

That would be as ridiculous as to suppose that you went immediately to heaven and joined the Saints and Angels.

The point is that when you die. You're always reborn. De novo, that is to say, just as you were before. When you came into this world. There gradually arose into being the sensation of I. And it stays there a while, it goes through a development and then it drops off.

But all the time, everywhere, there are other eyes starting up, see whether they be human, animal. Anything you like to be in other galaxies, etc. Always. They're starting up now. But we would say, is there? No, there is no connection between.

No. In the same way. There is no connection between the molecules in your hand. And yet you say it is a hand.

But if you look at it under a powerful enough microscope, the molecules in your hand are miles apart. And you would say there is no connection between what's the connection between this galaxy and other galaxies.

While we can't see any connection and yet there are gravitational swings whereby they respond with each other and move in a certain collective order. So in a very similar way, the constant appearance of beings who feel that they are I. Constitute a wave motion.

And they may be considered individually.

See what we're doing in this? I'm not sure. Is not setting down a doctrine, but it is doing an exercise in perception. You can see it either way. You can see yourself, in other words, as existing only now. That's the only you there is. The alternative to that. Logically is to see yourself as everything. Either it must be that you exist. Bingo like that, your point, instant bond.

You know, if you go and the Fillmore Auditorium and dance, they've turned on the strobes, copy light going very rapidly.

Brilliant light on and off, on and off, on and off, on enough. And it seems that everybody's all the time going in and out of existence.

Now, in a way, that's a kind of. Exemplify creation of the truth that we are vibrations and that everything does go on and off, on and off, on and off all the time.

So the only real thing is the moment of on where you are now. Got it busted. Got it lasted. Got it last. See, that's the only thing real. That's one poll. The other poll is the view that.

All these on and off. Just like the molecules in your hand constitute a continuous reality.

But if you follow that line, you've got to add up not to just what you are at this moment. You're going to add up to the whole universe. Through the entire span of its existence in space and time. Any middle position you take between these things is arbitrary.

Say, OK. I'm gonna be so much. I'm going to call myself this particular human being who lives for substance at a time.

OK. That's where you want to play the game as the rules you've been told. And if you wonder to get attached to that and hung up on that, you're going to say that matters. And so you feel material.

And the Buddhist idea is simply saying don't get hung up on a what is called in Sanskrit, Rushdie.

Rushdie means a view. A particular way of looking at things.

You say that's it. I looking at it from this point of view.

This is the way it seems to me to be. And I'm going to stick for that. I'm going to get hung up on that. That is the meaning of attachment. So in Sanskrit, the word psychiatry, she means the view of separateness. The view that this is the separation of a certain bundle of. Wiggles. Taken out of the total willingness of all that there is is me. And another bundler, Wiggles, is very definitely you and I get stuck on that, see, and therefore to start a fight about it. Therefore, to start crying and weeping and gnashing of teeth, all about this thing being the real thing.

That is what these people are trying all these Buddhist sages and Hindu sages to get people off that hang up.

And say, wake up, wake up, wake up.

Don't you understand the whole thing's an illusion. Not that this is a word to put it down and say that it's horrible or bad. If you could see that the whole thing is an illusion, you would be happy as a lark. And life would be lived much more joyously by everybody.

We would dance together and give things away and stop, stop fighting. See if we really saw it was an illusion. We'd all be happy in our big dream.

But we are constantly saying to ourselves and we are saying to our children, it's real. God dammit, it's real. And death is gonna be awful and sickness is gonna be horrible. You see, it's real. And you better watch out.

See, you can see people say to me, you can say as a philosopher that all this things and you could talk this way because you're sitting in a comfortable place. You've got plenty to eat, but you watch when the thing hits you, you'll laugh the other side of your face.

Well, I don't give a damn when it happens, it'll happen, but it's not happening now. And what I'll do when it does happen is these sufficient unto the day is the trouble. They're off. As if you let yourself be free to react as nature dictates when catastrophe falls.

You'll be OK.

But if you go through your whole life standing in a state of preparation for catastrophe and you know what's going to happen, you just torment yourself and get ulcers and rotting of the brain long before it's necessary for that to happen.

In this seminar on birth, death and the unborn, we've been discussing the Buddhist philosophy of change. Of life as a flowing, dynamic pattern process, which is essentially immaterial. Because it isn't anything you can grasp we use the word substance we use the word silent we use the word matter for something you can catch hold of or stand on or rely on or cling to. And the basis of the Buddhist philosophy of change is that there is nothing of the kind. There is nothing to hang onto nothing to rely on nothing to cling to. But, when we say you see something matters the word has a double meaning in that it means that it's substantial in that it's important. And so we are brought up from birth to play the game of life in a certain way that a sudden things we are told by adults who were told by their out so were told by their adults that these things matter. And that one of the fundamental things that matters is that you go on living. And so, everybody is tremendously concerned with the things that matter that they've been taught to value, and because these things actually don't matter that is to say because they're not substantial but they're all a flowing pattern as I illustrated. A flame seems to be a substantial object that's there to burn unit in and watch it for a long time. Actually it's a stream of hot gas. And so likewise, the human organism is a stream of energy never the same for two seconds. Only we've we've been taught to watch that thing, and to cherish it and value it and it matters damn it. And yet it's going to wear out and yet

it's going to get sick and yet it's going to die. So everybody is involved in playing the game of life in a way that goes beyond play and becomes deadly serious. And as a result, the whole of existence is lived in a state of constant frustration. Because you are trying all the time to hold together and to preserve something which in the long run can't be preserved at all.

And therefore, in response to this cry of pain which everybody puts up as a result of being in the situation of trying to hold on to things, the wisdom of the various ways of liberation be they Hindu, Buddhist or whatever, is saying to everybody love now, wake up, see what the scene is. This is the kind of thing that's going on and. You are not a captive in a trap. You're not just some mere little measly being that somehow or other was brought into an insane universe, but you are what the thing is. You are not the victim. You are the system. Only, you have identified yourself with one wave in it and have forgotten that you are one with the whole energy that's going on but what you're doing is you, you have got a particular way that is to say a particular accumulation of memory. Of associations, of skills of things that you've learned and you don't want to let go of them because you found in that accumulation of memories which you call yourself an identity so you know where you are or think you do. But actually, you don't need to be anywhere. Where is the universe? You know, think up an answer to that one. And so the question of where is the universe is really ultimately the same question as where are you? Said what this is saying is let go. It's all right to play the game be involved and. Work out the various intrigues problems, creative projects and so on that life involves that's fine. But if you get involved in it so that you're hung up, this deprives you of delight and joy in playing the game. So the point is to get people un-hung-up on the whole thing, which in the way we have been accustomed to translate Sanskrit Chinese with because we have been calling unattached but on hung up as much better it's a much clearer this colloquial phrase a hang-up is a much more direct and exact translation of what the Sanskrit word klesha means. Attachment or evil passion or something like that. [It] is hang-up. It is blocking, being fixed on a particular point of view. And I was trying to show this morning. That we can take ever so many different points of view towards what's going on no point of view is the right one. Infinitely many points of view are possible. But if you take a point of view and you insist that is the only point of view then you're hung up on it.

If for example you take the point of view that there are only two kinds of human beings men and women. And either you are a man or you are a woman that's a hang-up. Because actually we vary a great deal there are men who have much more feminine elements in them than others and women who have much more masculine elements in them than other women and so there is an enormous variation but so long as you insist that black is black and white is white and that there are Republicans and Democrats and capitalists and communists and good guys and bad guys it's a hang-up. So also between what is you and what is other than you. Well that's the general area of what we were discussing this morning. And now I want to go further in explaining what I started out to explain, which is the basic Buddhist idea of rebirth. Of our being reincarnated. I said that this was not in Buddhism the idea that one has a kind of spiritual spook or astral spook or soul which travels from one life to another. It is a much simpler idea than that. But it's so simple that it's difficult to explain. I would begin you see with the assumption, that every person, every sentient being whatsoever is I. I it is simply the universe aware of itself at a particular place and time. That's what the word 'I' means. William James once said the word. Is a noun of position, like this or here. And so, the feeling that we call eye is how everything feels on the inside. But it is always in a particular place at a particular time. And these particular places and particular times they keep going on and on and on and on and on. Myriads of them, all over. Not only on this globe but probably in well scattered throughout the phone calls plus the I feeling arises, and you feel that you are i just as much as I feel that I am I. And your I feeling and my I feeling are essentially the same. Only we're looking from different places but it's all one I. Only we don't see this because we are hung-up on the coming and going of I. On the particular circumstances in which every I appears. And so, just as the flame changes its physical identity every second every split second every microsecond so do you you're a stream.

And so, taking us all together supposing you watched the human race from a very different point of view you were watching us. You didn't know anything about human beings never seen them before and you were observing what's going on in this planet. From some other point of culture in space and time and you would say well this world is people in this planet peoples, just like a tree bears fruit. And year after year the apples that come

up an apple tree all up very very much the same. And you would say, yeah, the apples come and go but they're always the same apples coming back. It's only if you look very minutely at the apples and started the details of coloration and formation that you would say that one Apple was different from another. Now we are also used to each other and we know each other so well that we see and emphasize the differences between us but somebody who knew nothing about humanity would see the coming and going of human beings as a repetition of the same process. Just as the flame burning. We say it's a flame but it's a repetition of the same process, it keeps on flaming. Now, if you're going to count each cha as a distinct and separate event, then you cannot hear the rhythm.

So because of our myopia because our point of view is fascinated by the details and the differentiations between everything that's going on the differentiations between people the differentiations between generations. We are so preoccupied with that particular view of things that we're hung up on it, and we don't see that it's the same thing happening again and again and again and that every I that comes into this world is you. Now you don't have to have any inside information to understand that. [It] doesn't require any sort of is a esoteric knowledge and something that can be demonstrated is just looking at things the way they are standing right out in the open and facing. Or eyes I. Wherever some of them scattered because you see this is the place. At the put the point call here in our this universe knows itself on the inside look around you and you see everything as it were presenting and next year or two. Supposing I want to delve into another person how am I going to do that there are many ways I can talk to them I can get them to express their inmost thoughts and their feelings. I can make love to another person and exchange of very fundamental sort of electrochemical union. I can take a knife and like a surgeon go in and analyze but my relationship to the other is always seeing life on the outside. However much I get down to the tiniest cells that constitute your nervous system, I'm still looking at that cell from the outside. If I go down into the molecules, I go down into the atoms, I'm still regarding them from the outside The only point at which I know the thing on the inside is where I am. Then I have inside knowledge of what everywhere else appears to be outside. So if you want to know what it's what all this is, that's why mystics say you have to look within. That say so they talk about the inner life within yourself and so on as that's the point

at which. You know what it's like on the inside. And so, to realize inside there must of course at the same time the outside to realise self, there must be the counterbalance of other. Because this light black and white is like back in front they're inseparable.

So then, this is where we start from. That every being coming into this world is I. And they keep on coming. It doesn't matter how long the intervals are between their appearances those in this planet were completely wiped out by a cobalt bomb explosion. That would be the end of this race in just the same way as say a group of insects will eat their food supply up on a plant and the whole population will perish. [It] happens again and again. And so in all probability throughout this galaxy and throughout other galaxies there are human or comparable populations that arise and go arise and go just as we do individually. So don't get too worried about the thought that this whole human system on this planet may go away and disappear because if you get too worried about it it's going to happen faster than if you don't worry about it. Because of the attraction of a Vertigo. The feeling of wanting to throw yourself over the precipice even though you know it will destroy you.

But it seems perfectly reasonable to suppose in other words that there is a constant rhythm. Of what we call consciousness, being awake to life, going on and on. Just as stars go on and on. If the stars are going all over the place and galaxies are going on all over the place. It's equally reasonable to suppose that life is going on all over the place. And although the distances from our particular point of view between these islands of life may be vast, don't forget that the distances between the molecules in your own body are equally vast, on their scale. You could go down and blow up the inside of your own head so that the various elements would be hundreds of miles away from each other and yet somehow or other they hang together. Don't be deceived because distance, space, isn't just removal. Space isn't just nothing.

This is the grand delusion. That space is somehow a thing to be ignored. When Buddhists say that the root of frustration or Dukha is other. Avidya means ignore and it's ignoring not knowing and this is very clearly explainable in terms of the doubt theory of perception the get out theory of

perception is that we notice the figure and ignore the background. We notice what is a relatively small enclosed space and ignore the more dispersed we notice what moves against what is relatively still and what is relatively still is ignored so likewise when we get a constant stimulus of consciousness. We begin to ignore it. And not to notice that consciousness tends always to notice novel things, novel changes in the environment. So, everything that that the most unnoticed things in life are those which are the most constant and the most regular. And because you see you lose touch with the most constant, and the most regular things. You screen them out of your your general thought is insignificant, they don't matter, they're not there. And the most ignored thing is space. Because space is always the background. The solids other figures. And therefore we say simply the space is just not is there's nothing there maybe filled around this planet for a little distance with air, which is important, because we do this a while and you notice something so there's some which going on. But up there space to that's nothing and all we can do the Michelson-Morley experiment show that isn't even ether in it. And so we say that is nothing. But all that is saying is that that is the background to every figure, and as the figure cannot be there without the background the solid cannot be there without the space and so the space are the world is that one thing we've forgotten. And the one thing that is absolutely essential to there being anything at all. But because in every direction the stimulus of space is a constant, we don't notice it. Just in the same way you don't notice when you hear music on the phonograph. You don't consider the fact that all the music that you hear is a vibrating diaphragm. Whether it imitates drums, flutes, human voices it's still a vibrating diaphragm but that's it not we don't say that's not important but it is important because without the vibrating diaphragm there wouldn't be any music at all. Space then likewise, is everywhere. But, we ignore it, because it's common to everything. A constant stimulation stimulation of consciousness is forgotten.

So then, we must realize that this is what we call separate things, separate molecules, separate lives, separate planets separate star separate galaxies are joined by space. Space, in other words, is a relationship between solids you would not be able to think about space without a relationship between solids. And so the whole theory of rebirth in Buddhism is based on intervals. Not on a transmigrating soul but upon intervals between lives as

is the interval that's important just as in the same way when you listen to music, you hear melody simply because you hear the interval between the tones. If you couldn't hear that interval you would not hear a melody. Tone-deaf people cannot hear a melody they hear merely a succession of sounds. And they can't understand why other people enjoy this, because they haven't got the capacity to hear the interval between tones following each other in succession or the intervals between tones played simultaneously as in a chord. Isn't that magical when you come to think of it? That music is created by not so much the tones, as the distance. The musical or sonic space between them. But so goes for everything. It is how it is spaced that creates the significance and interest of any being whatsoever. You say, for example, the human body consists of about ninety-five cents worth of chemicals. But how it's arranged. Playing a violin by a Great Master is just scraping cats entrails with hot air. But how it's done.

So the order of the way things are distributed is the magic, and that requires the spacing how it is spaced. And so architects, they understand that space is real, because there always they talk about space using space. People, when they first listen to architects talking a very puzzled because they are an architect will use an expression like the function of a space. And the ordinary person says how can space of a function how can nothing do something when the physicist speaks of space being curved. How the devil can space be curved? How going to be properties of space, see? Does the average person simply brought up to ignore space as being a total non entity. So then it is bases between. What we'll call solids. Instants. Points. That makes it possible for the points to have some point and. Grow all of everything this point nobody would be able to make up. One point from another. So has to be interval.

So likewise then when it comes to considering relationships between lives. Your past life, or past incarnation, your future incarnation. Do you understand this problem I repeat you do not need any spookery. It is all perfectly obvious and I'm going to demonstrate to you. By playing a game with pebbles. Now, [I have] scattered these pebbles at random all over the floor. And let's consider for the sake of argument that each pebble is a human life, and you see that the slats of the floor going across this way. They may be taken to represent, each one a century in time talked on

calendar time. And so here are human lives, all of different sizes, lengths that is to say different breaths how much they travel and how much space they occupied scattered right across a period of time. And we are looking at them from a sort of celestial position. With a kind of eye of God and seeing history happening scattered all over the place. Now one of the first things that we do when we see a scattered arrangement of this kind. The first thing, maybe say oh it's just a mess. And the second thought, hmm, it seems to have some lines of continuity in it. Because especially you see as...you can make out. Very quickly you can pick out a line you know how you do this lying in bed in the morning and looking at a chintz curtains or lying in hospital and looking at patterns on the ceiling you start to pick out designs and themes. [Leonardo] Davinci used to look a dirty old walls weathers moisture and damp and mold and see in those walls all kinds of paintings that he could therefore bring out the glorious cave paintings. Which are found in the south of France by most prehistoric man they're done by what's called eidetic vision. Those people looked in the caves at the patterns on the wall and in them they saw cattle. People and they simply touch them up and therefore got the most vividly realistic impressions It's called eidetic vision so in just the same way in looking at the scatter of pebbles on the floor. You can with eidetic vision pick out certain continuity is.

So, if for example we...it's very easy to see as things are to spot this line. It's almost a straight line, and a straight line is an abstract concept which is useful to us. See, I notice those are all lined up like that. Now is there a line there or isn't there? How real is the line? There was no intention to make a line, these are just where the things fall, but they do so this particular set of pebbles happens to be pretty much in a straight line now the straight line is a concept. It isn't something in the actual pebbles, and yet at the same time I can see it that way.

So then, we might argue if each of the pebbles in that line is representing the lifetime of a human being. Because they are lined up in this way, you can say that is a continuity in other words. This one. Here. Reincarnates as this one, and then as this one because they continue each other and form the line they talk about a line of descent. A line of succession. That's what happens. And you see that continuity in their system just as you see the continuity of the wave moving across the water although actually nothing is

moving the water is just going up and down. So you would see the continuity of this. So in the same way as I explained this morning you consider that you sitting here are the same people who came in at the door although you're not, you've changed completely. So this in other words, if I insist upon seeing this continuity of lives, then I'm reincarnating. If I realize however that my seeing of the line here is purely a projection, I'm not reincarnating, I'm liberated. Or we could do it in some other way. You don't have to see a straight line to make the connections let's imagine that these are all pebbles in a stream. And what will make connections between them for a little fellow who is walking around you see, and he wants to get across the stream. And so he put his foot on a pebble here and what next one can reach in get that one. And then get that one. Wowee, have a little problem to go on from there. But maybe with a jump you can land on that. And then on that one and whoops with a jump you can hit that. It all depends on the stretch that one. Sees and because they they're each within a a stretch then that's another reason for setting up a line of continuity. Being able to see a significant connection between any of the members of the group.

So what you're doing here you see, you are making sense out of a whole multitude of human lives in just exactly the same way that you make sense out of anything else. The way you make sense out of a Rorschach blot. But after all the whole world is a Rorschach blot. Everything in it is what we're doing is we're making sense out of wiggly processes. There is, you see human... wherever you fly across the world in a plane. And the landscape suddenly begin. To look rectangular. Or straight lines. And clear triangles or clear circles you know human beings have been around. Where they haven't been around the outlines of everything we really like the courses of rivers the shapes of mountains and forests because human beings are always trying to straighten things out. But the... we ourselves are not straightened out. We are wiggles. And we're interminably wiggling, but we're trying to regulate our weakling by setting ourselves up in houses and going along streets with traffic lights and regulations and so on, but we are we're going we're trying to straighten out this wheedling but wiggling is basic. So the whole world especially us, is a rorschach blot. And science is the art of trying to make unanimous sense of this block what science does. Is it isn't that there are certain fixed laws of nature which things obey. It isn't as if the wiggly events of the world are running on tram lines and. They have to they

have to do that. They don't have to. The point is that in order to make sense out of what is going on. There's no way of making sense, because sense and order the same thing. Therefore, we invent orders, and describe the way things that. In other words, here is the scatter of stones but it just so happens that I scatter them over a regular lives spaced floor. Each of these divides in that plane. And so, I can classify every stone according by by numbering the board which it's on. And by doing that, I'll be able to identify them and I'll be able to talk about various regularities in the way you see I threw them all out like that and there were certain dynamic principles involved in these principles can be measured and discussed in terms of the intervals at which all the stones fell.

But in fact though I invented the order. That order of distances between the divides in the blogs is just as much a projection on the formation of the stones as considering for example that this group lie in a straight line. Something projected onto it. So in just this way there, we are projecting onto a wiggly universe an order. [It] is the only way to make sense out of it. And to a very set because after all wiggles, although they are very irregular, there is regularity in them. And you can only know that those regularity in Wiggles because there's also irregularity and vice versa. So through noticing the regularity is you begin to make out a consistency in the behavior of events and if you dig consistency and say Great that's that's do it again is our this is this was fun all that wiggle was beautiful once more please yeah see then then you dig irregularities and you don't want to be irregular because deep. I mean well I've no idea what was going to happen next no summit is going to be enough great sun to bang, the whole thing's going to vanish. And I don't what's going to happen band show that could be crazy be great you know. But well we don't really settle for that we like to think to go to bump,bump, bump, long as it doesn't get too monotonous and boring.

So therefore we're looking we're scanning all the time the field of experience for regularities. And thus build our hang ups. It's got to happen every day, the mail's got to be delivered every day. You know you've got to keep doing your work gotta eat regular meals all kind of Desi and so it keeps going because we're looking for this regularity thing. But once again you see the Buddhists say, do you know this thing actually is neither regular

not irregular. You can pick out I want you to do what you want with it here the chips; what value do you want to put on? What pattern you want to see in? Or do you always want to see them in this call they're suchness. See that's the point of the garden the sand at Rionji. You go there and you see in lovely great stretch of white sand five rocks on it. And that's so those Zen boys made up but I didn't get away with murder. They set up first rocks in the garden. And everybody comes around and looks at it and I think this must be some deep meaning in this. And so there's little guide books that explain what it's supposed to be. They say well it's supposed to be an ocean with islands in it other people say oh it's a beach with the rocks on it other people say oh well these rocks have a certain dynamic relationship and they represent kinds of Buddhist principles and there's a guy at Dyson in where they have another rock and sand garden a very funny cute Zen monk who gives a lecture in English. He doesn't speak English, but he's memorized a particular English lecture which explains the symbolism of all the various rocks and how they work out and how eventually you get to the ocean of liberation. All this is made up out of whole cloth because the whole point of the Zen garden is just that it doesn't mean any more than this means. Or any more than anything else means the the mountain over here the fact of water the fact coastline goes and such and such a way and here we all sitting around wiggling you know only because I'm talking, and you've attributed certain sense to my words and so on you think that I'm communicating something. But actually, everything that we're doing is like this. Now we are brought up to think oh that's too bad if that's all it is you see if it's just this option is if it's just an arrangement that fell out like that. What's the point? Life seems meaningless and empty and without purpose and so on but that's just because you're geared you have been conditioned so all your thinking to feel that things meaningful unless they're meaningful. Where you say well life doesn't have any meaning that's because you added drilled into you that it ought to have. So you make a meaning out of. And if on the other hand nobody ever told you that life. Ought to have a meaning and that ought to make some sense that it ought to be going somewhere and that you should survive then you wouldn't expect it. You just dig it as it happens.

So really what this is saying is, that isn't that things are meaningless it isn't that they're meaningful It's just that they are so happened to be spread this way. And so, there is no fixed way you should look at it. So what is called

as the first principle of the Buddha's eightfold path samyak thrishti. Means samyak perfect. View. Says OK once was giving a lecture about Buddhism you know. And he said. Force noble truth of Buddhism is called a noble rate full path. First step of the Noble Eightfold Path of course shock can mean the view or of Buddhism some up in the. Second step of noble path is.. second step you better look it up in the book.

But the right view doesn't mean right in the sense of the particular correct view one should take. It means the complete view which is having no fixed view. So in other words, when you say what is the correct position of the stars in the Great Dipper the Big Dipper. Depends where you're looking for. There is no such thing as the correct position of those stars. So in the same way, what is the what is the right interpretation of these pebbles? Depends how you want to look at it there was a Zen master call it Q In the front of his monastery he had a very very not crooked pine tree. And one day he pinned a notice on it that said I will pay one thousand yen to anybody who can see this tree straight. So all kinds of people came around the tree and started standing on their heads and the getting it in weird ways so somehow they could line up the branches to see them all straight. And there was one very smart man who came and looked at this for a while and then he went off to see another priest who was a friend of the cues. And he said look what is this thing accuse doing. How would you say how would you see that tree straight when he said you look straight at it. So he went back to E.Q. and said I claim that with one thousand yen all you have to do to see the street tree straight is to look straight at it. And he looked at him in a very funny when he forked out the thousand yen and said, You must have been talking to my friend the priest down the road.

So, what of it what are we doing you see you've got it you've got a universe which you're living in which is fundamentally wiggly like this. And you are in it and in this way go see. Only you're trying to straighten it up. You're trying to see order in it. And your doing this is itself a wake up. After all and you may say part of this. One of two things in here is straight. You know. And that's their nature to go that way to be orderly things to be straight things or whatever other quality you want to put on and we're like that. But we are something in this. Which has it in its nature to arrange it this and that way to want to see things straight. But actually, there really

isn't anything in the whole arrangement that is the right way of doing it. There isn't anything in life in your life that is supposed to happen. You're not supposed to live to be eighty, or to die when you're twenty three. It doesn't make the slightest difference you can be one of the others by the way in the scenery of spring there is nothing superior nothing inferior flowering branches grow naturally some short some long.

So liberation is the realization there is no way that things are supposed to be. You don't have to go on living. You are you know you're what there is it's up to you to decide is it there's no way it has to happen. But on the other hand if you want to feel that there is some way you would like to arrange this means we can stop pushing these things around you know but them in some kind of an order that's OK too. The point being, you will be miserable to the degree that you are hung up on the notion that things should last go a certain way. That is to say, to have a fixed view. If you have no fixed view, you remain elastic. And about this there is always something that can't quite be said. When we say I have no fixed view it sounds as if I were just a non-entity like a moron. Chinese proverb says as a hollow room echoes all sounds an empty mind is open to all suggestions but there's another sense of an empty mind and that not the moronic empty mind, but the lively empty mind. The empty mind that can either let it alone or project patterns onto it. And especially do both. So that instead of saying what do you really ought to do is to project no pattern on the world, and realize that it's all fundamentally senseless is to say always do both at the same time project the patterns that realize at the same time there is no fixed view that you should take. This is exactly the same thing as being able to realize that there are rights and wrongs and things that should be done and should not be done, but at the same time there's another point of view from which you can see that everything that happens is right the way it is and that human life never makes an aesthetic mistake just as the patterns of the clouds in the foam never make aesthetic mistakes.

World as Play

This seminar is going to be a fundamental course on cosmic gamesmanship.

We shall discuss, first of all, the yang and the yin.

Because what we are studying is the way whatever may be called the universal energy plays. And so the fundamental thing is Yang Indian, the positive and negative principles to use the Chinese words. Next, we shall discuss relativity.

Next, we shall discuss group theory. In and out. And finally, we shall discuss identity. Who are you? But in starting. The moment one talks about cosmic gamesmanship, it carries with it the assumption that the physical universe is a game.

And that doesn't seem to be taking it sufficiently seriously. Of course, according to Hindu philosophy, the physical universe is an illusion. They use the word Maya, but Maya has many meanings. And among these meanings, only one is illusion.

And the word illusion, of course, always carries a bad connotation to Western ears. We want something that's for real.

But it doesn't necessarily carry such a bad connotation to Hindu ears, because the word Maya also means magic, creative power, art and of all things, measurement. Because it comes from the Sanskrit root Motrin and may tr from which of course we get meta. Martha? And the Latin matter mother.

In other words, the world is looked upon or can be looked upon as a perfectly good illusion. Because all art, in a way, is a creation of illusion.

On a stage the actor plays and Hindus think of the world by analogy with drama. The whole thing is a big act.

And there is one actor behind the whole thing, which is you, not you, in the sense of your.

So-called empirical ego.

Not you, as you imagine yourself and as you ordinarily censor yourself to be. But what is really and truly you at a much deeper level.

But you see, when we use the word game or play in English. We usually tend to mean that it's something trivial. You see, we divide life very strictly into play and work. Other people's don't do this.

And that's one of those shattering the awful features of our culture.

This division of play and work so that most people are working at tasks which they hate so that they can make enough money to stop doing it and play. This is perfectly ridiculous. Nobody needs to do that.

Because what you get with work. Done in this way. Done heartlessly and without joy is money. And what can you do with it? Supposing you do earn time to spare and money to spend, what is there to buy with it? The answer is the other fake and joyless products made by other people who hate their work.

So there is a certain phoniness, a certain lack of essential quality in almost all the work that we perform, because the work is done not for the work, but for money.

And play is considered something separate from work. Work is serious, play is not serious. In fact, we have a strange incapacity to play at all because we always, especially in the United States, play with an ulterior motive. That is to say, play is good for you. And we do everything because it's good for us, because we judge the physical world with. Without our senses, we judge in theory.

We believe that the proof of the pudding is not in the eating, but in the chemical analysis.

It is often my fate to have to take lunch in college cafeterias and what must be happening to the intellectual life of the nation as a result.

Professors, graduate students and students eating this kind of stuff must be catastrophic because I go all over the United States to various colleges and everywhere. The fair is exactly the same. You'll get a so-called salad, which is a piece of that wretched iceberg lettuce with a dollop of cottage cheese and a wedge of and pineapple on top of it. Then you get slices of beef that

have been tormented for hours in an electronic purgatory. Sloshed over a rubber coated is the exact word with a gravy made a water library, paste and bouillon keys. Then there are very repeated carrots and corn which have been sterilized because that's important by boiling for hours. And finally, there is a pie which is a slab of beige goo crust that is reconstituted cardboard and topped with sweetened shaving cream squirted from an aerosol bong. And all this has been analyzed by dietitians and by the whole Department of Home Economics and is found to verifiably contain the right amount of calories, proteins, carbohydrates and vitamins. Now, actually, this is all a result of academic politics, because academic politics, you know, is mainly concerned with feuding between departments. And this is the way in which the Home Economics Department has won out by rotting the brains of historians, anthropologists, mathematicians and physicists. But this miserable affair. And this goes on all over. Things are judged to see because they are good for you. And if we inquire carefully as to what this good for us is, you know, you mustn't look into that. It's taboo. The whole culture would fall apart if we found out what it was, because what is the good that is good for you, as always, and necessarily something in the future. It never happens and there's never going to happen. All of these vitamins and carbohydrates and things can do for you is keep you in a state of reasonable survival and in which you never catch up with anything.

Because you see, time is strictly an illusion. There is no such thing as time any more than that is such a concrete thing as the equator. The measurement of time time is a measure of motion, just like lines of latitude and longitude are a measure of the geographic surface of the earth and nobody will ever tie up a roll rose with the equator.

There is, however, such a thing as timing, which is quite different from time. Timing is skillful rhythm. And but you cannot ever attain proper timing if you hurry, if you're in a hurry to get to the future because the future is never going to arrive. So if you hurry to get to the future, you always get a punishment for it. For example, instant coffee.

TV dinners.

The sort of food they serve on airplanes of all beef that is cooked in electronic ovens, where you push the switching on and a whole roast is

done. It isn't that heated through, it's not roasted. And all these things are awful because they are the result of the illusion of time that there is something that is good for us and that we're going to get to.

And so this is the result of an educational system which is completely geared to literary and mathematical pursuits, which trains everybody to be clerks, sales, insurance salesman and bureaucrats. And only with great reluctance does education offer any kind of instruction in material competence.

And then only for people who are considered too stupid to be intellectuals to go on to college.

So the basic arts of life in our culture, farming, cooking. Dressing, furnishing, lovemaking. Utterly neglected. There is no sophisticated training widely available in any of these things for the average person. And so that that's the reason why there is nothing on which to spend the time that we save and the money we earn. Except trash.

So fake cards, pasteboard houses, bread made of squishy Styrofoam, vitamin enriched and all that sort of thing.

See, because of the illusion that we've fallen for the illusion of time.

So only that what is absolutely necessary for a culture that means a society of cultivated people. Is the cultivation and devotion to the present, to the material world, rather than to the purely theoretical world.

You see, Maya in Sanskrit, I does indicate in one sense the physical world. Because in the positive sense of the physical world is actually a marvelous work of art. But Maya, in another sense, in the sense in which it means measurement refers to all the ways we have of numbering and naming and dividing up into categories, the physical world. So time is Maya. Latitude and longitude is Maya. The future is Maya. In the less exciting sense of illusion. So you see, because of this state of mind, we we don't think that play is important. We play in order to refresh ourselves, to go back to work. And that's not playing. Playing is a real absorption. In a in the delight. Of a dance, for example, you don't dance because it's good for you, dance

because you're happy. You see, we have a very odd in capacity for happiness because we are happier when we expect good things to happen rather than when they're happening.

And so we say of a thing that we consider bad. It has no future. Well, nothing has a future. There isn't a future.

There's always a present and one has to get this is a kind of a basic approach so that one can also therefore use the word play or game in a sense that is not trivial.

We don't think, for example, that when we hear a performance. Of a Bach cantata. Or better a purely non symbolic thing like a feud. We don't think that that's trivial.

We don't think it's trivial to play the organ in church.

We do not think that the plays of Shakespeare are trivial. Their plays.

Play, you see, in the sense that I'm using, it is a musical thing. It is a dance. It is an expression of delight in the sense of Blake saying that energy is a tunnel delight. And for example, the art of Islam, the arabesque, which aren't pictures of anything. They're just fantastically intricate, beautifully colorful designs. They are play. And according to this thesis, the universe is just like that. It is a very, very elaborate play system. And the fundamental elements of this play.

The Chinese call the yang and the yin.

Yang means the positive and yin the negative yang refers to the south side of a mountain which is in the sun and into the north side, which is in the shade. Yang refers to the north bank of a river, which is in the sun and in the south bank of the river, which is in the shade. Yang is symbolically or proto typically male in is symbolically female. That's not to cast any reflections on women. But so you might say there's the reason they're called male and female is that Yang is aggressive and yin is yielding. Yang is calm. Vex Yin is concave.

Now, the secret about the opposites, which is as important as realizing that there is no such thing as time.

The secret about the opposite is this.

That they. Appear to be as different as different can be.

We say of opposites like black and white that they are the poles apart.

But in using that phrase, polls. You imply a connection between them. As there is a connection of the north to the South Pole of the earth, and as there is a connection between the north and south poles of a magnet.

There are two ends in the same stick. Two sides of the same coin.

Two opposite points on the same sphere. And that means that they go together in Chinese this is called a rising mutually.

As in the second chapter of Louder, where he says When all the world knows beauty to be beautiful, there is already ugliness. When all the world knows goodness to be good. There is already evil. For to be and not to be arise mutually.

What confuses people is that they don't see this. They think, for example, that the positive. It's something they're. Which truly exists. Whereas the negative has less reality. It doesn't exist. We think that, for example, the space in which this universe floats is a nonentity. And has no importance.

And we are thereby because we see energy manifested in the positive aspect of things and no energy manifested in the negative. We are afraid that energy. And it's delight is threatened by nothing's. That it's going to be swallowed up and that in the end, darkness will win. We feel that about ourselves and we feel it about the universe as a whole. Because energy is effort. And effort, after a while, you get tired and you can't keep it up. And so darkness must win.

According to Chinese philosophy, that is a hallucination.

Because.

Energy cannot be manifested without inertia. There must be something to push against for there to be any manifestation of energy. You cannot dance without a flaw. To use your energy against. You cannot when energy or any kind of motion is completely unobstructed.

There's a sort of squash, a fizzle and nothing happens. Because fundamentally, as we shall see next hour. Motion is only realized when there is stillness. Relatives. And so energy is only realized when there is inertia and.

The positive is only realized when there is the negative to bring it out.

These things work together.

But when you don't realize it, you are anxious, you are afraid that the dark side is going to win.

Now, the minute that happens, you become unable to play.

You start getting serious and the game degenerates into a fight. Because you feel it absolutely urgent, necessary under those circumstances that the positive must be made to win, accentuate the positive. You see, and that leads to all this beastly kind of religion where people go around with false smiles and hearty handshakes and accentuate the positive.

And the moment that a person does that, you know that it's a big fake to put on and then do something utterly unreal about it.

That's why you may have often experience the fact that certain kinds of virtuous people are offensively virtuous and they are very difficult to get on. They don't have any light touch. And of course, this is particularly prevalent in religions.

Because. Not all religions, but many religions. Our. States of terror. About the negative side. I was talking with a very enlightened none other day Catholic.

And she was open to all sorts of new ideas. I said, you know.

There's one thing wrong with your worship. And the way you sing your hymns and chant your chant and do all these rituals. You don't swim.

I mean, I don't mean by that, but it isn't syncopated. I mean by that that there is not an attitude of delight about it.

It's always you feel the service is being conducted in the presence of the chief inspector of morals.

The the original stuffed shirt, the appalling grandfather in whose presence you doubt.

Show any kind of spray cleaners, because after all, you know, when we are children and we are very exuberant and we leap around and bouncing all over the place, we make the adults tired.

Because the moment a child starts getting exuberant is they really tried to give him a guilty conscience. You have no business having so much fun. There are other people in the world who hurt. There are people who are starving. There are people who suffer.

And to you to go around leaping around as if the whole thing is gorgeous. It's a kind of irreverence. So be guilty. Shut up. So as a result of that, where we think that an occasion is of particular celebrity, where you're in charge or in court or standing in a row of Marines or something saluting the flag, everybody gets grim.

And so there is no delight in religion of that kind. Well, this nun agreed with me that they really ought to do something about that. And I said, well, maybe I'll come to your convent and teach you how to sing.

But you see, all of that is because of the fear.

That the. Nothing. Will win over the something.

Now, it's true in games there is a winner and there is a loser.

But in a fight, it is different. In a fight, the object. Of victory is to get rid of the defeated party.

Because he's bad and he ought not to be there at all. But in a game, it's quite different because. If there is to be a winner, there has to be a loser. So it's terribly important not to get rid of the opponent. You could have no chess unless you had the black side as well as the white. Impossible.

So in a game, what we admire a person we call a good loser.

That is to say, a good sport because he does not take the loss seriously. It's very instructive, for example, to play any game that you know well, whether it's chess or checkers or whatever, but with yourself. And each time you move over to the opposite side. Play it with your best skill. For example, you can play a very marvelous game. You take two cocktail olive toothpicks.

You know, the kind they make in the little plastic swords and you do a fencing match with yourself and actually try to stick one of your hands, on the other hand, really tries to defend itself. You'll find this is extremely interesting. It's a meditation exercise.

And then you realize, you see what is the nature of a game? Because if you are a good chess player, you may congratulate yourself. If your opponent wins, if you have given him a good contest.

Because then the game as such was interesting, and you come to realize that you and your opponent in a game of chess together constitute a single organism like your right hand on your left hand fencing with each other. Let not your left hand know what your right hand do, if that means. Have a conspiracy. To pretend that they don't belong to one organism and that they're different, like black and white, like space and solid. They must look as different as possible, but underneath in order that there be a game, in order that there be, in other words, a relationship of these two, there has to be a secret agreement.

They have to be tacitly one, but openly to.

X satirically too esoteric. One. Because you see on the stage, when you get the hero and the villain, they are really friends behind the scenes because they belong to the same company of actors. But this must not be admitted

on the stage because that would give the show away. Now, you see, it is true. We must not give the show away. That's why there are esoteric teachings. But on the other hand, there is another opposite extreme, which is not realizing that the show is a show that is as bad as giving the show away. So you have always, when you are in the theater, say you go to the movies. And you go to see some great horror movie, you know, awful thing. Well, why does one do it?

You want a thrill? And the whole of the universe once a thrill. That's what it's all about.

Otherwise, it would be boring.

But when you go to the movie, you know, in your heart of hearts that it's only a movie. And yet you contrive to some degree to forget this while you you're there and therefore get scared and feel real creeps. But that's great. Some people like to go and cry. They go and see some tragedy and just love to weep. Because it's a catharsis, it gets all the salt allergy or something on it.

And so you you do this thing and it is if we can say it's vicarious.

Yeah, but that is the spirit of showmanship, of play.

So one might say then that it is possible in this life to attain a sort of metaphysical courage.

In which.

You are, you know, really know deep within. That the most harrowing experiences that physical existence can offer. On our show.

Now, this is the what you might call ultimate nerve. And for example, when the samurai in Japan studied Zen. That's what they wanted to get from. They wanted to get ultimate nerve so that absolutely nothing would phase them. So there is a poem which says Under the sword lifted high, there is hell making you tremble. But go ahead and there is the land of bliss. Don't hesitate. Say don't. Don't be blocked. Don't be fazed, nonplused by the

illusion. Now, you would say, well, that's all very well, but I can't bring myself to that. I start to shake and I can't stop it. There's not to do with my will.

And no amount of gritting my teeth, clenching my muscles, exercising my willpower can get rid of the shakes. When I am really scared.

That's true, but you must remember that the secret to all this is not to be afraid of fear.

When you can really allow yourself to be afraid and you don't resist the experience of fear, you are truly beginning to master fear. But when you refuse to be afraid, you are resisting fear, and that simply sets up a vicious circle of being afraid of fear and being afraid of being afraid of fear and so on.

And that's what we call worry. Worry is simply a chronic condition, and people who worry are going to worry no matter what happens.

Because when one possible threat is exterminated, they will immediately discover another because worry is an infinitely skinned onion. And you can go on and on and on because the moment you see you reduce the size of the onion and you get your worried out too about this. Suddenly your whole sense of distance and size changes.

And because you're looking so intently at this little onion, it fills your whole field of vision and is once again a big onion. You start peeling that down. But as you get another one about this size, then it enlarges itself in your judgment and your sense of values. And once more, it's colossal.

Now that's always going on.

So if you are disposed to worry, there is always plenty to worry about.

You make plenty of money and you have no troubles about that and you start wondering if you're going to get a disease and the doctor says, no, it's all right. Nothing wrong with you. Then you wonder if you're going to get into an accident. And then you take precautions and then you wonder if

there's gonna be a political revolution, etc., whether your house is going to be robbed. There's always something.

So it is really this kind of worrying, is it completely useless pursuit? And yet we feel a little guilty if we don't do it because it somehow put into us that a proper amount of worrying is showing a good sense of responsibility.

Your concerned and Paul Tilley use this word concern in a special way. Quakers always use the word concern and all people, you might say, who are socially conscious are concerned. So when we say I'm concerned, it means I have a frown on my face. And I'm worried about you, about the nation, about the war, so concerned.

Nick said religion is ultimate concern.

I am concerned about the universe. And he used his wonderful decontaminated word for God, which he got from Eckhart to the ground of being to God, still has whiskers on it. But the ground of being doesn't, obviously. And so the ultimate concern is to be concerned about the ground of being. Well, now, I don't think you. Well, I'm not sure about to it.

I knew him. And he was a very wonderful man.

But what I call concern in the way I would want to interpret it instead of this sort of from.

Is something more like amazement. In other words, that existence.

Is extremely peculiar.

Minutes. I can't get my. I can't explain this feeling because I don't know quite. How to ask a question about existence so that I could be said to be wondering about it in some sort of clear thinking way. What what?

This is a very nice thing to consider to yourself that if you were going to have an interview with the Lord God. And you would have only five minutes and you might ask one question, what would you ask?

And you've got plenty of time to think this over in advance and you realize. Question after question is now.

That's not really the thing I want to get at.

It's not that like, do you exist because of God? Yes, there are. Am I having a hallucination?

No. Well, I'm not.

How can I be sure that this isn't a hallucination thing? Well, then you reject all that sort of question. And when you finally come down to it, you don't know what to ask. There is a sort of question in your mind.

Not so much a question as a questioning, a feeling of it's all unbelievable. It's amazing. I wonder at it. I marvel at it. It is a miracle. That there is anything.

But.

It's like a friend of mine who went to a Zen master. Got an interview after a deal of trouble. An interpreter. And he sat down and said, you know, now I'm here. I don't know what to ask. I just feel like laughing.

A Zen master said, Well, it's love. And they just broke up. So.

But that feeling you see of the.

The modern listeners.

Of being is what I call. I would want to mean by two x rays, ultimate concern.

It's also love is involved in it.

See, that's the part of the problem. An abstraction is culture such as ours.

As I indicated, we are not materialists. We are abstractions. A materialist is as a lover. And therefore, is somebody related to the present? Because you

see, you you can't love except in the present. When you have under your hands a piece of wood. And you say my hasn't got a gorgeous green. No. And you fondle it. If it moves.

You you you run over this and think he's not going to succeed. Well, yours, your loving it.

It may be that it's an apple in your hand and you say, I love you so much. I could eat you.

And you eat it. And he relished. That's loving in a special way.

So concern and love and there are many forms of love.

There's a whole spectrum of different kinds of love which runs from the red of libido to the violet of divine charity. But all of them are equally important because, as you know. You can't have the violet him without the red and. And vice versa. You wouldn't know what Violet was. Unless you had all the other colors. The colors create each other. So it isn't simply black and white. Between black and white is the spectrum.

And. Just as black and white arise mutually. So, you know, red in relation to yellow, in relation to green, in relation to blue and. But if they all come out of black and white. That's the secret. I think Mr. Lamb, who invented the camera. Made a rather spectacular demonstration of this. So. If then you try. To obliterate fear, the fear that black may win. You're working in the wrong way. To attack fears is to strengthen it. Because immediately you feel guilty if you don't succeed. Or you feel inadequate.

But fear is something that arises naturally and spontaneously under certain circumstances. Just as you will feel warm if you get near a fire.

And you can't go up to a fire without some sort of self hypnosis and then say, well, I refuse to be warm.

There's something a bit weird about that because I do often wonder if you're one and you get in a fight.

No, on the contrary, it is very natural to be afraid. And so if you don't try to knock it down, you don't try to make yourself over into some sort of preconceived idea of what you ought to be.

Then you are on the track.

Now, where do you think, for example, that I ought to change myself into something different? What is the agency which will affect this change?

Well, we could say two things. On the one hand, it's the same self that you want to change. So how can it change it?

Or on the other hand, you can say that the idea that there is a sort of separate ego in you which can go to work on the rest of you is a hallucination.

And that's why. Gurus and teachers said their students. Weird tasks. They may discover that the.

Dissociated ego is indeed a hallucination.

For example, one of the ones that has commonly used. Is to get yourself a pure mind, and that means you control your thoughts and emotions.

You mustn't have any violent or hateful emotions. You must not hate anybody. You mustn't have any sexy emotions or pure ideas. Cleanup.

You know what happens so many in the parent child relationship? Many parents can't stand their children. They are a nuisance. They are the result of bad rubber goods. And they didn't mean to have them any way. And they're expensive and noisy, and they disturbed the peace of the place and they protested. But you cannot admit in this culture that you detest your child.

That's the most awful thing. But you see what happens if you don't admit it. Is that whereas outwardly you go through the motions of being loving and beautiful. You don't smell right and the child gets it. The child knows

intuitively and inwardly that these have crossed up message here. It says love. But it act hate.

Vise versa. A lot of children hate their mothers, hate their fathers. That's supposed to be very bad.

And the whole pandemonium that's going on these days is. Largely due to that, that nobody can come out and be honest about it.

So now control your thoughts.

Watch that hate the moment it arises.

Dying, knock it down.

Well, now you know the guru who's teaching you all this. You've projected quite a bit on him.

The fact that you accepted a guru at all shows that you have endowed another person with much greater wisdom than yourself.

That's your opinion, incidentally.

And therefore, people will invariably attribute to gurus all kinds of astounding powers, especially that of a telepathic nature and indeed a good guru is a very sensitive fellow and can tell by a people's eyes and gestures and tone of voice, all sorts of things about them.

As can any experienced psychologist.

But you see, when you are trying to control your thoughts and you know you have some kind of wrong thought, you project upon the guru to recognize it instantly.

He reads you. He sees right through you.

And therefore, you know that he almost must look at you as a terrible worm because you can never quite succeed in doing it. See?

And the lesson of this is you see the whole point of this lesson is to discover that the alleged you, which is different from your thoughts and feelings, is a hallucination. There is a stream of thought and feeling going on, just like there is a stream of water going by, and that's you. It's an organized stream just in the same way that when you see a whirlpool in a river, it's organized, it's recognizable, it has a shape and it has an enduring shape, even though it is a constant flow. Or take a better illustration. Still a flame on a candle.

It is a stream of gas and no particle of this gas stays in the flame for a split second. But the flame keeps apparently there and is recognizable, I will say one, two, three flames this one that one for the one that's like us.

But that stream, which we are at is thought feeling what we call the body, everything like that, but the body is one of the most intangible things there is.

You seem to be able to grab hold of it, but it is nothing more than a vibrating pattern of energy. And on it flows.

So when you understand that.

You can see a little bit more why Hindus speak of the body as Maya as illusion, because one of the things they mean by illusion is transit of Venus as distinct from permanence. That is to say, everything in this world is disintegrating.

In fact, if it weren't, it wouldn't be now. Disintegration is life.

And it's as important to see that as it is to see that there is no time. And that black and white go together.

Because.

It to the extent that you see it is disintegrating and that there's no way of stopping this. You can get into a frame of mind where you get with it.

Where are you, as it were? Give up and fall apart along with everything else. Now, you might think you see again our in our general western frame

of mind. We would think, well, that's just giving up that spineless. That's cowardice. That's so. That's awful. And anybody who would just give up like that would be expected to become a slob. But the country is true. You see in all what you might call the dynamics of the spiritual life, there are what appear to be many paradoxes.

Courses of action, which in common sense would lead to one result, turn out in fact lead to an opposite result. So you would think that a child who admits to hatred of parents or vice versa would act out the hatred would do something violent. No, it is precisely the one who does not admit it. That will act out and who will do something fun.

Because like the monk of Siberia, who are fasting Ruwi here and weary of the violence, will at last bus from itself.

It can't be contained. And I found again and again and again.

Going around, especially in religious circles where so many people are trying to.

Not admit what they feel.

Especially Puritans prudes very frequently have a strong streak of cruelty.

And this, of course, can be a kind of a sexual substitute, a sadistic or masochistic thing, that is simply because they that they don't admit to having a negative side. And so the negative side will express itself in a violent way.

People who are always doing things for other people's good will be liable to bomb them for their benefit and utterly destroy them in the name of goodness.

And this is because such people are not ever going to be good soldiers.

I was talking a few days, a few weeks ago to the Air Force Weapons Research Lab.

At Kirtland, near Albuquerque, and I was somewhat surprised to be invited to this sinister institution, but that was full of extremely brilliant people, fantastic minds, and so naturally we got onto the subject of strategy.

Because military strategy is a very, very interesting thing. It contains all the basic life problems. And I said to them when I started out, I said, now you have asked me to tell you as a philosopher. What are my basic premises for moral behavior?

Well, I said they are total selfishness. I'm not going to beat around the bush with you people. I'm going to be sentimental or anything like that because you're dealing with military matters where you have to be tough and where you have to be so tough that you have no time for finer feelings. So let's begin that way. Now, I said you might imagine, therefore, that if I base my behavior on total selfishness, that I would go around being rude to people and aggressive and pushing through and so on. But I said I don't because I found that doesn't work. People put up resistance. They get obstreperous and I don't win them over. So my self-interest is better conserved by putting on a pretense of politeness and that I really are concerned about you all and so on. But I said I'm not. This just a big act.

Now, when I said the next thing that happens is this when I decide that I am going to base everything on total selfishness, I start wondering what I want. Well, so many things that I thought I want when I got there, when I found out I didn't.

So I have to go very deeply into the question, what do I really want? What sort of friends do I want? What sort of the house do I want? What sort of a life do I want? What sort of a job do I want to do? And you see, people don't think this through.

They get all sorts of ready made ideas of what they ought to want.

Because what education does to a soul to so large an extent, is to fit us into a set of prepared stereotypes. And we never stop to find out what we really want to do. Well, that's one thing.

But then something else very odd comes up when I say I'm purely selfish, which is what is me.

Then I come across this curious thing that I don't know who I am and this I know who you are.

If I would live without any other people, I don't think I would know I was there.

I see myself in terms of others. That is to say, by a social relationship. I am I because you are you. You are you because I am I.

But then there's something, something that's gone screwy here. Something funny about this. Which is, of course, that myself isn't at all what I thought it was.

Myself is.

But almost everything else as well as myself. Well, then I really don't know what to do because.

There's no point my thinking anymore that I can just go around attacking people and getting rid of them and so on and. Because all I'm doing is sort of is if I was hungry and I started chewing on my own toes. Because I have discovered that hurting others hurts me. Now, of course, you do have to cut your toenails and take care of your hair and things like that. And there's always some kind of violence is necessary in life, just like you have to kill a fish to eat it or you have to kill an apple when you chew it.

Well, it's sort of like cutting off the toenails and coming your hands or clipping things like that. And so like getting rid of dead skin and the general elimination process. But fundamentally, you see, when you think that there are.

Dreadfully wrong people.

Who ought to be obliterated, all that the world outside you is something that you are in a fight with. Well, that's just like.

A person. Who?

Is completely insensitive in the middle. So that he doesn't know that his legs. Leg and goes with the Top End. You know the worms, if a worm gets damaged, it develops a sort of callused area in it, and the worm, when it wiggles, the rhythm of the wiggle doesn't pass through the callused area. It has to wiggle separately on each end.

So the worm, instead of going we will, we will we go as we go bump, we go bump up quickly.

I think so. A lot of people are like that physically. This is one of the important things that will have right farmed out that people tend to have a state of tension in the diaphragm. As a result of which they can't sweep. You know, have you ever tried to teach anybody to dance the hula? Lots of people just cannot bring themselves to make that hit motion. They're too rigid. And they like the world with the callison.

Or then there's another myth about this. You know, there's a famous snake called a rubber us and he's always drawn chewing his own tail and eating it. Imagine what happens when the tail gets inside and he gets inside and outside.

When the whole thing is clutched up, you see and this worm is this snake is a symbol of what the Buddhists call samsara. That is to say, the round or rat race of life and death. And this goes on so long as the worm doesn't know that his tail is himself. When he discovers that he lets go of it and wiggles happily along like every good snake.

Of course there is some more to it than that. You might say, well, why in the first place did he not realize that his tail was his own? Well, because he wanted something else. See, there wasn't anything except the snake in the beginning. The snake is the symbol of God.

But in the opening shots, in the Isha opening shot first line, it said that in the beginning there was the one God, the father, and he said, I'm Loman. And so he made another, which was a woman. And he made love to her. As a result of which all gods were born. But the woman got guilty about this

because she felt it was incest. And so she turned herself into a cow. And he became a bull and he made love to her. And so came all cattle. And the same thing happened, she got guilty and turned herself into a sheep and he turned himself into a ram and so on. And by this means the universe was created.

So this is othering. It's called in Christian theology by the Greek word. Kenosis. Which means self emptying.

Where God others himself, in the sense of getting himself into a position where he forgets his God.

Aware he has abrogated omnipotence. Now in the theory of games.

It is absolutely important to abrogate omnipotence.

Because you realize that if you knew if your knowledge and power was without limit. There were no obstacle to it whatsoever. There would be no way of realizing it.

When we know for certain the outcome of a game, we don't play it, we call it off and we invent a new game in which we don't know the outcome.

So power, whether partial power or army power will always be in the state of abrogating itself.

So the fundamental game, therefore, the fundamental game form, which is manifested in the yang and the yin, the two opposites is of course the game of hide and seek.

Of remembering and forgetting.

You seem really to forget it is the opposite of remember only the word hasn't the same form.

We should but remember opposite dismember. Because to remember is to put back the members of something that has been dismembered.

So when the snake thinks that its tail isn't itself, it is dismembered.

When the snake finds that its tail is itself, its remembered.

So that's why the Catholics say the words of Jesus at the mass, do this in remembrance of me. So that you will discover that you are one body. Which is, of course, the only body there is.

So lesson number two is relativity. Lesson number one, having been the opposites in this course on.

Cosmological. Cosmic gamesmanship.

We were discussing the fact this morning that any manifestation of energy needs an opposition.

In other words, nothing happens. There is no motion. There is no possibility of energy unless there is something opposing it. There is no dancing except on a floor against which you can push and move.

And so I pointed out, therefore, the sense of self depends entirely on the sensation of there being something other, but that this is a kind of a Maya. In other words, the general feeling that one side is definitively split off from and separate from the other is an illusion.

But nevertheless. There is the opposition.

Between energy and inertia.

Motion and stillness. Is something that, as it were, is the bifurcation or two aspects of a single process. And you know, it's a single process because they can't do without each other.

If they could do without each other, then it would be a divided process. Radically divided, split down the middle. But as it is.

The interdependence of these two sides of things are two ways of looking at things shows that there is something in common between the two.

And to understand this is the essential key to living in a sane way, because if you're insane, you are split up an idiot. You know, the word Greek in your TS is means private. Purely private.

Isolated. Out of communication, out of relationship.

And so this is a way of saying that insanity is a lack of awareness of relativity because all existence is relationship. Now, if we can take a very fundamental illustration of this, I want you to imagine a universe.

In which all that exists is one ball. This ball will, of course, have to be floating in space because if there is no space outside the ball, nobody knows that it's a ball. There's no possibility of a ball which has no space beyond it, because then the ball itself, the solid material of the ball would be all that was and there would be nothing outside it.

So there would be no way of defining it as a ball. So there has to be our universe, one bowl in space and the space outside the bowl.

Furthermore, must be regarded as depending upon the existence of the ball, the ball and a space go together. Now, then, however, there is no way of telling what this ball is doing, whether it's moving or whether it is still. It could be roaring through the space at thousands of miles an hour and there'd be no way of proving it will be no air friction upon it. There would be nothing relatively stable with which its movement could be compared and against which it could be measured. So this ball has no energy.

It can't even be said to be still.

It can't be said to be in motion.

And of course, this is the situation of the universe as a whole in the beginning.

But one of the things that God said before the Bible started, the first thing, according to the Bible, was let there be light.

But actually there were several former pronouncements, one of which was you've got to draw the line somewhere and the other was have a ball. And this is why most objects of celestial existence are spherical. Don't you think it's very odd to be living on a spherical rock revolving around an enormous spherical fire with wake up, in fact, itself in that situation?

So he said, I have a ball. Now, this is the fundamental situation. The universe as a whole is presumably some kind of ball. It's curved space and there it is. And nothing can be said about the whole universe as to whether it is moving or whether it is still. It's neither. That's why the Hindus, in trying to make some indication of the ultimate reality, say it is not this.

It is not that. It is not one thing is not the other. It doesn't exist. It doesn't not exist. It doesn't both exist and not exist. It doesn't neither exist nor not exist.

So you can't say anything about it. Your tongue is tied up. That's why it is said in the moment, CON, which is a great Zen text, that when you attained enlightenment, you were like a dumb man who's had a marvelous dream. Everybody who's had a marvelous dream wants to tell everybody about it. But if you're dumb, you can't say a thing. So in the same way, the moment you realize that you are one with all that there is. Well, it's this fundamental ball and you can't say anything about it.

Cost isn't moving. It is not moving.

You can't think about it because and the reason you can't think about it is not because it exceeds you. It's because it is you. You can't get at it like you can't bite your own teeth. So then if we introduce two balls into our cosmos, then we can say something about motion because it is apparent that they can approach each other or get away from each other, but no one can say which one is doing it or whether both are doing it because there is no way of determining it.

One may be still on the other, moving to it or away from it. Both may be moving towards each other or away from each other, but there is no way of saying which one starts. And furthermore, they can only move with respect to each other in a straight line. They have no possibility of moving on the surface.

They have defined linear motion.

Now we will introduce three balls into our system and suddenly we find not only that they can move on the surface with respect to each other, but also

that there's going to be a little fight started because if two balls stay together at a constant space apart and one ball appears to approach them or to recede from them. Well, here is the problem. Are the two standing still and the one likes them or doesn't like them, so moves closer away? Or is the one standing still and the two moving towards it or away from. Well, there's only one way in this thing of deciding two balls that stay together constitute a majority.

And according to the majority vote, they will decide whether they are moving away from the other one or approaching it or whether it is standing still or whatever.

Now, then, the third ball, of course, can lick them by joining them. It can always stay if it wants to out a constant space from the other two unless they break up. And go off in different directions so long as they stay together. It can stay with them. And then we are back to the original situation because no one is moving at all. However much they move. Because the three constitute now one constellation, one triangle. All right. Introduce the fourth ball. Now we have the possibility of motion in three dimensions and you would say, well, now this is good because we've got an umpire, somebody who stands at the distance of objectivity and looks down upon those three ball and will decide which of them are moving and which of them are still very good. But the problem is, which one of them is the fourth? Who is the umpire? Everyone is in a position of a third dimension to the other three.

So everyone is both involved in the game of three. And could be the external observer who is the umpire of what the three are doing now.

That is exactly your situation as being sensing yourself as an external observer of the world. And this is a simple basic principle in terms of which all bodies in the cosmos may be understood. It's simply nothing but a multiplication of this situation. It's. It's complicated. Yes. So that you have to scratch your head to think about it.

But it all reduces down to this fundamental mutual motion of balls.

So you see from this, what is the meaning of relativity?

So none of the balls, incidentally, have such a thing as a true position.

Because the position of any one of the four is where it seems to be from the the different points of view of each member of the group.

The members of the group can get together and agree upon a theoretical. Positioning of the balls, but they can never directly see. All of the balls, including the one that's looking. In this theoretical position, just in the same way as you have a theoretical idea of the dimensions of a room which would correspond to an architect's ground plan and elevation, and you would say, you know, that that corner up there is a right angle, although you see it as an obtuse angle.

Now, this agreement as to what are the true positions of things.

Is very important.

Because upon such agreement depends. All possibilities of human communication.

We have to have a standard of what is north, south, east and west of what is a unit of measure. Of what languages and what words are, what noises are to mean, what experiences. And by constructing this conventional standard of measures. We are able to agree with each other. But one must see at the same time that this is a convention.

There is no reason for driving on the right side of the road rather than the left. Except that everybody must agree what side they're going to drive. One isn't really preferable to the other. The point is to agree. So when we agree about certain social conventions. Whether they be legal or moral or.

Description, all aesthetic, whatever they are.

They are a construct. They are an abstraction.

And nobody. Well, let's say they're an abstraction and it this abstraction.

Is never directly perceived.

Just as you cannot possibly go up to the ceiling.

To a position where you can see the whole floor as a linear pattern as it would be drawn in an architect's blueprint.

Your vision will always be distorted.

If by distortion, you mean departure from the blueprint. So then, except in terms of some sort of convention of this kind. There is no such thing as the true position of the four balls in space.

Because you must always ask when you ask about truth. Truth for whom? Or truth in relation to what standards?

Now, you see when we measure something by inches. Inch number one is the same length as the inch number two, three, four, etc.. When we measure things by the clock, the clock is a circle regularly divided into 360 or multiples thereof degrees. But I've often wondered whether it wouldn't be interesting to have elliptical clocks. Or Mae West shaped clocks so that certain times of the day would go faster than others. Slower than others.

And might be very convenient to have the evening to last longer.

Slow, slow time down for the evening, you see speeded up at some other time. Why not?

But you see.

We tried to fit everything into an ideal of regularity.

Now, the next point is that if relationship is existence.

We are going to discover from this that the existence of any identifiable thing or event in the whole cosmos.

Depends upon.

And in an opposite sense, is responsible for the existence of everything else but to do that. We've got to understand another image.

Which I will illustrate with the parable of a rainbow. Now, you know, there's an old philosophical conundrum. If a tree falls in a forest and there is nobody around to hear it, does it make a noise? This is a very simple problem, but it has been discussed in ways that make it very confusing. A noise. Is a neurological experience caused by a vibration of air interacting with an eardrum and an auditory nervous system? So therefore, obviously, when the tree falls, it will set up a vibration in the air. But if this vibration in the air does not pulsate upon an eardrum, there will be no noise. You can see it in a simpler way. What will happen if I hit a skinless drum?

There will be a hit, but no sound because the drum has no skin. So if there is no eardrum, the vibrations in the air will not make a noise. I don't need to introduce to prove this any spook worry about mind as distinct from matter or anything like that.

That's quite straightforward. But now let's take the somewhat more subtle case of seeing a rainbow. To perceive a rainbow. There must be three variables present. Three factors.

There must A be the sun B. There must be moisture in the atmosphere.

Then, funnily enough, C, there must be an observer.

At a certain angle relative to the angle of the sun and the moisture. The observer will, in other words, be standing. Shall we say, on a straight line between the sun and the body of moisture and what will then appear to be the center of the rainbow. That's why the sight of a rainbow is always off to one side. You never see this side of a rainbow directly in front of you. So the position of a rainbow differs for every observer. Just in the same way as that, the position of this table differs for each one of you in the room.

Depends where you're sitting. That's the way you see it. Now.

The trouble with this illustration is that a rainbow is a rather diaphanous thing and we tend to accord it a rather low reality status. And he added, fulfills all the requirements necessary for a genuine existence. Oh, it's true, you can't grab hold of it.

But neither can you grab hold of the moon. Least not yet.

Now it has these criteria. It isn't a hallucination. Because everybody standing around will curse and swear and they see that there and such and such a time and place, they veritable to see this rainbow.

It's not like a ghost or a hallucination, but.

Everybody sees it in a slightly different place. And you see, if there were no sun shining, there would be no rainbow. If there were no moisture in the atmosphere, there would be no rainbow. But let us suppose that the sun is shining and there is moisture in the atmosphere, but nobody is around. We only say with great reluctance that there would be no rainbow. Because that way of looking at things upholds that particular mythology of the world, the world is something independent of us. This is the great superstition of Western culture that the world is independent of you.

That you don't make any difference to it. Is there something into which you come and it's going along and allowing us to come in and look at you, look in the box and say, well, that's the way it is. And then they kick you out again. But now let's set up the situation in another way. Let's suppose the sun is shining out on the ocean somewhere and I'm on a ship and I could look over there and I say, my goodness, isn't this a nice day? If there was some moisture right over there, we would have a rainbow.

Then everybody says, well, there isn't one. It just does not truly exist that there is a rainbow.

All right. The sun is shining out on the ocean and there is some moisture. If there were a ship sailing near it so that there could be someone to sea, there would be a rainbow. Now, in these two situations, they are both exactly the same. There would be a rainbow if there was some moisture around, but there isn't, and equally there would be a rainbow if there was someone to see it and there isn't. Those are two completely equivalent situations because if this isn't, again, a question of spookily, it's a question that the existence of the phenomenon rainbow depends on the presence of three factors, like the existence of a human being depends on the existence of two factors a man and a woman. Everybody has to have a father and a mother or

have had. And the otherwise it with the exception of that relationship, you don't exist. One other case of the rainbow. It's exactly the same case as everything else.

It's just because a rainbow is rather diaphanous and intangible, although it sure hits you in the eye. And the eye, the ceiling is a form of touching. Seeing as touching at a distance when you find that the table is hard. That is a way of feeling with your fingers, the same thing as that, you cannot see through it with your eyes. So we we are funny about this, purely optical sensations are regarded as having a lesser grade of reality than tactile sensations. When you get hold of something and can grab it and you feel it solid, you feel you are sure of its existence. Then if you merely see it. But it's all the same thing.

Touch is a sensation, as if your finger hands were full of millions of little eyes.

Every nerve and an eye and they close around this and they find it is not transparent.

There is a limit. Here is something we don't go through.

But that's exactly the same as when you see with these eyes here. You don't see through something.

Southern.

The the physical world responding to the sense of touch. I mean, it's another way of saying that the table would not be hard and is not hard except when touched.

It is the touch that evokes the hardness in the table when it has not touched, it's not soft, it's not hard.

It has no quality at all.

Nothing, which is not in relation to us, has any existence or I will add in relation to some other kind of responsive creature.

Just in the same way that when light energy goes out of the sun into space, the energy will only be manifested as light.

If there is somebody outside the sun to reflect the light. Otherwise, the light does not in any way illuminate the darkness of space.

You must bring something into it. To.

Manifest the light in space.

So a Zen poem says the tree manifest, the bodily power of the wind, the water manifest, the spiritual nature of the moon.

Because you see, if the wind is blowing. That is to say an energy is moving along and there is nothing to stand in its way.

The energy is not there.

The energy in the situation is evoked only by something standing in its way.

Then it's manifest.

The water manifest, the spiritual power of the moon. Why? Because in the breaking waves, the moon can be shattered into thousands of fragments. And yet it always remains one. That's it. Spiritual power.

You wouldn't see that.

Miracle of the Moon. If it weren't for the waves.

They divided up like that. All right, you can say it's a distortion. That's not the way the moon is. The waves do not reflect the.

But that's only trying to say that things reflected in a smooth and still surface are reflected more real lives and things reflected in a vibrating surface. OK. If you want us construe it that way, it's your your privilege.

But you can have any kind of reflect that you want.

So in the same way it is with you. What you see therefore depends on the way your senses are constructed. You have certain kinds of sense organs and these sense organs evoke the kind of universe appropriate to them.

It's not necessarily the way things are because there is no way that things are. Apart from their impact or better relationship with some kind of perceiver or perceiving organs, because things are only in relation when there is nothing to which they can relate, nothing is happening.

And the so-called existence, which we perceive and that to which it is related, come into being together.

Now, is that to say that before any living organisms existed, there wasn't any universe, is that to say that all our knowledge of the prehistoric and geological past of the world and the cosmos before life came to it is nothing but an extrapolation? That is to say, all we are saying is that this is what would have been happening if it had been people around to see it.

But since there was no living organism around to witness this, nothing was going on. Now it's possible to make a very good case for that point of view.

But I would like to be a little more modest and not make it quite that radical. And I would say rather this.

That would never have been a universe.

Before living beings existed. Unless there was going to be a creature called man.

Man living in a future says implies. In the past, a certain state of affairs.

In other words, this planet had to come into being with an adequate amount of temperature, oxygen, gasses, everything else, food supplies for the organism called man to exist.

So let me say then, the existence of man implies a certain kind of environment meteorological, geological and astronomy.

But the other side of this proposition is that such an environment implies man.

Now where you get two sides of the situation where they imply each other mutually. You have, in fact, a truly relational and unitary system.

Well, then therefore, the answer to this problem is.

That prior to the existence of any form of life, the universe at that time is dependent upon the fact that those forms of life are going to emerge. Now, this is a thing that is very difficult for us to understand because we think of reality proceeding forward into the future. But dependent only upon the past. It's very difficult for us to see that the events that we call past are dependent upon events in the future. That a lot of things would never started unless certain results were going to happen. Again, this is another of those ideas, which is an affront to common sense.

But.

There are a number of ways of showing that it's quite a sensible idea.

Unless you were if you know you're flying an airplane.

You leave London. You arrive in New York.

You wouldn't have started out from London. Unless you had known in advance there was a place called New York where you could land.

So in a very similar way.

The energy system of the universe. Does not start out with certain, say, very primitive, immediate creatures. Until it knows that it can arrive.

I don't know where where it's going on beyond man, but at least it's got to get as far as man.

Because if it's not going to be able to do that, it won't even start. Now, you can put this in other terms, an electric current.

Electricity isn't like water. When you turn on the faucet, the water goes right down the hose and waits at the nozzle. So as soon as you turn on the nozzle, there's the water.

But an electric current isn't like that.

When you've got two wires. I mean, two terminals, positive and negative, and you've got the positive one hitched up and here's your wire and you leave the end of that wire just an inch away from the negative term. There is no electric electric current moving. It hasn't slowed down the wire from the positive terminal so that it waits to be ready to jump.

Trouble with is that is that electricity move so fast we don't see these things. And you can only see it if you do it on a colossal scale. Let's supposing that we had an electric wire that was. Oh, 300 million miles in length.

Now we connected at the positive end. Nothing at all happens. Connected at the negative end.

So that, too, can have a possibility. See, that's the other term and then immediately the circuit starts. But the circuit of electric current does not start until there is a place for it to drop to arrive.

See, that's the point.

So in exactly the same way it makes me, it makes no difference whether the wire be something that is 180 thousand miles and is traversed in one second. Or whether it's 60 billion miles. That will take a somewhat longer time. In either case, the current will not start until the receptor terminal, the minus terminal is secured.

So in this way, I would say just exactly the same way. Life will not stop. Up.

In a universe. To which it really doesn't belong.

In which it is can be regarded as nothing more than a stranger.

So if you follow that out, you see this, that is the whole existence of the universe depends on every individual.

It isn't a question of how long you last that the only universe will only last as long as you do. That's not the point. The universe is much bigger than you are and you are very small. But at this moment, it depends on you. The universe is much longer than you are and you are very short in time, but nevertheless it depends on you. The universe in the future, long after your dead, will still be depending on the fact that you once existed, the universe in the past existing long before you were ever thought of. Still depends on the fact that one day you would exist. And it depends on each person.

So in other words, there is in everything that happens. Every hold depends on every part because you see, in truth, there are no parts of the universe. Parts are an abstract creation. When we think of someone or something as a part, we are quite arbitrarily cutting him off and saying by convention we will agree that our skins are our boundary. And therefore, since our skins do not include the whole cosmos, we are only a part of it. But there are no parts. Just as in your own when you study your own organism. All of its continuous.

All the so-called parts flow into the others, like the motions of waves. You're not have detachable parts that you can unscrew inside you.

You see, unless you've got false teeth, I mean, not that, then take it out easy when the ordinary way. You can unscrew parts of the human being from another. They are continuous. Well, in exactly the same way you are continuous with this environment. And although we have been habituated to looking upon ourselves as separate things, we are no more separate from what's going on around us than each of these waves. Here are separate from the ocean. All that mount Tamil pies are separate from the planet Earth. We have great freedom of movement.

So do the waves of the gulls floating in the air. So do the trees waving in the wind. We have a larger degree of freedom than that because we are more volatile. But we are just as much waves in the total process. It depending upon us and we in turn depending upon it.

Now, I understand the meaning of there being no parts.

All parts are. Ideas. We have an idea of a part. We.

Chop things up and say one human being to human being, three human beings and so on, and so think of it as part.

But that's not the way it works.

You can see this from the most elementary neurology by understanding that it is the way you are as a living body that evokes the kind of universe that you see. It is your body which turns the sun into light, which turns it into heat, which turns water into wet and rocks into hard. And in turn, your body is one of the pulse sessions of nature, along with the sun, the rocks, the water, etc. so there's a mutual arrangement. It creates you or evokes you or does you whatever word you want to use. And at the same moment you do it and you do all of it.

So this is why. There was some kind of truth in astrology. I.

Say this, but at the same time, I suddenly don't consult astrologers and plot my life by the crude calculations of horror horoscopes. But because you if you do that, you get into endless tangles of self-deception because it isn't accurate.

But it has a principle. The astrologer was right when he drew a map of your soul. He drew a crude map of the universe. He drew the universe as it was at the time and place of your birth. The universe as it was, as seen from the point of view where you were born. And that was your soul.

So your soul, you see, is not in your body. Your body is in your soul because your soul is the entire network of relationships in terms of which you live.

Your soul is the whole universe.

But each one of us, as it were, is a different point in it. But all these points in it are the center. We can go way beyond Ptolemy and Copernicus now,

and if we think that space is curved, every point of space is the center of the universe, because any point on a ball is the center of the sphere of the surface. See, you could turn any point of a ball. And wherever you look at it, it's the center, isn't it? See, so in the same way, take a crystal ball in your hand. A crystal mirror.

And know what I mean, it's not a Crystal Miller, I mean a spiritual mirror. Look at it. And wherever you turn it, your face will be in the middle.

So in exactly the same way every place in the universe is the middle of the universe from a standpoint of curved space. So we go back to an entirely new Talmudic view of the world beyond Copernicus. Not that the earth is that. Yes, the earth is the center of the universe, but every other place is also the center of the universe. There is no absolute center.

So this is a an astronomical way of saying in Sanskrit. Talk to them, I see you're at. Everyone is rightly the center. You may think, oh, my mother used to say to me, you're not the only one. No, indeed. But in it but in a way, everyone is the central pebble and the feeling that you have of being the center, which turns out into selfishness and all this sort of conflict and scrapping is nevertheless based on something true. What we do is we misinterpreted. We don't realize that everybody else is the center to. In that sense, you are not the only pebble on the beach. You're not the only center of the universe, and yet there is only one center. And that's why. Who was it? I think it was an Bonaventure who first thought up the description or the definition of God as that circle whose center is everywhere and whose circumference is nowhere.

And.

This is a poem I seem to remember from Alfred Noyes.

Well, said the king. Oh, well, I have not found it here. Said the dwarf. And music echoed here. This infinite circle hath no line to bounded behold. Its strange deep center everywhere.

So this then you see, as I'm what I'm playing with here is what the Buddhists call the G.G. MLK.

That means a G means a thing event. Can you repeat it twice? That means between thing event and thing event more. There is no mutual obstruction.

This is called the doctrine of the mutual inter penetration of all things and events.

So it would be like those lovely drawings where you take a circle and you can play with this. It's a nice thing to play with. And you mark out 12 equal points around the circumference of the circle. Then you join every point to every other point. You get that beautiful star. And incidentally, this is the diagram of the notes of the twelve notes of the scale. BLOCK work this out.

And it's a lovely thing to see beautiful star.

So this is the diagram of the way it all fits together.

Now, if you study that. And by study, again, I mean not just think about it. But feel it out. You will find very strange thing happening.

That.

You will find that the present moment with all its particularity in which you live and are functioning now. Is exactly the same thing as anything you could possibly conceive of as eternity.

You will find that your limited life. And remember what I said about limits. You have to have something to push against your limited life with its frustrations and with its particular problems. At this instant is the same thing as omnipotence. And that your situation in space.

Which is appears to be in Sausalito, California, sitting on a boat which has a rickety old thing. Miles and miles away as China and Russia and England and Mars, Venus and everything.

But this particular point in space you will find in the same way by this law of relativity is the same thing as infinity.

Infinite space because it all goes together. It implies the infinite. The eternal.

All the energy of the universe is implied in any tiny hair on your skin, on your skin. It goes with it. Mutually implies this is the point. Just as the kind of cosmos and atmosphere in which we live. I my my existence implies that kind of an environment, so the environment implies me mutually.

And it all goes together. Now, the only reason for saying this. You see. This is really terribly obvious, but the only reason for saying it is that people don't know it.

And think instead that they don't belong, that this. You know, I'm just because of the parents put down, the children's little children should be seen and not heard. You don't belong here. Like I read the other day in some paper. Somebody was some young person was addressing a girl and saying.

He was trying to make love to you. He was trying to woo her.

And she said, you you won't be friends with me because you say, I don't like your personality. But you said you don't have to have a personality, a personality is something you had to put on because your mother didn't love you and you had to make up to her. Really? You don't need a personality because you're you. You're the essential things. And the personality is just a way of.

Performing to.

Ingratiate yourself. Well, we all do it because we put on personalities when we act like clowns and entertain the audience, put on masks, funny faces.

But really and truly.

The mask covers the oneself that we all have. And we all know it.

Only, just like black and white, we are pretending to be as different as possible while remaining the same.

I said that one of the aspects of cosmic gamesmanship that we were going to deal with was B group theory. And of course, I don't mean exactly by that sort of mathematical meaning, but the the relationship that's tremendously important and that is not sufficiently recognized between in

groups and out groups. You know how you've heard about little birds where they're cold and they're all huddling together.

The idea being to see who can get most inside and human beings are just like that. And so also is everything else.

Because, this is a an absolutely basic requirement of having an identity.

To have an identity is in some way or other to be in. I often try the experiment in giving a lecture and drawing a circle on the blackboard and asking the assembled multitudes what I have, what I have drawn, and people will almost invariably say that I have drawn a circle, a ring or a ball.

Only very rarely it some bright person suggest that I have drawn a wall with a hole in it.

Because the dished out theory of perception. It shows us that our attention is captured by enclosed areas as against open areas and by moving objects rather than still.

And so always, therefore, we tend to prefer the in the situation. That is something you see the the star is in THE SITUATION ROOM with respect to space, the space, the art situation. And so we feel that space is not important. It is nothing. It is just unimportant in a way. But the end situation is something. So then whenever human beings get into an out situation, like being a rejected minority, living on the wrong side of the tracks, they will find reasons for convincing themselves that their situation is the truly in one and that the people who claim to be in are really out.

So as I've sometimes said before, I hope this doesn't bore too many of you, but in Sausalito we have exactly that situation. We have the hillbillies with the old time people who regard themselves as in because they have the money and they live in the fancy houses up on the hill, and then we have the waterfront people whom they regard as out as a nefarious bunch of beatniks and bohemians and scallawag.

And so the people of the hill top fortify themselves at their cocktail parties with conversation about how awful the people are down on the waterfront

and at the cocktail parties down in the waterfront. People fortify themselves by discussing the squares on the hill.

And we believe down here that we have the true way of life, that we are not beating our heads out, making money to buy pseudo rocket ships. Although I do own a pseudo rocket ship, but it was wished on me because you see, I tried to be a bridge person.

That's what's called a pontificates one who between opposed classes points out the connections because the connection is that neither class would know who they were without the other. So it's tremendously necessary to have an outgroup in order to know that you're an in group.

In other words, if you belong to the church, which is the assembly of the elect of God, or if you belong to the synagogue, which is to be a member of the chosen people, an outsider, all those guys, then you know, you are in the sea.

But you must have the outsiders to know that you're in. There must, in other words, be beyond the pale of the village. The howling waste. Then you feel cozy. You feel protected. You feel you're there.

And so in that way, bodies have skins. Eggs have shells and so on. All through nature. Inside versus outside. About this versus must be understood as a form of symbiosis. And this is the crucial matter. This is absolutely of critical importance to anyone who wants to understand politics or military strategy or any of the real hard, tough games of life, that social conflict. Or conflict between the various biological species is a form of symbiosis.

Now, ordinarily, we consider the symbiotic relationship to be one of mutual support, as is obviously the case between bees and flowers. Which came the first be your flower. This is the same question as which came the first day. Go ahead. Because where there are no flowers, there can't be bees. And whether I know bees or other fertilizing insects, that cannot be flowers. So the truth of the matter is that bees and flowers, different as they are in appearance and separated as they may be in space, they constitute a single organism.

This is the real lesson of the bees and the flowers, and the same must be said truly of man and woman. There are no men without women. There are no women without men. Because it always takes a man and a woman to produce a human being. So we are our man woman arrangement, a woman man arrangement. Whichever way you want to look at it.

And so although you see, therefore, we move and look as if we are individuals. And separate from each other. This is not the case at all.

So now this is what I want to point out, is that the same sort of relationship exists between groups that would seem to be hostile to each other.

Now what are some of the bases of hostility? The real basis of hostility is that the biological order is a mutual eating society.

It's a very curious game indeed. And if you are philosophically inclined, it is one which might bother your conscience when you realize that you as an organism are a compound of murders. You are actually a bag of water because the human organism consists mostly of water.

And this water is held together and prevented from slobbering, prevented from slobbering all over the floor by a very complex arabesque of tubes and cells and films, the material of which was invariably belonging to some other being before you got it. You had to kill a chicken, a cow or a cabbage or an apple in order to get that tensile film of tube or whatever, to hold the water in you and as you.

And so we are, as human beings, a predatory creature. In fact, we are more predatory than anything else in nature. The sharks are supposed to be predatory, but they stay in the ocean. The piranha fish are supposed to be very predatory, but they stay in the Amazon.

The Eagles are predatory, but they stay in the air and on the land.

Only man ranges the whole range of elements earth, air and water and preys on things. And he eats like a swarm of locusts. Not only does he prey on the living beings he play preys on the minerals. And someone recently

described ARC our civilization as a lot of people sitting in the middle of a sewage dump shooting rockets at the moon.

Because if you you read get Playboy magazine for. September and read about the use of water or rather the misuse of water in our civilization. And it is absolutely horrifying. We've got to get that atomic power bringing this water from the ocean in nothing flat. Or we're going to be very thirsty. And you can see how we use water in the most amazingly uneconomical ways. So we are a predatory monster eating up the planet. And I have seen, say, a sorrow plant in the country covered with green fly one day. It is full of little green, succulent bodies having a ball a day or two later, stock with gray dust all over it. They've eaten up. They multiplied to the point of eating up the plant. And so they turn into great dust. Human beings could do just exactly the same thing.

And the reason why human beings are in danger of this is that they have refused membership in a mutual eating society.

They want to be top and only eater. And do not want to be eaten.

So that instead nowadays of returning what you aim to the earth.

We return our remains to the earth in an unassimilated form. Our remains include not only mummified formaldehyde in bodies, courtesy of the morticians encased in concrete so that no worms even get in, but also the fact that many things that we return to the earth are no longer in the organic cycle. For example, rust does not assimilate properly. All sorts of chemicals, all sorts of gases that we give off do not return into the organic cycle.

And we are ruining. We are we are actually abolishing animals. Wild animals have less and less of a prospect of living. Wild birds are being greatly reduced in numbers. Whales have almost are ceasing to exist because the whaling industry is getting rid of them.

And what is more, some of the animals we farm like chickens are no longer chickens. They are strictly non chickens which lay pseudo eggs because they are raised in enormous wire cellblocks and fed on chemicals under the

superstition that anything fed to a chicken will turn into chicken. And it won't. That is why you may have noticed that the chickens you buy don't taste like chickens could taste, especially those that have been allowed to run around in the sunlight and scratch, those can become real chickens. Because you see, the necessary thing about any species that you live on is that you must love it. I love you so much, I could eat you or I eat you so much, I could love you, but where you get things raised without love, you cannot love a whole cellblock of chickens.

You cannot love wheat when it is grown in vast wastelands or out of any trees and it is sheared off the earth and then winnowed and reduced to pancake makeup, and then chemicals are added to it and it is converted into the Styrofoam material called bread. Now, you know, like one converts milk into KAZIN so one converts wheat or rye into a plastic material, which is a kind of universal solvent, which is nothing at all and tastes of nothing at all. In fact, you know, when you feed babies that kind of nasty white pablum and you feed it and there was spit it back into the spoon. Well, our white bread reduces itself to that instantly on the contact with liquid and becomes a miserable paste. It's not bread at all. So if you are unwilling, you see to join the mutual eating society and you want to conquer everything and not be eaten by anything, the penalty you pay for this is the annihilation of your species and you eventually annihilate through eating things that taste like chalk and string.

That's what it will come to because you don't love what you eat. You have no respect for the raw materials.

So what we haven't understood then is that all groups need an enemy group, but that the enemy group which preys upon it is actually a kind of friend. Because the. Enemy group prunes your own group. It keeps your population at a reasonable level. And it keeps you on your toes. Because you have to defend yourself against it so you don't become flabby.

But you see in. We have lost the meaning of chivalry in all war situations and all conflict situations. Chivalry is indicated, for example, still in such customs as that the partners to a fight salute each other before beginning to fight and salute each other again at the end. You shake hands before boxing. You do these various things, you bow before judo contests and so on. And

that means that you recognize the opponent. As an honorable opponent. Somebody with whom a fight is a really important matter.

And that is really one of the most essential laws of survival to recognize that enemies, unless they are predatory locusts who have no respect, who do not, in other words, farm the species that they prey upon. That's the essence of the thing. You must cherish the species you prey upon. You must see like for example, in in lumbering, you must read. So you must plant a tree for every tree you take.

That is cherishing the species.

And few farm cows, you don't treat your cows, you often treat them better than you would your servants because the servants can go hang about, the cows are valuable, and so you nurture them because they're going to sell as beef and they're going to provide milk or whatever it is.

So the. The perception of the fact.

That is absolutely necessary to have an outgroup for your having an in group and that you cannot do without it is the beginning of sociability.

And so what you get then in that case is a situation of contained conflict. A conflict gets out of hand when an in group does not realize that it needs the outgroup. Then it says, let's get rid of the outgroup. Get the dirty communists off the face of the earth. But do you realize what a fix we'd be in without communists? The whole economy would fall apart because there would be no external threat.

And the communists are in exactly the same situation. They are kind of politics would fall apart unless there was some wretched capitalistic imperialists with whom they could contract contrast themselves and against whom they could organize their energies. Because it is a curious thing that is very difficult to get human beings to organize their energies for something pleasant. It's only under the fear, the external threat to their life that human beings will really get busy and cooperate. So the solidarity of any group of human beings. Depends to an enormous extent on an external menace, and therefore that menace is friendly to the solidarity and the

cooperative enterprise of the group. And this will be true of big groups as well as of small groups.

Even people who say, say in matters of religion, that religious exclusive ism is bad. That bigotry is terrible.

Those same people are actually playing a game called I'm More Tolerant Than You and so constitute an in group of the tolerant opposed to the outgroup of the bigots. There's no way of getting away from this except by transcending it with a sort of humor. When you see that the two groups need each other, you start laughing. When, for example, if I have people who argue with me with contrary opinions and who belong to different religions, I can't get mad about it because I realized that I wouldn't know what I thought unless somebody disagreed with me. And therefore your disagreement is necessary to the preservation of my opinions.

And this is this is the secret of humor.

So.

When you realize that. You are given one of the most important clues that there is.

To the nature of yourself.

Now, you see, we are all brought up in a huge historical, cultural, linguistic background, which has a very powerful influence upon the way in which we experience self. And we experience self as an enclosed island confronted by an enormous outgroup called the universe. Within me, within my body is a palpitating, soft, sensitive reality.

There is the self, but outside.

I don't feel when I hit you, you suffer. But I don't. It's the outside is therefore somehow alien. And it has been drilled into us, therefore, that.

The world as a physical entity of process.

Is an organization that goes on and on and on probably through all eternity,
but that the individual.

Is in it as a brief occurrence.

And is furthermore, as man, a tiny little germ living on an obscure rock
revolving around an unimportant star on the fringe of one of the minor
galaxies.

And that the other galaxies are much bigger and that there are more of them
than you can think of.

And so this puts us in this extremely remote position. As if to say you don't
really belong at all. Now, I explained yesterday a new cosmology where we
can surely say that any point in the universe can be regarded as the center of
it. There is no absolute center, but all points are the center. And so in the
same way, if we can see that, we can make a very curious psychological
readjustment to our life situation.

And learn how. What it is that we call I. It is not. A poor little puppet.

But that the situation of I.A., that is to say, are feeling central to all things.
Is a kind of distortion.

Of the true situation.

Which is that I anus and being anus and.

Existence all the same thing.

Only just as the sense of self requires the sense of other.

The sense of being here requires also the interval.

Of apparent nothingness, which we call this.

Life goes with death in the same sense of self goes with other we saw there
has to be this yang in rhythm, the crest of the wave and the trough of the
way. The crest is the life. The trough is the death, the interval.

Someone has asked me what I think about. The survival of the individual personality. And so you see this problem of death. It's very critical to us.

But you have to understand it and approach it by seeing that the real you is not the individual. If, for example, we draw a circle. And that circle represents the universe. Then we draw rays coming from that circle in such a way that you are drawing. Tangents to the circle which meet at points outside it. So making a star in which each ray is a point which focuses the entire diameter of the star.

Now turn it inside out.

So that the rays go inwards into the circle. So that inside the circle, the whole circle focuses itself at innumerable points within it. And then you have something like what we are. I said, using the astrological illustration that the soul is not in the body, but the body is. And so the soul is the whole universe. Focused at a particular time and a particular place, a here and now. And that is what you really are. In other words, those galaxies that are immensely far off and which you could think would have nothing to do with you, would all.

All that's in you.

And what you call your body or brain, your nervous system and so on is in you to.

Now, you can never get out, just as we can't get at the whole universe in the sense that if there is only one ball in space and that one ball constitutes the whole universe.

I showed you that we couldn't say whether that ball was moving or standing still because there is nothing else in relation to which it moves or stand still. So there's something about the universe as a totality which is always indescribable and get out of article. Now, that is the same indescribable ability and, um, get at ability as your own mind. There is no way, in other words, just as we cannot find a name for the color of vision.

The color of the lens of the eye. And so we call it transparent. No color. Of course we have to, because in the same way a mirror is has no color. Otherwise it would not be able to reflect colors. So at the root of all experience whatsoever, there is the non experience, which is fundamental to it. It can never be described in terms of any of the experiences within it, but its basic. And it lies between light and darkness coming and going. Life and death.

But there is no way of your as it were, possessing it.

And you have to realize that there is no way of your possessing it for the very simple reason that it is you.

So because.

Of the invisible and intangible nature of this reality.

One tends to forget all about it.

And to become fascinated instead with subsidiary features inside it.

Because it has no color, no shape, at least none that could be defined because it would have to get out, it's outside itself to define its shape. Now, for all practical purposes, it doesn't have any shape.

Therefore, it slips out of attention and especially out of conscious attention, because as I've pointed out to you, conscious attention always is a concentration on figures in contrast with backgrounds. And so naturally, the total background of everything that's going on. This is again what tillage means by the ground of being escapes attention. It is the very first thing we fail to notice. And so in this way, we've become absolutely fascinated with all the things going on inside it. And we start identifying with them and taking sides as if, for example, again, when you read the newspaper and you read out about all the terrible things going on, you find you get worked up, you get mad about this, that and the other. And before you know where you are, you're completely absolved. That's just in the same way as going to a play or in the cinema. You know, you get infuriated. You get excited. You get somebody you've identified, you see with the contest going on. If you

could look with at your blood with a microscope and see all the different kinds of creatures in your blood eating each other up, you would think that you were in grave mortal danger.

If that side is going to win. Well, we look at that poor thing. And that's part of me.

And so you get absorbed, you'd get partisan in that quarrel. So we're all in this way, absorbed in the daily events going on, the conflicts and everything like this. And we're taking sides not realizing, you see, that you can't actually take sides because you need both sides. You are both sides. You are self and other, you are inside and outside. How can you take the side of the outside against the inside? Cause if you won, you wouldn't be outside. You wouldn't be inside either. So then the project of ways of liberation, like Hinduism and Buddhism and Daoism is to restore to the fascinated individual and awareness of his eternity.

And his Infiniti.

Not necessarily in terms of what we ordinary ordinarily call personal immortality, a system in which we would be able to go on into a future life with memories of all the past lives through which we have lived or past times in which we have been. So that I could address myself to the pleasures of heaven in the person of Alan Watts. I think there might be something mutually exclusive about that.

But in another way, I'm much more interesting way, because, as you well know, if you think it through that, if you remembered forever and ever.

And it had a kind of continuous cumulative experience that after a while you would want to forget things that had happened.

You see, forgetting is as important to remembering as elimination is to assimilation.

Just as you don't simply eat food, but you let out the excrement. So in the same way in ones that we were discussing this morning while somebody

brought it up, an analogy between the mind and the digestive system. So forgetting is tremendously important to one's mental functioning.

That's why we sleep. That's why we have these intervals of unconsciousness and unconsciousness renews things. You remember, don't you, your childhood when the world was new to you and how extraordinary it was and how very beautiful.

Well, if you want to go on being an adult for always and always and always, you can never have that experience again.

Because you've got to die first.

And see it all anew. And that is why all initiation ceremonies involve a symbolic death.

What you call dying to yourself in various rituals, people are put in coffins and all books of the dead, like the Tibetan Book of the Dead and the Egyptian Book of the Dead actually are coded references to initiation rites and initiation processes whereby you die to come alive. And that is for this reason. Thinking about death is extremely productive. You you know, it's so difficult to think about death, isn't it? Imagine what it would be like for consciousness to cease and never occur again.

To go to sleep and never wake up.

This is a consideration which teases you out of thought.

What would it be like to start out of nothing at all, as it seems that you did when you were born, that equally teases you out of thought? What is outside space? You see all these questions which are beloved of children. Bring you to a point where you have to stop thinking you can't possibly imagine. And that is a creative moment. When Salt is nonplused. Because what you have got to at that point is yourself. Just in the same way as you cannot conceive yourself in its vastness sense, in the sense of being one with the universe, so you cannot conceive these particular questions that I have raised.

And you will find, if you think long enough about death, about the possibility of your total disappearance and which will, so far as you're concerned with the total disappearance of everything else, there's a clue in that you see as to who you are.

If you think long enough about that, that will occur. A curious flip yang leads to yin. You will realize that the infinite nothingness into which you will disappear when you die was the same infinite nothingness out of which you came when you were born. Do you remember not existing for millions and millions of years before you were born? You see how it flips, and so you will see the rhythm of this that, you know, of course, from objective observation that after you are dead there will be babies born baby humans, baby snakes, baby beetles, babies, Biden's baby fish.

Billions of babies.

You've watched people die and you've watched babies born later. So then you will be every one of those babies. Only one of the interesting properties of being a baby individual is that you can only experience yourself one at a time.

That's the game.

There would be no point in experiencing yourself as many eyes simultaneously because the nearest thing to that would have cost of being the self of all the cells in your body, which are coagulated into one individual.

But you are all of those ones that are born.

But each one, of course, experiences itself in the singular. So you can expect very well after your dad to have the same experience in general as you had when you were born. Now it may be that you are born again as a human being. Or you may be reborn as a fish.

But if you are a fish, you will be in a situation where you feel that you're a human being and that people are fish. I mean, there are something else. They are another species. You are the center species, which is the human

situation. So it will be like it is now. It keeps repeating itself only it does it with variations on a theme. That's the reason for the many different species, many different kinds of consciousness. So you do not need if you understand the sense of this, you do not need to believe in any secret supernatural information which I might have access to and you don't. It is perfectly obvious what's going on. You would say, but there is no connection between me and somebody else living later. My dear friends, there is no connection between the molecules composing your hands. There are no strings joining them together. There is nothing but space between. There is, as I talk, no connection between the sounds I am uttering because they are vibrations. And if you magnify the sounds, I'm saying that means you would have to slow them down on a recording system. You would eventually get something that go.

Ah, ah, ah ah ah ah ah ah ah ah ah ah ah ah ah ah ah ah ah.

And you see, I can goggle that a little so that you can I get a deep bass enough.

You can actually hear the texture of the sound. That is to say you're beginning to hear the spaces in the vibration. What is the connection between these things. Well you say as you listen to it while I'm talking to you, it makes perfect sense.

Or is this one sound. Sounds like it's one sound continuous, but it's not.

It's discontinuous.

But when you look at it from far enough away, it looks like it's continuous.

So it is with connections between lives. With connections between anything whatsoever. There are no connections. You could look at the universe from it, the prickly philosophy. Point of view and see it as purely discontinuous particles.

Pop up, up, up, up, up, up, up machinery. But if you are a good type person, you see it as all continuous to relay these themes that are. But. But, but.

But both points of view are correct.

So if you want to be continuous, you go a little bit to go. If you want to be discontinuous and some people would much rather be dead when they're dead, then you can go over the particles about you must realize you see that the differentiation between particles and waves is a differentiation that is necessary to both sides of the difference. You'll always find this is so whatever kind of duality you make, you will never be able to escape non duality, which is what holds duality is together. So cheer up, the whole system is rigged.

Laughter You're it, only you. You learn to be bugged. Yes, to be bugged, to be phased by eventualities.

See? Well, suppose when you're a baby. See, this is pushed into you by the whole society. The baby know and see when they first arrive in the world. The babies know that. They can't say because they don't have any language. They know who they are. They have what Freud calls the oceanic experience. I don't know really how he found this out.

See, the problem of a child psychologist is that we would just love to teach an infant to talk so that it can tells it how it feels not to be able to talk about how things are before you get any concepts. And so we have a kind of a theoretical notion that a baby experiences the whole world is its own body and that makes no differentiation between itself and its mother.

And so on may be very probable. As a matter of inference, cause none of us remember quite how it was. We don't we can't remember because we didn't have any words to put our memories into no notation. Memory depends to a large extent on such notation.

Well, you can get regressions by hypnosis and maybe they tell us something, maybe they don't.

But at any rate, what happens is that as you start to grow up.

You.

Let me put it like this. I think I can get this across to a baby.

Nothing has any special value. Life is just a thing that you knew you.

Dee dee dee dee dee dee dee dee dee.

See, there's something just happening. There's just the play of energy, see, and there's nothing to say in it that this is the right noise and that's the wrong noise.

This is the right shape and this is the wrong shape. It's all just shape. It's jazz with no discriminations to what ought to happen, what ought not to happen when the baby is in pain.

It hasn't yet been taught that pain is bad. The baby just squawks and squawking isn't necessarily bad. Until mummies teach babies that they ought not to squawk, then squawking becomes bad.

Now when you get enlightened at the other end of the road, you will once again see that everything that's going on is just going yo, yo, yo, yo, yo, yo.

And all kinds of ways. Marvelous. It has no value. There's no it doesn't have to go on. But as a matter of fact, if it stops, stopping means going on later.

It's just an interval.

There's nothing except intervals. You can't just dismiss. There's nothing outside space. You can't stop permanently.

Supposing you take the theory that the universe is called the explosion theory of the universe, that there was a big bang some time or other, and that all these galaxies were flung into space and they are systems of falling energy and eventually they'll fade out.

That'll be that. Well, then we'll. Well.

But then how did it ever get to start? I mean, presumably before it all happened, there was nothing going on, which will be the way it is when it

stops. Anything that happened once can happen again.

So, I mean, you may say I can't prove that. You may say that is my metaphysical leap of faith, that anything that happened once can happen again.

But I would like to be able to bet on it if I could find some way of collecting the winnings, cos if I lose I'll never know I lost.

But I think this is the way it works because everything works that way. Only the thing is that you don't don't worry about not retaining your personal identity because you would get absolutely bored with it if you could.

Enough of it would kill you.

And indeed does so in that far eastern philosophy.

Human life is looked upon very much as one looks on the seasons. And spring, summer, autumn, winter.

And as that is felt, especially in Japanese poetry, it would be an absolutely essential rhythm in the rhythm of the seasons.

So to that is felt to be this marvelous rhythm in the biological cycle, in the life cycle. And you will disappear. But she will reappear. And the interesting thing about it is this.

You could reappear in a form very like what you are now, just in the same way as two performances of a given musical piece are different performances and yet the same composition.

And there are all possibilities of making this energy system.

Go into every conceivable kind of complexity. Differences of shape and differences of games and every conceivable sort of possibility.

And it's going wow, well and all the time.

Now, the moment you see this is an essential step.

You might call it in the meditation process is to see this is to see everything as nonsense, as completely meaningless.

That being just what it is, is what Buddhists call seeing things as of one suchness. The words such as this in Sanskrit is *cathartica*. And that means *Dada*.

See it like this, when you get to seeing everything like that where nothing matters, it doesn't matter if you die this instant because that would be one kind of a jazz. You go on living a long time, it'll be more kind of jazz if this happens. If that happens, it's all just kind of jazzy. You get to being able to see that. And simultaneously with seeing that, it becomes perfectly obvious that you sitting here are a continuous life with everything else all around you.

One life.

But that the jazz, which is called feeling that I am myself as a way of going, Billy, believe me, we will be this way and then feeling that something other is a thing because of rapid and rapid, rapid, rapid like that. You see. But it's all, as it were, banging on the same drum.

And he was a drum.

Well, now, following on from our discussion yesterday afternoon about relativity and about the mutual inter penetration of every individual thing or event in the universe with every other one. And having previously discussed in the morning the yang yin principle, the inter relation of the opposites. We are in a position to take a look at the meaning of this extraordinary classic of China, the book of Changes.

Call the aging, not the way cheap.

I'm afraid that the way that we romanized Chinese words, there's very little resemblance to the way they are pronounced. That's because the scholars have a secret conspiracy to outgroup everybody else, because only if you're in the know do you know how to. The fact that it should be *jing* when

there's no apostrophe after the C H, but Ching when there isn't an apostrophe after this the H.

And so it goes.

So the aging or the book or aging means a classical book scripture. The Sanskrit Sutra is translated into Chinese by Jean. So the classical book. The book of ye, which is change. It is suspected that the character for he was once a picture of a chameleon or lizard. And that because in the same way that the chameleon changes its color on whatever background that's put, so it came to mean change. But you see then that idea of change. It isn't simple, change is an idea of adaptation, an idea of harmonization with surroundings. And one of the basic ideas of Chinese thought about nature is a word that means resonance. As when tuning forks respond to each other. And so the resonance between any individual event and the context in which it occurs is one of the most important things that strike the Chinese mind. For example, if we take blood. Blood in the veins is not the same thing as blood in a test tube because it's in a different environment. It is not behaving in the same way.

And to a very large extent is, you know, I must say that a thing is what it does.

But this I never tire of pointing out this fundamental confusion in our thinking by reason of the fact that grammar contains both nouns and verbs and therefore gives the impression that there are two quite distinct classes of reality. One is process denoted by verbs. The other is.

Stuff. Objects, entities denoted by nouns, but actually there is no need for this division because all nouns or so-called things are processes.

They are particular forms of behavior. And we never can possibly describe anything but their behavior.

We can say what they do, but we never can say what they are and we can never say what does things. There isn't any need for anything that does anything. All you need is doing. That is energy. And that's enough for anybody. What is energy? Well, look at it and you can see for yourself. You

don't need to define energy, just like mathematicians found out that for purposes of geometry, you don't need to define a point. You use points, but you don't say what they are. To say that the point is that which has position, but no magnitude is a lot of nonsense position, but no magnitude.

That's just gobbledygook and it's based on human beings being confused by the words they use. So in this way then in Chinese thought. The world is process. And it's changes because behavior is change. And so they watched the rhythm of behavior and as you see, basically one of the basic rhythms of behavior is a wave. Waves on the water, waves of sound in the air. Light waves. And the nature of a wave is that it's Yang Indian. It has a crest and a trough. Now, you can't have a crest without a trough. You can't have half a wave. There is no such thing in nature as a half wave. So there are always full waves, at least one full wave in any energy system.

And that implies a now you see it, now you don't. An up and a down, a crest and a trough. And those are the crest is the yang and the trough is the yin. Well, now the book of Changes has a very mysterious history.

And scholars are naturally disposed to believe that a great deal of this history is pure legend. But there was supposed to have been many thousand years ago a great sage emperor by the name of Fu Shi, who was followed in due course by a king whose name was one. And full, she is said to have looked around and studied nature and to have felt the forces in it and to have invented what I call the bar gua while the eight tri grams.

Now you see if you will arrange yang and yin, which are represented by broken and unbroken lines, unbroken line for yang, a broken line for yin. You if you combine these in groupings of three, you have eight possible combinations. For example, three young lines which are unbroken will then represent what the Chinese called Chun or heaven. Three broken lines being all young or female will therefore represent the opposite of heaven, which is earth. To. Broken lines. On either side of one unbroken line will represent water and the opposite arrangement to unbroken lines on either side of one broken one will represent fire. And so on until you get eight fundamental elements.

And this this call the back wall you will see on the national flag of Korea. There it is with the Yangon symbol. The two interlocked black and white comers in the middle. And you will find this symbol of the young in and the Barca on ever so many plates and Chinese objects, the backs of mirrors and things like that. It's a very common thing. And the idea is you see that it represents eight elements of the process of nature.

Now, we used to say in the West before in a pre scientific age that there were four elements Earth, Water, Fire, and we got this from India. The Indians at another one actually called Akash, which is space. We say now that is pretty scientific gobbledygook because actually there are how many elements today, 90 something have been established by chemistry. But it's the same sort of thing as saying there are three primary colors, so many colors in the spectrum. So many notes in the scale. It is simply that in order to describe nature, you have to divide it up some way. For example, in classifying people, there are various schemes have been worked out. We talk about there being extroverts and introverts and Young made up his four functions so that he could describe intuitive type sensation types, thinking types and feeling types. Sheldon has his own special way where he can talk about atom morphs, may some offers an end themselves and then have them variously cerebral tonic summit a tonic and visceral tonic. And he could combine these three in various ways.

Now, a man like Aldous Huxley was quite obviously a cerebral chronic victim of the long, skinny intellectual. But if you look at any of these sort of classifications, you can always find flaws and they never really fit.

And so in the same way, the same political classifications that we have don't really fit people because their opinions are always too complicated unless they're quite stupid to be able to be fitted into any of these divisions in a precise way. But nevertheless, you can't do without classification of this sort. You can't do without spectra. We used to have a sergeant in training in the in the army in England.

We used to teach us about rifle shooting.

And he said to die, well, he's going to practice aiming all for wind. Now there are three kinds of wind.

Mile Frisch and Strong and three kinds of women that are stuck with it.

You say because as always, you can always think of this extreme, that extreme and something in the middle. Well, now you've got us something a little richer to play with if you have eight instead of four. And that's the the sort of thing that the aging classification is based on. Now then, that was who she was supposed to have invented these things.

And there is another legend that he saw these tri Grams by heating the shell of a tortoise until it cracked.

And then studying the cracks in the same way Leonardo da Vinci used to go to a filthy old wall where there were all sorts of bird droppings and scratches and markings, and he would do a Rorschach blot on it and he would see a great battle scene.

And this would give him inspiration for a painting.

This is the same thing that you do when you gaze in a crystal ball or when you look into a deep pool of ink. There are all sorts of ways of what is called divining.

To divine is to consult the oracle. Like, it's like a word to divine. You see, there's a subject called divinity, which has to do with the Scriptures, so to Divine is to study the Oracle, just as Lincoln Stein wanted to make a verb out of philosophy philosophy. He always start to do philosophy.

Philosophy isn't just the subject, it's an activity. And so to divine is to call upon the unconscious.

Instead of thinking something out in a logical way, you allow your imagination to flow into something that is useful for an oracle, whether it's a Rorschach blot or a crystal ball or a hex, a gram of the book of changes.

For after Fuji King won combined the eight tri grams and there are obviously 64 possible combinations of eight. And so the book of changes is simply a setting out of the 64 hex grams with a commentary on them.

And when you are a beginner in the art of the book of Changes, you need the book. You look up the commentary to help you find out what the heck's a grand means. But when you are an expert, you don't need the book. You simply feel the meaning of these combinations of two elements. Now, the theory of the book of changes is a very curious one. It is related to G.G. mugging, that is to say the mutual into penetration of all things and events, and is based on the idea that anything that happens at this moment will be related to this moment because it's in the context of this moment.

Therefore, the way I would do something at random at this time will be what we call a sign of the times or a manifestation of what in German is called the zeitgeist.

The spirit of the time on the mind of the time.

Another way of putting it would be the configuration of the time.

And it's in the same way that, for example, astrologers cast what is called a Harare horoscope. That is to say, as of the moment. What are the stars? What is, in other words, the configuration of the universe? And so in exactly the same way the aging philosophy is based on the idea that how one randomly select the arrow stocks or the sticks or tosses coins.

In a given situation.

And you might define the situation by asking a question that random pattern that falls will be related to the situation.

And you can divine something about the situation from it. I remember a Zen master who used to use the edging. He had another way he would take anything. He took, for example, one day a bowl of flowers and he looked at the pattern of the arrangement of the flowers and derived a hexagram from the pattern. And from that he told us about the mood. The person who had arranged them had been in. Now, of course, this is all from our scientific point of view, unverified and maybe unverifiable.

And of course, a scientific person who pulls this kind of thing. Because he was in it's not the way to go about deciding what to do in an important

situation when you have to decide upon action in an important situation.

What do you do if you're a scientifically minded person, if you study all the relevant data and you get information, and then on the basis of that information and past experience and previous scientific studies of behavior, you decide how this situation is likely to turn out. But there is a very serious problem about that. It is not any use for practical purposes.

It is only applicable in trivial situations which are highly controlled in an experimental way. For example, in the old times when you went to the doctor, he would look at you would produce and smell you and come up with some feeling about what was the matter with you. No doctor will do that today.

They say they don't move unless they take innumerable tests. See? So you are tested and measured? Precisely. Then they come back and they think about it. But, you know, they still don't know what to do. Because there comes a point in any decision making process where you have to act on hunch. How do you know when you've got enough data about in situation when to call a halt because you can go on collecting data forever?

There are always infinitely many variables in any situation whatsoever and especially in the human situation. So ultimately, you don't kid yourself. You are always deciding on a hunch what you're going to do.

Even the best informed person ultimately comes to a leap of intuition before making a decision.

So then when you really don't know which way to decide on a certain thing, people say flip a coin.

You know, you can always rip Christians on this because the disciples of Jesus cast lots and to make a decision.

And but we always doing that. You're fundamentally always at the point where you don't decide for what we call purely rational reasons.

So then. Flipping a coin gives you two possibilities. Yes or no? Now, let's suppose you had an eight sided coin.

The six sided dice is a little bit richer. Instead of giving you. Only two decisions are possibilities here. You've got a possibility of variation. Now let's consider a 64 sided coin. That's what you've got here.

Now.

Again, when you get the oracle in the aging. It is never.

Terrribly specific, although sometimes in your given situation it seems to be absolutely specific when you consult it. But on the other hand, you usually use it like theologians use the Bible. That is to say, they read into it anything they want to find. Only you mustn't do this deliberately.

You have to let your own unconscious processes read the oracle for you and decide what it means. In other words, you use the Oracle like a Rorschach blot. And the wisdom of that is this that your brain, if it is your brain and nobody really knows. You see, just to put something in parentheses is the brain, the mind.

Some say yes. Some say no. One would think that the structure of the brain has something to do with the structure of thought. But on the other hand, it may not in the same sense that a structure of a radio has nothing to do with the message that comes over it. Although Marshall McLuhan says he belongs to the other school, see that the medium itself is the message.

What is the relationship, for example, between the grid pattern of a newspaper photograph and the picture? The same grid pattern can convey any picture. So there seems to be a complete irrelevance between the two.

But on the other hand, there is not quite as much irrelevance as you might think because any picture reproduced.

By this method.

Has some connection with a time and with a technology that can produce this method.

It's a rather roundabout connection, that one. But nevertheless, from a big point of view, it's a very close connection.

Depends where what what framework you're looking at it and whether you've got a very big framework or a very narrow one. But so when it comes down to it and you don't know how to make a decision or write you, then you consult your brain. Now I'm using the word brain here to mean a complex organization, which you have at your disposal. Which you don't understand and which is much smarter than you are.

Because you see, whatever it is, that is the mind, the brain or whatever. I don't care what you call it. It takes care of ever so many things at once which you could never possibly think of consciously.

You can't be bothered consciously to regulate your glands, to see that your blood flows all right all the time, but your nervous system is taking care of that. It is regulating at all. Your nervous system is receiving information which you don't know anything about. Because when we look consciously, we by no means notice all that our eyes see. But your mind or brain registers everything that is input to your eyes. So genius in thinking is fundamentally based on being able to trust your own mind.

And not confuse your mind with the content of conscious perception. The content of conscious perception is a tiny fragment of what's going on around you.

You can train yourself to be more receptive than you are in ordinary consciousness. But this isn't quite the point. It is not like how many things did you notice?

You know how you can play a game of children and then when they become boring in a car and they get out a pad and write down how many things you noticed as you went along.

The scouts play this sort of thing. That's all right. But that's not the point here. The point here is not how much did you notice?

Because there's no end to that. You can play that game. And there are infinitely many things that you could notice. The point is to take them all in in one glance.

And you can't do that with conscious attention, but you do do it with your basic neurological or mental equipment, whatever you want to call.

So therefore, you have a choice disposal this amazing computer or whatever it is that can think. Multidimensional. On ever so many levels at once.

Now thousands of years ago.

We don't know how far all this goes back. But people. Naturally, I trusted their minds to tell them what to do.

They didn't make decisions. They did what they felt like.

RS we should call it. They followed instinct as animals do. Then they discovered how to figure.

Through language and through numbers, they found that figuring.

Could be very effective. And they started using it and relying on it more and more and more.

And as a result of this developed anxiety. Because when you don't figure and you live purely spontaneously, you never worry.

If this decision is disastrous, it's disastrous and death will hit you in a hurry and you never know what it is. You don't spend all your time worrying about did you make up your mind in the right way?

And you see that may. Lead to trouble.

But the thing is that people don't realize is that everything leads to trouble in any case. If you develop the intellect and its calculation processes to an

excessive degree, what do you have? Well, you have the weapons lab of the United States Air Force and you have the Russian this, that and the other and the Chinese, something else you have planned disaster.

If you leave it alone, which is what the Dow is mean partly by way or non interference, there will still be troubles in the world, but you won't have to worry about them.

And you will float along and you will feel very free. And the question is to try and calm modern people into living that way.

Now.

I'm putting this you mustn't take me too literally.

Because for a really well-developed human being, he isn't one who simply abandons thinking and planning because after all, that is some faculty that we have in just the same way that a bird has a beak.

And you don't want to, as it were. Amputate your faculties.

The point is rather something like this.

We have to recognize the hierarchical situation of our faculties that the thinking faculty is the servant of the larger mind. Which doesn't need to think. Just as God, if I may use that expression again.

Wolf, you asked him how high is mom long in millimeters. He would say, well, I really don't know.

I'll have to measure it, because to ask that question is to ask.

The relation of mom long to a ruler.

My blog is not in itself any millimeters or meters in height. That is it. What is this is simply a short way of talking about comparing it with a scale and knowing what it is in height is the same thing as comparing it with the scale. So the Lord would have to say, I must get out my ruler. Just in the same way as you don't know how you breathe, but you do it. So the Lord

God creates the universe without knowing how it's done. That is to say, knowing in terms of technical considerations. But you still know how to breathe. Even if you don't know how you do it because you do it. That's knowing how to do it.

You know how to walk. Do you know how to think?

Nobody does, but they do it.

So then this unknown process produces the knowing process, but the knowing process is subordinate to it.

And therefore you have to learn how to include thinking.

In spontaneity.

But it's subordinate to spontaneity. That's when I wrote that thing in the bulletin about Suzuki and ended with a quotation in which he described his own life as a thinker because he was an intellectual. He was a scholar. But he did scholarship. In the spirit of spontaneity. He used thinking he was not used by thinking. And when I say he here, I am referring to the mind beyond consciousness.

Now, the mind beyond consciousness, we discussed that a little bit of this yesterday that we call.

The self with a capital s as distinct from the ego. And I pointed out why the horoscope was traditionally considered to be the map of the soul and that the body is in the soul, not the soul in the body. So the mind that I am talking about is not merely your nervous system. If we will talk about it now in physical terms, it is not merely the nervous system, but it is the entire physical environment in which your nervous system exists and all the relationships operating within it.

That's your mind.

In other words, the kind of mind you have at this moment is impossible without your living in this kind of a society. Your mind includes the

telephone book, the Encyclopedia Britannica, the University of California and everything else going on, say, in the intellectual world. Every one of us exists mentally in relation to the total intellectual process going on in this day and age in society.

You draw on it. It infiltrates you. It provides you with language.

You didn't invent the English language.

It was given to you as a result of a social enterprise. Going on for thousands of years.

So in this sense, when you consult your mind, you are consulting the entire organization of the universe as it is immediately, more immediately reflected in the structure of your nervous system and everything that your nervous system is doing. All the kinds of messages that are running through it. It is these messages that constitute the mind.

And so this is what Buckminster Fuller means when he talks about synergy s why n e RG y means the suit from the Greek scenario. Goss working together and.

He believes.

That any organization has more intelligence than any one of its members. And he therefore goes on to believe that the industrial complex of communication systems covering the face of the earth is developing its own intelligence. And it will be much more intelligent than any one of us. And this may perhaps save the situation. We don't know. I mean, one illustration of this is that I'm very familiar with this, our transportation. Now, every country in the world has invested a fortune in jet aircraft, and by Jove, these things have to run. Otherwise they fall apart. So they must run on time. And this network of air communications is joining every city in the world together, so that by 1968, according to Buckminster Fuller, we have a one town world. Figure it if it takes you an hour to get from here to New York in a supersonic craft. New York is only as far away as Palo Alto. Well, that's practically in the same community. And this is going to include Tokyo and Moscow. And Paris and so on, and they're all going to become

the same place. They'll speak increasingly the same language, share the same culture, eat the same food you can fly in San Francisco.

Bread to Paris, which is being done because of some of the bread made here, is better than the bread made.

You know, it can go the other way to. And we're going to share a common urban culture. And this is the work of synergy.

Also, the aircraft, people get increasingly bored at passport and customs regulations because they hold up traffic.

Well, now. Then.

You might like to see how the aging is used. And.

I have here mainly for symbolic reasons. Three ancient Chinese coins.

You will see that they have a square hole in the middle and that on one side they're inscribed and on the other side they're not, the inscribed side is counted as the thin face and the undescribed side is counted as the end.

And when you. Use the book of changes. You usually face it with a question.

And it seems to me that a good question that it might be faced with is what should the people of the United States do about China?

And you I respectfully request the wisdom of the article in this matter, and you throw the coins down to see how they fall. And what I have is one yang and two yens, strangely enough, that counts in the system and I don't quite know why.

As.

What's called the young. Young. I think maybe I do know why you would think it would be a yin. With two yens and one yang. But it counts as the young yang.

And that's the bottom line of the hexagon. And by being a young, young means it's a fixed line. It doesn't change. Perhaps the reason why that's called the the young young is that when you've got two eons and one young, it means the yen is weakening and the yang is coming up. Because when you reach a point at which the enforcer comes to a maximum, there is in it the seed of the young force.

And vise versa.

And you see, you have to do this six times to get six lines.

So this time we have two yams and one in which gives us the young in not again is a line which doesn't change. And we get to yens and one young, which gives us another young.

And there's made the heck's a gram of water. No fire.

And this time we get three yen, which gives us a changing yen line, which is written like this.

That means that after you consult the heck's a gram in its first form, you consult the hex a gram, which is so far as that line is concerned, the opposite.

Again.

Two yens and one yen giving us the young yen. And we get here. Two hands and one in. Which gives us the young man.

And so we get far over water.

Fire, no, water over fire, water over fire. Cool it, baby.

So that is fine. Sweet, sweet, sweet.

When the 63.

See, the article is often very surprising. 63.

DG Meaning after completion.

This hex gram.

Is the evolution of tie of the hex a gram number eleven meaning piece?

The transition from confusion to order is completed and everything is in its proper place, even in particulars. The strong lines are in the strong places, the weak lines in the weak places. This is a very favorable outlook. Yet it gives reason for thought.

Authorities, just when perfect equilibrium has been reached that any movement may cause order to revert to disorder, the one strong line that has moved to the top, thus effecting complete order in details, is followed by the other lines, each moving according to its nature and thus suddenly there arises again the hex gram P number twelve, which is standstill.

Let's see, we're going to move to.

Forty seven. Now here comes the the oracle itself. It says after completion, which is the name of the hexagon.

Success in small matters, perseverance furthers at the beginning good fortune. At the end, disorder. Then following the judgment comes another part of the oracle called the image. Water over fire. The image of the condition in after completion. Thus, the superior man takes sort of misfortune and arms himself against it in advance. And then there's a comment on the lines.

And we have a an eight in the.

Now a 6. In the one fourth place.

And the oracle here says of this line, which is a moving one. The finest clothes turn to rags. Be careful all day long. Now, there are many comments on this. But we should look first at the A gram it turns into. Which is, uh, no, I say 43.

I think I said. What if seven turns into forty seven?

Well, the one it turns into indicates the direction of the motion of the.

It turns into cotton, which means oppression or exhaustion.

With the lake above and the water below.

The judgment is oppression. Success. Perseverance. The great man brings about good fortune. No blame when one has something to say.

It is not believed the image.

There is no water in the lake. The image of exhaustion. Thus, the superior man takes his life on following his will. There is a comment on this one, it says the lake is above water, below the lake is empty. Dried up. And once the water flows out, exhaustion is expressed in yet another way at the top. A dark line is holding down two light lines. Below a light line is hemmed in between two dark lines. The upper tri gram belongs to the principle of darkness. The lower to the principle of light. That's everywhere. Superior men are oppressed and held in restraint by inferior men.

Now, the commentary on the judgment of the original Hex Gram reads The transition from the old to the new time is already accomplished. In principle, everything stands systematized and it is only in regard to details that success is still to be achieved.

In respect to this, however, we must be careful to maintain the right attitude. Everything proceeds as if of its own accord, and this can all too easily tempt us to relax and let things take their own course without troubling over details. Such indifference is the root of all evil symptoms of decay are bound to be the result. Here we have the rule indicating the usual course of history. But this rule is not an inescapable law. He who understands it is in position to avoid its effects by dint of unremitting perseverance and caution.

And then the image, which is water over fire when water in a kettle hangs over fire. The two elements stand in relation and thus generate energy. But the resulting tension demands caution. If the water boils over, the fire is extinguished and its energy is lost. If the heat is too great, the water

evaporates into the air. These elements he had brought into relation and thus generating energy are by nature hostile to each other.

Only the most extreme caution can prevent damage in light junctures when all of.

Pursuit of Pleasure

We can consider the pursuit of pleasure in two broad senses.

One which might be called lower than the other, which might be called higher, although I'm not very happy with that classification.

There is the pursuit of material pleasure and art. Very much neglected in this day and age. Because it must be carefully distinguished from the pursuit of theoretical pleasure. The pursuit of material pleasure is an art requiring a difficult discipline. Much devotion and much skill. And it ranges through all the activities of man. Engineering. Cookery.

Clothes architecture. Love making. And the so-called fine arts, music, literature, painting, sculpture and so forth.

But we are living in a culture.

Where the pursuit of material pleasure is, as I say, neglected in pursuit of a symbolic pleasure, which of course, like many religions, has its prayer mat because a monetary unit.

Is, of course, useful in exactly the same way that inches and hours, days, months. Pounds, grams and other units of measure are useful. But nobody has yet made a claim to fame by collecting inches. I have more inches than you because it is not a matter of social agreement that the possession of inches represents the possession of wealth.

It is a matter of social agreement. And this is the only validity for money having any value whatsoever is that everybody agrees that the chips are worth so much. And money is exactly like poker chips. Except there's an

agreement between all of us that we will accept them in lieu of goods and services.

But goods and services constitute real wealth.

And we are living in a society where we eat the menu instead of the dinner. Because we are more interested in accumulating the tokens of wealth than wealth. And this flows over from symbols such as money itself into many other dimensions of life, because we tend on the whole to confuse symbol with reality.

The idea that this world that we see with our five senses is a material world is merely an idea.

Materialism as a philosophy of nature, dialectical materialism, naturalistic materialism is a point of view. It's a concept. It's very, very highly abstract notion.

So equally is the notion that this world that we see with our five senses is basically mental or spiritual. That also is a concept. The actual world is neither spiritual nor material. There is no way of saying what it is because it is like mystical experience, ineffable. It cannot be left or spoken from the Greek *fehmi* to say. So. That world, which is neither spiritual nor material, is the neglected world.

Most people think of it as material, but it's very much overlooked. Symbols are substituted for it.

That is to say, we have symbolic goods.

People live in symbolic homes, drives symbolic automobiles where symbolic clothes.

Which are valued for what they cost. Rather than for their quality.

And this is, of course, as I've insisted perhaps that nausea especially manifested in what we eat. We our standards of cooking are improving.

Thanks to Gourmet magazine and a few redoubtable people on the radio like Julia Childs.

But by and large, the food of even wealthy people.

It's disgraceful.

It is symbolized by bread. Which is supposed to be our staff of life and we eat nothing but a kind of consumable Styrofoam fortified with vitamins, and you can read the list of them on the wrapper as if it were medicine.

Also in the pursuit of pleasure, in the form of the fine arts, we don't really enjoy it. An enormous number of reasonably affluent people who attend concerts and go to exhibitions of paintings go there because they think they are improving their minds. That in some way doing things like that is good for you. People go to church for the same reason. That's the last reason for going to church because it's good for you. That is an absolutely morbid interest because it distracts you from what is going on. If you listen to. Bar, because you think it's good for you, you're not listening. In order to listen to bar, you have to swing with it. And then you forget all about whether it's good for you or not. In fact, it feels more like things that are bad for you when you swing with Bach, it begins to feel like sex.

As everybody knows, that's terribly bad for you.

So I'm not going to dwell at any very great length on the niceties and the disciplines of the pursuit of pleasure in that so-called lower sense. I only want to say in passing. That. If you don't have. The realization that the pursuit of material pleasure requires a certain degree of asceticism.

You won't be able to pursue any other or higher kind of pleasure.

Because. Asceticism is not unpleasant.

Asceticism is like an olive between wines you cleanses the palate and what's the matter with olives.

It is like.

Taking some sort of exercise. Which can be very pleasurable indeed, provided you don't do it grimly. There is a dreadful exercise being used today called jogging, which has absolutely nothing to recommend it because to begin with. When I watch people jogging, they obviously show they don't know how to run. They're running mostly on their heels and that jars the bones all the way through and upsets the vertebral disks and so on. And there's a sudden grim determination about joggers. They tend to run in straight lines, which they believe to be the shortest distance between two points. A straight line is not the shortest distance between two points on earth. Because earth is wiggly. It is not a flat surface except by courtesy of bulldozers and occasional freaks of nature. This world, as I keep repeating, is a fundamentally wiggly phenomenon. But wherever human beings have been around, you will see they have a passion for Euclidean ism. Everything is ruled out in straight lines and put in boxes and grid patterns of streets are laid across the surface of the earth. And that tells you human beings have been. Why this passion for Euclidean order?

Because Mr. Euclid had a very, very simple mind and tended to think in these rather uninteresting shapes instead of in curvaceous wiggles. Now, nobody would fall in love with a Euclidean woman. What we appreciate about women is their curvaceous. Now.

And women in this offends some people because they are not sure that they can't figure it out.

You never know quite what it's going to do next. That's why people often don't like snakes, because a snake is the great symbol of wiggly vitality, of undulations, of waves. And all this world is fundamentally a system of wave vibrations. And if you cannot wave with it, if you are rigid.

You will always be resisting life.

So a wiggle in this and going with wiggle in this. In other words, do you swing is fundamental to the pleasure of life. But you see where we think that order and getting things in order is getting them squared away. We always say, let's get it squared away. Let's get it straight. And so there are certain kinds of people who are called streets and squares who do not swim.

And as a result of that, they are out of harmony with a wiggly universe.

And their attitudes range from cookery at one end to religion at the other, because a square religion.

Is one that is too abstract. That resists.

The flow element of life.

It wants a canal instead of a river. And it conceives heaven as a city rather than a rose garden.

Paradise is a garden.

And while the trouble began when people substituted the heavenly city for the Paradise Garden. When, in other words, popes began to be called urban.

And unbelievers were called pagan. Because guns is a country dweller. A man of the Wiggles as distinct from a man of the streets.

Deliver under the sky instead of one who lives in a box. Because the box you see is the great symbol of classification. What box are you in? All words are labels on intellectual boxes.

Is it animal? Is it vegetable? Is it mental? Three boxes. Is it solid or is it a gas? Is it Republican or is a Democrat? Is it capitalist or is it communist? Is it Christian or is it heathen? Is it male or is it female?

All boxes.

And so because we think in boxes, we live in boxes, it's all made out of ticky tacky and they all look just the same. And whereas. Certain kinds of fish live in beautiful shells. Gloria spiraling wiggles on them and lovely colors. And what we tend to want everything straightened out. See? And that rigidity is always in a fight with the surrounding. Fluidity. And so we are, as it were.

Land lovers rather than men of this of the waves and the British have always made a great thing about this because they've always associated

freedom with the ocean.

Who are so free as the sons of the waves and Britons never, never, never shall be slaves.

Because of this seamanship.

Now, we think you see of the sea as fluid and the land as solid. Nothing could be further from the truth, as you've all experienced recently in Southern California. The earth is not very solid.

It flows.

Where I live in Sausalito. We have all along the waterfront a lot of land that has been reclaimed, and not so long ago they built a marina quite close to it where they dredged out mud to make the marina, not realizing that land is liquid. Therefore, the land adjoining the water is sinking to fill up the hole made by excavating for the marina. People just don't think of things like that because they think of land as solid. And so in religion, we are seemingly looking for solid. For something upon which I can take my stand for a firm foundation for the Rock of Ages or even poorer, reportedly for the ground of being.

But we are not living in that sort of universe.

We are living in a fluid universe.

In which the art of faith is not in taking one's stand, but in learning to swim. You don't claim to. You don't try to stand on water. By breathing. And by a certain relaxation, you learn to trust the water, to support you.

This is even more true in flying in the air, gliding especially or in sailing.

In all those arts, there is an adaptation to the fluid, and that is the major thing that we have to learn. If we want to survive as a species and survive happily, nobody wants just to go on. One wants to go on in an elegant way. And even that passion for survival is something against pleasure.

Because nothing ruins pleasure more than the anxiety to go on having it more, more, more, because that shows when you ask for more, more, more and have the anxiety to go on that you're not having it now.

You always think it's coming, that you want jam tomorrow is more pleasing than jam today. And we say of something that is useless, it has no future. That's the most awful thing you can say about it. I would rather say of something that's no good. It has no precedent.

Not that has no future.

Calls the future is merely a promise in the same way as this symbol is merely a promise to pay. Promises, promises, promises.

So therefore.

It is fundamental to pleasure that one learns to wiggle.

And not be stiff and rigid.

As we would say, let them all relax. That doesn't mean become droopy. Relax means to become supple. It also means to learn the strength of your weight.

How to use weight, how to flow with gravity water, for example, always flows with gravity and it wiggles.

It takes the course of least resistance and yet has tremendous strength.

But we in our white Anglo-Saxon Protestant ethical system, not to mention our Irish Catholic one, which is really the same thing only a little bit more fancy and dressed up in lace is to take a line of least resistance is considered cowardly and despicable. Go straight, flowing right through the bulldozer ahead.

Why go straight? We've got to get there fast sway. Shortest distance between two points.

I get back to jogging.

That is not the right way to run, the right way to run is to dance. To dance across the countryside and anyone who dances across the countryside will outwit and out time the jogger.

I don't know if any of you witnessed the World Cup in soccer last year on television. It was won by the Brazilian team and I have never seen such soccer. That's not the way they told us to play it in school.

As the Sportswriter and The London Times put it, they danced their way to victory because the whole thing was like very fine basketball, where instead of being this sort of tough pushing the victory, they were tilting with the ball. And the most incredible teamwork of subtle passing, bouncing it off almost any part of the body with a capacity to give it direction, with one's back, with one shoulder, with one's hip, anything head. It was a beautiful art and a magnificent spectacle. But you see, we are not taught to do things that way because we are taught that life is serious. And therefore must be done in an efficient way. But according to Euclidean ideas of efficiency. In ancient times when people worked, they used to sing. Hardly anybody sings anymore except at a performance of some kind or something like that. Imagine a bank teller singing as they were counting out the money.

Oh, the king was in his counting house, counting out the money, five, 10 and 20, 30, 40, 50 hip hop.

Why not? What would happen if you were confronted by a singing bank teller would complain to the management and say, this is money is very serious. He could sing about it. Everything will go wrong. Can you imagine a stockbrokers working song?

I have seen people. I once had my shoes shined in a New York subway. That was a most extraordinary performance.

Could you do that? Did he do that?

No. And he was swinging. And imagine supposing you were a bus driver.

You know, most people when they drive a bus in through city traffic, they are cursing and swearing and being angry and fighting the clock all the way

through town.

Well, that's a disaster. But imagine driving a bus.

With the idea that going from here to there wasn't the point wasn't to get there, but the promise was to go. And dancing that bus through the streets with very, very skillfully accurate traffic dodging, and when you get to a stoplight in the JAG, you play a little tune on the horn where you pass jokes to the cab driver near you or you play with the passengers.

See, anything can be turned into juggling in playing with balls. That's why they have a ball.

So this bus driver is swinging through the streets and he prides himself in the marvel of his Topsy Korean art. But people don't do because work is not supposed to be pleasant, because you get paid for it. You're not supposed to get paid for enjoying herself.

See, that's what I did.

I think I'm smart.

I talk to you not because I think I'm doing you any good, but because I like talking about these things. And if you pay me for it, then I make my living as simple as that. I'm a sort of philosophical entertainer.

But that's the point that the transformation of work.

Is winging it. And the curse of work that came in the story of Genesis as he work became a curse because the tree of knowledge.

Was the knowledge not of good and evil in the ordinary sense, but of the advantageous and the disadvantageous? The words in Hebrew refer to the art of metallurgy.

That's where the trouble begins.

When we use technology.

To get there fast.

And the faster we get there.

The less worth is the place of arrival.

Because you've eliminated the distance between. And that's what makes the difference between here and there, the distance. If you take it away, then there is the same as here. So there was no point going there. There's no point going from here to Honolulu. None, whatever. It's the same place. To all intents and purposes, and certainly no point in going from Los Angeles to Tokyo. I mean, there are a few nice little bars in Tokyo where you get sushi, but you can get them in Los Angeles, novelist Tokyo's come to Los Angeles. Superior is practically the same place and both have the same smog. The police in Tokyo wear gas masks when they're directing traffic.

You know, crazy is this wealth. You have a hundred and fifty thousand dollar house in Beverly Hills. You live in poison gas. Crazy, that's wealth.

So work then being regarded as a method of getting there effectively. A lot of businessmen imagine that they are practical people. Not an answer philosophy in that kind of thing. I'm a practical manager to get things done.

What?

What is practical? Well, you made money, but that's not practical until you spend it. Did you enjoy it?

And it's very difficult to enjoy money. Money is a great responsibility. Besides, if you get lots of it, you're afraid something is going to take it away.

It gives you the jitters.

I know lots of people think that if that little more money, their problems would be solved and they get it and they worry about their health, though, is something to worry about if you're the worrying kind. Oh, wait, it can get

worse instead of getting better by achieving all those things you think will stop you worrying.

So the first principle. Any we could call it the art of pleasure. Is humor sweet?

And that means, or at least it looks like superficially that you mustn't take anything seriously.

You must realize that life is a form of dancing, and dancing is, of course, not serious. And that's why it's prohibited by Baptists. And you do meet people of that kind. They don't approve of dancing even in the Catholic Church. We don't normally see priests dancing. I mean, it's not because it's sexy. You can dance without partners of the opposite sex. You can dance by yourself, but it's considered undignified. This was all started by one of David's wives. When I think her name was. And it wasn't Bathsheba. I forget which one it was. Perhaps somebody remembers it better than I do. Anyway, way he danced before the Ark of the Covenant and she approved him for being undignified. Because he didn't set stiff and rigid.

But what is the virtue in being stiff and rigid as loud says that man at his birth is supple and tender? But in death, he is rigid and hard. Plants when young are juicy and soft, but when old they are brittle and dry. And thus, suppleness and softness are the signs of life, but rigidity and hardness are the signs of death. I suppose some men confuse. Psychic rigidity was getting a hard on or at least substituted for it. As they substitute guns, rocket ships and other things of that kind to manifest a masculinity which isn't really there. But suddenly women should uphold to us.

I mean, the real secret of women's liberation is the liberated woman, the woman who is the human serpent.

The wiggly one, the gentle one who has the power of water. And we should look to that as loud again said.

The valley spirit does not die. The valley spirit, that is the spirit of the valley, that is the feminine as distinct from the mountain, which is the male.

And so while being a man, you should have a certain feminine element. Because then you will become a universal channel. How old are the masculine? Yes. The mountain is necessary for that to be a valley. You can't have valleys without mountains. But unfortunately, the gorgeous music of Handel has prevented us from realizing the horror of that biblical passage. Every valley shall be exalted.

And every mountain laid low, the rough places made plain, why it's happening all over California. So.

The feminine in the sense of the lily, the playful, the curvaceous, the soft. Is the neglected principle by all us, Euclid NS. And it is the principle of life and of nature.

But the problem that exists for rigid people and we all get rigid in the sense of resistance, resistance to life, resistance to change is how on earth do I stop that syndrome, which makes me girls uptight.

How do I stop that? Because it's useless.

Almost useless.

And do you know that your basic sense of ego of existing here and of being I as distinct from all that?

Do you know it is muscular tension?

Of a certain kind that is your the physical basis of your sense of identity. It is. For example, you can try this experiment, man, and maybe we'll just try it. It's the simplest thing to do. I just want you to look. Little downwards at whatever view is just in front of your eyes, just allow your eyes to rest on that.

Just let the light, the color play with your eye. See, just rested easy. Now, supposing I said now I want you to look hard at it. Pay attention.

To be totally attentive and aware of what is in front of you, so look hard. Now do that. Do whatever you would do if somebody told you to look hard.

Now don't do it. Just see.

Don't love. Now, again, look hard. And now don't do it.

So what's the difference between the two states? What did you do when you were looking hard that you didn't do when you were looking easy?

Well. 1.

How do you tense your brain? What did you tense of muscles around the eyes? Anything else? Temples? Yes. Narrow your focus. Yes. That was a muscular action.

The seed money won. Where do you feel concentration?

You all go tense, tense, although. But you see muscular tension in your jaw and your focal muscles has absolutely nothing to do with seeing the focal muscles of the eyes, all they do is simply open or close the aperture or move the lens in such a way that it becomes in focus. It doesn't need any effort to do that.

In fact, the effort you make when you look hard distracts from your seeing accurately. But we are constantly making efforts to do everything we do. For example, will something. We make all this absurd, muscular straining. Grit your teeth doesn't help you to do anything at all, this accumulates as a constant strain between the eyes and hair, and that's what you call I.

That sensation of totally unnecessary strain that exists all the time. That is the ego, the physical referent of the idea. Ego. Does that unnecessary strain, does that tell you you exist? Teacher I'm trying at least give me B for effort.

And it doesn't work.

So we could say psychic staring. Is the ego. That we feel as being the center of myself, which is opposed to and which is resisting all that is defined as not myself.

And so that rigidity of holding against life, so that I maintain my shape, my form, my place.

All the time that constant resistance makes you uptight and unable to swing through fear of what will happen if you let it go. And so therefore, a non wiggly person is an adaptive and a wiggly world. And so you get these in sexual, mechanical like behavior patterns that have to go on, on, on regularly. Always the same. Chug, chug, chug, chug, chug.

And. They are not adaptable.

And it doesn't hold up as we watch, as it is holding up. The cracks are in the pavements.

And, you know, the grass comes through.

We're squaring all the fish out of existence. Well, what will they be to eat? Somebody said we're gonna be left with nothing but crows, crab grass and an edible fish. So this is it is there. You might say it's a square world, but then you can always not buy preaching at people and condemning them. But by wooing them, you can get them to come off it. See, that's the thing that I've often said, that preaching is no good.

Because on Sunday, you go to church and the preachers baa, baa, baa, baa, baa and lays down the law, law, law, and always he throws the book at you.

Lutheran Church.

The minister wears the same robes as the judge. He's got the book up there and on it is it tell you what to do, he tells God what to do.

As endless talk fest goes on.

And when you get to sing, you sing hymns while hymns that religious nursery rhymes. They all have dreadful tunes and stupider words. And that's all. The singing may be required as an anthem.

Nobody dances.

And there's nothing mysterious going on except in the Catholic Church and they're trying to get rid of it and now translate the mass into English that everybody understands it and finds out the last, but it meant after all.

Sunday is supposed to be the day the swing is a God, worked for six days and seventh day rested as a time out, time out from being rational and methodical and efficient.

It's like a Mardi Gras. It's like the old meaning of an orgy. A carnival.

You got to be crazy a little. Because if you're not crazy at regular intervals, you'll become insane. Because you're too rigid, you don't swing in the wind. So you're gonna collapse.

But again, the problem remains father, rigid person, and we all have a rigidity.

How on earth do we release it?

Because I noticed that people who undertake programmes of derision define themselves. Maybe psycho analysis, maybe therapy of some other kind. Maybe exercises. It may be a sensory awareness training, maybe encounter groups, it may be yoga. All sorts of these rigid defined processes are done in such a grim mood.

I know as a book call, you must relax because then people get into these things and they start playing games.

You know, it's like people who retire and they think they're going to have fun. So they get on the golf course early in the morning. And instead of enjoying golf, which is entirely possible, they begin to think not in terms of athletics, but of mathematics. What is my score?

So they gamble on it and that gives it the interest of the prayer out of the abstract aspect. See how much? What is my measure? Do I matter? That matter is the same as the word meter, say measure. Do I matter? And so they get this religion of golf and playing all sorts of social games tied in with it in its various areas.

Then when golf is over, they'll go to the bridge table.

When they're completely worn out, they'll get vaguely drunk. And this grim pursuit of pleasure goes on. And the religious people do it, too. They do their meditations. At 40 minutes before breakfast. No. Meditate.

Then they've got stages they couldn't get through it and they wonder whether so-and-so so-and-so is doing yoga with Mrs. X and so-and-so is doing it with Swami B and Mrs. X, his followers are afraid that Swami is phony.

And it's not quite the real thing. Well, how do you know whether he's the real thing or not? Well, they're genuine. Swami is can perform magic and they can remain under composed and forest long for an indefinite period without benefit of embalming.

Crazy. Now, what does that prove?

You see, it's the same old thing that is spiritual technology and the people who want power, who want to get there fast. I want results now.

That same temperament that wants it in the management of the material world wants it in the management of the spiritual world.

My yoga is more efficient than yours because it's faster. I'm going to get that.

So we come to the great question, where is there? You're gonna get that. Where is it? What do you want? Where are you going?

Very few people now.

Some people have a precise, I would say, disciplined, clear sense of what they want. And they get it. And then they stop. As G.K. Chesterton once wittily said, progress is looking for a place to stop.

The very few people like that.

Most people you see when they think of pleasure that don't have any very definite idea. Or else they have a definite idea, which isn't really what they wanted. When they get it, they don't like it. So they're saying, be careful of what you desire. You may get it.

But.

Fundamentally, then the question arises, where is that? Where's your rush? Where are you going? What are you progressing?

Stop, look and listen.

Because you may be there already money that you don't notice it. From the point of view of a starving Indian in a Calcutta slum.

We are all as lucky as Mike Rogers. Even the most generous person in this room is, by comparison, the Maharajah.

You know that you've arrived.

But you say it can't last. Eventually I'm going to turn into a corpse. That's gives you the horrors you're going to take a painful route to that end to be a terminal case and hospital on the, you know, a lot of tubes.

So I don't want to disintegrate.

So. How can I overcome that?

So you turn to religion.

And say, well, that's physical demise is an unfortunate limitation of the body. So I'm going to identify myself with something beyond the body so that I can believe that that will go on. That will be the true vehicle of my personality. I shan't lose all that I've acquired carrying around with me my bag of rubbish. I managed to smuggle it across the border. I say you can't take it with you, but you can if the guards can't notice it because the baggage is spiritual. Do you know what the gate of heaven is here about the pearly gates? People think its gates decorated with pearls. It isn't. The gates of heaven. It says in the Book of Revelation is one pile.

It's got a hole through the string. You've got to get through there. And you can't get through if you've got a lot of baggage. So you've got to leave your past behind. To get through now, what happens to you when you get rid of your past? Forget it. Don't forget who you are. The future, of course, is the past reflected in your rear vision mirror. As McClellan says, he borrowed the metaphor from me as right. We like people driving, looking at their rear vision mirror. So you've got to let go all that past in order to get in through the pearly gate. And what is what is left of you when you let go your past? What remains? You can't bring out your education. Can't bring out your ancestry.

Can't bring out your distinguished accomplishments, things you've done, because I say while you've done all that. But let's see what you can do now.

Where are you? Who are you? When you have no past? After all, there isn't any past, whereas it.

Twist your commonsense around and see that you're not being shoved by the past, you're just leaving it behind like tracks. It's not pushing you unless you insist on it will always pass the buck. Everybody does that. They say it's mine. I'm an erotic mess because my mother was a neurotic mess.

I never had a fair chance in life.

And somebody says to your mother, you should you brought up a child like that? Well, she says that it's too bad. I know, but I couldn't help it. I was a neurotic mess and my father was just appalling and my mother was dreadful. And they go back over their shoulder and said, well, it was our parents.

Everybody passes the buck to the past. It gets back to Adam. Any. And you know what happened there? They passed the buck to the serpent.

And God looked at the serpent.

He didn't ask how sweet the fruit of the tree where I told you about us, not eat. It is looked at the serpent. The son didn't say anything.

So this happened. The wiggle, it really doesn't have a past. Because it wiggles from its head backwards to the tail. And it's always the head where it starts. So are you ahead? Are you just a tail? Do you move backwards? Forwards.

Which way you're going? If you're leaving your past behind you, it doesn't drive you. It wells up out of a mysterious presence. Ever knew this moment is the creation of the universe? Starting now to look back and back and wonder whether there was a big bang a long time ago, all you'll see is vanishing traces.

The big bang is happening now is when the world begins. You're doing it.

No, you're not doing it by straining you deeper than the straining you is doing all this the same you that is growing your hair and coloring your eyes and making a thumb prints and all that.

You don't think about it. You don't strain muscles to do it.

But that is what is creating the world. Here it comes. Now. So instead of. Thinking that the past is the reality, which explains everything that happens now.

Let's look at now and see it happening.

Where does it happen from? That's a question asked only by people who think that the past causes the present. There was one of them where it comes from, who started it. What makes it happen? Supposing nothing makes it happen?

As it happens. Well, what is it that happened? Again, we get to this basic question, what is it that you want? Whereas it. What you're looking for.

It's the same question as what is reality? What is now? What is life?

You will get at it by analysis of all sorts of things into their components.

We'll get it by labeling it in various ways and calling it names. You can only find out what it is by looking at. My feeling it director.

And all kinds of classification where we say, well, it's animal, vegetable, mineral is this that the other thing is putting it in boxes and tidy it up.

So tidy up and put everything away in a box. The boxes inside boxes and all that sort of thing that's tied it up, but when it's all put away in boxes, you can't see it. Instead of putting everything in boxes, let's just look at it the way it comes.

Now, that's enough. To start with.

I've therefore discussed the principle of the necessity of wiggling. Only when I say necessity, you mustn't take that word in a Calvinist sense.

We'll talk about the pleasure of wiggling as a means of adaptation to the wiggly world.

The human being is of such a design that it perceives everything. By contrast. There is no way of knowing whether the real world is arranged the same way or not, but we are a nervous system.

Composed of neurons in an extraordinarily complicated pattern, based on a very simple principle called is you is or is you ain't the neuron in transmitting any sensory input either fires or doesn't. So you could represent the fact that it fires by the figure 1 and that it doesn't by the figure zero. And out of zero and one with those two integers alone, you can represent all conceivable numbers. This is called binary arithmetic and it is the kind of arithmetic that is used by digital computers.

Messages in 0 1 language can convey not only mathematical and verbal information, but also information that comes out as television. Both black and white and in color and through the same notation, we can convey solid objects. You can turn a solid object into terms of this notation at one end of a process and have it come out at the other end of the process engraved in plastic, enlarged or diminished at will by the operation of laser beams.

So one is tempted, therefore, to think that is you is or is you ain't is fundamental to the universe. The Chinese thought so and therefore devised the yang and the yin.

YANG Meaning positive minion, meaning negative principles upon which they base the book of changes, the aging.

Showing the various combinations of an Indian that constitute the 64 basic situations of life.

They took extra grounds hex grams made up of six lines.

An unbroken line representing the yen and a broken line representing the yen.

So if you have six lines with two positive, with the two possibilities for each line, you get 64 different hexagrams.

They use this for making decisions when it was necessary to make a decision, you would by a random process arrive at one of the 64 exit grounds and on the basis of that decide what you were going to do. It's rather like tossing a coin. Only this coin has 64 sides instead of two. But it all comes down to is it heads or tails? Is it Yang or is it in? It seems absolutely basic to our life.

And it's rather awkward.

Because when we apply this to the pursuit of pleasure, it seems to be saying. Yes, you can have pleasure, but you will not know what it is unless you can contrast it with non pleasure. And if you want to know pleasure, then you must have known pleasure. If you want one end of the spectrum, you've got to know the other because you can't have a one ended spectrum any more than you can have a magnet with one polar. And that seems to put an awful kibosh on everything we're trying to do. Every sort of achievement, every sort of progress, sort of rearrangement of things always runs into the problem that what you gain on the roundabout, you lose on the swings. And this is dispiriting, to say the least. But in a way, oh, how true. So let's look into this business rather thoroughly, because if you understand the end, in the end, you you really understand something.

The first point is this. Let me sort of clarify the situation in its most simple terms. We'll take the contrast of black and white. Now, obviously, if I'm

confronted with a black background.

There is nothing particular to register upon my attention and I am as good as blind.

If I'm confronted with a purely white background, there is nothing in particular to try to attract my attention and I am as good as blind. If, however, I'm a naughty little boy and I'm confronted with a black wall and I have a piece of chalk, I am tempted to make a mark on it. And if I am confronted with a nice, clean white wall and I have a piece of charcoal in my hand, I'm tempted to make a black mark because nature abhors a vacuum.

So here I have a black ground with a white dot on it and a white ground with a black dot. Interesting.

Now of black and white, which is positive and which was negative.

If I look at the white background of the black dot, I shall be inclined to say that the black is positive because it's the thing. It's the mark.

If I look at the black background with the white dot, I saw on the other hand, he's inclined to say that the white is the positive because it's the thing, it's the mark.

I can think of white as positive in general in that it's light and black as negative because it's darkness. But I can also think of white as negative because it's blank. French Blanche.

I can think of black as positive because it's not black. It's all filled up.

Then again, I can think of the DOT as being the negation in both cases because my black background with a white dot has a picture of a wall with a hole in it.

And my black and my white background with a black dot. There's a picture of a box with a hole in it.

I can choose it either way, I like call white negative and black positive or vice versa. But it's difficult to do both at the same time.

Now, they are, of course, these two as different as different can be, we say. It's as different as black and white.

Or we also say these two points of view are the poles apart and we use the word polarization rather incorrectly to indicate an increase of discord in the society, whereas polarization is really a form of harmony.

The two poles of the earth are the harmony of the earth. The two poles of a magnet of the harmony of the magnet, because they are like male and female. A man and a woman are not the poles apart in the sense that they have no common ground.

We could say you can't have a fight between a shark and a tiger.

Because they have no common ground. One lives on land and the other in the water.

But there is common ground between poles. Obviously, the common earth has the common ground between the north and the south and the common magnet. If it's electrical.

The circuit runs from the positive to the negative, and the circuit won't begin to run until a negative pole is established. That's what happens when you turn on the switch. So therefore, although the black and the white, the positive and the negative are as different as different can be. They're also the same because there are differences of one of one field.

And this is what makes the difference between what we'll call an esoteric point of view and an esoteric point of view. In philosophy, religion and so forth from the excerpt very point of view.

The black and the white. Our emphasized with respect to the difference.

Good and bad. Life and death. How oh, how different?

Light and darkness.

God is light, I in him is no darkness at all.

That's the esoteric point of view.

But always behind that, there's a secret. Every religion has a secret. There's always something esoteric. What is the esoteric thing that is only revealed to initiates to people who can stand it?

It's simply that black and white, although explicitly different, are implicitly one because you can't have one without the other.

You could say black is white. If by the word is, you mean implies.

The Buddhists say emptiness is form and form is emptiness.

The Chinese way of saying it is not quite the English way it doesn't equal. It rather means Chinese is saying void that form, form that void.

In other words, it implies it goes with. If I may invent a word.

So we say that is esoteric. You mustn't let it out in church. That God has a dark side as well as a light side.

But it says so I say forty five, seven.

I am the Lord and there is none else. I form the light and create the darkness. I make peace and create evil. Either Lord do all these things.

Well, that's your answer to the problem of evil so bad that you see, we don't let up because someone who wants to commit a murder, they say there's no reason I shouldn't commit a murder, because if I didn't if somebody didn't commit murders, you wouldn't know what nice people were.

Somebody didn't steal. Or cheat. You wouldn't recognize honest men.

Like, if it wasn't a wet day, occasionally you wouldn't enjoy the sunshine.

There's no getting around it. That that's true. St. Paul wrestled with this problem. When he saw that.

The law of Moses made people conscious of right and wrong.

I had not known that there was last except the Lord said thou shalt not covet.

So therefore, he said, asking rhetorically, shall we sin that grace may abound or missing in detail? Heaven forbid. So you have to be careful. That you don't let this get into the hands of children. Like it says on the bottle of poison. Keep away from children. And yet we have poisoned and we have uses for poison. So in the same way we have uses for evil.

In the ordinary way, we do a balancing act between what we do is this we establish an in group. And say this in group, which is us, has a collective ego and it is wrong to do anything evil to any member of this group. But it's all right to do it to somebody who is not in the group. Therefore, when we are going to be very evil to someone, we have to define that person as outside the group.

And so we like when Hitler was going to persecute the Jews.

They were defined as not really human. And likewise, if we are going to persecute the Negroes, we define them as not really human. People can easily see they can imagine that because a Negro looks so different from a Caucasian that he's more like an animal.

Or you can take people who are generally thought to be insane and you can deprive them of civil rights without due process.

They're insane. They're defined as not all there. They're not human, merely bodies. Their mind is absent.

We we used to do that with heretics and other very seriously disease people, lepers and so on.

They were outcasts. They were not humans. And they were therefore outlawed. They didn't have the protection of the in group. So the worst thing we can do in eating is cannibalism. Don't eat your own kind. You made everything else, but not your kind.

But that still doesn't get away from the fact. You see that you cannot eat. You cannot live without eating. And you cannot therefore live without death, without committing murder. I don't know what a practical solution to that is, except one I've suggested is that if you do eat any living creature. At least you can show your respect by cooking it well.

As Lynn Newtown said, a fish that has died for you and has not been well cooked has died in vain.

Now, there are very, very interesting applications of this theory. Let's look at some of the contrasts in terms of which we are aware.

Primary, of course, is what is myself and what is not. Which is a sort of contrast, not of two ends of a poll, but rather of the center of a circle and the circumference of the circle. Because there's a two ends of the radius, one and still the other end moving.

And we say we feel there is a great difference between myself and other. I do not know your thoughts. I do not feel the pleasures and pains unless I am in a sympathetic relationship with you.

I don't know what you're going to do. My actions are voluntary. Yours are involuntary so far as I'm concerned. Yet when I think it over, I realize that I could not realize self.

Without the contrast of other.

I wouldn't know what I meant by myself. Unless I meant something contrasting by someone else or something else.

Self means self only because other means, other just in the same way as is means is only because you can think of isn't. And you know, isn't what isn't means because you know what is means and you know what is means because you know what isn't means.

There is a relation. And so. Likewise with the black and the white, we see the relation.

But that implies that self and other are inseparable.

They go with each other.

Characteristic of the difference between self and other is voluntary behavior and involuntary behavior. What you do on the one hand and what happens to you on the other.

This is not always quite co terminus with the difference between self and other.

Because when you have hiccups, you'll feel that it happened to you, but it was your hiccups or belly rumbles or headache or whatever. What about when you breathe?

Do you do it or does it happen to you? That's a very moot case because you can feel you are doing it.

But you can also feel it happening to you.

So perhaps the distinction between the voluntary and the involuntary is a little a little arbitrary, a little vague. Suddenly it is when it comes to breathing. But once again, I think how could I say of an act I have done it unless there were contrasting acts of which I could say I didn't do then. So I need the involuntary if I'm to have any voluntary. So that if there is a union, you union of implication between the two. I get the same sort of relationship between them, as I explained when I said you can use white for either the positive or the negative symbol.

In other words, I can regard what I do as what happens to me and I can regard what happens to me as what I do. It is in the sense that a Hindu or a Buddhist will say, if you have an accident, it was your karma. Because the word karma means nothing more than doing.

You had an accident. It was your doing.

Well, we would say that's not fair.

And naive people suppose it was their doing in the sense that this mishap is a punishment for a misdeed you did at a former time.

That's only a superstitious meaning of karma, karma means literally. You did it. But you did your accident in the same way.

You see, as you do certain other things that are classified as involuntary, like growing your hair or digesting your dinner.

Because it all depends what you mean by you. If you restrict itself to the voluntary.

Then you get the distinction between what you did and what you didn't do. But if the self really must include the other and the involuntary.

Then others are your others and involuntary happenings are your deeds.

That's rather interesting.

You may feel as a result of seeing that one of two things, you may feel that you really don't do anything at all, that you are not completely deterministic universe where everything happens. That your own voluntary decisions and deeds spring out of unconscious mental mechanisms which determine them completely so that you are at best only a witness of what happens. All you can feel the opposite of that, you can feel that you are God, that you are doing everything.

That rocks fall. Water is wet and fire hot because of you.

Which is in a way. True. Because the sun would not be light. Except in relationship to Ayers.

Can see light.

Norwood rocks be hard except in relation to relatively soft skin. Nor would they be heavy except in relation to a sudden musculature. So, by the way, you are you evoke the way the world is.

We might say there are some vibrations out there that are really out there.

But these vibrations. Are not colored or soft or hard or light or dark or light or heavy until in relation to some sensitive system.

But then again, the sensitive nervous system is part of the external world. And the external world is an event in the nervous system.

The inside of the box is outside the box and the inside and the outside is inside. I mean, you know, it seems to flip flop perpetually.

Take again another contrast. The solid in the space. Most of us think. That reality is solid. Rather than space. We talk about hard facts.

We talk about impenetrable reality, even brute facts. The heart always seems real, just like the black mark on the white background, even though the black thing, even though the solid is.

Untransparent and luminous, it seems to be more real than blue sky. This is a very partial point of view.

Can you imagine a world that was solid without any space? The edges of the solid would be, of course, invisible. There would be no edges because an edge is a point of interface between a solid and a space. So if you take away space, you take away solid. Most tests take away solid, where's the space? After all to say of space. It's a space between if there are no limits, there's no space.

Even if you imagine purely empty space was got the sense of yourself looking at it. And that's the solid.

That's a very awkward.

Because we are quite sure that space isn't there. We take no account of it and therefore get puzzled when our mathematicians and physicists begin to talk about curved space or properties of space or expanding space. KAHN People say the ordinary, average person, you can't talk like that, that's public space can't expand because it's not there. It isn't anything you can do anything.

Well, let's see if a solid can. Let's investigate a solid. You know what happens when you start going into nuclear physics?

You'll find that in any given solid, however dense a piece of steel, it may be a great deal more space in it than there is any solid. The distances between molecules, the distances between atoms and subatomic particles are relatively vast. In something there's a lot more nothing than there is any something, because as you investigate and penetrate the solid, you'll find it to be increasingly spacious.

Now, what happens when we investigate the spacious.

How do you investigate space? My Yugo, the. You bring in a solid. You map it.

So space and solid are really like poles that limit. And it's the same with yourself and the other the organism and the environment, the individual in the world. Go thoroughly into any one and you get the other. Ask, for example, the question, what do you mean when you love yourself? Love yourself thoroughly. I want you to be completely selfish as possible. Tell me, what do you love? Wow. We see. Well, I like to.

I like candy, beautiful girls.

I like beefsteak wine. I like good bread. I like the sun on a lovely landscape. I like clear water.

I like music. Come on and talk about yourself, will you, for a change.

I suddenly realize I can't when I love myself. I think of all things other than myself that I love.

It's very clear.

But that's what's called the basic flip flop ability between the powers of opposites.

That's why the Chinese represent them with these two interlocked symbols that suggest the kind of blue, blue, blue rhythm so that when you

get the full development of Yan, you get the beginning of yin.

And when you get the full development of yin, you'll get the beginning of yang. That is the one implies. And the other. So they're always flipping, doing a flip and doing a flip is the love that makes the world go round.

You've got a double helix, so the male and the female. That's the love position. The double helix spiral nebulae do this. So two creatures in sexual intercourse. The double helix, I'm chasing you, you're chasing me.

I love you so much. I could eat you.

I realized myself, you see only three other.

So in this way, then we get another marvelous instance of the pairs of opposites. We've got the differences and we see a unity between them. Then let's contrast the principle of difference with the principle of unity.

Here we are again. We know what we mean by different because we know what we mean by one.

So difference implies unity and unity implies difference. Now, what is it that lies beyond difference in unity? See, we found unity lying beyond differences. North and south. The difference is united in the end. They are poles of one. All right. Now let's take difference in unity. What lies between them?

You could say your mind.

As in the magnetic tape.

What lies between the on signals, the one signals and the zero signals? Of course, the tape.

They're both on the tape.

Only the tape as such doesn't register. It registers only in terms of yes or no. But you don't get a signal tape with yes, no tape because it's irrelevant. Makes no difference. And yet if the weren't the tape, they wouldn't get the

signals at all. So is there something underlying. Yes and no. Life and death, light and darkness.

Well, that's what we call God.

Only we can't say anything about it. Because everything we say is a statement and that implies an opposite.

But we. But as I pointed out in the beginning, this is so frustrating. Because.

We want to play a game with these opposites. You see, just like we have opposites in chess, the black side and the white side.

We want to win.

And we want to win. But then when we think of the other fellow, we realize that if I'm going to win, you're going to lose. It's rather hard, isn't it? Couldn't we arrange for a game in which everybody wins?

Then nobody wins. Nothing happened. There was no game. So to try to play a no lose game is impossible. We set ourselves an impossible task, and that makes us feel very frustrated, always frustrated because we're trying to do what can't be done. You want to good all the time? I want sunshine every day. OK. A desert for you. That's not what you wanted, was it? You really want a world which is all positive. No, nobody really does. I mean, we think we think we do. We think we ought to.

But it still bothers us.

Because after all, if I come to the conclusion that this really doesn't make any difference, it's going to be black and white, black and white. Life and death. Good and evil. Ultimately, forever and ever and ever. I can't improve this world. I feel sort of sad. And I'm just gonna sit around and vegetate.

Only got some on Artemis.

And yet and yet I can't put up with that.

I have an itch. Surely there must be some way of getting through.

So what is it? Is there a greater pleasure which lies beyond the ordinary contrast of pleasure and pain?

What are they Hindus mean when they say that Brahman the absolute reality is such hard and under soft reality shift consciousness under bliss? What is under what is metaphysical bliss? Joy beyond pleasure, pain. Good, evil.

Has such a conception even any meaning? Well.

In all the various accounts that are given to us of the mystical experience, they have an intense, joyous annus.

The sudden realization that the dark and the light constitute a harmony there are not discordant.

That somebody once put it to me, this was a lady of 60 or so or was in an accident with an elevator and she had her leg crushed and they couldn't get a rescue crew to her for half an hour. But she said during that time I had the most extraordinary experience. I realized there wasn't one grain of dust in this whole universe that is out of place.

Pretty weird.

But from a strictly philosophical and logical point of view, it doesn't mean anything I say everything is good.

No sort of a Christian science added.

It doesn't mean it it's no law in them from a logical point of view than saying everything is everything. Doesn't tell me anything. It's all good. It's all happy. It's all harmonious.

And yet, if any one of you ever had an experience of cosmic consciousness, you know jolly well that that those are no idle words.

As you can see.

The positive and the negative, the yes and no singing together, constituting each other in this fantastic dance. In which the outward radiance flowing outward of the white light.

Is at the same time the withdrawal of the black outline and that withdrawal seems to be drawing aside a veil to show the white light. And if the veil didn't draw back, there would be no light, the veil to the drawing, back to the light shine.

Or did the light shuffle the veil back if it didn't show, it hadn't got a veil to shove back. Well, with the contrast be. You see the light in the dark. Playing with each other.

So there is a concept in the game called good sportsmanship.

Which means that.

You can be a good loser, but you can play the part of blues with the same enthusiasm that you can play the part of win.

And.

Therefore, what you look for is a good opponent, someone who really give you a run. And so what you do is you let the opponent win every so often and you have to try and keep yourself on top as just a little edge on the other one. See?

Well, after a while you see your consciousness changes and you find your always a little on top when you average it out and that gets boring.

So you're going after a while to let the other person average out.

But then you're going to count the spaces. Do you see?

For a year, you average out that you will allow your how your partner to have six months of being averaging out better and you get a little more dairy and give him seven months to catch up with you just at eleven months. And I'm going to come in again and I'm going to add another 12 months in which I'm the usual winner.

The more you think of that. The more you think I'm kind of a cad to be like this, you're going to let the other person. Because you can't maintain consciousness without the contrast in.

You that's why people go in for adventure.

Why we take risks, why we do absolutely foolish things.

Toss a coin and see what happens. Go skydiving. Let's go roaring around in racing cars.

At some even have wars.

See what happens. US.

Some people are cautious and say life is like a fire. And the thing to do is to keep it burning as long as possible. There are two kinds of pipe smokers.

People who take enormous puffs and I mean vast clouds of smoke and pipe burns out very quickly and other people who very slowly take a puff and keep the pipe going for a long, long time. Some people like a quick, enormous flash. Others like a long, long, slow glow.

Who's right? Who's left? You can take it either way.

You may go off with a whimper, but we will go after the band.

The morning glory blooms for an hour, and yet it differs not apart from the giant pain that lives for a thousand years.

Fruit fly at one end, it lives a few hours, tortoise at the other, slow, solemn daughters, lives for 500 years, but slowly.

Maybe they're both from their own point of view, lived the same time. Maybe the fruit fly thinks a few hours are very long and the tortoise thinks 500 years.

But four score and ten on all flesh is grass. From your own point of view, it's always the same. It's your point of view.

If you are a person born to riches, you will feel it's terrible to go down the poverty. But if you're born to poverty, that will be the usual state of affairs. You'll think it's extremely lucky if you rise to riches. But you see, I haven't really answered the question. Is there any way around this?

Now we can be a good sport, but it all comes out the same thing in the end. I mean, it balances out. And so what it means, so what?

What's wrong with it doing that? Would you rather it was different?

Well, if you really go into your thinking, you find you can't rather that it was different when you see that you cannot have the positive without the negative. And if you want the positive, you will have to take the negative. You say, well, it's a making me making the best of it. You know, as if to say, well, things kind of a lousy deal, but I'll take it. But I would ask you, what else would you have suggest me a better arrangement. You suddenly find that if you do suggest what you think is a better arrangement. They did. That won't be what you wanted. You finally have to admit that you wanted the way it is because the whole nature of wanting involves contrast. You want the good to be good, don't you? You wanted to be real yummy.

Okay.

Not so I give you nothing but chocolate eclairs with honey and a glass of champagne for breakfast everyday and for lunch and for dinner.

Will soon get sick of that. Or I'll give you a hard. You just keep it up day and night.

Pretty soon he was. Someone take me to a bar.

So by following this through the relentless logic it is you is or is you ain't you come to the curious sensation?

That, after all, if I really go into this problem of life, it is the way I want it to be. If I look at it superficially and in a sort of short run view, well, it isn't the way I want it. I want it changed right now. See?

And I will see. Life is like sleeping on a hard bed. You lie on her left side for a while and then you say this I can't stand this anymore and turn on your right side. Same with politics and you get tired of that.

So I say, well, I'm not on my left. You get tired of that little bit faster than you did before. Try the right again. It's boring. You try it back. That begins to get up, that you turn over light on your tummy. Then you switch to your back and then your tummy. Then you try your right side again. Your left. I see.

And so you proceed.

But.

What else do you suggest?

I would like it to be so that I was always comfortable.

But you can see that if you were. You wouldn't know what comfortable is.

So here's this puzzle.

It's got two sides, side one. I cannot beat the game of opposites. I cannot have more positive than negative side, too. I wouldn't want it otherwise.

Because I cannot imagine how to improve it.

So involved in this as a sudden and curious initial deflation.

I'm out of sorts. When I feel that there's no impression I can make on it. As it's.

And yet I find.

Who is this I try to interfere and wants to be challenged and is put out of sorts.

Well, when I look for it, I can't find it.

I cannot find an AI myself opposed to Vai or it. Because how could I have the one without the other?

So.

That feeling that I had of deflation, of frustration was simply the realization there is no such thing as a separate eye.

If you don't want to feel that truth, you will resist feeling it.

But if you're open, this logic of the opposites of the game of black and white will lead you ineluctably to the conclusion that you have no separate self apart from what is called other. So there you are. You find that you are the vibration system, which is what's going on.

You are the undulations, the palisade and called existence. That's you.

And it's game 1 1 1 1 1 1 1 1 1 1 1 1. And ever so many different ways.

Well, say, is that all?

What more did you expect? Well, I don't know what I wanted. Just a little something more.

You mean you want to surprise?

I think we're back where we were a little while ago. But.

The surprise is it is in a way. This. We are locking in this system for that for that little something more which will give it meaning.

But. We're looking for the wrong kind of meaning. The meaning of this. Now you'll see it.

No, don't is who is or is you ain't Alsatian. Good, good, good, good, good.

The meaning of it is not apart from it. Away from it. Something different. The meaning of it is the dance, you see. That's why we get back to the point I made this morning to get with us.

He got a swing and swing means. I'll give it to you in a Zen story.

A Zen student said to his teacher, it's terribly hot. How do we escape the heat? He said why not go where it's neither hot nor cold? I said, was that the teacher said, in summer we sweat. In winter we shiver.

So.

It's a different from in Shakespeare's Richard the Second. Bolingbrook is about to be banished. And John Gaunt, I think it says to him.

To all places under the eye of heaven. To a wise man, Potts and happy havens. In other words, I don't think the king has banished. You think that you have that banish the king. You weren't fired. You quit babbling. Brook require replies.

Oh, who can hold a fire in his hand by thinking on the frosty caucuses a while naked in December. Snow by thinking on a fantastic summer's heat. Fell sorrows tooth that never rankled more than when it bites and Lance is not the sore.

In other words. If during the winter, I think of the summer, it's colder. If during the summer I think of the winter ice cream, it's hotter. So that's why the Zen master replies, in summer we sweat, in winter we shiver. When it's hot. Eat curry when it's cold.

Try ice water. Swim with it, roll with a bunch. This is due to the cold you make it, the hotter it'll get.

Now we'll have an intermission.

Now, you must understand that yesterday I was doing a demolition job. The negative aspect of what we're talking about, the pursuit of pleasure and by approaching it from two different points of view. I was explaining the fact that there really isn't anything that you can do.

To transform your consciousness into, shall we say, the state of pleasure or Ananda Bliss, ecstasy.

Especially the very high ecstasy of everyday consciousness.

There's nothing.

And I worked on this especially through an analysis of the nature of the opposites of perception.

By contrast.

And so that leaves you flat.

And so from that place where we can apply the Turkish proverb, he who sleeps on the ground will not fall out of bed.

We can proceed to the positive aspect.

Now, what happens when we are at the end of the negative aspect? When we come to the depths of the in motion. Which is the seed point of young. What happens when you are really convinced?

That, first of all, there is nowhere to be but now impossible to be anywhere else, to be conscious of anything else except what is present.

And that there is no trickery which you can play on your mind. Whether it be by. And iron forced discipline or by self hypnosis or by any kind of hocus pocus to bring about.

A Sartori. A state of illumination of cosmic consciousness or whatever you want to call it. Because this will always be a case.

Of a vicious circle.

In which the person who needs to be transformed is attempting to do the transforming.

In other words, it's the old story of trying to lift yourself up by your own bootstraps, trying to bite your own teeth, look into your own eyes without a mirror, gild the lily, put legs on a snake, beard on a eunuch and so on.

Count me.

So at that moment, when that is clear.

Where are you?

You may feel depressed.

And what will you do about that? Well, it's nothing to do about it.

Because you would have discovered at this point that the depression, when it's there, is the you of the time.

And if you try to get out of it by some sort of distraction.

You won't really do anything except cover up the dirt with white paint.

So if you feel let down. Meaningless. Somewhat depressed by this whole thing.

And you see at the same time, you can't do anything about it.

What happens? Why? You're simply. Watching what's happening. You don't know what's going to happen next.

And it isn't just watching something that is formally identified as a depressed state because a lot of other things going on to.

Thus the world around you.

There's your breath. Breathing still, your eyes looking still, your ears hearing still all that's going on. You don't know what to make of it anymore. You can't believe anything about it because you know that it's all a hoax.

So there's nothing left for you to do but watch it. And you have become inwardly rather quiet just because you're worn out.

There's nothing to do.

Then you realize that all escapes lead back to the thing you were running away from.

Take a detour, detour, detours, detours, but they always get shorter and you get back to where you started.

So when this sort of defeat of all enterprises and ideals and aspirations occurs.

You find yourself naturally and not in an affected or forced way in the contemplative state.

Where you're just watching what goes on and even if you're automatically thinking about it because you realize that those thoughts are futile so far as changing anything is concerned.

You might as well try to sweep dust on the stairs with bamboo shadows.

And so you watch your thoughts. As if they were the ticking of a clock. Oh, birds chattering outside the window. Or water falling or a leaky faucet. And they just chatter on and life does its thing and you watch the thoughts because they're just chatter begin to go away.

And the past has disappeared because, you know, it's just memory. The future has disappeared because it hasn't happened.

Never does. You know, tomorrow never comes. There is no tomorrow.

And if you don't realize that it's useless for you to make plans for it, if you do realize there's no tomorrow, then maybe plans will be of use to you, cause when they work out, you can enjoy the result.

But if you're not all here, you can't.

So tomorrow can only be handled by those who don't take it seriously.

So there you are.

Now, if you've read the literature, which many of you have of mysticism and.

Yoga, Buddhism, Vedanta, so forth.

You know, it said again and again and again.

That.

This kind of vision, this way of seeing, is always dependent upon transcending your ego in one way or another.

Giving up. Well, here you are. You've given up.

Only you are not able to pride yourself on having achieved a great achievement.

And this is this now for all people who go into these spiritual disciplines that make a project of getting rid of their ego. They're terribly proud of it. They come home and brag about how much they suffered, how long they sat and had their legs hurt so much. Their absolute ball was.

And this spiritual Bradbury is nothing more than blowing up and inflating the ego to a colossal degree, because the ego is undertaking the actually impossible but seemingly incredibly difficult task of getting rid of itself.

So.

When you run into this kind of thing, don't be beguiled. All those disciplines to get rid of your ego have as their underlying design to persuade you that it can't be done. Not in a merely theoretical kind of persuasion, but so that you actually realize that you can no more get rid of your ego than you can put out fire with fire.

It is precisely you see the ambition of the ego to be legal as. When you find a person who is what you might call frankly, egotistic, makes no bones about it. He will be less egotistic, actually, than people who are very self-effacing. That's a curious thing. People, for example, who speak very frankly and tell the truth and come right out and say whether they like you

or whether they don't, whether they want you around or whether they don't, and you say, well, can I stay overnight? And they say, sorry, but I'm tired and I don't want anybody around. You think, well, is that selfish?

But that kind of selfishness is not really selfish, because with a person like that, you always know where you are. Nobody likes to impose on anyone else, and you can't impose on that kind of person that makes for a very comfortable relationship.

So you owe it to other people to be as egotistic as you are. Then they know where you stand, but if you come out full of love and full of good intentions and make promises to all kinds of people and say, oh, you'll do this, that and the other for them and then you forget about it or you're too lazy or you think you'd rather not.

They've been relying on you for your promises and then you let them down simply because you weren't selfish when it was time to be selfish.

So, you know, if somebody asks you, will you help me? Will you give me some money or something like that? If you're not going to do it, say no.

And you shouldn't be ashamed of saying no, because if you're going to do no eventually, do it now. But if you say, well, I'll think it over, I'll go back and look at my bank balance. That means.

I know, but I don't want to say so. People always following each other up that way.

So it's very important to be as egotistic as you are. Because the ambition to be less egotistic than you are is a form of very insidious form of egotism.

And there is nothing more reprehensible than the ambition to be a saint.

So you found that out. You see, not by going through some project, some fierce discipline to get rid of your ego unless, of course, you were the kind of nut who had to go through that and couldn't find it any other way.

That's why I have nothing against gurus who put people through all sorts of complicated obstacle races because those people asked for it, they wouldn't have respected the guru unless he had made things difficult.

It's on the principle of anyone who goes to a psychiatrist should have his head examined.

It is because let me repeat the point.

You are responsible. And when you go to a guru, you did it and you gave him authority to take charge of your spiritual development.

And he's going to show you that the authority was always yours. But he can't do that by just talking. He has to carry the absurd things you are doing to their logical extremes so that you will find out.

You are making yourself miserable. He will increase your tendency to do so until you find out that it's you who are doing it. Well, I say you find out if you are doing it. Who is you? We never have to define this because it's become like a point in modern geometry. Mathematics in the old Euclidean system, we say the point is that which has a width no magnitude, the kind of absurd definition. But in mathematics today, we don't define a point at all. Say it's a limit of size. And. It's much more useful that way, so when I use the word you, you know what I mean?

But I'm not going to define it because then we get to thinking about is the you immortal or mortal or mortal or immortal, is it eternal or not eternal? Is it a separate? Or is it one with, et cetera, et cetera, et cetera? And all these are silly questions.

The word I, as William James said, is.

A pronoun of position like this or here.

Or like it, it is raining.

So when I say I know I do, I'm not thinking that there is some agent I.

Who is the doer of deeds? I do.

I say means the saying is coming from here as distinct from over there.

And there is no disjunction between the eye and the staying. I am what I say because the saying is the act. This is I while I say it.

So with the rest of the body I'm heading, I'm Harding. I'm a stomach boning and that's the I while it's happening.

This particular boning and stomachache and Harding and Browning, same. It's all process or wiggles.

But so then when you find naturally.

That the supposed ie the mythical soul in the body, ego in the brain, or whatever it is is fictitious, is a social convention like the equator and can't do anything except the thought that it can do something simply gets your psychic processes going in a vicious circle. So then at that moment, you are in the contemplative state naturally.

You are neither trying to do something about it. You are certainly not trying to do nothing about it because you find the only thing you can do. Now, this is interesting. What? The only thing you can do is let it happen. Whatever's going on, let it happen. And you're not even letting.

How can you stop it?

Because if you try to stop it, that trying to stop is all part of the happening. See?

So what have you discovered when there is absolutely nothing to do except it happens, whatever it does happen, you suddenly discover that you are what happens.

The church not limited to what goes on inside your skull.

That the wind blowing outside, the cars pouring down the road.

The rattle of human life, the sun shining and all that, that that there is no you there is no reality that is apart from that.

Then stay with that awhile.

Just don't don't try and get that recognition back as something you had remembered, you had suddenly this flash this inside of Satori. And then you think, oh, let's let's hold onto that, I don't want to forget that. Let's make a note of it.

See? And America is still trying to pull a trick here. See what happens next. Don't stay with that. Go on. The moment is always new, always fresh. Whatever's going on. Don't try to fix it into any mold. And say, ha ha, that state of mind is Sartori. See, I that that I must keep don't keep anything. You can't. It's just like pouring water into a bottomless bucket. Let it flow through. Let it go on. And as you go on, you see something is coming to you all the time. You don't know what it is. You don't know what's going to happen next. So you just watch. But don't slide back. You're always right where it's happening right at the critical moment, which is the moment. And don't worry about whether you're right or whether you are wrong. Whether this is what you're supposed to do or not supposed to do, there is no script.

Unless you insist on making somebody else's script, your script.

And you see it coming at you.

And yet you realize it's not coming at me from somewhere or someone else. This spontaneous arrival is me. There isn't any me besides it's.

So when the chickens cluck outside. That's just the same as my having belly rumbles. It's awfully big. From each one of our points of view.

Now, then, as you well know, those things in life which are most pleasurable.

Almost invariably happen unexpectedly.

They are not contrived.

When I take students with me to Japan. The first thing I tell them when we sit down together. Is that this is not going to be a scheduled tour except within certain rather vague limits.

Many people, when traveling in foreign countries see nothing.

Because they see what they're supposed to see. Somebody tells them when you go to India, you've got to see the Taj Mahal. You must see the caves, that agenda. You must see the burning guts of bananas and so on.

And they all go and see that so that they can say, I've said it, I've seen it. And then they take these little black boxes which are capturing devices for grabbing experience.

And they fascinated me. Go round, click, click, click, click, click like this and never see anything.

They're always looking at the aperture, figuring and see that. That's right. And so on. And as an absolute drag, taking a camera. Especially if you are not a professional photographer, you know, you just have to preserve this memory of this one thing once in a lifetime. I got a chance to see the Taj Mahal click.

What I say to these people is, look, the Japanese have a phrase which is like our phrase, just follow your nose. They say follow your feet. Because unlike the United States, Japan is a very easy place to wander in. I mean, here it's very difficult to wonder. It takes narrow streets. Funny courtyards, curly kind of places for effective wandering here. You're not allowed to wander if you go wandering in any nice part of town. The police will stop you.

Because where are you going? Nowhere particular. Well, that's very suspicious. Not to be going anywhere particular. Where are you from? Have you got a paper that proves that you are there? Paper always being more reliable than people.

So everything is straightened out. You know, it's the shortest distance between two points, Ghazali. Fast as possible. No wandering allowed.

But in Japan you still can wander. It's a miracle. You can still.

But you can. And you can take a side turning, not knowing where the faintest idea where you're going.

And suddenly you discover the most amazing garden in a courtyard.

Or a funny little restaurant.

Where the most unusual food is being served are a bar where there's room only for two people to sit and they're serving broiled sea snails.

Or a shop where rare pottery is being sold.

And although the shopkeeper can't speak a word of English, you go in and the utmost courtesy is shown to brought out tea to drink and.

Very pleasant, friendly surroundings. You didn't get shown as you followed your feet and discovered it. And now all of the best things on any journey I've ever taken were unscathed. And most of the scheduled things were a disappointment because of the big build up of expectations and then flop.

So therefore, the essential principle of the positive side of the pursuit of pleasure, you see, is the unscheduled life.

Now, of course, for the convenience of other people, some schedule is always necessary, but it's best to make it a kind of humdrum habit thing.

And don't get uptight about it.

Because it is nothing more. Just as the skeleton is a framework for the flesh. So a schedule is bones for Wiggles.

Snakes and ladders and.

We need some bones, you see, otherwise everything gets too gooey.

But don't take your bones too seriously. Always allow for the unexpected.

Because this is true at the level of the most simple, sensuous pleasures, as well as at the level of high mystical experience.

So the paradoxes that come into mystical literature. Such as that he that would save his life must lose it or lose it.

Or.

The highest knowledge is not knowledge in the.

Caner will punish hard where it is explained that Brahman, the Supreme is known to those who know it, not all that sort of paradox is simply this thing that.

The cosmic consciousness. Is water rises of itself. When you see that nothing arises at all except what arises of itself.

In other words, life isn't something on the one hand happening to you on the other or being done by you on the one hand to it on the other.

The whole thing. You and it is a spontaneous occurrence.

That.

Is going on and the word spontaneous in Chinese is means of itself. 1 means in Chinese. What is so of itself and it's their word for nature.

And be careful to remember what I said yesterday, that they're happening. The spontaneous is not something you can preconceived and by pretty conceiving, it imitates spontaneity by going against social convention.

Because then you are merely acting out the obverse of the convention and being conditioned by it as ever. The truly a spontaneous can only happen of itself and you cannot arrange it.

So then you may say, well, now, does that mean, as we say in kind of everyday talk, just take things as they come?

I mean, just live day to day. Song.

And. Then I know if a person asked that.

That they don't take things as they come. While they do have as they have a concept of what it would be like to take things as they come and they would say, well, the ordinary person is anxious and full of plans and schemes and therefore let's be the opposite of that.

They take things as they come see, and that's the same as fake spontaneity. Because this true taking things as they come doesn't mean that you imitate a placid attitude.

Or that you have some kind of expected behavior like, say, one expects of a psychotherapist, a certain kind of act which he puts on to accommodate you, if you say to a psychotherapist, you know, I have just raped my daughter and murdered my wife. He says that.

And, you know, it's an amazingly unhuman reaction.

Oh, also, then you see, you people have preconceived notions of a mystic or a Buddha or a sage, and they think he has no emotions.

And so if when Zen masters, for example, get angry, they get so angry that the room rattles and. But when it's over, it's gone.

It's like a child's emotion. You know, a child can flare up and scream and suddenly it's vanished.

People think, well, he ought to have more control over himself. Is niece supposed to have all that yogi self-control and all that? No emotion and be completely serene and placid under all circumstances?

Rubbish.

That would be to say that a stone Buddha is as good as a living one.

That isn't to say we will test your virtue by taking out our stopwatch and we will bang you about and see how long it takes you to scream.

If you don't scream at all, then, of course, you win.

But it doesn't make much difference. You might as well be dead.

Is that a test of anything? It's simply a test of insensitivity.

So I don't think, therefore. That there is some kind of stereotype.

Of what this state is, we don't know what this state is. And those who have tried to write it down and explain it have always said, but it's ineffable. And what I'm trying to describe as I'm doing my best, but I know I can't really get it across.

So you would say then going back to the point that I'm making here, the person who said, well, it's just taking things as they come.

And by that, you'll think of something like, come here.

Get up and brush your teeth and take a shower and look out of the window. And then you put on your pants and have a boiled egg for breakfast and then get on the bus and go and do some business.

And so on. And that's. That's it.

But that is no to it.

Because when you are in the state that I am talking about. What from the former point of view, would have appeared to be nothing more than ordinary everyday life. It suddenly seemed to be a magical process.

Absolutely weird.

So that you can see that you might be just rubbing around in some ash.

It becomes perfectly obvious that that's the whole point of the universe.

I mean, it's all there.

Infinity and the grain of sand and everything.

That's it. And you look at other people.

Rushing around when it made people's noses, when they're in that state of rushing around a more pointed somehow than they would be otherwise.

The nose seems to be leading out, the eyes wildly searching and people going about their business every day. Serious? No. I'm gonna get that going to make this thing. And they're quite mad.

You feel sorry for them? You don't feel angry at them. But they are quiet, man. They don't realize that that now is it.

That's that's where it's all going as well as where it all comes from. The Alpha and the Omega.

There's no.

And indeed, the angels keep their ancient places turned by the stone and start a winged.

The whole surround of us is completely magical. Now, of course, we become aware that imaginative people are conscious of this.

Imaginative people show their consciousness of it. By the way, they act. By.

That taste.

In whatever they surround themselves with. You begin to notice that there are some certain people with whom.

You either have great accord or great fear because they're not ordinary. Because they have an atmosphere of magic.

They have imagination and they are not hiding under an attempt to conform. To the ideal of being ordinary. And the artistic people are here.

They're also people you can call relaxed people.

Relaxed society.

There's a very wonderful class of people. They're not on edge. You know, there are some people who are edgy all the time.

And you you feel that your very presence around their place is a mess. If you know what I mean.

But relax. People have what the Arabic is called Baraka.

It means divine grace. But it also means the quality of an old frying pan that has had long years of use and is just perfect.

That's Buttercup. And there are people like that, too, to.

And all these other great spontaneous virtues that cannot be contrived. We can try to produce Barca by finding some scientific process for artificially and taking things. For putting patina on bronze and five minutes for a pre aging wine or something like that, I mean, none of it works.

It's all phony. Because this thing can only come in the process of growth.

So you say, well, do I have to wait? But the whole thing is in the waiting.

I don't mean the virtue of patience. I mean waiting when there is nothing to do but wait. And when you see there is nothing to do but wait.

Then it happens. But it won't be hurried.

Because the minute you're trying to hurry it, that introduces the one thing that stops it.

The miracle, the magic thing is happening all the time, but you can't see it when you're trying to get it and you can still less see it when you're trying to get it fast.

So there is no alternative but to go through the point of you can't get it at all.

You are going to be you. The same slob you've always been. See, you can't change it and all your good resolutions are just bombast. And then you start

to be real.

So just as the in traveling or in ordinary relations with your friends every day, these gorgeous things happen of themselves.

Those are the true pleasures. So at the level of mystical experience, the most astounding insights.

Of, you know, where you can go into the deep, most trivial everyday affairs. This is behind all those Zen stories of the monk who was sweeping the courtyard and a small piece of broken tile zipped out from under his broom and struck against the bamboo and made up plop. And that sound he suddenly saw as containing the entire secret of the universe.

One can do it from anything. As I say, it could be the ashes in the ashtray. It could be light in a dew drop. It could be the sound of a bell. Any point becomes the takeoff point because as a principle in operation, which the Japanese call G.G. M.J.. Now, the word G means any experience which you could identify as a thing or an event. And the doubling of the word G.G. means between saying event and thing event more gay, more means no gap means barrier or obstruction.

I'll put it in another way. Everything event implies all the others.

And here in this way, you begin to see that that is actually so. When you pick up a chain, you pick up one link and the rest comes in this, you pick up one thing event and the universe comes up with it.

Because you see. There are no separate things.

It's all a single unified process, no longer divided into the voluntary in the involuntary. The I and the you or the I on the hit because it is the big happening, which is neither voluntary nor involuntary, which is neither free nor determined. All these are mere ideas about it and about.

You've abandoned all that, you've abandoned philosophy. Totally. Because you see, it's just a net designed for catching water.

And when all that's gone and their whole attempt to crush life, to capture the pleasure has disintegrated.

There it is.

And you needn't feel anxious about will it stay? It's a gorgeous thing to feel we no longer got to worry whether it will stick around. Because you know that if you do worry or shoot away.

So it's a tremendous relief to see not to have to bother with will it stick around?

Will I lose my insight with my satori, take wing and go off with the bats, use it again.

Because the more you let go of it, the more it stays. And you don't even have to worry about, will you be sure to let go of it? That, too, is a hang up.

And you can begin, you see from your very weakness, that's your strength.

It's not your big ego and your big will. That is the strong thing here. It's your it's your sloppiness, it's your weakness. It's your foolish side that is your strong suit.

You see. Yo, Condi, she puts it in this way. You cannot take hold of it. You cannot get rid of it.

In not being able to get it. Let me repeat this is not being able to get it, you'll get it when you are silent. That speaks. When you speak, it is silent. The great gate is wide open.

And nobody obstructing it.

So we'll have an intermission. And then quite.

I suppose many of you are familiar with the work of Krishnamurti and you will of course recognize that there is something in common between what he says and what I have been saying to you, that probably you will also notice that the something different. Because Krishnamurti is more of a purist than I am.

And he takes a apparently a rather negative attitude to things that are recognisably religious.

That is to say, he sets no store by religious literature. By ceremonies, by meditation practices, religious ideas and so forth.

And does without them.

He wouldn't dream of being involved in a ritual, least not one that would be mistaken for a religious ritual.

I, on the other hand, have a different attitude about those things.

Because I first of all, I'm not going to argue with anybody about their religion.

Because everybody's religion. Is that same sort of thing as their life?

You may be living a very weird life.

But I could say speaking sort of from a Hindu point of view that that's your trip this round. If the generation of Maya of the World Illusion is the play of the Godhead, then he will play the villains as well as the heroes, the fools, as well as the sages and the sinners, as well as the saints. And that's why I am not out to convert anybody or win souls because. It's as if I would go and talk to a pig and say, my dear pig. You should be a cow. Or to a giraffe and say your neck is too long or too an elephant and say you are too heavy. I tried to see what people are not in the sense of trying to classify them or type them, but to see if it is possible to find what is called divine in every disguise. And be aware, old man, cobia was when he came to maturity. He used to look around. He was a mystic who was part Hindu, part Buddhist, part Islamic, who lived in India in about the 15th century.

He used to look around and say, to whom shall I preach?

Because he saw the beloved the Godhead on all sides in every being and therefore felt it would be presumptuous to make any recommendations.

That's a strange state of mind because it's so easily made over into a very shallow, Pollyanna ish optimism.

But, you know, in the mythology of the Hindus that they have some very nitty gritty characters. Let's take Kali Kali, the female one of Shiva's girlfriends, Chuck D. She is really represents the dark side of yin, the feminine of feminine.

The spider mother, the devouring feminine. The night, which sucks in all days.

But also, Carly is the mother of the universe.

But it emphasizes the dark side of the mother, and she is shown with fans black skinned. In one hand, she carries a scimitar and another a severed head and she is a bloody character.

And, you know, there are colleagues all around us.

And it's not like saying.

Ocala is not so bad after all. She has a good side. The thing is to see a bad side as an aspect of the divine.

And then genuinely be able to refrain from saying, I wish you would improve and say it's some sort of tough to do that.

I mean, I feel the same way when I'm confronted with a representative of the militant lunatic fringe of Protestantism, a Jehovah's Witness or a Southern Baptist or a Billy Graham type.

I have a men's personal distaste for that kind of religion.

So I wonder, and I look at it and I think where is the real kick in that one of those people really doing what do they get their basic pleasure from in this? How can God be playing that game?

It's a very mysterious business.

So I try to look at it that way.

Instead, our blanket is saying, well, all your religious gimmicks are vanity.

Therefore, cease and desist. Because although many religious gimmicks are vanity from my point of view.

I yet think of Blake's saying the former will persist in his folly, will become wise. And for this reason, even foolish religions are ways of realization.

Because the more far out you get from realisation, in a way, the nearer you get to it because the path is a circle.

Then on the other hand, I suggested this morning that there's a way of looking at religion, which is quite different from what will it do for me? What can I get out of it? What magic can I perform? Here is yoga. Here is meditation. Here is zazen. Ordinarily, we look into those practices and say, I wonder if that will do something for me. Now, I'm suggesting that we look at them quite differently as art forms. And instead of saying what little painting do for me, what will sculpture or music do for me? I don't think we ask that.

We say I enjoy music. It's it's fun. It's beautiful. Let's do some. So you're not looking for something from it.

And that's the attitude which I take to any practice which may be designated religious.

That it's an art form, that it is a way of expressing exuberance, delight and above all, the sense of wonder.

Appreciation of the magic of being. And I've often quoted that saying of Van der Loo that the mystery of life is not a problem to be solved, but a reality to be experienced. And the people who tried to explain mysteries are people who try to destroy mysteries, and that is in a way to destroy life.

It's often said by men that women are mysterious. Is that a complaint or a compliment? I take it as a compliment. May they remain mysterious and

may men remain mysterious to women.

But you would see that it there seems to be, after all I've said and after all that Krishnamurti says there would seem to be something inconsistent in.

Practicing meditation or going to church. Are participating in a ritual. If we didn't do those things.

I think myself that life would be very much impoverished.

All the churches would be turned into museums. The holy scriptures would be used for fuel.

The rituals might live on in funny dances, but we should be scrubbed clean of superstition. And I don't exactly look forward to that prospect from an aesthetic point of view.

I like magical toys. I don't believe in them in the sense of thinking they will help me in the competitive games of life. But when I see a figure of the Buddha.

Seated on his Lotus throne with an Oriole behind him, an incense burning in front of him.

I feel something glowing. Wong Civilizing, humanising.

And also mysterious.

Very hard to say what it is to put your finger on it, because I don't think it would be there if I could.

The especially the Mahayana form of Buddhism has spread a kind of warm glow all over northern Asia.

It's such a bane.

Such a sophisticated religion, it doesn't harass you with prejudice, it doesn't pursue you. It doesn't make a busybody a nuisance of itself.

And he it fosters the arts.

It fosters compassion and concern, but not of the kind of concern for people that shovels what is good for them down their throats.

And.

It's so it's so roomy. That's why it's called the Maha Yana. The great vehicle or the great cos it has so many different ways in so many different practices and there's no kind of scrubbing people down to the basic essentials.

It's not plagued with efficiency ology. So personally, you see, I dig that.

I also like that side of Christianity where it's expressed in Roman Catholicism or Eastern Orthodoxy.

I don't like scrubbed Christianity, the Protestant kind, where they take away the candles and the vestments and the mystery and the innocent and make it all rational.

Because when you go, you ask the question, what are the essentials of a religion?

To my mind, when people reduce any religion to what they call the essentials, they get rid of all the important things and leave in only the misleading ones.

Because when we get it down to essentials.

We say we get back to this question. You see that all religions offer a way of salvation or of liberation or whatever it may be of union with God and the Protestant would say to the Roman Catholic. Well, all your rituals and obscure ways are getting in the way of man reaching God directly.

We want to get all that crowd out of the way and find a more efficient way of getting to God so that we can reduce the costs from five years to 10 weeks.

Now have to take off all those holidays, too, which distract from business. It gives our apprentices holidays and we don't want to lose time. We are where we are on the make. Do you see the moment you reduce, the time it takes, you take out the religion because you make it into an enterprise to get something, and that's what I've been telling you all this weekend. You can't do because the moment you try to get God, you assume that you aren't there. When you don't try to get there's a chance that you may discover that you are there already.

We were thinking over lunch how funny it would be if we got a real speeded up easy course in meditation without tears. All the nonsense taken out of it. Only the essentials. But the big headline. They laughed when I sat down to meditate.

So here all the merchants are telling you the quick way.

But what is fascinating about.

The non efficient religions. Is precisely. They are California's all the other essential things they do.

All the exuberance of flowers and smells and ornaments and color. You notice in efficient religions, the first thing they take away is color.

Why do people take away color or they say color shows the dirt. You have to wash it all the time. So you wear black because you live in a grimy city. You don't want to show the dirt.

That's efficiency. But color is the first thing that goes.

But let's suppose we look at religion in an entirely different way. We have begun.

First of all, you see with the understanding.

That religion is not an acquisition and therefore there is nothing you can do to acquire it. You begin from the point of recognition that you are what you are. You can't improve yourself because if you try to, you'll only make

yourself more tied up in and messed up. You have to recognize that because there's no alternative. And then you're in a position to be very simply and ingenuous, fully aware of life without trying to do anything to it. You let it happen. And then it begins to show its color.

And then you feel intensely the marvel and magical nature of the world so that whatever you do by way of a religious practice is an art form.

Like singing to express the marvelous feeling that comes out of this. Not to secure yourself.

Not to acquire anything and a reward, but simply to.

Live it up.

It's difficult, perhaps, for many people to understand how you could be living it up by meditating. Meditation seems on the surface so, so dull. Why sit still for a long time?

That's awful. You know how when they tried to make you sit still as a child, how you resented it and be jumping around looking for this, that and the other all the time, because you can do that, you can take up dervish dancing as a form of yoga.

If your temperament suggested. But what about the more ordinary is still sitting kind of meditation?

Nobody seems to realize that it's supposed to be fun.

You know, when you have been sick. And you just have to lie in bed. There's nothing else to do.

While everybody else in the world goes about their business and you're left with almost nothing to do except listen.

And you hear all the funny little noises that you don't normally notice. Of not only people, but also animals and birds and things going about their daily business.

And it suddenly occurs to you that this is an unheated symphony that's going on. You notice the sunlight leaving curious patterns on the painted walls maybe of a hospital room where there are patches of damp and cracks in the ceiling. And because you are in a condition of complete receptivity and passivity, all this starts to come to life because, of course, passivity is the root of life. Activity is the end of it. But passivity is the beginning. It's the wound from which creation starts. And so in the same way, when you meditate in some schools, you will be given something to meditate on. Although very often when an Oriental explains that he meditates and a Westerner asks as he will. What do you meditate on? The Oriental will look vaguely surprised. I did. I don't know what you mean. I don't meditate on. I meditate. Although, as I say, you might be given the practice of concentrating on a visual image of a chakra or a mandala or a syllable or humming a sound or some focal point.

But that isn't necessary.

When you are at the point at which I am speaking, where you are simply not doing anything, even not trying to do nothing. You can't. Then you are sitting.

And you are as aware as can be of every tip of a half. And you've got nowhere to go. You're not in a hurry. There is a period of 40 minutes an hour or whatever it is. Where is it only required of you? That should be. Now, normally at that moment, one is impatient. Somehow bothered by having to be restricted.

If you take it easy.

You will feel no restriction. I'm trying to think how I can explain this. If you lift up a heavy weight and hold it up on the tips of your fingers, it's a big rock.

Normally, we think of that as an effort to maintain it.

But there's a certain way of looking at this where you say.

It isn't an effort, it's just going to stay there.

And instead of fighting against any feeling of tension that the rock causes.

You just turn that tension into. It's gonna stay the.

It's a curious thing. You can support a heavy weight for a very oddly long time doing that. So in the same way, when you're certain, even if your legs hurt or you get uncomfortable, there's the sudden attitude wherein that just disappears and you've got this extraordinary. The only thing it does is it keeps you awake, which is fine. Then you got this extraordinary feeling of the amazing nature.

Of looking at reality, at life.

Without doing anything to it. Without any sense of hurry, without any wish to improve it, just let it happen.

And you can understand then why Buddha images look blissful.

Because cats do this. Cats will sit for ages and watch. American Indians will do it. They'll set the hours by a roadside.

We think they're done. You know, sometimes I sits and thinks.

But mostly I just said they have nothing better to do.

Someone else was saying at lunch that if you bothered on the phone and somebody asks you, could you come over this morning and do that? And so perfectly legitimate to say, no, this is my morning for a hair appointment. This is my morning to go down shopping, etc. And I can't come. But if you say this is my morning to be alone, people would think you were very strange.

Because you wouldn't be doing something for the world. But hermits, for example, and people who live solitary lives and meditate a great deal are doing an enormous amount for the world. Just a very early suspicion that people exist like that is marvelous for everybody. Because it says to all of us. Where do you think you're going? Why are you making? Why are you raising so much dust? Because you think you're going somewhere and

you're already there and this dust is getting in everybody's nostrils and it is polluting everything in all because you are so busy to put up this big thing, whatever it is, it is getting top heavy and it's getting a bar holding the thing up.

So to know that there are hamlets.

Deep in the forest is like knowing that there are still streams and flowers, which no one has ever seen. We are mostly of the mentality that if we heard of a hidden valley full of flowers, which nobody has ever seen. We would say that should be open to the public, should be bought for the nation, and they should put in a ranger station and toilet facilities and a picnic ground. It would be still worse if there were one person living in there and enjoying it all by himself. Let's say the selfish bastard. He should live in that beautiful, flowery valley all alone. Open it up. Let's all have a look. And then when everybody's had a look, the place is a desert. Now I live opposite a forest. It's in a state park and I can see right across to that forest. It's a very big and very dense forest.

Occupying the whole side of a valley and I think sometimes be fun to explore it. And then on the other hand, I decide I'm not going to. I'm not going to disturb it.

The only one who lives there is an old she goat who comes out every so often and dances on top of a big rock. Oh, of course there are birds and probably deer and skunks, rabbits. But nobody ever goes there.

You never see anybody in that forest. And it's just wonderful to leave it alone.

So you see here two things, two cranes of my thought. Connect. The first train was you see the folly of trying to do good. And the second train is that you are doing good by doing nothing.

The very hands off. On this thing called life.

The meditative attitude which realizes to you how magical it all is.

Also.

It benefits other people in the same way as the untouched forest and wilderness land benefits people. It's essential to our sanity to have those areas of UN interfered with life.

So we might say that is the passive side of exuberant religion is the meditative.

The one activity in which we are completely here and now and not seeking any result. The other side of this exuberance is, of course, the musical dancing, ritualistic side of religion. When you see another kind of ritual, nobody is expecting to get anything out of this ritual because it's not considered as magic, it's the Japanese tea ceremony. It is apparently a purely secular ritual. It is a way of drinking tea together socially. Actually, it's a Zen Buddhist ritual. Because in Zen, you get to a place where there isn't any difference between religion and everyday life. But they don't. Therefore, not the ritual art of everyday life. They put the ritual into everyday life at the tea ceremony.

And they're the beauty of gesture and of the primitive style vessels that are used. And the serenity of doing this ritual for no reason except the ritual is a very lovely experience.

But you see in the life of America today, and you notice it here in a rather special way. There is very little joyous ritual.

I mean, there are Freemasons and there are shrines and Knights of Columbus.

But those people laugh at their own rituals. Really?

They they they don't understand them.

They have no real feeling for it. It's it's it's a kind of clowning affair where you dress up and you do this and you give the money to charity and so forth. And in the Roman Catholic Church, they don't understand ritual. So

that you get the impression you see that, you know, you put a quarter in the slot and political outcomes a goody.

We've got a confession.

And you'd only make the full confession that they would, you know, to say that the sins of a member of songs on Sunday in the present. And it is done. I see. And I remember once watching a midnight mass in New York. I never saw anything go so fast. I don't if any of you ever remember a story by Alphonse, do they call it Obama's bus? The three low masses with a play on bus lo was the three masses of Christmas being celebrated in one hell of a hurry because the priest and the acolytes all wanted to get the dinner and they gave themselves such indigestion at the dinner that they died and their ghosts were compelled to celebrate three masses through all eternity.

While this mass was just like that, I never saw anything like those. I the people at the altar, while that there was somebody and the acolytes suddenly went up, genuflect and vanished.

They reminded me that passage in the book of Genesis, where it says in Enoch walked with God and he was not for God took him.

He just disappeared.

I mean, so there's nothing stately about it. There was no rhythm, no sense of a dance. Well, let's get this thing ground out as fast as possible. Most of us now have a greater love. Many believe the mother will move. It doesn't really up his death.

Now, I can understand that being done because somebody digs a kind of.

Wait, wait, wait, wait, wait, wait, wait, wait, wait.

I assume you see, but this isn't done that way, it's done to get it over with. So nobody digs it. This ritual is just a magic to be done as fast as possible. It's like a prowler with an electric motor on it now. Well, you may laugh at prayer wheels. You ever try to use a prayer wheel? You get one. They're all over the place. Nowadays you rotate it and see it has a cylinder and a little

chain and a weight on the end of the chain. And you get this thing going. It says inside own money. Pardon me. You get this going and you know, you've got the earth going round the sun. That's the same sort of process. You've got this going like this. It's a little bit of a trick to it, so you don't want the chain to get loose and drop the weight on the end. So you've got to keep that rhythm going. Once upon a time, there was a miser and Buddhist priest. Was his friend going to trick that miser, the Buddhist priest said atomizer, look, every time you say the religious formula are normal. I mean, tablets, which means normal like Halo or early means the name of Army Harbor, the Buddha. That's the great sun Buddha. I'll give you one scene, which was one hundredth of a yen that was a very small amount of money, but all you got to say, it's a number I mean, books, I'll give you a sentence.

The miser thought, that's crazy. Think of all the money only.

So he began took out a brush. I mean, it was dumb, I mean, it was I mean, it was not I mean, it was no more I mean, it wasn't I mean, it was numb. I mean, it was not what I mean, it's not what I mean. It was not what I mean. It was no, I mean, it was not I mean, it was dumb, let me say.

And the priest used to come and look at him every day and see this huge sheets of paper accumulating with all accounts. He had done one sandwich.

The priest is very happy, is not what it was. I mean, it was dumb. I mean I mean, this one day he came, there was a miser sitting say no money. There was no one. There was no I mean, he wasn't making any marks.

In haha heart.

And another day. Still seeing nothing happening at all.

And then one day the priest came and he opened the gate at the end of the garden path and the doors flew open and the miser came rushing out and he embraced the priest and says, Oh, I can't thank you enough. You don't owe me any money at all.

Well, that explains the prayer wheel, you see, if the prayer wheels to do that thing or other you are to do that thing, you mother, you can't be in a hurry.

You can't be trying to get away. You must be fascinated with the possibility of C and you just do this to true to you at your wits end. It's why you're a kind of a nut. You have to be easy to do this. You're at your wits end. All there is. You don't have to say anything. You don't ever think anything. You don't have to be virtuous. You don't have to believe anything. Only up there to go to. Good, good, good, good thing. That's that's it. And so you can have a ball swinging that thing. So that therefore we need to be delivered from a utilitarian religion altogether and come to the realization that the highest form of religion is perfectly useless. And this is the true nature of play. And of course, it's the true nature of the universe. And see, what I'm doing is I'm playing a sort of little trick here because I'm showing you the importance of the unimportant. See, we got ourselves down to being absolutely incapable. That's what we did to begin with.

And show you that that's where you really begin to live.

So now, again, we're going to get down the very highest that there is the Godhead and religion and the Saints and angels and the tiny Buddhas in their Mandela's sitting at the heart of the universe. And we're going to show that they are all quite useless.

They serve no purpose, whatever. They are not good for anyone else or anything. Why they don't need to be. They're not going anywhere because they're now.

And the expression the Maya of the universe, which they show.

Is not done.

Because they have some purpose to work out.

It's the way you spend your time when you don't have any purpose to work out.

Then you can afford to be devious. You don't have to go the direct way. If you've got a purpose, get that baby. See you like that. Get that.

If you don't have any purpose, you wonder and you go and suddenly you say, well, that's the outline of a leaf.

And all those veins going through it a little earthy, so you get the wiggly path instead of a straight path.

Go round in circles.

So the planets go around the sun. They're not going anywhere. What's the sun going around another star? Oh, this thing is a great spiral nebula with its center somewhere beyond the constellation of Sagittarius going around and around. So in the religious dance, we all join hands and we go around. In meditation, you make your breath go wrong. It isn't just in and out like a pumpkin. It's not like that. It's like goes like this. And there's no sort of hitch between the in and the out. It flows the whole way. Yoga. Called the Chinese. Call it the circulation of the light.

It's going around.

In Buddhism and in Hinduism, they talk about the world as samsara, the round.

Sorry, around the sorry go round as distinct from the merry go round. Samsara, the wheel of becoming the power Chocola.

The wheel of birth and death, and so Edwin Arnold and his poem, The Light of Asia makes the Buddha say you suffer from yourselves. None else compels, none other holds you that you live and die.

And were upon the wheel and hug and kiss its spokes of agony, its tire of tears, its neighbor and nothingness. That's the rat race thinking you're going gonna get somewhere. Spin that wheel, baby.

Round and round that wheel of fortune.

Weigh what you gain on the roundabout and you lose on the swings.

And on the other hand, there are certain people who have a different attitude to the wheel of Fortune spinning for fun. Let's gamble. Not to make money

just because it's fun to gamble.

Now, you see that as the gay newsman, he's liberated.

He's not. He's not hung up on the game. So in the same way that Mandela is a symbol of the transformed rat race.

Now, what's the nature of the rat race? The barber chapter, a symbol of the six divisions of life with the successful people at the top. They're the angels, the unsuccessful people at the bottom. The Naka or the. The poker. Purgatory. Or States of extreme suffering. And then in between are various graduated states. The humans, the frustrated spirits, the furious spirits. And the animals seem at the top of the gods. At the bottom are the demons and the tormented spirits.

So everybody is moving to get up to.

So in a way, wherever you lie or at the bottom, you're tormented if those gods are trying to stay up in. But is no way higher than heaven. And the only way is down.

Down and out.

So they got that theme running, see?

Now, importantly, recognize on this wheel that being at the top is not being a Buddha. You may be a God, you may be an angel, a diva from which we get our word divine as well as devil.

But you are not a Buddha. You're not liberated from the wheel. How do you get off? Why? Knowing that wherever you are on the wheel, is it?

Peter?

Let's say we all at the bottom because honest squirrel cage wheel, the running squirrel or rat always stays at the bottom. So you're as low as you can get. That's what I was pointing out this morning.

Can't get any lower. You're in the Naka. The bottom of hell. But there you are. Now what happens?

You realize that every point on the wheel is there.

And so you'll get a different picture of the wheel, not as the significance of it is no longer in the Rotary movement around it, but suddenly in the movement from the center to the circumference and from the circumference to the center, you'll get a flower.

The path of the pedal and your wheels suddenly becomes a mandala.

That is to say, a circle's subdivided in by petals or other symbolic petals to be a floral shape. And there you see the great Tibetan paintings of Mandala's.

We go back to the five great Buddhas, Dynegy, in your eye, as the Japanese say is in Sanskrit, is Maha Varro O'Connor Buddha, who represents the basic energy of the universe, the great sun Buddha. He's in the middle. He has around him Mummy, Taba, Shabbir Rudner, some barber and some barber and a megacity, and they're all a beautiful jeweled creatures in their places and you see the balanced wheel, the joyous wheel.

So this is the transformation of the rat race.

And this also is a kind of ritual ization of everyday life.

And this you see, just as the rat race has transformed into the mandala.

So far, the person who is a master of pleasure.

The little things of everyday life are likewise ritualized.

Not because somebody is compulsive. You know, all the dishes must be without spot. Give me my magnifying glass.

Not that, but that doing any simple action with delight looks ritualistic.

If you watch a very skilled craftsman at work or a surgeon or a good dentist. Or a shoemaker or a potter who thoroughly loves the work. You'll notice that caressing hands, the delight, the dance they do. To do this thing, the doing of it is more important than the dunning of it.

You see, they look ritualistic in their action.

It's a ceremony and you think he's worshiping some kind of a God. That's because he's turned the rat race into the mundane. So you can do that with everything if you're not in a hurry. And you're not in a hurry if you know there's nowhere to go. I mean, they said he has the end of the line and there's a place called death and a tombstone on it says, well, he. He did it once. We write his name on the tombstone.

That's the end. That's where you're going. If you look at it from that point of view. But if you're going here.

And you've already arrived. What is proper behavior for a Buddha?

Supposing you are as rich as rich can be. And you are. The whole universe is yours.

Supposing you got all the time you need when you do have now is enough of what what what what to do, obviously.

Well, of course, live it up.

Take delight.

In all the ordinary things that are to be done.

Instead of trying to get them out of the way so that you could do something else which is supposed to be better or more rewarding. You'll see the reward is everywhere because there's no hurry. In this way now, the world is transformed in this way. You might have a utopia. Because as Gary Snyder, my friend, has put it, there is no possibility of your doing anything effective.

To.

Save this world from an terrifying ecological disaster unless, you know it doesn't need to be done. If you can see the dissolution of this world, the end of the human race. As the Kali yoga that Hindus talk about, the cosmic cataclysms, which comes at the end of every four million two hundred, three hundred and twenty thousand years, every culpa and realize that this ecological disaster is simply the periodical death of a world system.

And therefore, there's nothing especially tragic about it.

It's the way things go. Just like the death of every individual. You would think that such a realization would make a person cold, indifferent. But no. If you understand that and you're not fighting it, you are not afraid of it. And if you're not afraid of it, you can handle it.

But you have to show that the preservation of the planet and of life is not a frantic duty.

It's a pleasure.

And you won't convince everybody at the pleasure if you go and scream in the streets. Start throwing rocks.

Then you are saying it's your duty. To whom? To whom do we owe this duty? Do you owe it to yourself? Well, that depends what you want to do.

Do you want to go on chasing on the wheel? Do you want to think that by a fierce political action we will have a better world to live in and we'll all be so happy?

Five year plans and then another five year plan. And then after another five year plan, like my music teacher when I was a child, it's clear scale is ridiculous.

Diddy and you know, she said not once more applied, played against it. Now, just once more or once more, but a little about, you know, horrors. But you can find or realize the great life.

If you're not looking for.

Religion of No Religion

Journey to India

Now then, we have to get on to Buddhism. And in order to introduce Buddhism, it's necessary to remember the whole background of the world view of India. In other words, what we're going to study first of all to understand Buddhism, is Indian cosmology. Just as you would have to study the cosmology of the Ptolemaic view of the world in order to understand Dante, and in order to understand lots of things about medieval Christianity. So the cosmology of the Hindus, their view of the universe, has come right into Japanese life, through Buddhism, but it antedates Buddhism. Buddhism simply adopted it as a matter of course just as now if you invented a new religion you would probably adopt because military of modern astronomy astronomy.

Well now, how does the Hindu see the world? You know there are really three great views of the world that human beings have had. And they go, one is is the Western view of the world which looks upon the world as a construct. An artifact, by analogy with ceramics and carpentry. Then there is the Hindu view of the world which is dramatic. Looks on it as a play. And then the Chinese view which is organic and looks upon the world as an organism, a body. But the Hindu view sees it as a drama. And it's simply this there is what there is and always was and always will be which is called the self. That in Sanskrit is Atman, A.T.M.A.N. And the ATMAN is also called Brahman. Brahman from the root Bre to grow to expand to. Well, is that actually related to our word breath.

So, Brahman the self, according to The Hindu view, plays hide and seek with itself for always and always and always. How far out, how lost can you get? So here each one of us according to The Hindu idea is the Godhead armed purpose getting lost. For the fun of it. And how terrible it can get at times, but won't it be nice when you wake up? That's sort of the basic idea and I found it's an idea that any child can understand. It has great

simplicity and great elegance. Now in part of this cosmology we must understand another feature of this conception of the universe. Not only you remember now the Kalpas the periods of time the yugas, the qualities of the time through which the universe goes, but there's the final thing which are called the six worlds, or the six paths of life. And this is a very important for Buddhism although comes from indoors and is represented in what is called the poverty Bhava, means becoming B.H.A. V.A. chakra C.A.J. K R A means wheel the wheel of becoming, the wheel of birth and death.

And it has six divisions. It has the top people and the bottom people the top people are called Deva D.E.V.A. The bottom people are called Naraka, N-A-R-A-K-A. Devas are angels and they are the people who are the Supremes spiritual successors. The Naraka are tormented in purgatory. And they are the Supremes spiritual failures. They are the Poles, the happiest people and the saddest people. Then in between there comes the world of the pretas. Next to the narakas, next to the purgatory. The pretas are frustrated spirits who have tiny mouths and enormous balance huge appetites but very very limited means of satisfying. Then next, they come between the narakas and the Davis at the top. Next up from the predators are the human beings, and they are supposed to hold in middle position in the six worlds. Then you go up from the human beings to the Devas and then you start coming down again the next world is called the Asura. And those are the wrathful spirits, the personification of storm and all the anger and violence of nature.

Next down is animals, coming between the asura and the purgatory is again. Now all these needn't be taken literally they are different modellers of the human mind. We are in the narrow world when we are frustrated and in torment when we are merely chronically frustrated, we are in the pressure world when we are in the state of economically even mindedness, we are in the human world. When we are deliriously happy, we are in the Deva world. When we are furious, we are in the Asura world and when we are done we are in the animal world. So these are all model it is. And it will be said now. This is terribly important to understand Buddhism. Because the better you get the. The more you go up to the Deva world the worse you get the more you go down to the knockout world but everything that goes up has to come down.

So you can't improve yourself, indefinitely. If you improve yourself beyond a certain limit you simply start to get worse, like when you make a knife to sharp, it begins to wear away. So the Buddha-hood, or liberation, enlightenment, is no place on the wheel. Unless it might be the center. By ascending by becoming better in tie yourself to the wheel by gold chains, by retrogressing and becoming worse you tie yourself to the wheel with iron chains. But the Buddha is one who gets rid of the chains altogether. And so this will explain why Buddhism, unlike Judaism and unlike Christianity, is not very very frantically concerned with being good. It is concerned with being wise. It is concerned with being compassionate. A little different from being good. With having tremendous sympathy and understanding and respect for all the ignorant people who don't know that they're it, but who are playing the very far out game of being you and I.

And so this is why every Hindu greets his brother not by shaking hands but by putting his hands together and bowing. This is why the Japanese bow to each other basically. This is why Buddhist rituals are full of the bowing gesture. Because you are honoring the self playing the roles of all the people around you and all the more honor is due, when the self has forgotten what it's doing. And is therefore in a very mature way.

Now, that is a basic Hindu view of the world. That's the cosmology which goes along with Buddhism. According to taste, temperament, tradition, popular belief and so on, there is this additional idea that when the the Lord, the Self, pretends that it's each of us it first of all pretends that it is something called the jivatman. The Atman, the self, pretends to be an individual so called a jivatman. And the jivatman reincarnates through a whole series of bodies. Life after life after life, and according to what is called karma. Karma it literally means doing. The law of doing whereby acts occur in a series. And they are linked with each other in an unbreakable chain. So everybody's Karma is the life course that he will work out through maybe innumerable lifetimes. I'm not going into that because a lot of Buddhists don't believe that. You will find that the Zen people, for example, are quite divided on this. They will say no we don't believe literally in reincarnation. That after your funeral you know you will suddenly become somebody different living somewhere else. They will say reincarnation means this. That if you, sitting here now, are really convinced

that you are the same person that walked in at the door half an hour ago, you're being reincarnated. If you're liberated, you'll understand that you're not. The past doesn't exist. The future doesn't exist. There is only the present, and that's the only real you that there is. The Zen master Dogen put it this way. He said, 'Spring does not become summer. First there is summer. Then there is spring. Each season stays in its own place.' And so in the same way, the you of yesterday does not become the you of today. T S. Eliot has the same idea in his poem The Four Quartets, where says 'When you settle down on the train to read your newspaper, you are not the same person who a little while ago left the platform.' If you think you are, you are linking your moment up in a chain, and this is what binds you, to the wheel of birth and death. But when you know that every moment at which you are is the only moment... This comes into Zen, a Master will say to somebody, 'Get up and walk across the room.' And he comes back and says 'Where are your footprints?' So where are you? Who are you? When we are asked who you are, we usually give a sort of recitation of a history. 'Well I'm so and so, I was given this name by my parents, I went to such and such a college, I've done these things in my profession, and I produce a little biography. Buddha says forget it, that's not you. That's some story. That's all gone, that's all past. I want to see the real you you are now. But nobody knows who that is, you see, because we don't know ourselves except through listening to our records, and consulting our memories. But then there's a real you and that again leads us back to this question. Who are you, that is the real you? Which will see how they play with this in Zen by the koans to get you to come out of your shell and find out who you really are.

Well now, whereas in India this worldview is tied up with a whole culture, involving every circumstance of everyday life. Hinduism is not a religion in the same sense that say being in a Episcopalian, or even a Roman Catholic. Hinduism is not a religion. It is a culture. In this respect it's more like Judaism than Christianity. Because a person is still recognisable as a Jew even though they don't go to synagogue. Because as the certain cultural things that Jewish people who come of a line of Jewish parents people, who have been practicing Jews, they still continue certain ways of doing things; certain mannerisms certain attitudes and so, they are cultural Jews instead of religious Jews. Now Hinduism is the same sort of thing it is a religion-

culture. And so it involves living in India really to be a Hindu. Because of the differences of climate, the differences of Arts and Crafts, technology, you can't be a Hindu in the full sense, in Japan or in the United States.

So what is Buddhism? Buddhism is Hinduism stripped for export. Now the Buddha, was a reformer you might say. In the the highest sense of a reformer someone who wants to go to the original form. Or to reform it for the needs of a certain time. The word Buddha is a title, not a proper name, same way as Christ means the annointed, and it's not the surname of Jesus. So Buddha is not the surname of Guatama. It means the one who is awakened. From the root in Sanskrit Budha, B.U. D.H, to know. The man who woke up, who discovered who he really was. Now the thing that where in that crucial point where in Buddhism differs from Hinduism, is taht it doesn't say who you are. It has no idea, no concept, and I emphasize the word Idea and Concept. It has no idea and no concept of God, because Buddhism is not interested in concepts, it's interested in direct experience and direct experience only.

So from the Buddhist standpoint, all concepts are wrong. Just in the same way that nothing is really what you say that. This—is this a stool? It isn't now, it's a waste basket. It's now a drum. What is that thing? See? It is what it does, see? Anything you can use it for is what it is. So if you have a rigid idea that it's a stool and you can only sit on it and you kind of stuck. But if it's all these other things as well then you suddenly see that anything can be everything. So, in the same way, Buddhism does not define and say what you really are is something because it would say that if you believe that you got stuck with an idea and you're clinging onto it for spiritual security. So a lot of people say 'Well I like to have a religion because it gives me something to hold onto.' Buddhists would say 'Ah, cut that stuff.' It so long as you hold on to something you don't have religion. You only you only really there when you let go of everything. And you don't depend on any fixed idea any belief for your sanity or happiness. So you would think Buddhism is very destructive, because it breaks down—it doesn't believe in God, it doesn't believe in an immortal soul, it doesn't believe in. Doesn't seek any solace in any idea of life after death. It absolutely faces, the fact of the transiency of life, there's nothing you can hold on to so man let go. Because there's no wonder hold on to anything anyway.

So Buddhism is the discipline of doing that. But if you do that, you see, you'll discover something much better than anybody else who has a belief. Because you've got the real thing, and you can't say what it is. They say in Zen that if you were enlightened in Buddhism we were like a dumb man who has had a wonderful dream. That is to say when you had a wonderful dream you want to tell everybody what it is but you can't let your dumb if you can't speak. So that the real thing in Buddhism which they call nirvana which is a sort of the equivalent to moksha, means blow out. Here. You know, a sigh of relief. Because if you hold your breath, you lose. To hold on to yourself you hold on to life or breath is the spirit you hold on to God Rock of Ages cliff and me are let make going on do you. It's all dead, becomes just a rock, just an idle. But let go, breathe out, and you get your breath back, that's Nirvana. So the Buddhist idea, is in doctrine the highest negativism. The characterize the ultimate reality as Sunya, you know, which means emptiness. In Japanese Ku, which is the character you use for the sky or the air when you get an air mail. You know to write home it will the second character is cool the air which means emptiness and they use this to translate should not or emptiness. The fundamental nature of reality, the sky. But sky you see is not negative emptiness, the sky contains all of us. It's full of everything going on but you can't put a nail in the sky and pin it down.

So in the same way Buddhism is saying, you don't need any gizmos to be in the know. You don't need a religion. We don't need any even Buddhist statues you don't need any temples. You don't need any Buddhist bond years of the rose there isn't all that jazz. But when you get to the point that you know you don't need any of those things that you don't need a religion at all, then it's fun to have one. Then as it were, you can be trusted to use rosaries and ring bells and clappers and chant sutras and that sort of thing. But those things won't help you a bit they'll just tie you up in knots, if you use them as methods of catching hold of something. So every teacher of Buddhism is a debunker. But he does it not to be a smart Alec and to show how clever he is, but out of compassion. Just as when a surgeon chops off a bad growth or dentist pulls out a rotten tooth so the Buddhist guru or surgeon is getting rid of your crazy ideas for you. Which you use to cling on to life and make it dead.

Now, there are two kinds of Buddhism. They're called Mahayana; Maha and Sanskrit word for great M-A-HA, Yana means a vehicle or conveyance. And there is Hinayana, means the little vehicle in Sanskrit H I N A means little. Only That's a term invented by the Mahayanas. For the other people and the other people don't like it they like to call themselves Therevada, T.H.E.R.A V.A.D.A, which means bad or the way para of the elders. Now, Theravada Buddhism you will find in Salon. Thailand Cambodia and generally South Asia. Mahayana, you find in it originated in northern India. And you find it in Tibet, China, Mongolia, Japan. And to some extent in Indonesia.

The Mahayana is what we're finding here. All the sects of Japanese Buddhism are Mahayana. And what's the great difference between these two schools. The Theravada is very strict. It's a way for monks essentially, rather than laymen. And it is, you see there are many ways of living Buddhism. It will take me some time to show you this. The Theravada Buddhists are trying to live without desires. To have no need for wives or girls or husbands or boyfriends. Not to kill anything at all. To live the strictest vegetarian way and to strain your water so that you even don't eat any insects, little insects with it. And to this very strict way, and meditate all the time and eventually attain Nirvana which will involve your total disappearance from the manifested world.

Mahayana feeling is that that is a dualistic point of view. You don't need to get away from this world to experience Nirvana, because Nirvana is what there is. It's here, it's now. So the ideal person of Mahayana is called a bodhisattva This is originally meant somebody on the way to becoming a Buddha but in my younger it has a different meaning. It means somebody who has become a Buddha, but has gone back into the world. Out of it in the spirit of compassion. To help all other beings to become awakened. Well now, that's an endless task, it's like filling a well with snow, you know, put snow into a well, it never fills up.

So when it does Zen monastery, they said their homage to the Buddha the Dharma, that say the Buddha's doctrine, or method and the Sangha, the order of followers of the Buddha, and they take five hours. And one of them is however innumerable sent in beings are I vow to liberate them all. Well

so you see there is no end to that. Never Comes a time when all sentient beings are liberated. But actually from the standpoint of one who is a Buddha, he sees everybody as liberated. In other words, if I were to be a Buddha, I wouldn't say 'Now look everybody I'm a Buddha and I'm more experience than you and I know more than you and you will meet respect on that account.' On the other hand, I wouldn't I would see you all. As being exactly right where you are. All of your Buddhas, and even those of you who don't know it, it would be right for you not to know it at this moment.

In talking about Buddhism in past seminars, I explain that it's absolutely fundamental to an understanding of Buddhism to recognise that its whole method of teaching is dialectic. That is to say, it consists of a dialogue between a teacher and a student. And the method of this dialogue is called Upaya. That is to say skillful means, used by the teacher to bring about the enlightenment of the student. The word Upaya, meaning expert pedagogy in teaching, but meaning deceit when used in a political context. And since Buddhism is a dialogue, what you ordinarily understand as the teachings of Buddhism, are not the teachings of Buddhism, they are simply the opening gambit or the opening process of this dialogue. And the point being, that Buddhism is not a teaching, its essence consists in a certain kind of experience. In a transformation of consciousness which is called awakening or enlightenment, which involves our seeing through our transcending the Hoax of being a separate ego.

And so, a Buddhist does not have the same tendency that a Christian has to want to find out what his faith is by going back to the most original sources. There has always been a tendency in Christianity to ask what did Jesus really teach? What is the pure New Testament, uncorrupted by theologians and by scribes who inserted things into the mouth of the master? It does not occur to Buddhists to have this attitude. Because of this dialectic pattern. You see, when you have an acorn, if it's a lively acorn, it grows into an oak. And that's the way it should be, in other words, it should develop into something. And so, Buddhism, as it has developed since the days of the Buddha, has gone a long way. It has become sometimes more complex, sometimes more simple, but it has changed radically because the seed which the Buddha planted was alive.

Now for example, when we ask what are the Buddhist scriptures, you can get two answers to that question. In the southern school, there is a set of scriptures which are written in the Pali language, divided into three sections called the Tipitaka. Which means the three baskets. Because these palm leaf manuscripts on which the sutras were eventually written down were of course carried around in baskets, and three baskets of these palm leaf manuscript volumes comprise the Buddhist scriptures. But you must remember that in the evolution of the scriptures, of these scriptures, that the Buddha wrote nothing. Nor did his immediate disciples. That's a very important thing to remember, that all Indian scriptures were for many centuries handed down orally.

And so we have no clear guide as to their dates. Because when you hand down an oral tradition, you are not always likely to preserve certain historical landmarks. Supposing we're talking about a certain king, the name of this king will mark a historical point. But in an oral tradition, the name of the king is likely to be changed every time the story is told, to correspond to the king then reigning. So, in other words, things that do change, that have a historical rhythm, like a succession of kings they will be changed in handing down the oral tradition. But things that do not change, that is to say the essential principle of the doctrine, they won't be altered at all. So you must remember that the Buddhist scriptures were for some hundreds of years handed down orally before they were ever committed to writing and that accounts for their monotonous form. That is why everything is numbered, why there are four noble truths, eight steps of the Eightfold Path, ten fetters, five skandhas, four brahma viharas, or meditation states, and so on and so forth. Everything is put in numerical lists. So as to be memorized easily. And so there are formulae which are constantly repeated, and this is supposed to aid the memory.

Now then, it is obvious that those scriptures of the Pali canon, when you really sit down and read them, you know that what has happened here is that partly they have a certain monotony due to mnemonic aids. But also that in the course of time before they were written down, many monks spent wet afternoons adding to them, and adding things in such a style that no inspired person could ever have said them. And they made commentaries upon commentaries upon commentaries, and lots of them had no sense of

humor. I always love the passage where the Buddha is giving instructions on the art of meditation, and he's describing a number of things on which one could concentrate. And there's a commentator making little notes on this, and so when he's made his list of things on which you could concentrate, like a square drawn on the ground or the tip of your nose or a leaf or a stone or anything, and then he says or on anything and the commentator puts footnote but not any wicked thing. I mean that's that's professional clergy for you. The world over.

So, this sort of thing has obviously happened. But you must remember that this is not this accumulation, this attribution of one's own writings to the Buddha, is not done in a dishonest way. It would be dishonest today with our standards of literary historicity and correctness. It would be very wrong of me to forge a document and pretend that it was written by some very venerable person, say by Dr Suzuki or by Goethe. But, centuries ago, both in the West and in the east it was considered quite immoral to publish any book of wisdom under your own name. Because you personally were not entitled to the possession of this knowledge. And that is why you always put on any book of wisdom the name of the real author. That is to say, the person who inspired you. So in this way it is highly doubtful if the book of the wisdom of Solomon and this is not an adult for but it's perfectly certain that Solomon never wrote it. But that it was attributed to Solomon because Solomon was an archetype of the wise man. So, in the same way, when for centuries various Buddhist monks and scholars wrote all kinds of sutras, scriptures, and ascribed them to the Buddha, they were being properly modest. They were saying these doctrines are not my doctrines, they are the doctrines of— that proceed from the Buddha in me, and therefore they should be ascribed to Buddha. And so over and above the Pali canon, there is an enormous corpus of scriptures. Written originally in Sanskrit. And subsequently translated into Chinese and Tibetan. We have very inadequate manuscripts of the original Sanskrit, but we have very complete Chinese and Tibetan translations, and so it is primarily from Chinese and Tibetans sources that we have the Mahayana canon of the scriptures over and above the Theravada canon which is written in the Pali language Pali is a softened form of Sanskrit, whereas in Sanskrit one says Nirvana, in Pali one says nibanna. Sanskrit says karma, Pali says kamma. Sanskrit says the Dharma,

Pali says dhamma. Very, very similar language, but it's softer in its speech, articulation.

Now it's a general feeling among scholars of the West, that the Pali scriptures are closer to the authentic teachings of the Buddha than the Sanskrit ones. And so with our Christian background and approach to scriptures in general, the West has built up a very strong, you might say prejudice in favor of the authenticity of the Theravada tradition, as against the Mahayana tradition. Whereas the Mahayanas put it this way. They say that their most, they have a hierarchy of scriptures. One for very simple minded people. The next, they have about four grades. Going progressively to the scriptures for the most intelligent people, and they say that the Buddha preached that to his intimate disciples first. And then slowly, as he reached out from the most intimate group to others he came down to what is now the Pali canon. As the scriptures for the biggest dunderheads. But that, the ones that he preached first were not revealed until long, long after his death.

So they have no difficulty in making a consistent story about the fact that the scriptures in Sanskrit represent a level of the historical evolution of Buddhist ideas that from our point of view could not possibly have been attained in the Buddha's lifetime. But you see, they say though that learned the latest revealed was actually the first taught to the in-group.

Well, you've got to make allowances for these differences in points of view and not entirely project Western standards of historical and documentary criticism onto Buddhist scriptures because as I said, it is in the essence of Buddhism to be a developing process, because it is a dialogue. So then, you can see the initial steps of the dialogue in our earliest or presumed earliest records of Buddhism. In the four noble truths, where you have it put out that the problem which Buddhism faces is suffering. This word dukkha, which we translate suffering is the opposite of sukha. Sukha means what is sweet and delightful. Dukkha means the opposite, what is bitter and frustrating.

And Mahayans always explain that the Buddha always taught by a dialectical method. That is to say, when people were trying to make the goal of life the pursuit of sukka, that is to say the pursuit of happiness, he

counteracted this wrong view, by teaching that life is essentially miserable. When people thought for example that there is a permanent and eternal self in each one of us, and clung to that self, the Buddha, in order to counteract this one sided view taught the other extreme doctrine that there is no fixed self in us, no ego. But a Mahayanist would always say the truth is the Middle Way. Neither Suddha nor Dukkha, or neither Atman nor Anatman, self nor non-self. The whole point is like this. Once when R.H. Blythe was asked by some students do you believe in God? He answered 'If you do, I don't. If you don't, I do.' And so in the much the same way all Buddhist Pedagogics teaching is specifically addressed not to people in general, but to the individual who brings a problem. And wherever he seems to be over emphasizing things in one way the teacher overemphasizes in the opposite way so as to arrive at the Middle Way.

So then, with this emphasis on life is suffering, it's simply saying, this is the problem we're dealing with. We hurt. We human beings feel pretty unfairly treated, because we are born into a world so arranged that the price that we pay for enjoying it—that is to say, for having sensitive bodies, is that these bodies are at the same time, because they're sensitive, capable of the most excruciating agonies. And isn't that a nasty trick to play on us. What are we going to do about it? This is the problem. So then when the Buddha says the cause of suffering is desire. Trishna is our word thirst. And may perhaps be translated desire in a very general sense or perhaps better craving, clinging, grasping, something like that. He is saying now I'm going to make the suggestion. You suffer because you desire.

Now supposing then you try not to desire. And see if by not desiring you can cease from suffering. Or you can put the same thing in another way. You can say to a person it's all in your mind. There is nothing either good or ill, but thinking makes it so, and therefore if you can control your mind, you have nothing else that you need control. For example, you don't need to control the rain. If you can control your mind, if you get wet it's only your mind that makes you think it's uncomfortable to be where a person who's got good mental discipline can be perfectly happy wandering around in the rain. You don't need a fire if you've got good mind control. Because if you've got ordinary bad mind control, when it gets cold, you start shivering. That's because you're putting up a resistance to the cold, you're fighting it.

But don't fight it, relax to recover. And in other words this is a matter of mental attitude and then you'll be fine. Always control your mind. This is another way of approaching, you see.

Now then, as soon as the student begins to experiment with these things he finds out that it's not so easy as it sounds. Not only is it very difficult not to desire not only is it very difficult to control your mind but the something phony about the whole business. And this is what you're intended to discover. That namely, when you try to eliminate desire in order to escape from suffering, you desire to escape from suffering. You are desiring not to desire. In other words, I'm not limited playing with logic. I'm saying that, a person who is escaping from reality, will always feel the terror of it it. It will be like the Hound of Heaven that pursues him. And he's escaping, in a way, even when he's trying not to escape. And it was this point to see that this method of teaching was suppose to educate from you, to draw out from you, not by saying to anybody. All this in the first place but by making the experiment not to design all the experiment to control your mind thoroughly. This is the first step, you do understand this, you must go through that, or some equivalent of it, so as to come to the point where you see who are involved in a vicious circle. That in trying to control your mind, the motivation, the reason for which you were doing, is still clinging and grasping is still self-protection. You still lack of trust. And love.

So, when this is understood the student returns to the teacher and says look this is my difficulty I cannot. Eliminate desire, because that itself, my effort to do so is itself desire I cannot eliminate selfishness, because my reasons for wanting to be unselfish are selfish. As one of the Chinese Buddhist classics put it, when the wrong man uses the right means, the right means work in the wrong way. Now the right means are all the traditional disciplines. And you're going to use them so you're going to practice Zazen or whatever and make yourself into a Buddha but you see if you're not a Buddha in the first place you can't become one because you'll be the wrong man. And using the right means but because you're using them for a selfish intent or a fearful intent you're afraid of suffering and you don't like it and you want to get out of it you want to escape all these you see other motivations which frustrate the right means. So one is meant to find that out.

And so then, in the course of time when all this was totally explored by the Buddha's disciples, there developed a very evolved form of this whole technique of dialectic, which was called Madhyamika. M A D H Y A M I K A. It means the middle way, but it was a form of Buddhist practice and instruction developed by Nagarjuna. N A G A R J U N A, who lived approximately in 200 AD. Nargajuna's method, is simply an extension and drawing to a logical conclusions of the method of dialogue that already existed except that Nagarjuna took it to a to an extreme. And his method is simply this: To undermine, to cast doubts on, any proposition to which his student will cling. To destroy all intellectual formulations, and all concepts of the nature of reality or the nature of the self whatsoever. Now you might think that that was simply a parlor game, a little intellectual exercise, but if you engaged in it you would find it was absolutely terrifying. And you would feel yourself brought very close to the verge of madness. Because a skillful teacher in this method. Reduces you to a shuddering state of total insecurity. I have watched this being done among people you would consider perfectly ordinary normal Westerners who thought they were getting involved in just a nice abstract intellectual discussion. But then finally the teacher as the process goes on, discovers in the course of the discussion what are the fundamental premises to which every one of his students is clinging. What is the foundation of sanity? What do you base your life on? And when he has found out what that is for each student, he destroys it. He shows you that you can't found a way of life on that. That it leads you into all sorts of inconsistencies and foolishness. And the student turns back to the teachers as well it's all very well for you to pull out all the carpets from under my feet. What would you propose instead? And the teacher says I don't propose anything. He's no fool. He doesn't put up something to be knocked down. But you see, here are you.. And you if you don't put up something to be knocked down, then you can play ball with the teacher. And you may say, I don't need to, then on the other hand the something nagging you inside telling you you do. And so you go and play ball with him and he keeps knocking it down whatever you propose whatever you cling to. And this exercise produces in the individual, a real traumatic state. People get acute anxiety. And you wouldn't think so because it's just seemed as if it were nothing more than a discussion on a very intellectual and abstract level. But when it really gets down to it and you find that you don't have a single concept you can really trust, it's the

heebie-jeebies. But it is, you are preserved from insanity. By the discipline. By the atmosphere set up by the teacher and by the fact that he seems perfectly happy. Without anything in the way of a concept to cling on to, and student looks at him and says he seems to be all right maybe. Maybe I can be all right too. Know this gives a certain confidence that feeling that all is not man because the teacher in his own way is perfectly normal.

The Middle Way

I want to start by reemphasizing the point that what are called the religions of the east, the ones we're discussing Hinduism, Buddhism and Chinese Taoism, they don't involve that you believe in anything specific. And they don't involve any idea obedience to commandments from above. And they don't involve any conformity to a specific ritual, although they do have rituals, but their rituals vary from country to country and from time to time. Their objective is always, not ideas, not doctrines, but a method, a method for the transformation of consciousness. That is to say, for a transformation of your sensation of who you are, and I emphasize the word sensation because it's the strongest word we have, for feeling directly. When you put your hand on the corner of a table, you have a very definite feeling. And when you are aware of existing, you also have a definite feeling. But in the view of these methods or disciplines, the ordinary person's definite feeling of the way he exists is a hallucination. To feel yourself as a separate ego. A source of action and awareness that is entirely separate and independent from the rest of the world, somehow locked up inside a bag of skin, is seen as a hallucination. That you are not a stranger in the earth, that comes into this world either as a result of a natural fluke or being a sort of spirit that comes from somewhere else altogether.

But that you in your fundamental existence, you are the total energy that constitutes this universe. Playing that it's you. Playing that it's this particular organism, and even playing that it's this particular person. Because the fundamental game of the world is a game of hide and seek. That is to say that the colossal reality, the energy that is everything, that is a unitary energy, that is one, plays at being many. At manifesting itself in all these particulars, that we call you and you and you and you and you and you and you and you and this and that and all around us. And it's

fundamentally a game. And you can say that this goes really for all the systems that I'm talking about. It's the basis of Hinduism of Buddhism and of Taoism, this intuition.

Now today we're going to talk about Buddhism. Buddhism is an offshoot of Hinduism. You could in a way call it a reform of Hinduism, or Hinduism stripped for export. It originates in northern India, close to the area that is now Nepal, shortly after 600 Hundred B.C. there was a young prince by the name of Guatama Siddhartha, who became the man we call the Buddha/ Now the word Buddha is not a proper name, it's a title. And it's based on the Sanskrit root Budh. B.U. D.H.. Which means to be awake. And so you could say the Buddha is the man who woke up. From the dream, of life as we ordinarily take it to be. And found out. Who he was, who he is. It's curious, that this title was not something new. There was already in the whole complex of Hinduism the idea of Buddhas. Of Awakened people. And curiously, they are ranked higher than Gods. Because in the view of Hinduism even the gods or the Angels the Devas, are still-bound. On the wheel of the the sort of squirrel cage of going round and round and round in the pursuit of success. And the idea is that if you pursue something that you can call success, pleasure good, virtue which it originally of course means strength, magical power. All these positive things. You are under illusion because the positive cannot exist without the negative. To be, you only know what to be is by contrast with not to be, so is if we say now there is. A coin in the left hand, there is no coin in the right. And from this you get the idea of to be and not to be. And you can't have the one without the other, so if you tried to pursue, to gain, the positive. And to deny get rid of the negative, it's as if you were trying to arrange everything in this room so that it was all up. And nothing was down. You can't do it, you set yourself an absolutely insoluble problem. Because the basis of life is spectrum. Consider the spectrum of colors. When you think of a spectrum in what form do you think of it most people think of it as a ribbon. With red at one end and purple at the other. But the spectrum is actually a circle. Because purple is the mixture. Of red and blue. It goes right round. And so in this way, all sensation, all feeling, all experience whatsoever, is moving through spectra. You don't only have the spectrum of color you have a spectrum of sound. You have various complex spectra of texture, of smell, of taste. And you are constantly operating through all the possible variations of

experience. And it implies that you can't know one end of the spectrum without also knowing the other. So if you wanted, say your favorite color is red. And you wanted only red. And you had to exclude therefore blue and purple. Without blue and purple, you can't have red. Behind of course, all the various colors in the spectrum is the white light. And behind everything that we experience all our various sensations of sound, of color, of shape, of touch, there's the white light. And I'm using the phrase the white light, rather symbolically I don't mean it literally. But there is common to all sensations what you might call the basic sense. And if you explore back into your sensations and reduce them all to the basic sense you're on your way. To reality. To what underlies everything, to what is the ground of being, the basic energy. And to the extent that you realize this and know that you are it. You transcend, you overcome, you surpass the illusion. That you are simply. John Doe. Mary Smith. Or what have you.

So then, the Buddha, as the man who woke up, is regarded as one Buddha, among a potentiality of myriads of Buddhas. Everybody can be a Buddha, everybody has in himself the capacity to wake up from the illusion. Of being simply this separate individual. The Buddha made his doctrine very easy to understand, because in those days there wasn't very much writing being done and people committed things to memory, and so he put his doctrine or method, in various formulas, which were very easy to remember, and I'm going to explain it in those terms so that you can remember it just as well. He of course practiced the various disciplines that were offered in the Hinduism of his time. But he found in a certain way that they had become unsatisfactory. Because they had over emphasized asceticism. Had over emphasized, putting up with as much pain as you can. There was a feeling, you see, that if the problem of life is pain. Let us suffer. And this is the root of the ascetics you see, who lie on beds of nails, who hold a hand up forever and ever and ever, who eat only one banana a day who renounce sex, who do all these weird things, because they feel that if they head right into pain. And don't become afraid of it but suffer as much pain as possible, they will by this method overcome the problem of pain. And they will set themselves free from anxiety. There's a certain sense in that, as you can obviously see. Supposing for example, you have absolutely no fear of pain. You have no anxieties, you have no hang ups.

How strong you would be. Nobody could stop you. You would have ultimate courage.

But the Buddha was very subtle, he is really the first historical psychologist. The great psychologist, psychotherapist, he is very subtle, because he saw, that a person who is fighting pain. Who is trying to get rid of pain, is still really fundamentally afraid of it. And therefore the way of asceticism is not right, equally the way of hedonism, of seeking pleasure is not right.

So the Buddhist doctrine is called the Middle Way. Which is neither ascetic nor hedonistic. So it summed up in what are called the four Noble Truths. And the first is called Dukha. Dukha, means suffering in a very generalized sense. You could call it chronic frustration. And it is saying that life as lived by most people is dukha. Is an attempt in other words to solve insoluble problems. Try to draw a square circle you can't because the problem itself is meaningless. Try to arrange the things in this room so that they're all up and none of them down. It is meaningless, such a problem cannot ever be solved. So try to have light without dark or dark without light. It can never be solved. So the attempt to solve problems that are basically insoluble and to work at it through your whole life that is dukha.

Now he went on to analyze this that there are what we call three signs of being. The first is Dukha itself, frustration. The second is Anitya, and this means; the letter A in Sanskrit at the beginning of a word is often the equivalent of our 'non' So nitya means permanent, anitya means impermanent, that every manifestation of life is impermanent. And therefore our quest to make things permanent, to straighten everything out, to get it fixed, is an impossible and insoluble problem and therefore we experience nuclear look or this sense of fundamental pain and frustration as a result of trying to make things permanent. And the third sign of being is called an anatman. Now you know from my talk on Hinduism that the word atman means self. Anatman means therefore non-self. That there is in you no real ego.

Now I've explained that already I've explained in talking about Hinduism that the idea of the ego. Is a social institution. It has no physical reality. It is simply the ego is your symbol of yourself. Just as the word water is a noise which symbolizes a certain liquid reality, so the idea of the ego, the role you

play, who you are is not the same as your living organism. Your ego has absolutely nothing to do with the way you color your eyes, shape your body, circulate your blood. That's the real you. But it's certainly not your ego. Because you don't even know how it's done. From the standpoint of your conscious attention. So the idea of anatman is firstly that the ego isn't real, there isn't one. Now then, this then as the first truth. There is the situation that we have of frustration because we are fighting, the changingness of things. And because we don't realize that the ego the I is unreal. The second of the four noble truths is then called Trishna. Trishna is a Sanskrit word again and is the root of our word thirst. And it's usually translated desire. But it is better translated clinging, grabbing. Or there's an excellent modern American Slang a word, hang-up. That is exactly what Trishna is, the hang-up. Trishna now is clutching. As for example what we call smother love. When a mother is so afraid that her children may get into trouble. That she protects them excessively and as a result of this, prevents them from growing. Or when when lovers cling to each other excessively, and have to sign documents that they will curse and swear to love each other always, they are in a state of Trishna. And this is the same thing as holding on to yourself so tightly that you strangle yourself.

Now or so the second truth then about Krishna is that the cause of Dukha is Trishna. Clinging is what makes suffering. If you don't recognize that this whole world is a phantasmagoria. And in amazing illusion. A weaving of smoke. And you try to hold onto it you see, then you start suffering, seriously suffering. Trishna is in turn based upon avidya. The same negative. Vidya. From the root vid means knowledge as in the Latin video and the English vision. Therefore is ignorance. Good gnosis. Means of course, to know, knowledge is the same thing as good Gnosis in Greek. To know so this is not to know, to ignore. To overlook.

And I explained in the first talk in this series how we ignore all kinds of things because we notice only what we think noteworthy. And therefore our vision of everything is highly selective, we pick out certain things, and say that's what's there, just as we select and notice the figure rather than the background, sometimes I draw this on the blackboard. Now ask the question, What have I drawn? What would you say? What have I drawn? The circle and the other suggestions Oh. Yeah you're getting the point. I've

drawn a wall with a hole in it, you see, but ordinarily. [laughs] You've been reading my books.

So but ordinarily people see the ball the circle the ring or whatever and never think of the background. Because they ignore the background. Just as one thinks that you can have pleasure without pain. You want pleasure, the figure, and don't realize that pain is the background. So avidya is this state of restricted consciousness, restricted attention. That moves through life unaware of the fact that to be implies not to be. And vice versa.

So now the third noble truth is called Nirvana. This word means blow out. Nir is a negative word again like A. Vanna is blowing. So it's a kind of out-blowing. Now in breathing you know that breath is life. The Greek word, you may pronounce it pneuma or pneuma, is the same as spirit. And Spirit means breath in the book of Genesis when God had made the clay figurine that was later to be Adam he breathed the breath of life into its nostrils. And it became alive, because life is breath. But now, if you hold your breath, you lose it, he that would save his life will lose it. So Breathe in, Breathe in, Breathe In, get as much air as you can and Trishna cling. When you lose it.

So Nirvana means breathe out. Phew, what a relief that was. The sigh of relief, let it go. Because it will come back to you if you let it go. But if you don't let it go, you'll just suffocate. So a person in the state of nirvana is what we might call a blown out person. Like blow your mind. Let go, don't cling, and then you're in the state of nirvana. And I reemphasize the point. This is not I'm not preaching see not saying this is what you ought to do and simply pointing out a state of affairs that is so. There's no moralism in this whatsoever, it's simply pointing out like if you put your hand into the fire you'll get burned. You can get burned if you want to. That's OK but if you know the so happens that you don't want to get burned. And you don't put your hand in the fire. So in the same way if you don't want to be in a state of anxiety all the time. And again I emphasize if you like to be anxious, it's perfectly alright. See Buddhism never hurries anyone on, they say you've got all eternity through which to live in various forms. And therefore you don't have just one life in which you've got to avoid eternal damnation. You can go running around the wheel in the rat race and play

that game just as long as you want to so long as you think it's fun. But if the comes a time when you don't think it's fun, you don't have to do it.

So I wouldn't say to anyone who disagrees with me and who says, 'Well I think we ought to engage the forces of evil in battle and put this world to right' and so on and so forth and arrange everything in this world so that it's all up. Try it, please, it's perfectly OK to go on doing that.

But if you see that it's futile, then you can let go. Don't try to cling. Relax.

And if you do that, you're in the state of nirvana. And you become a Buddha. And of course it means that you become a rather astonishing person. You may of course be subtle about it and make like you're a very ordinary person. So that you don't, get people mixed up. And so in Buddhism the Buddha explained that his doctrine, his method, was a raft. It's sometimes called a yana, the word y-a-n-a, yana, means a vehicle a conveyance. And when you cross a river on a raft, and you get to the other shore, you don't pick up the raft and carried on your back you leave it behind. But people who are what I would call hooked on religion, are always on the raft. They are going back and forth, back and forth, back and forth on the raft, so that clergyman tends to turn into a ferryman who is always on the raft and never gets over to the other shore himself.

Now something to be said for that because how we going to get the raft back to the first shore to bring over the other people see somebody has to volunteer to take the back journey. But he must be awfully careful to realise that the real objective is to get the people across and set them free. If you dedicate yourself to ferrying people across. Don't ask them to come back on the raft with you. Because you get overcrowded and people will think that the raft is the goal rather than the other shore. So when I find this in in actual practice that when clergyman. Do not ever ask for money, and it's all right, you know like a doctor who simply charges a fee says, 'You come to me you pay me so much.' But the clergyman says he doesn't say pay me so much he says 'We would like your pledge your voluntary contribution.' You see, then nobody knows what to give you.

As the idea of the rot now then the fourth noble truth is called Marga. This word means 'path'. And. The way of Buddhism is often called the Noble Eightfold Path. Because there are eight. Phases I won't say steps because

they're not sequential. And samyak is a very curious phrase. [It] doesn't mean right in our sense of correct some is the same really as our word sum total complete. All inclusive. We might say we might use the word integrated as when we say a person has integrity. That every person has integrity we mean is all of a piece. He's not divided against himself. So in this sense of Samyak. Dirshi. This is related to the word. Darshan. Which means a point of view, or viewing when you go to visit a great guru or teacher you have that you look at [him]. And you offer your reverence to. Many senses of it but it means simply 'to view' Look at the view. So the summing up Darshan is the complete view. For example let's take the constellation called the Big Dipper. We look at it from a fairly restricted zone in space. And it always seems whatever the season of the year, because we're so far away from it that the stars in the Big Dipper in the same position. But imagine looking at it from somewhere else in space altogether and those stars would not look like a Dipper. They would be in another position.

Now then, what is the true position of those stars? Don't you see, there isn't one? Because wherever you look for position of hers. You could say that the true situation of those stars is how they are looked at from all points of view all possible points of view, inside the constellation looking outwards, outside the constellation looking inwards, from everywhere and everywhere. But you see, there is no such thing as the truth. And the world, in other words, is not existing independently of those who witness it. Because the world is precisely the relationship between the world and its witnesses. And so if there are no eyes, in this world the sun doesn't make any light. Nor do the stars.

So what is? is a relationship. You can, for example, prop up two sticks by leaning them against each other and they will stand. But only by depending on each other. Take one away and the other falls. So, in Buddhism it is taught that everything in this universe depends on everything else. That we have a kind of a huge network and this is called the doctrine of mutual interdependence. All of it hangs on you. And you can on all of it. Just as the two sticks support each other. And this is conveyed in a symbol which is called Indra's net. Imagine a multidimensional spider's web. In the early morning, covered with dew drops. And every drop contains the reflection of

all the other do drops. And in each reflected you drop the reflections of all the other do drops in that reflection and so at infinite. That is the Buddhist conception of the of the universe in an image. The Japanese call that jijimuge. Ji. Means a thing event. A happening. So. Between happening and happening. There is no gap. In separation. Jijimuge.

Now so the first phase of the Eightfold Path has to do with one's view understanding of the world. The second phase has to do with action. How you act. Buddhist idea of ethics is based on expediency. If you are engaged in the way of liberation. And you want to clarify your consciousness. Doing that is inconsistent with certain kinds of action. So every Buddhist makes five vows. Five precepts. And you may perhaps have heard the Buddhist formula of taking what is called pancha sila [sic] five precepts. And they take what are called Sana the three refuges and the five precepts the refuges are the Buddha. The Dharma, the doctrine and the Sangha, the fellowship of all those who are on the way. So, the priest, the bhikku, the Buddhist monk. And the laypeople will chant the formula [sings] Those are the three refuges the border the Dharma and the Sangha. Then they take the five precepts. [sings] So they take these five precepts but are they part of. I undertake the precept to abstain from taking life. Adinadana. I undertake the precept to abstain from taking what is not given. Come as a mature heart. I undertake the precept to abstain from exploiting the passions. Of other I undertake the precept to abstain from falsifying speech. So that I marry a magical mother Tana I undertake the precept to abstain from being intoxicated by Sora, Mariya and much of a mother tongue or whatever they were.[laughs] I presume tardy which is alcohol. I don't know I don't know what else it was nobody does know. Because you see if you start killing people. Or taking life you're in trouble you set up an opposition and you've got to become involved in taking care of it. If you start stealing you worry people you upset people's orientation in life because if you suddenly come into the back home for dinner and find somebody stolen your table, where you going to serve dinner? If you exploited your passions it means that when you are when you feel bored, and somehow that life is a little bit empty, you say well our what are we going to do this evening let's go and get stuffed. The A lot of people who suffer from the the city are trying to simply fill their empty psyche by stuffing themselves with food was the wrong cure.

So, likewise Musavada, if you start telling lies to everybody you know what happens when you start telling lies you have to tell extra lies to cover up the first one and you get into the most hopelessness understanding, speech collapses. And of course, the intoxication is the same problem as the exploitation of the passions. So there's a purely kind of, practical, expedient utilitarian approach to morals. There's another side to this, which doesn't enter into the into the precepts, which I will explain later.

So, that's the third phase of the Eightfold Path, then, now the second phase then, the third thing is has to do with your mind, with your state of consciousness. And this has to do with what we would ordinarily call meditation. There are the two final, the seventh and eighth aspects. Of the part. I called Samyak Samadhi and Samyak Sriti. Sriti means recollection. That's the best English word for it. Now do you understand the word recollect. Is to gather together what has been scattered. What is the opposite of remember. Obviously dismember. What has been chopped up. And scattered becomes really remembered. So in the Christian scheme do this in remembrance of me. You see the Christ has been sacrificed. Chopped up. But the mass is celebrated in remembrance. One of the old litigious says the wheat which has been scattered all over the hills, and grows up, is gathered again into the bread. Remembered. Go back to your Hindu basis. The world is regarded as the Dismemberment of the Self, the Brahman, the Godhead. The one is dismembered into the many. So remembrance, is realizing again that each single member of the many is really the one. So that's recollection. You can think of it too in another way and it's really the same way if you think it through I'm going to leave you with a few puzzles. So that you can think them through and I want to explain. That Another way is to be recollected. Is to be completely here and now, are you here and now? Are you really here? There was a wise old boy who used to give lectures on these things, and he would get up and not say a word and he would just look at the audience. And he'd examine every person individually. And they're all start feeling uncomfortable. He wouldn't say anything, he'd look at them all. And then he had sudden he'd yell 'Wake up!' You're all asleep. And if you don't wake up I won't give you any lecture. Are you here recollected. See most people aren't there bothering about yesterday and wanting what they're going to do tomorrow. And I and all here that's a definition of sanity, to be all there.

So to be recollected, is to be completely alert. Available for the present. Because that's the only place that you are ever going to be in. Yesterday doesn't exist, tomorrow never comes. There is only today. A great Sanskrit sort of invocation says 'Look to this day, for it is life. In its brief because lie all the realities of our existence. Yesterday is but a memory. Tomorrow is only a vision. Look well then to this day. Such is the salutation of the dawn.'

So Smriti means then, recollected this in the sense of being all here. In the sense that this is the only only where there is. Then beyond that comes Samadhi. Again, notice the presence of this word S.A.M. Sam. Somebody who is. Integrated consciousness in which there is no further separation between the know and the know the subject and the object. You are what you know. Now we think, in the ordinary way, that we are the witnesses of a constantly changing panorama of experience. From which we as the knowers of this in a way stand aside. And watch it. We think of our minds as a kind of tablet upon which experience writes a record and the tablet is always there. Although the experience goes by. And eventually the experience by writing so much on the tablet wears it out. It's all scratched away and you die.

But actually, if you will investigate this and you have to experiment on this because I cannot explain it to you in words you can only find it out for yourself, there is no difference between the knower and the known. When you say, I see a sight. I feel a feeling you are using redundant language. I see implies the sight, I feel implies the feeling. Do you hear sounds? That you just hear or you can say there are sounds. Either one will do. So you will find, if you thoroughly investigate the process of experiencing, that the experiencing is the same as the experiencer. And this is the state of samadhi. I put it originally in this form, that the organism and the environment are a single behavioral process. So likewise is the knower and the known. So you as someone who is aware, and all that you are aware of, is one process. That is the state of samadhi. And you get to that state, by the practice of meditation. Everybody Buddha figure practically is seen in the sitting posture of meditation. Which is sitting down quietly, and being aware of all that goes on without comment. Without thinking about it. And when you stop categorising, verbalizing, talking to yourself, inside your

head, naturally, the separations between for example no unknown self and other simply vanish. Can you point to the difference between my five fingers? Where will you put your finger if you want to point to the difference? You see the idea of difference is an abstraction. It just isn't there. In the physical world. Of course, that's not saying that the fingers are joined like ducks claws with the web. But that it's just that. They're not the same, that's an idea, they're not different, that's an idea. And these ideas. That just aren't here see. You can't point to it, can't put your finger on it. Get down to the state of affairs where you see the world free from concepts. That's what but it's mean by void, and they say the world is basically, they use the phrase Sunya. That has a meaning of like empty, void, everything is sunya. This has certainly also the meaning of of a nature of transience gotten basically it means you can't catch the world in a conceptual net. Just if you try to catch water in a net it all slips through. If you try to tie up water in a paper package or grab it in your hands it all flows through.

So, sunya doesn't really mean that the world itself, that the energy of the world is nothing at all. It means that no concept of it is valid. You cannot make any one idea or belief or doctrine or system or theory tie the thing up. So, if you go through this, and you get completely blown out. And released in or in the state of nirvana. For no reason that anybody can explain it in just as for example as I pointed out when you see that you can't change yourself you can't lift yourself up by our own bootstraps you then get a new access of psychic energy. So in exactly the same way when you get to the state of Nirvana, there wells up from within you what the Buddhists call Corona or compassion. The sense that you aren't different from everybody else, everybody else's is suffering is you are suffering. And so this tremendous sense of solidarity with all other beings arising. So that he who reaches Nirvana, doesn't as it were, withdraw into a sort of isolated piece, but is always coming back into the world into the difficulties into the problems of life. In compassion for everyone else. You can't be saved alone. Because you're not alone.

[You've been listening to following the middle way with Alan Watts from the Alan Watts radio series number six on Buddhism. For information on how to obtain the radio series on cassette tape call one eight hundred nine hundred nine to eight seven or you can write to the electronic University.

Buddhism as Dialogue

Now I hope you remember that this morning, I was trying in the brief space of fifteen minutes, to give you a basic introduction to Mahayana Buddhism. The kind of Buddhism that is found in China and Japan, and the kind of Buddhism of which Zen Buddhism in particular is a subsect. And, we are rather particularly concerned with Zen, since it has had such a fundamental influence in the shaping of Japanese culture and the arts of Japan. And since we are in the course of this informal tour going to be visiting a good deal of Zen monasteries and seeing a great deal of Zen formed works of art, architecture, and so on.

So I want to lead now tonight from Buddhism in general or Mahayana Buddhism in general to Zen in particular. Now, Zen plays a little game with you. Whenever anybody like myself or Dr Suzuki talks about Zen, all the other people say because they talk about it they don't understand it. Those in the words of Lao Tzu, who know do not say those who say do not know, and yet he said that. You wrote a book of several, 80 chapters or so, to explain. The Tao, and the debt its power and. Nobody can help themselves they've got to talk human beings are a bunch of chatterboxes and when we've got something in our minds that we want to talk about we talk. Now poetry, though, is the great language, because poetry is the art of saying what can't be said. Every poet knows this. They're trying to describe the indescribable, and every poet also knows that nothing is describable. Whether you take a some sort of ineffable mystical experience at one extreme or whether you take an ordinary rusty nail at the other. Nothing is really describable. In the words of the famous count Korzybski, 'Whatever you say something is, it isn't.' We used to have a professor at Northwestern would produce a match booklet in front of his class and would say to them what is it. And they would say matchbook it he'd say No no no matchbook it is a noise is this a noise what is it. And so to answer this he'd throw it at them. That's what it is. So in this way, you see nothing can really be

described, and yet on the other hand we all know perfectly mean well what we mean when we talk. If you know, if you shared an experience with somebody else, then of course you can talk about it we can all talk about fire and air and water and wood because we know what it is, and there's no mystery. And so, in the same way, when it comes to discussing something so esoteric as Zen it can be discussed only. Then people play games with each other they play little tricks they test each other out by saying to somebody I remember when I met Paul Reps for. The first time who wrote that lovely book Zen Flesh and Zen bones, and he said to me 'Well,' he said, 'You've written quite a number of books by now you must think you're pretty fancy.' I said I haven't said a word. So this is theft is then game. And people sort of feel each other out. There's a poem which says when two Zen masters meet each other on the road they need no introduction. Thieves recognise one another instantaneously.

So now, having got that out of my chest it's to say then if I were to give you a really proper and it really hadn't truly educative talk about Zen I would gather around here and sit here and silence for five minutes and leave. And in a way this would be a much more direct exposition of it than what I'm going to do instead would talk about it only I have a feeling that you would feel that you were disappointed and somewhat cheated by this kind of behavior, if I just left and five minute silence. So then, this word Zen is Japanese way of pronouncing the Chinese word Chan, which in turn is the Chinese way of pronouncing the Sanskrit word Jana. And Jana is a very difficult word to translate into English if not impossible. It's been called meditation. Meditation in English generally means sitting quietly and thinking about something, and that's not what Zen is. Contemplation might come a little nearer if you use the word in a very technical sense the sense that it was used or a still is used among catholic mystics. Perhaps that's something a bit like Zen. But again contemplation, as we normally use the word, has a sense of inactivity. The sense of not doing anything, of being completely still and passive. Whereas Zen is something I acted.

So we really don't have an English word for Jana, Chan, Zen. But I would say that we do know what it is. Because we do all sorts of things every day of our lives in this spirit. When for example, you drive a car. Most Americans, at any rate, drive car since they were teenagers. And are very

expert drivers. And when they drive a car, they don't think about it. They're one with the car. Or when a rider of a horse is one being with a horse, when you watch a good cowboy or cavalry rider, he's glued to the horse. He's like a centaur almost, as the horse moves, he moves, which is in control is the horse riding the man or the man riding the horse you practically don't know the same way when you have an excellent dancing partner who leads who follows it seems as if you are one body, and you move together. That is Zen that is Jana,. And so, in the in that in a wider sense, when a person doesn't react to life, on the one hand, or try to dominate it on the other. But when the internal world or runs an organism and the external world of other people and other things move together as if they were and indeed are one and the same motion. That is Zen.

So you could say in a very very simple way, that the real concern of Zen is to realize, not merely to think, but to know in your bones. That the inside world inside your skin and the outside world outside your skin going out as far as anything can go into galaxies beyond galaxies, is all one world. And all one being, one self, and you're it. And once you know that, then you have completely abolished all the problems that arise as a result of feeling that you're a stranger in the world, that you're set down in the middle of a hostile and alien domain of nature or people. Who are not you. This whole sense of estrangement, foreignness, to the world is overcome in Zen.

Now let me illustrate this a little before we go into Zen in any kind of technical way, by a few rather superficial but nevertheless significant facts out of Japanese culture and the place of Zen in Japanese culture. Japanese culture is as you may have noticed, was as you may have noticed extraordinarily ritualistic. There is a right way of doing everything. A good form, a proper style, and nowhere is this more apparent, than in such practices as the tea ceremony or arranging flowers, or knowing how to dress. Or knowing how to organize a formal dinner. The punctiliousness. The skill, of these people in doing these things is quite remarkable. But in the same measure as they are very skillful at doing these things, they're very worried about it. The whole question, for example, of bringing presents to somebody else. Have they given us more than we've given them? Did we remember this occasion? Did we remember that occasion? These weigh very heavily on the Japanese soul. The debt which you owe to your parents.

The debt which you owe to your country and to your Emperor.
Immeasurable, infinite debt, never can be paid. All these way very heavily.

And therefore in Japan, until the sort of break away of modern youth, with its westernized ideals, this is a very nervous culture. Concerned about whether one is playing the ritual correctly. A culture like that needs an outlet, needs a safety valve, needs a way out of this thing. And Zen provides just that. And so, by contrast, when you meet a Japanese, who is not thoroughly trained in Zen, he is a different kind of personality altogether from ordinary Japanese. He is in manners. Not all. Studiedly courteous. Nor is he Brusque. But he is simply at ease. He gives you his whole attention so long as you give him your whole attention. If you start wandering and frittering, he's got work to do, and he promptly leaves.

But so long as you are wanting to talk to him, he is there for you and for nobody else. And he sits down, and he really sits, you know, he doesn't worry about whether he ought to be somewhere else. And so unable to sit with complete serenity in one place you know, if you have half an idea that you ought to be worrying about them going out in the garden all that you ought to be cooking dinner, or you want to be done in your office or something you can't sit where you are. You're not really there, you are a kind of gas balloon that keeps wanting to wander off. That these people when you see as you meet people connected with Zen even they are sometimes the most. Neophyte novice of a priest has as this atmosphere of knowing how to live in the present. And not to be fidgety and giggly and worrying about whether he's done the right thing. Or that's very much zen style, even though at the same time the Zen people do have a very exacting and demanding discipline, the function of this discipline is rather curious, it's to enable you to be comfortable. It's an aid to enable you for example to sleep on a concrete sidewalk on a cold wet night. And enjoy it. To relax completely under any situation of hardship. You see ordinarily when you sit on a. You're out in the cold, you start shivering, why? Because you're resisting the code you are tightening your muscles against the cold and you get the staggers. But you are taught if you would learn Zen discipline not to do that. Take it easy go with the cold, relax. And all those monks in those monasteries here there, it's cold as hell in winter. And they simply sit there most of the time and there we would be frozen to death and miserable and

have influenza on the great Siberian itch, but they simply relax, and learn how to take the cold.

So there's nothing about Zen discipline which is masochistic. It isn't to beat your body because your body is bad and the creation of the devil or something has nothing to do with that it is how to be comfortable under all circumstances. But that again, is something rather incidental to the main question of Zen. As I said, the Zen people as you meet them, and as you get to know their style or personality, are at ease in a culture that is not at ease. In a culture that is chronically concerned with protocol. And is it just right, that is indeed a terribly self-conscious culture. Where everybody is always watching themselves. And having therefore second thoughts about everything. And so, the discipline of Zen is to enable you to act without watching yourself. We would say unselfconsciously. The Japanese are as terrified of this as we are. They think, and we think, if I don't watch myself, I'll make a mistake. If I don't hold a club over myself hour cease to be civilized and become a barbarian. If I don't discipline myself with all sorts of [grunts] down on that is passions of yours you will become like the monk of Siberia who burst from his cell and devour the fathers Superior. So this basic mistrust and so on in one's own spontaneity makes it, makes us wonder that if they Zen people are really spontaneous. And they don't plan and premeditate and all clubs over themselves well they become very very dangerous people socially when they go out and rape their mothers and daughters and murder their grandmothers to inherit their fortunes and so on and so forth. And Zen people just don't do that. And yet, they are perfectly spontaneous.

So then, let me try then and indicate. How this discipline called Zen actually works. This will involve a little bit of letting the cat out of the bag. But it can't be helped. Let's go back to what I told you was fundamental to Buddhism. Buddhism is unlike other religions, in that it does not tell you anything. It doesn't require you to believe in anything. Buddhism is a dialogue. And what are called the teachings of Buddhism, are nothing more than the opening phrases or opening exchanges in the dialogue. Buddhism is a dialogue between a Buddha. And an ordinary man or rather someone who insists on defining himself as an ordinary man. And thereby creates a problem. I quoted you this morning hour saying, that anybody who goes to

a psychiatrist ought to have his head examined. And in exactly the same way, in this culture, anybody who goes to go to a spiritual teacher or a Zen master or whatever, ought to have his head examined. Or as the old Chinese master Tokuzan put it. If you ask any question you get thirty blows, with my stick if you don't ask any question you get that it closed as the saying another words, what the hell are you doing around here. Defining yourself as a student and defining me as a teacher.

In other words you have to raise the problem. And in the way of training it was then this is very clearly emphasized if you go to a zen teacher, and you approach him in the traditional way, the first thing he will do is to say, 'I haven't anything to teach. Go away.' Well you say what are these people doing around here and they used to. Say 'Well they're working with me but unfortunately we are very poor these days we don't have enough rice really to go around and make ends meet and we can't take on anybody else in this community.' So you have to insist to be taken in. Every postulant for Zen training assumes immediately that the teacher has given him the brush off in order to test his sincerity. In other words, if you really want this thing. You've got to work for it.

That isn't the real point. The point is that you've got to make such a fuss to get in, that you cannot withdraw gracefully after having made such a fuss to get in. Because you put yourself on the spot and you define yourself as somebody needing help or somebody with a problem who needs a master in order to be helped out of the problem. So then, when you've done this in the old days of course and it's still the formal rule among the Zen monasteries here, that when you're a postulant and you want to come in, you have to sit outside at the gate for a week or maybe only five days, in a position of supplication with your head bowed down on the steps. And they let you in at night because they must give a hospitality to any wandering monk but you. I expect not to go to sleep any of those five nights but the sit there in meditation. And they give you food. But are you sit and you sit and you sit there and you make a damn fool of yourself. Saying, 'I insist on getting into this thing. I insist on learning I want to know what the secret of this master here is.' And he stole it from the star that he doesn't have a secret of that he doesn't eat anything. But you insist that he does. See, that is the situation of everybody who feels that life is a problem to be solved. Whether you want

psychoanalysis, whether you want integration, whether you want salvation, whether you want Buddhahood, whatever it is you define yourself as wanting. You created the problem.

What is the real problem that everybody brings to these teachers? What is it all about. It's basically this isn't it, teacher, I want to get one-up on the universe. I feel a stranger in this world. I feel that it's a problem and that having a body means that I am subject to disease and change and death. Having emotions and passions means that I am tormented. By feelings which I can't help having and yet it's not reasonable to act on those feelings without creating trouble. I feel trapped by this world and so I want to get the better of it and is there some wise man around who is a master of the. Life and who can teach me to cope with all this.

So that's what everybody's looking for in a teacher. The man who is the Savior and who can show you how to cope with. The Zen teacher says, 'I don't have any answers.' Nobody believes that. Because he seems to be so competent when you look at him. You can't believe that he has no answers. And yet that's the consistent teaching of Zen. That it has nothing to say, and nothing to teach. The great Chinese master of the Ton Dynasty called Lindi in Chinese or Rinzai in Japanese said Zen is like using a yellow leaf to stop a child crying. A child is crying for gold, and the father takes an autumn leaf with yellow and says Gold.

Or he said it's like using an empty fist to deceive a child. See, you've got a closed fist and you say to the child that I got here. And the child says 'Let me see.' You put your fist behind your back. And the child to come to more and more excited to know what the devil's in that feels and fights and fights and fights and finally is apparently in tears. And then suddenly you finally open the system is nothing inside. So in exactly the same way, a person who is under the impression that there is something that we ought to get, see all this is dressed up in a big way, to be a Buddha, to know the answer, to finally solve the problem to get the message to get the word or however you put it. In other words to be in control, of your fate and of the world. Would you like it? If you could have it. And so all these powers are projected upon the Zen master. He is a Buddha, he is a master of life. And if he is, the reason why this is that he has discovered the unreality of the whole

problem.

And so, all these powers are projected upon the Zen Master. He is a Buddha, he is a master of life. And if he is, the reason why is this, that he has discovered the unreality of the whole problem. There is not life on the one hand, and you on the other. It's all the same. But you see you can't tell people that. And just by telling get them to see it.

Just in exactly this way you are people who know that the earth is flat. Can't be reasoned with. People who believe that the Bible is the literal word of God, absolutely impossible to reason with them at all because they know it is. So in the same way, we tend to know that we are all separate poor little me, and that we are in need of salvation or something. And we know this is so and so somebody says well you're not really that you know that that feeling of separateness is an illusion. Well that all very nice in theory but I don't feel it. So what will you do? What will you do with a person who is convinced that the earth is flat? No way of reasoning with him. If it's for some reason important that he discovered that the earth is round, you got to play a game with him, you want to play a trick on him you tell him great the earth is flat, let's go and look over the edge when that be fun. Because, if we're going to look over the edge of the earth we must be very very careful that we don't go around in circles or we'll never get to the edge. So we've got to go along consistently along a certain line of latitude westwards. And then we're going to come to the edge of the earth, just so long as we're consistent. In other words, in order to convince a flat surface that the world is round, you've got to make him act consistently on his own proposition, and go consistently westwards to find the edge of the world. Now, at last when he by going consistently westwards he comes back to the place where he started, he's been convinced that the Earth is at least cylindrical, and he may believe you. Then take it on faith that if he goes along the line of longitude, the same thing will happen. But you see what you did was to make him persist in his folly.

Now that's the whole method of Zen. To make people become perfect egotists. And so explode the illusion of the separate ego. So what happens? In effect then, in the, in the discipline of Zen ou finally, when you convince the master that you are stupid enough to be accepted as a student. Because you persisted and because you've defined yourself as someone having the

proper. He is want you well in advance that he has nothing to teach. But he says now I will ask you a question. There are many ways of asking this question, but they all boil down to one common theme, and that is Who are you? You say you have a problem. You say you'd like to get out of the sufferings of life, you say you would like to get one up on the universe. I want to know who's asking this question, show me you. And only they put it in such ways as. Before your father and mother conceived you, what was your original nature? Questions like that. And they'll say now, look I want I want to be shown I don't want a lot of ideas about who you are I don't want to know who you are in terms of a social role. You know, that you have such degrees or you have such professional qualifications and such a name and such a family, all that's the past, I want to see you genuinely now. It's like saying to a person, 'now don't be self-conscious, see I want you right this minute to be completely sincere. C'mon now.'

Well nothing is better calculated to make a person incapable of sincerity. As when relatives come and uncles and the little child and they want to review this child and see it and the parents say to the child, 'darling come on down play for us.' And the poor child is completely nonplussed. Doesn't know what to do. Because you cannot play on demand. Now what is the Zen teacher doing in saying to a person. You must answer this question by coming before me in in fact a rather formal situation where you use the kind of context in which is and master interviews his students is very formal. And there he sits, sort of enthroned tiger, he is definitely in this culture a sense a a of parity figure. And so he is the last kind of person you can respond with. Because you feel that he knows you through and through. And that you know ever read that story of one Clive about a man another fight with a bear, and the bear is a mind reader and always knows what movie is going to make. It so that the man can never conquer the bear unless he makes a move which he doesn't think about first. How would you do that? And then you get the same feeling with relationship to a Zen master. You feel that he is absolutely aware of everything phony about you. That he reads you like a book, but that you can't find a way of being not phony. Think about this a little.

You see it's, we can arrange a group session and this is a little game that's being played by lots of people it's a kind of psychotherapy we can arrange a

group session, in which the gimmick is this. That when anybody says anything or does anything. The group or some section of the troop of the group challenges its sincerity. And says 'Why you coming on so strong? Are you trying to dominate us?' And you see anything that you do can be interpreted in that way. Because the moment a group of people becomes, starts making comments on its own behavior, it is setting up a situation in the group which is analogous, say in a T.V. studio, to turning the camera on the monitor.

So, when we start, thinking about thinking. Being aware of being aware, this is what is called in the Japanese, the observing self. I watch myself all the time, you see, a hopeless mess. But this is the price that human beings pay for having become self-conscious. Anxiety and killed. Anxiety because, am I sure that I thought this out sufficiently carefully. When I left the house did I turn off the gas stove? And incidentally I remember turning it off but can I trust my memory. Don't think about memory now I wonder if I can trust it maybe I better go back and look I went back and I looked at it I really see and thinking about my sight, and whether whether this is quite authentic, did I did I look properly, because you know how the unconscious can alter your senses so I better go look again see as soon now I've got into a sort of vicious circle where I'll never get away from the house. Yes. And this you all this sort of getting mixed up is the penalty we pay for the advantageous gift of being able to know that we know. 'There was a young man who said though it seems that I know, that I know what I would like to see is the I that knows me when I know that I know that I know.'

And so this is the Zen trick. It's to put you into this situation in a very crucial way. To think about thinking about thinking about thinking about, or just the same thing. To make a very strong effort not to think. That's Zazen. Sit, let your senses operate and be responsive to whatever that may be around but don't think about it. But now this is already thinking, I'm thinking about not thinking. How will I stop thinking about not thinking? So there you are! See, you're all caught up it's like somebody came to you and they put tar on one hand, molasses feathers in the other that the to dance to gether rub them around said, 'Now pick up the feathers.'

So you see what happens the teacher is well aware that he's played this trick on you. And he's going to see what will happen if you act and he's got to help you to act consistently on this foolishness. Now, you see what he's done, is he simply made a special case of what society does to us all any how. And this is true of most cultures, the high cultures of the world, whether they're of the East or whether they're of the West, play a game on every new member they don't know they're playing this game because their forefathers played it on them and they're still it's hopeless victim.

The game is called the double-bind. And the formula under which, under whose auspices, everybody comes into this world is as follows. You are required to do something which will be acceptable only if you do it voluntarily. You must love me. You must go to sleep. You must be natural. You must be. Listened to that you must be free. Now what happens you see, society, the community into which every child enters, defines the child. We know who we are, as other people react to us. So the other people say to us, you're an independent agent. Your responsible. You're a freely acting individual. But this is a commandment. And we obey it because we can't help it. Child has no way of criticizing us. Or of seeing the something phony about it. So the child, has to be free because he is commanded to be so by the community. Now then, the community sets itself a problem. Having defined the child as an independent agent, and how they got the child to believe that he is an independent depended agent because he isn't. In other words, he wouldn't believe this if he were independent. It then has trouble getting him to behave as the community wants him to behave.

So they feel that the something ornery about all children they're born in Original Sin, they're a fractious and so on of course they are because they've been defined in a self-contradictory way. So when the community says to a person you must be free. Or when we are in a family relationship in which the members of the family are saying to each other you must love me it's your duty to love me. What a bunch of rot. Supposing your one day you get up and you say to your wife, 'Darling, do you really love me?' And she replies 'Well I'm trying my very best to do so.' Is that the answer you wanted? No! You wanted out of say darling I can't help loving you I love you so much I could reach you. You don't want to try to love you but yet that is what you put on people. In almost any marriage ceremony, that you

shall laugh that's both shout above the law by God shout love thy neighbor as thyself. This is a double bind. And anybody who lives under the dominance of a double bind, lives in a state of chronic frustration. Because he is devoting his whole life to solving a meaningless, nonsensical problem. Let's take the double bind that is the deepest of all, you must go on living. Now living is a spontaneous process. And to say to it, you must happen, is exactly the same thing as saying to any kind of creative artist. You must come through with the goods. Tonight you must give the super performance and above all you must be unselfconscious.

Well, this is being done to us all the time, and the object of the Zen discipline is that instead of doing this to people and consciously as parents do it and as teachers do it to children and as the children's peers do it to their own peer members. In Zen, the double bind is put on you deliberately knowing how stupid it is. The teacher is well aware of everything he is doing, and the tricks he's playing on you, because he has behind it all the compassionate intent of getting you into such a fierce double bind that you will see how stupid it is.

So then, what happens is this. He gives you the double bind. Be genuine. I want to see you do something that is the real you. I had a friend who was studying Zen and he was given some koan like this to work on. And when he was one day going for his interview, he walked through the garden that connected the Soto, or the monks study quarters with the master's place, and there was a big bull frog, bull frogs in this country are rather tame, people don't eat them. And so he swept up the bull frog and dropped it into the sleeve of his kimono. And when he got in front of the teacher to answer the koan, that is to say to do spontaneously produce his genuine self he produced the bull frog. And the teacher looked at it and shook his head and said 'Too intellectual.' Or, as you might say, too contrived, too studied. That's not yet YOU. Now do you see the bind in this? It's like being told that everything is all right at this moment so long as you don't think of a green elephant. So try not to think of a green elephant. Now as he works at this, as he tries to produce the genuine you the teacher really strings him out on this and makes him work and work and work over a period of many months, until he comes to the point of seeing this. There is nothing you can do to be genuine. The more you do the phonier you know you are. But at

the opposite extreme there is nothing you can not do. That is to say you cannot give up trying to be again. You can't relax you know and be completely passive. And say well let's forget about it. Let's think about practical. Matters and forget all these spiritual concerns the moment you do that your abandonment of trying is itself an insidious form of trying. For example or there's a very interesting Hindu teacher by the name of Krishnamurti that many of you may know about. And he tells people you know that all their religious inquiry or their yoga practices their reading religious books and so on is nothing but a form of perpetuating one's egocentricity but on a very refined and highbrow level. So he gets a kind of disciple who studiously avoids reading any kind of philosophical edifying book they're reduced to reading mystery stories. And they become devoted non-disciples. See what a clever bind that is it's the same as theirs in technique. You can't, in other words, let go, of you we've seen is a My point was at the beginning we saw that. The way of Buddhism is to let go of yourself. To see that you live in a universe in which in which nothing can be grasped. Therefore stop grasping.

So here's the problem. I come and say to the teacher teach me not to grasp. You say 'Why do you want to know?' And he's rich shows you that the reason why you want to stop grasping is that it's a new form of grasping you feel that you will beat the game by being unattached. It's horrible to grieve when somebody you love dies and the reviving on attached to that I can avoid grief. Pretty cold isn't it? Maybe you see, by not having an ego. When life comes and bangs on me. If there's nobody there, it'll be all right. So that's why I want non-ego state. That's phony. All this is a new way of safeguarding and protecting the ego. So this is the way in which Buddhism is a dialogue. So you see, if you go back to fundamental primitive Buddhims, people say to the Buddha, I want to escape from suffering. Perfectly honest statement. All right. I realise that suffering is caused by desire. Trying not to desire. So the student goes away and tries to eliminate desires by controlling his mind and practicing yoga. Comes back to the teacher and says a pretty difficult but I have managed at least to get rid of some desire. Teacher says to him, but you're still desiring to get rid of desire. What about that one? And then the student sees. That if he tries to stop desiring, but then he's got to stop desiring to get rid of not desiring to

desire. And suddenly he finds himself once more with molasses in one hand, and feathers in another. Absolutely tied up in a vicious circle.

So he realizes, there is nothing I can do about it, and there's nothing I can not do about it. And this predicament in Zen is called in mosquito trying to bite an iron bull. A position of such psychic extremity, that nothing can be done about it. Now the point here is, what does this situation mean? When you find yourself in that kind of a trap, what's the meaning of the trap? Why that's very simple. If there's nothing you can do, and also nothing you cannot do about a given situation. It means that you are phony. And in other words, what we call a separate ego. Isn't there. Cos it can't do anything because it is not an agent and by virtue of the fact that it can't do anything equally It can't not do anything. It's completely phony. So what has happened is to expose the fiction of there being a separate ego, either to force its actions upon the world, or to have the actions of the world forced upon it as a puppet this thing just doesn't exist. Except as a figment of the imagination. Or except as a game rule. Let's pretend everybody is responsible, is independent is separate. Sure, that's a great game. But it's a game. And so, the whole object of this is then dialogue between the teacher and the student is to carry that game of being the separate ego to its logical conclusion, to its *reductio ad absurdum*. So that as Blake said 'the fool who persists in his folly will become wise.'

Religion of No Religion

I was discussing last night, the Bodhisattva doctrine in Mahayana Buddhism, and comparing it, or relating it to, the two great tendencies in Indian spirituality. Anti worldliness, or other worldliness. Affirmation and showing how, the idea that the highest kind of a Buddha is in a certain way a non-Buddha. The highest kind of a Buddha is like an ordinary person. And this comes out very very much in various tendencies in Zen. Where, for example, all the painting, peculiarly characteristic of Zen Buddhism in the Chinese and Japanese tradition, is as it were secular. It has a peculiarly non-religious atmosphere. That is to say, that the painting of ShinGon sect and ten dissect as you saw it in the museum today was a religious painting you could tell at once that the subject matter of these paintings is religious. But with Zen painting, the way of dealing with philosophical or spiritual

themes is secular. So that, when an artist like Sendai and the. Being in the seventeenth century Japan paints the Buddha. There is something slightly humorous about the Buddha. He wears his halo over one ear. There is an informality, slight raffishness. And this comes from China, from those great song artists like the young. Who painted the six patriarch of Zen chopping bamboos. Looking like the most extraordinarily unkempt country oaf. So, also, the greatest Zen painting, has as its subject matter not really religious themes at all. It uses pine branches, rocks them bills grasses everything of that kind and you would never know that these things were icons. Likewise also, in poetry, which we will go into more extensively in the future. The superb expression of Zen poetry, is derived from the Chinese poet. Hokoji, who says 'Wondrous action, supernatural power. Drawing water, carrying fuel.'

Now that's, that poem is a little bit too religious for Zen taste. And so. Preferable to that is Basho's famous poem. 'The old pond. Frog jumps in plop.' Plop is the only possible English translation for the Japanese Misono Oto, which means literally the waters sound. Pop. But that poem you see is a very high styles and. Because it has nothing in it about religion. There is a poem on the edge which also was written by Basho, which says, when the lightning flashes how admirable he who does not think life is fleeting. And you see, the flash of the lightning is a Buddhist cliché for the transiency of the world. Your life goes by, and it disappears as fast as a flash of lightning. That becomes a cliché. So, all religion, all religious comments about life eventually become clichés. Religion always, is falling apart, and becoming a certain kind of going through the motions, a kind of imitation of attitudes as if one would say we've got a book called The Imitation of Christ. It's a terrible book. Because everybody who imitates Christ is a kind of a fake Jesus.

So in the same way, there's all kinds of imitation Buddhas. Not just sitting on altars made of wood gilded, but just sitting around in monasteries. So, one might say then that the highest kind of religious or spiritual attainment has no, no sign about it that it is religious or that it is spiritual. And so as a metaphor for this there was used in Buddhism from the very beginning, the idea of the tracks of birds in the sky. They don't leave any tracks. And so the way of the enlightened man, is like the track of a bird in the sky. And as

one poem, a Chinese poem says, entering the forest he does not disturb a blade of grass. Entering the water, he does not make a ripple. In other words, there is no sign about him to indicate that he is self consciously religious. And this goes too for the fact that his not having any religious sign, is also not something contrived. It isn't like Protestant simplicity. You know all those Catholics with their rituals and how dreadful and insincere that is, the real reason you know why Protestant think Catholic ritual is insincere? You know? It's expensive. Protestantism started in the burger cities of Europe. Places like. Freiburg, Hamburg, you know. And Geneva. Because, the merchant class, who were the foundation of the Bourgeoisie got annoyed because every time. A saint's day came around all their employees got a day off because it was a holiday and they had to attend mass. You know so many of these nuisance holidays. And all these contributions that were assessed by the church. Buying your way out of Purgatory and thing masses for the dead, and so on it's of what they found is not very you cannot handle the priests were getting the money instead of the matching. And so they decried as unbiblical and the religious and wasteful all the finery of the Catholic religion and wanted something plain and simple.

So it became, in course of time, a sign of being really religious. To avoid rituals and to avoid colorful clothing and splendor in churches and to be as ordinary as possible. But that is not yet their real religion of me giving no sign of having a religion because this simplicity and absence of ritual itself becomes a sign. A way of advertising how spiritual you are. So, the completely Bodhisattva type of person doesn't leave any track, either by being religious overtly, or by being non-religious overtly. How will you be neither religious nor non-religious? See that's the great test how do you avoid that trap? Of being one or the other. It's like I you a theist Are you an atheist. You see the theist is caught by God. And the idea of God The belief in God but the atheist is equally caught. Because an atheist is very often an atheist because he cannot stand the idea that God is watching him all the time. That there is this constant all-seeing Eye, prying on your most private life. And that there is this is you know how were you when you were a child in school and you're writing something or doing arithmetic and the teacher walks around the class and looks over your shoulder. Nobody wants to be watched like that, even someone who's good at writing or arithmetic,

doesn't want somebody looking over their shoulder while they're doing it it puts you off it bugs you.

So the idea of the Lord God who is watching us all the time he was judging everything that we do puts people off and they can't stand it so better be an atheist to get rid of teacher. So better be an atheist, you see the man who advertises his disbelief in God, is a very pious person. Nobody believes in God like an atheist. There is no God, and I am his prophet. So then, the true Bodhisattva state is very difficult to pin down as being either, neither supremely religious nor blatantly secular. And people who think that the height of Buddhism, or the height of Zen, is to be perfectly ordinary have still missed the point. That the atheist has missed the point. But, for this reason then, there is an element in the art, the painting the poetry, et cetera, which has been inspired by this kind of Buddhism. This kind of art where the subject matter is non-religious Nevertheless, there is something about the way in which this non-religious subject matter is handled that stops you. And you know there's something strange about it, this is how I first became interested in oriental philosophy and all that kind of thing. I had an absolute fascination for Chinese and Japanese painting. The secular painting, the landscapes, the treatment of flowers and grasses and bamboos. There was something about it that struck me as astonishing. Even though the subject matter was extremely ordinary. And I had just as a child practically I had to find out. What was this strange element in those bamboo. And those grasses. I was being of course taught by those painters to see grass. But there was something in there that one could never pin down, never put your finger on. And that was this thing that I will call the religion of no religion. The Supreme attainment of being a Buddha who can't be detected. Who, in this sense then, leaves no trace.

You remember some of you have seen those ten paintings, called the ten stages of spiritual ox herding. And the author, there are two sets of these paintings there's a heterodox one on and off a ducks one. The heterodox one, has the, as the man catches the ox, it gets progressively whiter, until in the end it disappears altogether and the last picture is an empty circle. But the author ducks set of paintings. Doesn't end with the empty circle that he and his circle arises to from the end. Three from the end. It is followed by two others. After the man has attained the state of emptiness, the state, in

other words, of complete iconoclasm, the state of no attachment to any spiritual or psychological or moral crutch, there are two more steps and one is called returning to the origin. Which is represented by a tree beside a stream. And the final one, called entering the city with hands hanging down. That means hands, giving a hand out, as it were, of the giving bounty. And it shows a picture of the fat water to tie. Or in Japanese known as Hote. Who has an enormous belly big years who carries around a colossal bag. And what do you think this bag has in it? Trash. Wonderful trash, everything the children love. Things that everybody else has thrown away and thought of as valid as this bum collects and gives it away to children. And so it says here. That he goes on his way without following the steps of the ancient sages. His door is closed. His case that sort of his house and no glimpses of his interior life are to be seen so in other words it's unlike when you erect a building while you're building it you have all kinds of scaffolding up. That shows you that building is going on, but when the building is complete, the scaffolding is taken down. To open a door as they say in Zen You may need to pick up a brick to knock at the door but when the door is open you don't carry the brick inside to cross a river you need a boat but when you reach the other side you don't pick up the boat and carry it. So the brick, the boat, the scaffolding, all these things represent some sort of religious technology or method. And in the end, these are all to disappear.

So that the Saint will not be found in church. Don't take what I say literally, the saint can perfectly readily go to church without being solid by church. But ordinary people when they go to church they come out stinking, of religion. There was a great Zen Master once. And one of his disciples asked him, 'How am I making progress?' He said you're all right but you have a trivial fault Well what is that he said you have too much zen. Well he said 'When you're studying Zen, don't you think it's very natural to be talking about it?' The Master said, 'When it's like an ordinary conversation it is much better.' And so another monk who is standing by listening to this exchange said to the master, 'Why do you says special it is like talking about zen?' and he replied 'Because it turns one stomach.'

So what did he mean when he said when it's like an ordinary everyday conversation it is somewhat better? When the old master Joshe was asked at

the end of the Kalpa, when everything is destroyed in fire there will be one thing remaining What is that? And Joshi replied It's windy again this morning. So, in Zen, When you are asked a question about religion, you reply in terms of the secular, when you are asked about something secular you reply in terms of religion. So what is the eternal nature of the self? It's windy again this morning. Please pass me a knife. The master hands him the knife with the blade first. Please give me the other and what would you do with the other and. See, here that could be the the disciple starts out with the ordinary please pass me the knife and suddenly he finds himself involved in a metaphysical problem. But if he starts out with a metaphysical, he's going to get involved with a knife.

So, now, to go deeply into, the religion of non religion, we have to understand the, what you might call the final ultimate attainment of Mahayana Buddhist philosophy. And this is contained in a school of thought which is called in Chinese Wa-Yin and in Japanese Kagan. Kagan is the intellectual foundation for Zen. And there was a great Chinese master by the name of Shumatzu, who was simultaneously a Zen master and the fifth patriarch of the Qua-Yin sect. Qua means flower. Yin, garland, the garland of flowers. And it's all based on a Sanskrit Sutra called Avantaksura [sic]. This is called simply The Japanese King or The Very Big Sutra. And the subject matter of the sutra, called the four Dharma worlds. And I must explain what these four worlds are so that you get the point. First of all, there is a a level of being, which we will call ji. The word ji, which is Japanese way of pronouncing the Chinese chir, is the world of things and events. What you might call the common sense world, the everyday world, that our senses normally record. This the word ji, character in Chinese has a multiplicity of meanings, because it me it can mean a thing or an event. It can also mean business. An affair, not in a love affair but something. In the way the French say laissez faire for business. Something important. You can also mean affectation. Putting something on or showing off. And so a person who is a master in Zen is called booji, which means no business, no affectation, nothing special. The poem says, on Mount Lou, there is misty rain. And the river Jun is at high tide. When you have not been there your heart is filled with longing but when you have been there and come back it was nothing special. Misty rain on Mountain Dew River Jun. But this nothing special is not a way of putting something down. To see that I could

say well it was nothing special, it didn't really amount to anything. That's one way of saying it was very ordinary. But just as it doesn't mean it was very ordinary. In the same way that the person who has no religion is really the most religious, do you do see, he's not just a common ignorant moron. He looks like one, but he isn't. And you have to know what he knows, in order to see that he isn't and to recognize him for what he is. So nothing special, booji. It did doesn't stand out, it doesn't. As we would say that doesn't stick out like a sore thumb. So the world of ji. Then means generally, the world of particulars. The world of multiplicity, the world we ordinarily feel we're involved in.

So that's the first world, the second world is called the world of ri. Now re in Chinese Li. Is as I explained to you when we were discussing the idea of the law of nature. The character means the markings in Jade. Or the grain in wood or the fiber in muscle. But in the Wa-Yin philosophy the word really means the universal, underlying all particulars, the one underlying all multiplicity. The unity of principle as distinct from ji, which is the differentiation principle. So as it were, like it's like this, when you see into the nature of this world. You start from ji. You start from noticing all the particular things, and being baffled by the multiplicity, and dealing with the multiplicity of things, but as you go into this, you discover, as you understand things...What do you mean when you understand things? It means you become aware of their relationships to each other and eventually you see the unity of the mind. And it is as if the multiplicity of the world dissolved into unity.

You start from noticing all the particular things and being baffled by the multiplicity and dealing with the multiplicity of things but as you go into this you discover as you understand things what do you mean when you understand things it means you become aware of their relationships to each other, and eventually you see the unity of the mind. And it is as if the multiplicity of the world dissolved into unity. And so here you encounter a problem. I can see the world as a unity. I can see the world as a multiplicity. But how the devil am I going to put the two visions together. If I am to be a practical success, in business, in family life, and so on, I have to observe the world of particulars. Its particulars that matter. I have to know chalk from cheese. But if I become a saint, a monk, or hermit then I care about even perhaps a poet or an artist, I will forget about the practical matters, and

contemplate the unity, the secret meaning underlying all events. Then ever all those practical people are going to say to me, you're falling down on the job, you've escaped from life, because they feel that the world of particulars is the real world, but the other guy says No your particulars are not real. You make a success of things yes but it's completely temporary. You think you're an important person that you're really contributing to human life, but actually your success in doing this sort of thing lasts for a few years, and then you fall apart like everybody else does. Where's your success now, when you're dead? What happened to the millions of dollars you made? Where are you all gone so that isn't real from the standpoint of the person who concentrates on the unity.

So then to perfect our understanding we have to go to the third of these worlds which is called the ri game will get. Now that means between ri, the unity and ji, the particulars, mu there is no gap block. That means that world of the universal and the world of particulars are not incompatible. Let's take two very different things. And see how they can be united take shape and color. Never in a million years can you, with a black pencil that can draw shapes, make red. But, if you have red, you can draw a circle. You can draw a red circle. Even though the circle shape and the red color, will never be the same. Yet red circle, they go beautifully together. So think of a circle. As ji, and red as a ri. The circle is the particular, the color is the universal they go together. So then we might say, the properly rounded out person, is both spiritual and material. Both, other worldly and worldly. This is the supreme attainment of a human being. To be both. Don't get one sided.

A person who is what you might call just a materialist ends up by being very boring. It's, you know you can live the successful life of the world. And you can own every kind of material refinement. You can have the most beautiful home, delicious food, marvelous yachts and cars and everything. But if you have no touch of mysticism it eventually is all perfectly boring. And you get tired of it. Then on the other hand there are people who are purely spiritual. And they live in a kind of dry world, where all luxury has been scrubbed away, and they are very intense people. When you are in their presence, a very spiritual person, an excessively spiritual person, you feel inclined to sit on the edge of your chair. You are not at ease, because

you know the eye of judgment is looking through you and going down into your very soul and finding that you are just a scallywag after all. They are absolutely sincere, this dreadfully honest and unselfish person. This is something which is always puzzling to people brought up in a western environment. Because great Spiritual people are often very very censorious because they, they can't be materialist in the ordinary sense. They can't be straight open censorious, because for them the world is too wonderful for that. Any any human being is too marvelous to be treated as just a kind of sexual object. They may be very much a sexual object, but so marvelous, you have to stop with it and really go into the whole of that marvelous wonderful personality. So there is a trouble, keeps coming up for the west. When you go to church, and you suddenly go to a church where there's a marvelous clergyman and you think he is a very exemplar of life and you idealize him and then suddenly there develops a fightful scandal, that he has an affair with his secretary. And you think all is lost that faith has been sold out that everything's going to rack and ruin because he was not purely spiritual. And he himself may be terribly confused and worried about this. Because in our world, you see, we make the spiritual and the material mutually exclusive. But rijimuge, this third world means that between the spiritual and the material, there is no obstruction.

So we might say this. Would sound as if it were the highest level. But as one more to come. Which is call jijimuge. This means then suddenly ri has disappeared. But between ji and ji, there is no obstruction. Between one event, and any other event or events there is no mutual exclusiveness, should I put it that way? This is the doctrine of the highest doctrine of Mahayana Buddhism, which you could call the doctrine of the mutual interpenetration of all things, or the mutual interdependence of all things. And it symbol is the what is called Indra's net, that is used Avatanksara Sutra. Imagine at dawn, a multidimensional spider's web covered in dew. A vast, vast spider's web that is the whole cosmos, and is not only a kind of a flat thing but a solid thing and are solid in four five six and n dimensions, covered with jewels of dew, all of which have a rainbow coloring, and every drop of dew contains in it the reflection of every other drop of dew. And since every drop of dew contains the reflections of all the others, each reflected drop of dew contains the reflections, you see, of all the others, and

so ad infinitum. Now this is the Mahayana vision of the world. Which is to say this is relativity.

That whatever exists in this world and is characterized as something particular, as a thing, as an event as something or other you see as a unit. This does not exist without all other such things and events. So that you might say any one event, implies all events. And all events, the total universe, past, present, and future, depends on every single member. In other words, you may say, I can understand that I depend on this whole universe. There could not be me unless there was everything else it is harder to see the current corollary of that. That the whole universe depends on you. You might say, well how can that be? Because I come into being, and then I go out of being and when I am before I was born, I'm sure the universe was here and after I die, I'm sure it will go on. How can you say then that the whole thing depends on me? Very simply. It depends on, your supposing you're dead, and we're talking about someone in the past let's say we're talking about Socrates. And I'm going to say this whole universe depends on Socrates. I may put it more exactly. It depends on Socrates having existed. You see, your parents now, some of your parents may be alive, but some of your parents may be dead. Without your parents he would not have come into being. So you depend on your parents even when your parents have gone. So everything, even when you disappear, the universe will still depend on you. On your having been here. Or if you have not yet arrived, it depends on your going to be here. So we can say obviously, going back to Socrates, that the fact that Socrates existed tells us something about the kind of world we're living in. This world once Socratized, and that Socrates and his wisdom was a symptom of the kind of universe we're living in in just the same way as I showed you that an apple is a symptom of a tree certain kind of tree tells us something about that tree what it functions how it produces things. So a world which produced Socrates, or a world which produced John Doe. Who was nobody in particular, and nobody ever remembered him or thought to write his biography.

Nevertheless for all his obscurity the whole universe to them from him and it depends equally on every fruit fly every gnat every vibration of every gnats wing, and it depends on every last electron, however brief its

manifestation may be. So that, what this is saying is, that everything that there is implies everything else. And all those other things, collectively, in their totality, which we call the universe, in turn, imply. Each individual object event and so on. That's the meaning of Indra's net. So that, this is called in Zen, to take up a blade of grass and use it as a golden Buddha sixteen feet high. When you have a chain and you pick up a link, all the other links come up with it. Because it implies, if this is a link it is a link in a chain if it isn't it's just an oval piece of metal. But if it's a link, up come all other links. So if you are an event, every event, no there's no such thing as a single event the only possible single event is all events whatsoever. That could be regarded as the only possible atom. The only possible single thing is everything. But the things that we call things all imply each other, we know what we are only in relation to what we aren't. We know of the sensation of oneself only in relation to a sensation of something other.

So the other goes with the self as the back goes with the front. And your life, however short, everything depends on it. If that did not happen, nothing would have happened. So in this sense, the whole world there's your signature. It would not be the same world if it weren't for you. And you've heard, haven't you, what is called the pathetic fallacy. This was an idea of the nineteenth century which said that it was false and wrong to project human feelings on the world. The wind in the pine trees is not sighing. It's you who are sighing. The sun is not happy. It's you who are happy when the sun shines. So don't mix up your happiness with the sun, the sun has no feeling the sun is not human the wind has no feeling and is not human. The poet says the moon doth with delight look round when the heavens up there, and the logician says no, the poet looks around with delight at the bare heavens. How awful. I mean if that's what is the if that's the point you see better not say any poetry, just have prose. But actually, the moon does look around with delight, when the poet looks around but delight plants. The world of which one symptom is the moon is the same world of which another symptom is the poet. They go together a world where there is a moon implies a world where there is a poet. A world where there is a poet, implies a world where there is a moon. So in this sense, the moon can be said to look around with delight, through the agency of the poet. Because you can't separate poet and moon. Just as you can't separate head and feet without destroying the unity of the body.

So in that sense then, this whole world is a human world, and we should not take this silly attitude, of Philosophy call the philosophy of the pathetic fallacy, which says outside our skins it's all inhuman and dumb, and blind force, and only inside the skin is there the human world. All this world is human because it depends not only on the existence of humanity in general, but on the existence of Mary Smith in particular.

So the whole world is covered as it were, with your personal signature. But at that moment when you suddenly seem to be everything and to be Mr A, you know, you suddenly see the obverse of this, that your particular personality is nothing at all without everything else. That everybody else. I need in order to be Alan Watts I need every single other human being and the. Uncontrol, the uncontrollable otherness of all those other human beings that I can do anything about they are going to be themselves whatever I do. And yet at the same time, I depend on all their difference from me, and yet they all depend, likewise on me. So that I'm in a very funny position. The moment I would be egoless and say, I'm nothing without you, then suddenly I find I'm the kingpin they all depend on me then suddenly when when I get swelled headed about being the kingpin, I find I'm nothing at all without them. So everything keeps going bloop bloop bloop bloop in other words about how much you think you've got it in one state it transforms itself into the other. That's the jijimuge.

Now in jijimuge. I'm again see. You got a vision of the world, in which everybody is boss and nobody is boss. There is no one boss who governs the whole thing it takes care of itself it's a colossal democracy. But yet every man and every who agrees to and every snail is king. In this world. And at the same time is coming. And that's how it works. And there is no great king. Although, in Hinduism, they have an idea a very strange one to us the call Ishvara, means the supreme personal god. The top being in the Deva world. And they, many Buddhists believe, that there is such a God there is a ruler of the universe but he is lower than the Buddha. Because in the course of the endless cycles Ishvara, will dissolve into nothing. All gods, all Angels, are within the round of being. It's a very curious idea. Minds and therefore all the Buddhists believe in God In that sense. They don't take it importantly there are no shrines in Buddhism to Ishvara.

So then, it is through jijimuge, this idea of the mutual interpenetration and interdependence of all things. That we have the philosophical basis for Zen as a practical non-intellectual way of life. Because of the realisation that the most ordinary event, the charcoal brazier, the mat. Soup for dinner. Sneezing. Washing your hands, going to the bathroom, everything, all these so-called events, separate events, imply the universe. So this is why Zen people will use the ordinary event to demonstrate the cosmic and the metaphysical. Only, they don't rationalize it that way. To see infinity in a grain of sand and eternity in an hour is still and not rijimuge and not jijimuge. Jijimuge again, is when you offer somebody the grain of sand. For God's sake, stop thinking about eternity. Here's, that's the grain of sand, there is no difference between the grain of sand and eternity.

So you don't have to think about it and it has something implied by the. Of sand. The grain of sand is eternity. So in the same way exactly, our sitting here at this moment is not something different from Nirvana. We are nirvana, as sitting here exactly like this saying. So you don't have to say any philosophical comment, on the grain of sand, or on our sitting here. That's called legs on a snake or a beard on a eunuch. And you put legs on a snake, you see, and you embarrass the snake in its motion. And a eunuch doesn't need a beard. We would say in our idiom, don't gild the lily. Or Zen would say don't put frost on top of snow.

So all, what you might call specifically religious activity is legs on a snake. Eventually this is going to be eliminated, just as eventually, we hope that government will be eliminated, and will become unnecessary, because every individual will be self-governing, and therefore relate properly to his brother. And the state will vanish. So too, at the same time, the church will vanish. And that's why in the, in the Book of Revelation, in the New Testament, it is said that in Heaven there is no temple. Because the whole place is the temple. So in, when we achieve the fulfillment of Buddhism. There is no Buddha, no temple, no gong, no bell. Because the whole world is the sound of the bell. And the image of Buddha is everything you can look at. So as a Zen master was asked mountains and hills are they not all forms of the body of Buddha the master replied, 'Yes they are, but it's a pity to say so.'

Diamond Web

Now you know, those people you've just been listening to, chanting the sutras on Poyason [sic]. Which is the sort of ultimate center retreat in our sanctuary of Japanese practice of budgeting on a monthly on a Buddhism. [They] are a bunch of boys, who are just like and they're open college boys who play football. And they haven't the faintest idea what they're doing. Not today. They're doing this because their fathers have sent them there. Their father's own temples. And they've got to carry on their father's tradition, because after all the family business has to go on. And they have no more idea what this is all about than the man in the moon. And you and I can sit here, and we could get swinging with this music, we could dance to it, and we could go very far out on it, which was what you were originally supposed to do. And for them it's a chore, it's a thing you have to get up for at five o'clock in the morning. And you have to memorize all this and you have to get it exactly right and do it. And they've completely forgotten what it was all about. But it was originally there.

It's a funny thing how this happens you see, but you see how I was explaining to you this morning, how we have a rhythm, between remembering and not remembering. You remember long enough to know that you're there. Because if you don't remember, nothing makes any impression upon you, therefore we are not there. But then when memory gets too much, and you're too much of there then you have to realize that all memory is an illusion, that there is nothing except the present moment. And that there is no future, as equally no past. And then you are liberated. But when you get liberated. You have to come back in and play memory again there's a cleaning process. In other words, you wipe off the blackboard. And then you start writing again. And then you wipe it off, and then you start writing again, and this is the process whereby life is kept going. So in the same way with these people. They have come to a point in the historical development of their way of Life, where they remember too much, it's not new to them. And all this therefore becomes. What we call going through the motions. And so this is the same paradox that I was talking about this morning. That the Echo, which is memory, is simultaneously what tells you exist, and what traps you. So in the sense that it tells you you exist, it's an advantage to the extent that it traps, it's a debt.

You're in debt you should be thankful somebody gave it to you. Ultimately, in the Judeo Christian tradition the law of God did it all for you and you should be thankful. And say, anything bad that I did this for me. Dear God, anything good that I did was from you. You see? What a marvelous mix up that is. But all I'm saying is this. There is a point in in in all of this development, where, you have to say to people please come off it. In other words, these boys here and call your son I was a king to know enough Japanese to say to them. 'Do you realize what a great thing you have here.' Couldn't you possibly enjoy it for a few minutes, and let's get together and all join hands around here and go through this again, these Sutras, and really make it.

So I'm talking, you see, about the same process of what has been called Flip-Flop ability. Whereby we switch from one attitude to another, one situation to another, and this pulse switch situation, is the very nature of existence that's why your heart does that, that's why all sounds all light everything is going bloop bloop bloop bloop bloop. See and so because of that bloop, you know you're here. Well now, I've been trying to show how this game, has its own inner meaning. So finally, we we've got to come around to one form of Mahayana that I haven't really discussed at all to complete the whole scene which is what is called the School of the Pure Land. And this is the most popular form of Mahayana Buddhism in the in the Far East. In China, in Japan everywhere the the multitudes go for this kind. And it's all under the presiding image of the, one of those Johnny Buddhas, called Amitabha, whose name means boundless light, and who is a sort of subdivision or aspect of my How about O'Connor. Who is the great Sun Buddha. And who is therefore probably derived historically from a master. From Persia. The. Great Sun god of than Muzdans and it Pasis. But although that may have been what set it all off it has been greatly transformed. By being canonized through Buddhism. Now you have all seen. Photographs of the Buddha at chemical or the dye butz, that enormous bronze figure, that sits. In a beautiful park with pine trees. The Temple having long been demolished by a tidal wave. For which Thanks be to God, because if it hadn't been for that tidal wave nobody would ever have really seen this figure. But there is a comic or a huge bronze figure it's about forty two feet high. And here this creature sits, surrounded by a great business, thousands of schoolchildren are all the time on tours streaming by,

photographers, people selling this that and the other souvenirs. Exhibitions of dwarf trees and everything are all going on around and here this thing sits and looks down forever. And nothing can hush it. I mean, let's put it this way. It hushes everything. That no matter how much turmoil of children and cetera is going on in this park, this huge face presides over everything. And you cannot ignore it. It subdues you into peace. Without doing it in an authoritative way, it doesn't say to you shut up. It just is so peaceful that you cannot help catching the infection of peace that comes from this figure. And this is the figure of Amida, Amitabha. Not the historical Sakyamuni, Guatama Buddha, Living in India but one of the Johnny Buddha, who is not manifested in the world.

Now the religion connected with this figure is called Pure Land. Jodo, In Japanese Shinsho. The the true sect of the Pure Land. It comes, again the origins are always in India. But the Japanese. Under the. Genius of them Honan and Shinran, who were medieval Buddhist Saints developed their own special variety of it. And this is a very strange religion. Because it takes its basis as follows. We are living now in the most decadent period of history. That's what they say, and this comes back from the Hindu idea that this is the Kali Yuga. This is the end of time, where everything is completely fouled up. And this started in about three thousand B.C.. February the twenty third, three thousand and twenty three B.C. the Kali Yuga began and it's got to last yet for five thousand years, and then everything will fall apart, the universe will disappear out of sheer failure. So that now, nobody can be virtuous, because everybody who tries to be virtuous in this part, this epoch of the world is merely showing off. It's not really pure. It's just pretending it works it's a big act. In other words, so you give money to charity, not because you really love the people you're giving money to, but because you are under a sense of guilt and you feel you ought to. And therefore, because of that inescapable bad motivation, nobody can possibly liberate themselves from the chains of karma. The more you try to get out of your karma that is to say your conditioning your bondage to your past, the more you simply get yourself involved in it. And therefore all human beings living in the end time of the Kali Yuga or what the Japanese call Mapol are just hopeless. Hopelessly selfish. So in this predicament, you cannot rely on JiRiki, that means your own power. To get out, to get liberated from Self. You have to rely on Tariki which is the power of

something else altogether the new something quite different. So in the Jodo Shinsho sect. The Tariki, the other power is represented in the form of a me Tomba on. Japanese say Amida. This great beneficent Buddha figure, who everybody loves. And he's so strangely different. From any kind of authoritarian God figure that we have in the West. Amida doesn't bombinate. He sits there serenely. Quiet. He doesn't preach. And all you have to do is to say his name. In the formula. Namu amida butz. Which means namu,l name. I mean upwards of a meter Buddha. Namu Amida Butz.. All you have to do is to say that formula. And after death you will be reborn in a special paradise call Sukhavati, which is Jodo, the Pure Land, where becoming enlightened is a cinch. It has none of the difficulties surrounding it that we have in our ordinary life today. Everybody born in the Pure Land is Born in the inside of a lotus. There's a huge lotus pond in front of where a metre sits. With all his attendant. And the Lotus has come up and they go but the bug breaks and every time it goes up like there's there's a new little being in there who is somebody who said that formula Namu amida Butz. And those are human beings when our sitting on Lotus is like Buddhas.. And you should see you go to call your son and they have a great painting now in their museum of what it's like to arrive there. They have a huge panorama of Amitabha, and all his attendants and especially the Absaroke and she looks at you lovely longing eyes. And so this is welcome to Amida's paradise where you will also add on notices. And be Buddhas, without any difficulty but the point is all you have to do to get there, is to say Namu Amida Butz you don't even have to believe that it works.

Now that is the religion, of most Japanese Buddhists, believe it or not. In other words if you eat if you if you of course if you really get this and the feel that that's really going to happen to you you'll be grateful and you'll try to help other people and be able to stop that and so on and you know be generally helpful around the scene. But the whole idea is that you cannot do it by your own effort and if the moment you think you can do it by your own effort, you're a phony. You have instead to go completely with the other, to disown your own power and capability of being virtuous, unselfish, etc,

So then, this kind of religion develops a peculiar kind of saint. And they call these people Miokonen. Mio means wonderful, ko in this fine in means man. Or person. That can be a woman you know konen is not sexually restricted to men. So in your konen there's a very special kind of character. There are stories told about Miokonen. There is one for example a travelling man who comes to a temple during the course of the night. And walks in, and he takes the sacred cushions on which the priests sit, and arranges them right in front of the altar and goes to sleep. In the morning, the priest comes in and says what's going on here. And the miokonen looks around and goes oh, you must be a stranger, you belong to the family. Another time, he had a great ability for doing calligraphy, beautiful writing. And people were always trying to get his calligraphy from it. And he was cagey about it. It wasn't so easy to get it. So one day, a very very great man invited him for dinner. And again, left him alone in a reception room where there was stretched out on the floor some absolutely gorgeous paper. With ink and brushes just waiting there. And he got so fascinated. That he just couldn't resist. You know, like a child, he simply couldn't resist doing is calligraphy on that piece of paper and suddenly as he realized he had done it. That he had spoiled this god. Are just paper you know which was incredibly expensive the host walked in. And he apologized and said Really I don't know what to do. So sorry I couldn't resist the temptation to make some things on this beautiful paper. And the host said, Oh please don't worry about that. Because he had now possessed himself of the priceless object of a this man's work today Celts for thousands and thousands of dollars. So this is the spirit I'm trying I'm telling these anecdotes to try and illustrate the spirit of what's called a miokonen. Somebody in the swing of realizing that all the very great thing in life is not your own doing. That it comes from the side of things, the flip, in other words, of experience, that you call other. There are some people who believe it comes from the split in experience you call yourself that's the jariki people the tariki people believe it comes from the other. But now what happens is this. When you penetrate deeply into the doctrines of the Pure Land school, the simple people believe that there really is Amitabha Buddha, sitting on his golden Lotus, surrounded by all those apps ours. Exactly that from Japan one hundred eight thousand miles to the west there is a paradise where all those people sit and where you will be reborn you die. And the simple priests of the sect in the country villages today still insist that that's what you should believe.

But the sophisticated priests don't believe that at all. They know that Amitabha is in you, only it is that side of you which you don't define is you who. When you say, I have a body. You know instead of saying I am a body. That's because you feel that your body happens to you. That it's something you got mixed up with. That was given to you by your parents you don't say I beat my heart on purpose. You feel that your heart is something that happens to you.

So all that side of things that you experience as a passive recipient of it is tariki. But in all this who are you? Who is the recipient of these gifts? Don't you see that Self and Other go together? That you don't need to cling to yourself because you have everything you called other and that's you too. That if you, but you only realize this if you explore it. If you go to an extreme. So you can go to the extreme by pursuing the idea of total courage. Of letting go of everything being a true Zen monk, and abandoning all your property and living in a barn, and sitting in the middle of the night. In the cold and eating rice and pickles and so on, and you can explore liberation that way. That's going to an extreme.

But eventually, you will come around to the same point as the person who goes to the other extreme. Which is, no effort whatsoever. It comes of itself. Only, he gets in a kind of bind too. Because when am I making no effort, even if I say Namu Amida Butz I'm doing something about it now I gotta stop. Doing saying this now my meter but not saying this Namu Amida Butz, this is so easy. But it's still a little bit work. And I mustn't do any work at all! How could you get to the point where you don't do any work at all? You just mustn't do anything. And you find yourself that that is death as difficult as the other situation was, you see to do nothing really do nothing, with perfection is as difficult, as to do everything.

Transcending Duality

Now I want to go today into the subject of the male-female symbolism in tantric yoga. You will find that in the tantric forms, that every aspect of the Buddha has a feminine counterpart. And that not only do they have feminine counterparts, but they also have various levels on which they're represented. In other words, we started out you remember I described in the

last seminar there was the idea of five so called Jani Buddhas. And these five who represent as it were the center of a rose, ones in the middle and four surround. Then each one has a corresponding Bodhisattva form, and then each Bodhisattva has in turn a corresponding Hiroko form, but they're all forms of the original five then whether they're in the form of a Jani Buddha in the form of a Bodhisattva, or in the form of a Hiroko which is kind of wrathful and weird far out to kind of. Character often with bulls heads. There's one here. Which we can look out of the little statue, which Kim has brought over. There all reducible to the original group. And all have these female counterparts and they are represented as in sexual intercourse, touching at all points. In a complete embrace. And the idea is, that this embrace lasts for ever and ever and ever and ever and never ends. Because this is a way of representing, the nature of life. What is fundamentally involved in the system is self-knowledge. You see, without resonance, nothing happens. If there are no echoes, you can't hear anything.

Supposing we get a room in which we blanket all the walls. And blanket the floor, soundproof it in every possible direction. You can hardly hear anyone talk, because voice requires resonance. And that's why people enjoy singing in the bath tub. They suddenly discover they've got a good voice, because suddenly the bath and the structure of the room which is all non-soundproofed, resonates their voice. That's why you use a violin, or a cello or bass fiddle, has a big wooden structure to make the sound resonant. To play back to itself. And that's why we're all so fascinated with recording things taking photographs. Writing them down and above all remembering. It's a form of resonance. Because you see if you don't remember anything you don't know you're there. A person who had total amnesia, and lived in a split second only wouldn't know he was there. We could conceive, and perhaps there are some forms of life that don't know they're there. I don't know whether my in particular cells constituting my body. I don't know whether they know they're there. Maybe they do, maybe they have some wonderful system of resonance that I know nothing about and they're all worried about what I'm going to do with them. And having conferences and meetings and policy decisions, and so on and so forth, because there's this person in charge. You know, it might well be that when I die or when we all die all our cell suddenly say God is dead. And they have this big theological

controversy, and say well. We just have to fend for ourselves from now on and that's called corruption but they all go off on their own.

So, I don't know, it may be here that we've got some kind of a system like that, but certainly to know that you're there you need an echo. So I invented this limerick: 'There was a young man who said though, it seems that I know that I know what I would like to see is the I that knows me when I know that I know that I know.' So this is the the thing you see not only do you remember what happened and say it made an impression on me, which means it made me remember. Like your retina remembers whatever is seen so that it sticks there a little. In other words that's why you get the illusion of a circle of fire when you revolve a cigarette in the dark. It makes the impression of a circle because your retina remembers and holds, as it were the impression of the flame. And so then, beyond that, we have we are absolutely fascinated with the whole principle of remembering, and so then when there's some gathering of people. And we say, well this is a great day what a wonderful big picnic or whatever it is we're having, it's a pity somebody didn't bring a camera. It should have been photographed. Now, do you see that in this whole thing there is both a gain and the loss. The, one school of people are saying it should be photographed. The other school of people are saying let go of it. When you go around, we had so much experience of this in Japan because all our students brought cameras and were constantly photographing things and I had a camera and I was constantly photographing things, but I felt that as long as I had a camera with me, I was somehow distracted from actuality. I had a little box with which I went around grabbing life, of course it's great to come back and look at it, in the form of photographs, but there's something about the photograph that is inferior to the actual experience that you're photographing. But, there is an immense fascination, in photography, in painting, in reproducing, and reproducing you see is the same thing as sexuality it is reproduction. Only in another way. Because it tells you you're there, you're alive the thing bounces, it echoes.

So the duplicity in all this, is that you see, one school of religious people say let it all go, don't be attached in other words...and they also say live in the moment like Krishnamurti's doctrine of stop trying to remember everything you may need a kind of factual memory for your name and

address and telephone number. Or things like that but don't linger over memories and treasure memories and say well I'm going to keep my girlfriend's lock of hair and I'll take it out every now and then and look at it and feel wonderful thing that's clinging to life, because that memory has got you hooked. It holds you to the past, and it holds you to death. But, then there's the other school of thought, you see, quite opposite of this which says remember to remember, title of one of Henry Miller's books. Hold on to it all, get involved. Keep your girlfriend's hair. Keep all the photographs you know how in some houses the piano everything is completely covered with photographs and reminiscences.

I went to visit. Gloria Swanson once. I have never seen such a house full of memories. Everything in all directions was Gloria Swanson, photographed on this occasion, signed on that occasion presentation there's I want to visit once to the wife of a former Archbishop of Canterbury and the whole house was memorials when it was a complete clutter of Tombstone furniture. With little brass plates, on it presented on the occasion of this that or the other. Well, you say look that person isn't really living. And they're all in the past. But on the other hand., what is life, you see, except there is a memory, except there is an echo. So what I want to point out you see, is the duplicity of all this. That you don't take if you're a wise man you don't take sides in this issue. You do both sides. And that is the meaning of the unity of something Samsara and Nirvana. On the one hand, you let go of everything and you live in the eternal now because that's all there is the memory is an illusion, it's all gone. So everything you know about, that makes an impression on you, is no longer there that's the meaning of Maya. There is only the eternal now. There is only the present moment and never will be anything else. Because even what you're remembering is happening in the present, the memory is in the eternal now there isn't it see so it's all really absolutely here. But on the other hand what fun to drag it out. And to make it echo, and to get involved. And to fall in love. And to become attached.

Once R.H. Blythe wrote and said to me, I may have told some of you the story before you wrote me a letter and said What are you doing these days as for me I am now abandoning all kinds of satori and enlightened and I am trying to become as deeply attached to as many people and as many things as possible. As these are the two sides.

So, the thing is this. It's just like riding a bicycle. It's a balance trick. You suddenly find yourself falling over one way. Well, you balance that you turn into that direction and you stay up. And so in the same way when you find yourself becoming, too attached to life, you correct that with the realisation that there is nothing except the eternal now. Then when you feel it's all right now you see you're safe again to is the only done that once my. You go and get attached. Or you get involved, you get concerned, about some enterprises social, political, amorous, familial, scholarly, artistic, whatever it is, you get involved. And the two always go together, so this is the meaning of the symbolism. Because the male only knows he's there if there's a female. It's the echo, and she only knows she's there if there's a male. Nobody ever came into existence without a couple of parents, see. And there's a simply no other way into this you universe.

Now this is simply I'm using this simply not as the main point, but as a sort of illustration of the simultaneity of attachment-detachment all in evolution and evolution involution is how you get involved evolution is how you get out. Well now, this tantric yoga represents all of us in the most extraordinary symbolism, which is basically the human body. Again, it's not simply the sexual functioning of the human body, it's the whole nervous system. If you really dig into this, you will find, that there is a psychic anatomy, and this psychic anatomy in yoga philosophy belongs to what I explained yesterday as the subtle body. You must not expect to find this in the physical organism. Nor must you expect to find that there is in addition to the physical organism a sort of spook that goes around with us. The physical body is the body as examined by others. The subtle body is the way you feel yourself.

Now, there is a then again an anatomy of the subtle body. Which consists of the process of involution and evolution. There is a spinal tree, and it's represented as having two paths down it. It is a represented as a canal called the social. And then in this canal are two routes one is called the IDA and the others call the pingala. P I N G L A and the IDA, Ida. And one come current Something is going down. On the other something is coming up and you will recognize I think the familiar image of two serpents on a rod The Caduceus, is carried by Mercury. And alchemically the mercury. The mirror substance is the void is the pure clear light the same thing as the blood is

done. Now down at the base of the spinal column according to the chakra system. There is what's called the kundalini, which is the serpent power. And the symbol of the serpent power, is an inverted triangle, with a phallus upright and erect, and a sleeping serpent coiled all the way around the phallus. That is in other words, involution, to be absolutely involved. And the sex symbol is used again because sex stands for symbolically complete involvement. Now when you got in the trick is to get out. See?

So then, the process of yoga is represented as waking up that sleeping serpent, who is under the sleeve of Maya, who is captivated by illusion and thinks that the world really exists in other words the female echo of himself, or the male echo of herself has captivated. Memory has caught you. And you think it's all really there and you don't realize this is there's only the eternal now. And you need to know that. In order not to get quite lost, because if you go out to any one end of the spectrum, you forget you're there. At sort of a non-existence, you can't really non exist, you always come back eventually, but if you get one extreme too much you don't know you're there.

So then, the symbol is that you draw up the energy located in the kundalini, which is the sex symbol. And you send it back up the spinal tree to the top again from whence it came. Now, this is the theory of sex yoga. The theory is that, the male and the female partners. Well as I explained yesterday husband and wife or, some kind of spiritual marriage. What they do is this: by, the male sits in the normal meditation posture. And the female sits on top of them wrapping her legs around his waist and her arms around his neck, and he holds her around the waist. And in this position they arouse the sexual force. Now the theory goes on to say this. That instead of dissipating this energy, in the ordinary way, having aroused it, they send it up the spinal tree. Back into the brain. Now, don't take this literally, this is a symbolism. It's just the same kind of superstition is thinking that heaven is somewhere up in the sky and that there really are streets of gold, and angels wandering around in night with harps. All this is a way of talking about inner. Inner anatomy psychic anatomy. The kingdom of heaven is within you. And when Jesus ascended into heaven he went right into the middle of himself. And disappeared. You know, like the gates of heaven, there are pearls. People think the pearly gates the gates covered in pearls, there's

nothing of the kind. The gates of heaven are pearls each one is one pearl and you know a poem has a very thin hole through it for the thread to go in and that's why it's a camel can't go through the eye of a needle. Because you have to become no one to get through that hole. That's why the idea of many incarnations is likened to beads strung together on a thread and this thread is called the Sutraman. Sutra is a thread are among the self the threading self that angles all the beads together but it's so thin you see that. It's like nobody. The real you. You have to divest yourself of all hang ups, you see, to discover the real you. Well, we're back again to the thing of pulling the snake up the tree the serpent power... You have to let go of the hang ups and realize that there are no possessions everything's falling away all your memories are holding onto illusions. And then when you thoroughly understand that, you can go back in.

So you've got a marvelous picture of the world of the sort of systole and diastole. Of attachment and detachment, attachment and detachment. And this takes us right back you see the Bodhisattva who is liberated, who has let go and is no longer attached, to a given up memory. And in this is the meaning of giving up woman. Who was your resonator. Give that up, see, and you find you're free. There's only the eternal now. So the Bodhisattva, instead of staying there, goes back in. And there are all sorts of funny symbolic stories about Bodhisattva's appearing in the world as whores, and all kind of using every conceivable kind of device in order to liberate other beings. But this takes us completely back, you see, to the original Hindu image, of the world as the Pralaya and the Mahapralaya. The Mahapralaya is the period in which Brahma manifests himself as multiple beings for four million, three hundred twenty thousand years. And the Pralaya is the period in which he withdraws and everything disappears. And then starts all over again, and this goes on forever and ever and ever in not only our kind of time but in many other kinds of time. And in all sorts of different kinds of spaces. But it's the same fundamental myth, recreated in another form.

And you may say this is pretty monotonous. And that is you see one of the basic feelings underlying Buddhism. Must we go around again? So indeed you see you stay right now for this let's go to sleep. Let's stop, time must have a stop, so you stop. Well when you do that, you forget that it has happened, you see, this is a marvelous arrangement. Because then it can

start all over again without your knowing that it happened before, so you were never bored, and this is a cure for being tired of it. Because if you didn't know, I mean, that's where the memory goes you see. And so when you come back, there's no problem. At least no problem of boredom, of remembering the past are going to be all sorts of new problems. But you won't know you've had any problems that far so that won't worry you. Until you begin to accumulate memories again and you've had these problems, and it's becoming a bore dealing with problems and then you get rid of yourself. It's called death. It's a beautiful arrangement for keeping everything young and new. And for keeping the universe running without getting tired of itself and that's the definition of keeping on.

So you see, these are the two motions, that fundamentally then represented by the male and the female, the in and the out, the now moment and the memory, see, memory remember, creates the future as well as the past. You wouldn't know you were going to have anything happen tomorrow unless something happened yesterday. You figure because the sun, rose yesterday and yesterday and yesterday that it will arise again tomorrow. If you didn't remember it, you wouldn't know there was going to be any TOMORROW. Because there isn't, tomorrow is an illusion. So was yesterday. Simply isn't here where is it. Bring me tomorrow's newspaper. This is perfectly marvelous arrangement you see.

So that, you may feel as you think these things over that you are almost on the verge of going mad. I sometimes feel that, when I get involved in the sort of contemplative state, it is so weird and so far out that I think I'm going to lose my mind. But don't worry. You see, just like being dead. Just like....Just... let go. And swing with it. Because it always bounce. And what makes you gives you the sense of going mad, all is that you think you're not in control. And that it's all lost and someone someone else is going to take over. Or something else is going to take over. Well of course it has to. Because like you say, when you've driven long enough in the car you say to your wife will you drive for a while please? You want relief or something else has to take over. But it's all you. So do see that the how the nature of being is constructed in this extraordinarily fascinating way. So that. It constantly renews itself, and therefore is worth going on by eternal forgetting and getting rid of itself.

Eastern and Western Zen

Introduction to Zen

Reading the Book of Changes at the morning window, I rub the million stick of ink in the deal that drips from the pine trees. Discussing the sutras with a visitor, the sound of the wooden clapper is borne away on the wind from the bamboo. An ancient worth says, 'The shadow of the bamboo sweeps over the stairs, but the dust does not move.' The disc of the moon passes through the water of the lake, leaving no trace. One of our Confucians says, the stream rushes down swiftly but all is silent around. The flowers fall incessantly. But we feel quiet. If you have grasped the meaning of this in all your relations with things you are free in mind and body.

Zen and Taoism in common, involve not a system of doctrine, not a set of beliefs as we ordinarily understand religion, they involve a transformation of your consciousness that is to say out the way in which you experience your own existence at every moment. One might say that the average individual, not only in the West, but also in the east, has a feeling of himself as separate from his surroundings. From his, from other people, and from the Earth itself and from the space and the stars and everything around the earth.

He feels this in such a way that it's expressed in all the phrases of common speech. We talk about coming into the world. I came into this world. As a matter of fact you didn't. You came out of it, just in the same way as an apple comes out of an apple tree, as an expression of the apple tree. We say, I'm facing facts, as if facts, that is to say that the things going on in nature around you were something you confronted as a being alien from different from those facts. And meeting them as if they were total strangers. We talk about the conquest of nature, as a phrase expressing man's control over his environment, which is a very hostile phrase. Now, in order to get the Chinese point of view, may I be so simple as to take you back to the old

lesson about the bees and the flowers. Not to illustrate how sex works, but to illustrate the very fundamental property of nature. There are no flowers where there are no insects. There are no insects where there are no flowers. They go together, just in the same way as your head goes with your feet. Or as the head of a cat goes of the tail of a cat. Except in the case of Manx cats that don't have tails. But ordinarily, if you were watching a cat walking, and you had never seen a cat before, and you were looking at it through a narrow crack in a fence, you would see first the head and then the tail. Then the cat would turn around and walk past again, and you would see first the head and then the tail and you might assume that the.. your experience of the head of the cat was one event. And the tail was another example that they would be separate from each other but they would be related as cause to effect. But if you are a crack in the fence but widened, and you would see it was all one cat and that the head and the tail go together.

Now we have a way of attending to life which we call conscious attention, and that is like a narrow crack in a fence. Our speech reflects it, you can only think of one thing at a time. And that is our one of our ways of experiencing the world. Bit by bit, for example if you want to eat a chicken, you have to cut it up, and so you go to the grocery and you get a cut up fryer where else you cut it up at the table. Chickens do not come out of eggs as cut up friers. They come out the entire chicken. And so the world that we live in and we experience, is not caught up into things and events. It all goes together in the same way that the bees and the flowers go together, only we don't notice this we've got a way of thinking which splits it all up, and as a result of that we think of ourselves and so feel ourselves as if we were something separate from the whole domain of nature.

And to make a long story short and to tell you the whole quite right at the beginning, the the disciplines of our them and of Zen supposed change of consciousness in such a way that you will no longer feel that you are an isolated unit locked up inside a bag of skin but that you will actually experience the fact that your real self, the real you, is everything that there is. But concentrated on expressing itself at the point called your physical organism. There is of course, there are of course intimations of this in the west just as much as in the East. For example, to go back to something that is. Whole partly superstitious.

To my point of view that is to say astrology. Astrology does not seem to me to be an effective method of predicting the future. But it had some sense to it in that, when a child was born and people consulted the astrologers what he did was to draw a map of the person soul, his character. And this map consisted in a symbolic picture of the universe as it was at the moment when the child was born. Now, if the picture of that child's soul is the same thing as a picture of the universe. It shows that your soul is not in your body, your body is in your soul. And what your soul is, is the entire pattern of everything that there is, focused at the point you know as here and now. Just like you can focus the sun on a small point with a with a magnifying glass. Now, we know this to be true from the point of view of twentieth century Western science.

The science of ecology, which studies the relationship between organisms and environments is very acutely aware in an intellectual way. That an organism whether human or animal or insect or plant it doesn't matter what it is is not merely a something in an environment. Like you might say you are in this room. But the organism and the environment behave together. They go with each other. In the sense of the saying in the Gospels, figs do not grow on thistles, nor grapes on thorns. Has this application that human being in this do not grow in a cosmos which is unintelligent. If human beings are intelligent, and we define intelligence as the behavior of human beings. And their way of thinking, feeling and so on you will not get an intelligent organism in an unintelligent environment. An apple tree doesn't grow apples all the time. Planets and stars do not produce life all the time. But every so often, they do.

So if an apple tree may be said to Apple, this kind of universe in which we live peoples. It's a peopling world. And we go with it. But the problem you see, is we don't feel that. In the ordinary way we feel strangers in the earth and so talk about the conquest of nature and facing facts and all that nonsense. So that there is proposed then to get a transformation of our everyday consciousness which is a new kind of sensation. The sensation that what is going on outside you. Is all one process with what's going inside you, and that you are all that there is now you don't necessarily know this in the same way as you know something else out over there.
